Preparation.—p-Xylene (1 pt.) is heated with Br (6 pts.) at 140° to 200° with inverted condenser. The crystalline tetra-w-bromo-xylene [169°] thus obtained is heated with three times its weight of H2SO, (S.G. 1825 at 120°-130°), the product poured into water, and the needles that separate recrystallised from water (Hönig, M. 9,

Properties.—Long needles, v. sl. sol. hot water and cold ether, v. sol alcohol. Slightly volatile with steam. Dissolves in 25 pts. of saturated aqueous NaHSO₃ at 45°.

Reactions .- 1. Oxidised by chromic acid mixture to p-aldehydo-benzoic acid and then to terephthalic acid .- 2. Conc. NaOHAq forms terephthalic acid, w-oxy-toluic acid, and di-woxy-xylene.—3. KNO₃ and excess of H₂SO₄ at 110° form nitro-terephthalic aldehyde.—4. Cold cone. NH₃Aq forms tri-p-aldehydo-hydrobenz-amide (C_aH₄(CHO).CH)₃N₂, a crystalline powder, insol.water, alcohol, and ether, yielding on oxida-tion Bf KMnO₄ crystalline N₂(CH.C_aH₁,CO₂H)₃ (Oppenheimer, B. 19, 574).—5. Dry or alcoholic NH₄ forms crystalline C_aH₄(CH:NH)₂.—6, NaOAc and Ac.O give p-aldehydo-cinnamic acid.—7. Acetone and dilute NaOH give a white pp. of C_sH₄(CH:CH.CO.CH_s)₂, which crystallises from ether-acetone in matted needles [156°], insol. water and alcohol, and gives a deep-red soluwhite and alcohol, and gives a deep-led solu-tion in conc. H.SO. An intermediate body is C_aH₁(CH(OH).CH..CO.CH₃)₂.—8. NPhMe₂ and ZnCl₂form C_aH₄(CHO).CH(C_aH₁NMe₂)₂, the leuco derivative of the aldehyde of malachite green.-9. Cold conc. aqueous KCy added to a cold saturated alcoholic solution of the aldehyde ppts. amorphous C₁,H₁,O₁, which probably has the formula C₄H₄(CHO).CH(OH).CO.C₄H₄(CHO) [170°-174°]. This body reduces cold ammoniacal AgNO₃, forming a mirror. It also reduces warm Fehling's solution and combines with phenyl-hydrazine. KMnO₄ oxidises it to benzoin di-p-carboxylic scid. NaOHAq dissolves it, ferming benzoin di-p-carboxylic acid, di-a-oxy-p-xylene, and other bodies (Oppenheimer, B. 19, 1814).

Phenyl-hydraside [230°].

Oxim C-H_(CH:NOH).* [200°]. Formed

from the aldehyde and an alkaline solution of from the alderyde and an algaline solution or hydroxylamine (Westenberger, B. 16, 2994). Crystalline, v. sol. alcohol and ether, sl. sol. water. Yields $O_{\bullet}H_{\bullet}(CH:NOEt)_{\bullet}$ [55°] and $O_{\bullet}H_{\bullet}(OH:NOAc)_{\bullet}$ [156°]. Reference.—NITRO-TEREPHTHALIC ALDEHYDE. TEREPHTHALIO AMDINE $C_{\bullet}H_{\bullet}NN_{\bullet}$, i.e. $O_{\bullet}H_{\bullet}(OHN.NH)_{\bullet}$. The sait R"2HCI. formed

C.H.(C(M.).NH.). The salt B"2HCl., formed by digesting terephthalic imido-ethyl ether with alcoholic NH., is crystalline, and yields B"H_PCl. (Luckenbach, B. 17, 1436).
TEREPHTHALOPHENONE ... PHTHALO-

PHENOME.

TERPENES $C_{10}H_{16}$; also Sesquiterpenes $C_{13}H_{23}$ and Polyterpenes $(C_{10}H_{16})_n$. The greater number of these hydrocarbons exist ready formed as constituents of essential oils secreted by plants. Others are produced from the natural terpenes by the action of heat or of chemical agents. A dihydrocymene isomeric with the natural terpenes has been obtained synthetically from methylisopropyl succino-succinic ester and the homologous dihydroparaxylene and dihydrobenzene by corresponding processes (Baeyer, B. 25, 1840, 2122; 26, 232). The natural terpenes are generally optically active liquids, with right- or left-handed rotatory power. The only exception is the racemic compound dipentene (q. v.). The following isomerides are known :-

1. Pinene. This includes two varieties, australene or dextropinene and terebenthene or lævopinene. American spirit of turpentine conlevopinene. American spirit of turpename consists chiefly of dextropinene. (156°). [a]₁ = +21·5 (Berthelot, A. 83, 105; 88, 345, 110, 367, Suppl. ii. 226). S.G. $^{0}_{4}$ =8765; $^{25}_{52}$ =8586; $^{100}_{100}$ =8278 (Tilden, unpubl. expts.). French turpentine oil consists almost wholly of layopinene. (156°5°). $[\alpha]_{j} = -40.32$. S.G. $\frac{0}{0} = .8767$; $\frac{17.88}{17.88} = .8619$ (Riban, C. R. 78, 788; 79, 314). It is also present in oil of rosemary (Bruylants, J. 1879, 944), oil of lemon (Tilden, Ph. [3] 9, 654), sage and juniper (C. J. 31, 554), thyme and anise (Bruhl, B. 21,

156), and other essential oils.

For production and properties of turpentine oils v. Oils, ESSENTIAL, Thorpe's DICTIONARY OF

APPLIED CHEMISTRY.

Different specimens of the pinenes, both dextro- and levo-, obtained by fractional distillation from turpentine exhibit considerable variations in their rotatory power. An optically inactive liquid has been obtained by Wallach (A. 258, 343) from pinene nitrosochloride by treatment with aniline, whereby a diazo- compound is formed, which with the neighbouring chlorine atom gives rise to diazobenzenechloride and regenerates the hydrocarbon

- CCl -- C.NO -- + H.NC.H. $\begin{array}{ll} -\operatorname{CCl} -\operatorname{C(N:NC_0H_3)} - +\operatorname{H_2O} \text{ and} \\ -\operatorname{CCl} -\operatorname{C(N:NC_0H_3)} - + -\operatorname{C=C} - +\operatorname{ClN_0C_0H_3}. \end{array}$ The hydrocarbon thus obtained boils at 155°-156°, has a density 858 at 20°, a refractive index for D 1.46553 at 21°, and is supposed to be identical in constitution with the pinenes. It is apparently not resolvable into a mixture of dextro- and levo- pinenes, but with nitrosyl chloride and other reagents it behaves in the

same manner as pinene. Dry pinene unites with one molecule of dry hydrogen chloride, forming a crystalline com pound formerly called artificial camphor [125°], which appears quite saturated, as it is unacted upon either by excess of hydrogen chloride or bromine. The hydrochloride prepared from dex-tropinene is dextrorotatory, while that from levo-pinene is levorotatory. The compound is very pinene is laworotatory. The compound is very stable; it may be distilled almost without change, mere traces of hydrogen chloride being evolved; and it is unacted upon by aqueous solutions of the alkalis, except at high temperatures under pressure. Heated with sodium stearate, benzoate, or acetate, or with alcoholic potash, it loses the elements of hydrogen chloride and yields solid camphene (v. Camphene, infra). In the presence

of water, alcohol, ether, or acetic acid, pinene takes up two mols. of hydrogen chloride, producing a compound of different character [50°], which on the application of heat is readily split up into hydrogen chloride and a mixture of liquid into hydrogen chloride and a mixture of liquid hydrocarbons (v. DIPENTENE, infra). Nitrosyl chloride passed into a solution of pinene in chloroform at -10° yields a compound C₁₀H₁₀NOCI [103°], which is ppd. as a white crystalline powder on the addition of alcohol (Tilden, C. J., June 1875). The same compound is formed by adding hydrochloric acid to a cooled mixture of the terpene with amyl nitrite and glacial acetic acid (Wallach, A. 215, 245). The nitrosochloride gently heated with alcoholic potash yields a nitroso-compound, $C_{10}H_1$, NO [129°] (Tilden). For crystallography v. Story-Maskelyne (C. J., June 1875, and Phil. 'Mag.). Nitrosopinene unites with two atoms of bromine, forming a crystalline dibromide, which decomposes on melting [132°]. Mixed with alcohol and nitric acid both pinenes form crystallised terpin hydrate $C_{10}\Pi_{1}(OII)_{x}OH_{x}$ (Wiggers, A. 33, 358; 57, 247; Tilden, C. J. 33, 217; Hempel, A. 180, 71). Pinene dissolved in carbon tetrachloride and mixed with bromine yields a mixture of products, from which a well-defined crystalline dibromide $C_{10}H_{1a}Br_2$ [169°-170] may be isolated. On heating this with aniline it gives up hydrogen bromide, and ordinary cymene is produced. The yield, however, amounts only to about 10 p.c. of the bromide employed (Wallach, A. 264, 1). Exposed to the action of air or oxygen, in sunlight, the pinenes produce a crystalline compound $C_{\rm in}H_{\rm in}O_{\rm i}$ (Sobrero, C. R. 33, 66) which when distilled with dilute acid yields a compound called by Armstrong 'Sobrerone' (Armstrong a. Pope, C. J. 59, 311), which is identical with one of the products of the action of nitrous acid on pinene, isolated by Wallach a. Otto, and called by them 'Pinol' (A. 253, 249). Pinene distilled with bleaching powder and water yields a large quantity of chloroform. Pieric acid has no action upon pinenes in the cold, but at the b.p. of the latter a brisk reaction sets in, and if the liquid is afterwards allowed to cool a compound is deposited in colourless scales, which on boiling with alkali yield borneol (Lextreit, C. R. 102, 555; Tilden a. Forster, C. J. 63, 1388).

2. Limonene. This compound, like pinene, occurs in two optically active varieties. Dextrolimonene (175°-176°), S.G. 2°. 846, [a]_b = +106°8 (Wallach, A. 252, 145) occurs in oils of the fruit of oranges and lemons, also in caraway and dill, &c. The most convenient source is the essential oil of sweet orange, Citrus aurantium. Lavolimonene is obtained from the oil distilled from the leaves of Pinus sylvestris and P. picca. This oil occurs in the drug houses as 'Fir-Wool oil,' but is now much adulterated with common turpentine, and the commercial oil seldom yields more than a small percentage of limonene. (175°-176°), S.G. 2°° -846, [a]_b = -105° (Wallach, A. 227, 287, 246, 221). The limonenes, treated with perfectly dry hydrogen chloride, yield a liquid monochloride. In the presence of alcohol they give, with excess of hydrogen chloride, a quantitative yield of a dihydrochloride [50°], identical with the compound obtained from the pinenes. By the action of nitrosyl

chloride (Tilden a. Shenstone, C. J. May, 1877), or by the use of amyl or ethyl nitrite and hydrogen chloride (Wallach), they yield a crystalline nitrosochloride, which, whether formed from dextro- or lawo-limonene, is always a mixture of two isomerides separable from each other by cold chloroform or ether. There are therefore four isomeric limonene nitroso-chlorides, as follows:

```
From d. Limonene: 

\alpha compound [103^{\circ}-104^{\circ}] \alpha_{\rm D}=+313^{\circ} 

\beta , [105^{\circ}-106^{\circ}] \alpha_{\rm D}=+240^{\circ} 

From l. Limonene: 

\alpha compound [103^{\circ}-104^{\circ}] \alpha_{\rm D}=-314^{\circ} 

\beta , [100^{\circ}] \alpha_{\rm D}=-242^{\circ}
```

From the nitroso-chlorides by the action of heat (Tilden a. Shenstone), or by boiling with alcohol (Goldschmidt a. Zürrer, B. 18, 2220), is produced an isonitroso-limonene, which when made from lawo-limonene is identical in every respect with carvoyim C₀H₁, N.OH, from carvol, extracted from oil of caraway (Goldschmidt a. Zürrer, B. 18, 1732). For a comparison of the rotatory powers of the two limonenes and their derivatives, see Wallach (A. 252, 141). The limonenes are further characterised by the formation of a crystalline tetrabromide [104°-105°] by direct addition of bromine (Wallach, A. 227, 277)

By mixing together equal quantities of dextroand lawo-limonenes an optically mactive mixture is obtained, which behaves in many respects as a distinct hydrocarbon, and appearate be identical with dipentene (q. v.). Strong sulphuric acid acting upon citrene (d-limonone), causes polymerisation, the chief product being a colophene (310 '-320°) (Bouchardat a. Lafont, C. R. 115, 1083).

The oil of Licari kanali contains a compound, licarene C₁₀II₁₀O, from which a hydrocarbon, licarene C₁₀II₁₀O, from which a hydrocarbon, licarene C₁₀II₁₀O, from which a tation of acetic anhydride at 150° (Barbier, C. R. 114, 674, and C. R. 116, 993, and 1062). This terpene appears to consist of impure d-limonene, as it boils at 176°-178°, gives a tetrabromide [103°-104°], forms a nitrosochloride, from which carvoxim [72°] is formed by alcoholic potash; but its specific rotatory power is low, [a]₁₀ = 7.61°.

3. Sylvestrene occurs in Swedish turpentine (Atterberg, B. 10, 1206) and in Russian turpentine (Wallach, A. 230, 245), in company with australene and other hydrocarbons of higher boiling-point. (176°-177°). S.G. 18 = 8510; 29 = 8470. [a] = 66°32 (Wallach, A. 245, 197). The odour of sylvestrene differs from that of pinene and limonene, and resembles the odour of fresh firwood. It forms a liquid monohydrochloride, and a crystalline dihydrochloride [72°], from which the hydrocarbon may be recovered unchanged by heating with aniline. Sylvestrene also gives a nitrosochloride [106°-107°], which, by treatment with alcoholic potash, yields only oily products. The tetrabromide crystallizes in monoclinic tables [135°] (Wallach, A. 289, 29).

4. Phellandrene. The seeds of Phellandrium

4. Phellandrene. The seeds of Phellandrum aquaticum were found by Pesci (G. 16, 225) to yield about 2½ p.c. of a volatile oil, consisting chiefly of a dextrorotatory terpene (1712-1723). The same hydrocarbon is contained in the oil of bitter fennel, Foniculum vulgare (Wallach, 4.

239, 40), and in the oil of elemi. Lævo-phellandrene is found, according to Wallach (A. 246, 232), in the oil of Eucalyptus amygdalina. Phellandrene is characterised by the formation of a nitroso-nitrite $C_{10}H_{16}N_2O_3$. Pesci obtains it by the action of a nitrite and dilute sulphuric acid upon the hydrocarbon. It crystallises in needles [94°], and although obtained from the dextrorotatory hydrocarbon it rotates the plane of polarisation to the left. $[a]_0 = -183.5^\circ$ (Pesci). By reducing agents this compound is converted into a base $C_{10}H_{16}(NH_2)_2$ (20 $\hat{9}^{\circ}$ -214°). Ammonia converts it into nitrophellandrene

Ammonia converts it into introprenantierie C₁₆H₁₆NO₂ and an acid.

5. Dipentene, formerly called terpilene or terpinylene. As already stated, this compound is produced when equal quantities of dextroand lawo-limonenes are mixed together (see Pentylenes). It is formed by heating isoprene to a temperature of about 300°. It is also the chief constituent of 'isoterebenthene,' formed by the action of heat on lave-pinene. It occurs among the products of the destructive distillation of caoutchouc. Dipentene is also produced, together with terpinene, terpinolene, and terpineol, by the action of sulphuric acid or phosphoric acid on terpin, or by the action of sulphuric acid on the pinenes under certain condi-tions (Armstrong a. Tilden, C. J. November, 1879). It is also formed from the dihydrochloride [50°], whether made from pinene or limonene, either by the action of heat upon the chloride alone (Tilden, B. 12, 1133) or by boiling it with a mixture of sodium acetate and acetic acid, or with alcohol and aniline (Wallach). The products thus obtained were formerly supposed to consist of a single hydrocarbon, to which the name 'terpilene' was given. The hydrocarbons known as cinene and cajeputene formed from cineol and cajeputol respectively also consist of

dipentene. Dipentene occurs ready formed in the volatile oil of the camphor tree, also in oil of elemi and in Russian and Swedish turpentines (Wallach, A. 227, 296, &c.).
Dipentene boils at about 176°, and has a

pleasant smell of lemons. It combines with bromine forming a tetrabromide [124], and unites with 2HCl forming a chloride [50°], from

which it may be regenerated by methods given above. It is to be noted, however, that in all cases more or less isomeric change occurs, and the hydrocarbon, whether reproduced by heat

alone or by the action of aniline, always contains

terpinene and terpinolene, beside cymene and a small quantity of a paraflinoid hydrocarbon (Tilden a. Williamson, C. J. 63, 292). The nitrosochloride C₁₀H₁₆NOCl yields an inactive carvoxim C₁₆H₁₁NOH [98°] (A. 245, 267). A mixture of equal volumes of dextro- and levo-

limonene behaves in many respects as though it were a distinct hydrocarbon, as it was supposed to be previously to Wallach's researches. Thus the tetrabromide melts at 124°, while the limonene compound melts at 104°. The inactive

isonitrosodipentene or carvoxim, melting at 93°, is formed by mixing together equal quantities of lavo-carvoxim [72°] from dextro-limonene and dextro-carvoxim [72°] from lavo-limonene. The

resulting compound gives, by Raoult's freezingpcint method, a molecular weight corresponding to the simple formula C₁₀H₁₀NO (Wallach, A.

246, 280).

Certain derivatives of dipentene exist in two optically inactive forms. When d-limonenenitrosochloride, prepared from either dextro- or lævo-limonene, is warmed with an alcoholic solution of piperidine, a mixture of two crystallisable nitrolamines is formed in each case, as follows:

NITROLPIPERIDINES C10H16NONC4H16, FROM LÆVOLIMONENE :

> (a) [93°-94°] Rhombic, from alcohol. $[a]_{D} = -67.60^{\circ}$. Hydrochloride

dextrorotatory. (β) [110°-111°]. Monoclinic. $[a]_{D} = +60.18^{\circ}$ Hydrochloride almost inactive.

FROM DEXTROLIMONENE:

[93°-94°]. Rhombic. [a]_D = +67.95°. Hydrochloride lavorotatory.

(3) $[110^{5}-111^{\circ}]$. Monoclinic. [a]₀ = -60.48° . Hydrochloride (?). When the two a-piperidine bases [93°-94°] are dissolved in petroleum-spirit, and the solutions mixed, an inactive nitrolamine [154°] is at once precipitated. A second inactive compound [152°] is formed by mixing the β -piperidine bases (Wallach, A. 252, 123). Similar results have

been obtained by the employment of aniline and benzylamine. The salts of the bases thus produced possess a rotatory power opposite in direction to that of the free base. No method is at present known of producing from limonene active addition-compounds with two molecules of hydracid. With excess of hydrogen chloride the same inactive dipentene dihydrochloride [50°] is

always obtained. The corresponding dihydriodide seems to crystallist in two forms differing slightly in melting-point (Wallach, A. 239, 13). 6. Terpinene. (180° about). This compound

is formed, together with dipentene, by the action of acids upon pinene and terpin, &c. It is said to occur in oil of cardamoms (Ev. Weber, A. 238, 98). Terpinene has not been obtained in an absolutely pure state, but is characterised by

forming a nitrosonitrite $C_{10}H_{16}N_2O_3$ [155°] (Wallach, A. 239, 33). The tetrabromide is fluid, and it yields no crystallisable hydrochloride. The nitrosonitrite by the action of

the action ...

C₁₀H₁₅ < NOH₂ yields nitrolamines [116°-118°], C₁₀H₁₅<NOH_{NHC,H5} [130°-131°], &c. (A. 241, 315).

7. Terpinolene. (185° about). This hydrocarbon is formed along with dipentene and terpinene by the action of acids upon pinene, &c.

With hydrogen chloride and hydrogen bromide terpinolene unites to form the dipentene dihydrochloride [50°] and dihydrobromide [64°]. It forms an optically inactive tetrabromide which crystallises in monoclinic tables [116°] but is gradually converted at ordinary temperatures into a porcelain-like mass.

8. Fenchene. A liquid isomeride of camphor

(190°-193°), obtained from oil of fennel, is treated with alcohol and sodium, by which it is reduced with accordance solutine, by which is reduced to the alcohol $C_{10}H_{1}$, OH, a colourless crystalline compound. By treating this with phosphoric chloride the chloride $C_{10}H_{1}$, Cl is formed, and from this, by heating with aniline, fenchene $C_{10}H_{10}$ (158°-160°) may be obtained. Fenchene is optically inactive. It differs from other terpenes in resisting the action of nitrie acid unless heated (Wallach, A. 268, 149).

Isoterpenes.

Camphenes $C_{i0}H_{id}$. Pinene monohydrochloride [125°] was formerly described under the name 'artificial camphor,' from its resemblance to camphor in appearance and to a certain extent in odour. This compound is remarkably stable, but may be decomposed by heating with sodium stearate or benzoate, with potassium acetate, with alcoholic potash, or, better, with a mixture of sodium acetate and alcoholic soda (Brühl, B. 25, 147). The resulting hydrocarbon is a camphene [51°-52°] [160°), dextro- or lavorotatory or inactive according to the nature of the hydrochloride used and the reagent employed, though the exact conditions which determine the production of one or other are scarcely known (Riban, A. Ch. [5] 6, 353).

Camphene is also formed from bornyl chloride by the action of alcoholic potaslı (Riban), by the action of water and magnesia (Kachler, A. 197, 86), or by heating with aniline to the boiling-point of the latter (Wallach, A. 230, 234); it is also formed from camphor chloride and from pinene hydrochloride by the action of sodium (Montgolfier, C. R. 89, 102). In the last case it is accompanied by a liquid hydrocarbon (170), C₁₀H₂₀, which behaves like a paraflin, and is probably identical with a liquid obtained by the action of hydrogen iodide on turpentine (Berthelot), also by the action of iodine (Armstrong a. Gaskell, B. 12, 1756) and by the action of sulphric acid on turpentine (Armstrong, B. 12, 1759).

Camphene is also formed by the action of strong sulphuric acid on turpentine, and constitutes the characteristic ingredient in the liquid formerly known as 'terebene' (Armstrong a. Tilden, C. J. 1879, 733).

Camphene closely resembles camphor in appearance and even somewhat in odour. It is soluble in alcohol, ether, and benzene, and crystallises in leaflets from a concentrated solution. It is incapable of combining with bromine, but it forms a compound [157°] with hydrogen chloride, which is distinguished from pinene bydrochloride by its instability, being rapidly

decomposed by water with reproduction of camphene (Riban, C. R. 80, 1330). It is also dissociated into camphene and hydrogen chloride when volatilised (Ehrhardt, C. N. 54, 239). Camphene hydrochloride is said to be identical with bornyl chloride (Kachler a. Spitzer, A. 200, 310; v. also Brühl, B. 25, 160). Camphene does not combine with nitrosyl chloride. In contact with bromine it is slowly attacked, forming an oily monobrono- derivative (230*240*).

Oxidised by chromic liquor, camphene yields camphor, dextro-, laworotatory or inactive according to the character of the camphene.

By the action of phosphorus pentachloride on camphene, and subsequent treatment of the mass with an alkaline solution, salts of two phosphonic acids are formed (Marsh a. Gardner, C. J. 65. 35).

When camphene is heated to about 300° it is converted into liquid products which seem to include dipentene, but have not been sufficiently investigated.

Homologues of camphene.

Ethyl-camphene obtained by the conjoint action of sodium and ethyl iodide upon camphor monochloride C₁₀H₁₀Cl, is a colourless mobile liquid having a smell like turpentine (197-9° – 199-9°, bar. 742-1 mm.). Isobutyl-camphene is also a liquid (228°-229°, bar. 750-4 mm.) (Spitzef, B. 11, 1817).

Sesquiterpenes C15H24.

Oils of clove, calamus, cascarilla, patchouli, and cubebs contain a hydrocarbon of this composition (Gladstone, C. J. 1872), as also do the oils of galbanum, and savin and hulle de cade, a kind of tar made by distillation of the wood of Juniperus oxycedrus (Wallach, A. 238, 81). The hydrocarbon obtained from cade or cubebs (274°-275°) (S.G. \\ \frac{1}{2} = 921) forms the following crystalline compounds: C, \(\mathbf{H}_2\), 2HC[[17°-118°], C, \(\mathbf{H}_2\), 2HE [124°-125°], C, \(\mathbf{H}_2\), 2HI [105°-106°]. The hydrocarbon, especially when partially resinified by exposure to the air, gives the following characteristic colour reaction: dissolved in chloroform or glacial acetic acid and then

shaken up with a few drops of strong sulphuric acid, the liquid assumes an intense green and then blue colour, which, when heated, passes into red (Wallach). An attempt to prepare from isoprene a polymeride of the composition C₁₈H₂₈ proved unsuccessful (Wallach).

Conimene C_{1,}H₂₄, a liquid (264°) having a pleasant odour, is obtained from the incense resin (*Icica heptaphylla*) of British Guiana (Stenhouse a. Groves, C. J. 1871, i. 175).

Polyterpenes C .. H 32, &c.

This group includes (1) the constituents of certain natural essential oils; (2) products of artificial polymerisation of terpenes; and (3) caoutohoue and guttapercha.

1. Oleo-resin or so-called 'balsam' of copaiba (Copaifera Langsdorfii and other species) is a mixture of a resin with an oil (250°-260°). The latter unites with water and absorbs hydrogen chloride, with production of a deep violet colour but no crystalline hydrochloride. A similar hydrocarbon is obtained from Gurjun balsam or 'wood oil,' the product of various species of Dipterocarpus growing in the East, and from other essential oils.

2. When turpentine oil and other terpenes are heated for some time to about 300°, or treated with concentrated sulphuric or phosphoric acid or other agents, a large part of the hydrocarbon undergoes polymerisation. The name 'colophene' was given by Deville to the less volatile portions of the product obtained in this manner from French turpentine, apparently under the impression that it was closely related to the oil obtained by distillation of resin. Resin-oil, however, contains oxygen, and exhibits quite different characters.

Colophene is a yellowish viscid fluid, usually

fluorescent, which begins to boil at about 300°, but the distillation even under reduced pressure is attended by decomposition. The boiling-point continually rises, and even at a temperature approaching dull redness a viscid residue is left which on cooling becomes nearly solid (Armstrong a. Tilden, C. J. Nov. 1879). The portions which distil at 300° and upwards appear to consist of saturated compounds, for they absorb mere traces of hydrogen chloride. By the action of antimony trichloride upon turpentine a solid, C. M., is formed. This combines with hydrogen chloride to form two compounds Co. H., 14HCl., and Ci. H., 12HCl. (Riban, C. R. 1874, 389).

3. CAOUTCHOUG v. vol. i. p. 677. For further information concerning the products of its decomposition by heat v. Pentinenes (vol. iii. p. 807) and DIPENTENE (supra).

GUTTAPERCHA, v. vol. ii. p. 658.

Caoutchoue is formed from isoprene by polymerisation, which sometimes occurs spontaneously under circumstances not fully understood (Tilden, C. N., May 1892).

Oxidised compounds connected with terpenes.

A considerable number of oxidised compounds are known which are evidently closely connected with the terpenes, and in many cases directly derivable from them. Some of these, as, for example, borneol and camphor, occur as natural products in essential oils; others, such as terpin, are the products of the addition of water to a terpene, or, like camphor and some of its isomerides, may be formed from terpenes by oxidation. These compounds are enumerated in the following table, together with the hydrocarbons with which they are presumably immediately connected.

Hydrocarbons	Alcohols	Glycols	Ketones (?)		
Cymene C ₁₀ H ₁₄ (ii. 361)	Carveol C ₁₀ H ₁₅ OH (i. 711)		Carvol C, H, O (i.

Tetrahydrocamphene C ₁₀ H ₂₀ (v. Decylene, ii. 869, et infra)	- .				

Cymene $C_{10}H_{14}$ (176°); ii. 361.

Dipentene $C_{10}H_{16}$ (176°); v. supra.

Fenchene $C_{10}H_{16}$ (160°); v. supra.

Camphene $C_{10}H_{16}$ (160°); v. supra.

Menthene $C_{10}H_{16}$ (160°); v. supra.

Menthene $C_{10}H_{16}$ (160°); v. supra.

Dihydrocamphene $C_{10}H_{16}$ v. Decinene, ii. 367.

The liquid produced, together with the solid monohydrochloride, by passing hydrogen chloride into pinene, yields when treated with sodium a mixture from which a liquid hydrogenhom C. H mixture from which a liquid hydrocarbon C10H18 (148°-149°), having a smell of oranges, may be separated by fractionation, &c. (Bouveault, C. R.

116, 1067). Tetrahydrocamphene C₁₀H₂₀ (DECYLENE, ii. 367). A liquid obtained by the action of hydrogen iodide and phosphorus upon oil of turpentine (Berthelot) and another (160°) by action of phosphonium iodide on turpentine (Baeyer) have this composition. The same formula is ascribed by Armstrong (B. 12, 1758) to a liquid (160°-170°) obtained by the action of iodine upon oil of turpentine and upon camphor, also by the action of sulphuric acid upon turpentine. these products are insoluble in strong sulphuric acid, and resemble the paraffins in chemical

characters.

Carveol C₁₀H₁₅.OH (219°); i. 711.

Terpineol C₁₀H₁.OH. [35°]. (215°.218°).

Wiggers, A. 33, 358; 57, 247; List, A. 67, 362;
Tilden, C. J. 33, 247, and 35, 286; Wallach, B.
18, 618, Ref.; Kannonikoff a. Flawitzky, J. pr. [2] 32, 497; Bouchardat a. Voiry, C. R. 104, 996. Dextro- and lavo-terpineol are obtained by the action of alcoholic sulphuric acid upon d- and *l*-pinene respectively, or inactive by distilling terpin with very dilute sulphuric or hydrochloric acid. Terpineol as thus obtained is a viscous liquid, having an odour of white lilac. By fractional distillation under reduced pressure a portion is obtained (130°-135° at 40 m.m.), which may be crystallised by cooling to -50°, or by the introduction of a crystal of the same. These crystals melt at 30°-32°, and boil undecomposed at 218° (Bouchardat a. Voiry, C. R. 104, 996). Terpincol treated with sodium evolves hydrogen, but in consequence of its viscosity the action soon ceases. Contact with dilute acids converts terpineol into terpin hydrate. Hydrogen chloride and iodide react to form C10H18Cl2 [50°] and C₁₀H₁₈L₂ [77°] respectively. Potassium hydrogen sulphate at 200° produces dipentene. Terpineol unites with two atoms of bromine, but excess of bromine gives rise to dipentene tetrabromide. With phenyl cyanate it yields phenyl-terpinyl-urethane C₆H₃.NH.CO.OC₁₀H₁, [110°]. These and other reactions have been repeated by Wallach, using crystallised terpineol (A. 275, 103). Terpineol oxidised by permanganate yields a substance C₁₀H₂₀O₃ [121°-122°], which probably has the constitution of an oxyterpin C₁₆H₁₇(OH)₂. Further oxidised by means of chromic acid this yields a crystalline compound

C₁₆H₁₀O₂ [62°-63°] (Wallach, A. 275, 145). Cincol C₁₆H₁₀O (176°); ii. 187. Cincol appears to contain no hydroxyl, since it is not acted upon by metallic sedium nor by benzoyl chloride at 120°. It is also unaffected by hydroxylamine and by phenylhydrazine. Hence it appears to be neither an alcofiol nor a ketone. Its relation to terpineol (infra) is shown by the fact that when heated with

alcohol and sulphuric acid cineol is converted into terpinene and terpinolene; also that terpineol, and therefore also terpin, are partly converted into cineol by prolonged heating with phosphoric acid. Cineol oxidised by permanganate of potassium yields the potassium salts of carbonic, oxalic, and cineolic acids, with a small quantity of acetic acid. Cineol yields 45 p.c. of its weight of cincolic acid. This compound forms well-defined anhydrous crystals, which dissolve in 70 pts. of water at 15°, and in 15 pts. at 100°. They melt with decomposition at 196°-197°.

Calcium cineolate C₁₀H₁₁CaO₃.4H₂O is soluble in cold water, but is completely precipitated by boiling the aqueous solution. Silver cincolate C10H11Ag2O2.H2O is soluble in both water and alcohol, but cannot be crystallised. Ethyl cineolate C.H. (C.H.), O. obtained by passing hydrogen chloride gas into an alcoholic solution of the acid. is a colourless liquid (155° under 11-12 mm.). By dry distillation cineolic acid yields cineolic anhydride, water, carbon dioxide, and a liquid which appears to consist of a monobasic acid (A. 246, 265).

(A. 240, 265).

Fencheol C₁₆H₁,.(OH). Fenchyl alcohol
[40°-41°]. (201°). (Wallach, A. 293, 143; 272,
99-125). S.G. 22 933 (W.). [a]_D = ± 10·36 (W.). Dextro- and lavo-fenchyl alcohols are obtained by the reduction with sodium and alcohol of lavo- and dextro-fenchones respectively, Concentrated HNO₂ oxidises Henchyl alcohol to defenchone. PCl₃ gives rise to fenchyl chloride C₁₀H₁₁Cl (84°-86° at 14 mm.).

Borneol C₁₀H₁₂OH, ii. 522.

Geraniol C₁₀H₁₂OH, iii. 146. Linalool is said

to be convertible into the isomeric geraniol by treatment with acetic anhydride, and saponifying the resulting ester with alcoholic potash (Bouchardat, C. R. 116, 1253).

Menthol C₁₀II_{1p}(OII), iii. 203. Terpin C₁₀H₁₈(OH)₂ [104°-105°]. (258°) (Wiggers, A. 33, 358; 57, 247; Tilden, C. J. 33, Ter-247; 35, 286; Wallach, A. 230, 225-272). pin is best known in the form of its hydrate $C_{10}H_{20}O_2$. H_2O [116-117°], a beautifully crystalline compound which on heating to 100° loses water and leaves terpin as a vitreous mass. Terpin hydrate is readily obtained by shaking turpentine oil with alcohol acidified with sulphuric or nitric acid (Flawitzky, B. 12, 1022; Tilden, C. J. 33, 247; 35, 286), and leaving the liquid to evaporate. It is an optically inactive, saturated compound, slightly soluble in boiling water, soluble in alcohol and crystallising in rhombic prisms (Rammelsberg, P. 63, 570; Maskelyne, P. M. 1879). It possesses the characters of a glycol and with hydrogen chloride yields dipentene dihydrochloride [50°]. Boiled with water containing a mere trace of mineral acid, terpin dissolves with production of ter-pineol and water.

Camphene glycol O₁₀H_{1a}(OH)₂ [192°] (G. Wagner, B. 23, 2311).

Formation .- By the oxidation of camphene benzene solution with a 1 p.c. solution of KMnO, (l.c.).

Properties.—Colourless prismatic needles (from benzene) very readily soluble in ether, alcohol, CS, and chloroform. Exhibits the

same phenomenon as camphor when thrown on water. Sublimes when heated above 100°. Melts when warmed with water,, but only dissolves in it with difficulty. Heated with acetic anhydride in a closed tube at 120°, the greater part loses water, only a small portion being converted into the acetic erter. Treatment with difute HCl results in the loss of 1 mol. of H,O, giving rise to a solid body, C10H10O, isomeric with camphor, which reduces ammoniacal AgNO, and reacts with hydroxylamine.

Carvol C₁₀H₁₀O (228°), v. i. 711.

Fenchone C₁₀H₁₀O. [5°-6°]. (192°-193°)
(Wallach, A. 263, 130; 272, 102). S.G. 12 9465
(W.). R_A 44·23 (W.). [a]₁ + 71·70 and -66·94.

Occurrence.—Dextro-fenchone is present in

fennel oil, the fraction boiling between 190° and 195° consisting almost exclusively of the ketone, together with traces of anethol; derived from Thuja oil, fenchone possesses levorotatory optical properties. D- and l-fenchone form a series of derivatives which bear to one another a relation similar to that subsisting between the two tartaric acids, and the analogy extends to the formation of racemic modifications when equal proportions of the two classes of derivatives are mixed together.

Preparation.—The fraction of fennel oil boiling between 190° and 195° is treated with concentrated HNO₃, the ketone remaining unattacked. After being freed from acid and distilled in a current of steam, the dry oil is cooled,

and the fenchone crystallises out.

Reactions .- With bromine in the cold, an addition compound is formed, substitution taking place if the mixture becomes heated. P₂O₃, P₂S₃, and PCl₃ have the same action upon fenchone as upon camphor. Fenchone is dissolved by cold concentrated HCl, being thrown out of solution on warming. HNO, has but little action in the cold, but in a scaled tube at 120° HCN is formed (A. 263, 134). KMnO, oxidises fenchone to a mixture of oxalic, acetic, and dimethyl-malonic acids. D- and l-fenchone yield d- and l-fenchyl alcohols respectively on reduction with Na and alcohol (v. Fencheol). On heating d- and t-tenchone with ammonium formate, t- and d-fenchylamines respectively are formed. Fenchone does not react with phenyl-hydrazine or with alkaline sulphites, but both varieties form oxims [161°] with hydroxylamine.

d-Fenchon-oxim C₁₀H₁₈NOH [161°] (240°) loses water on treatment with dilute H.SO., an unsaturated dextrorotatory nitrile (218°) being formed.

l-Fenchon-oxim C₁₀H₁₈NOH [161°] behaves in a similar manner on treatment with dilute H₂SO₄. The resulting nitrile yields with potash a laworotatory α-isoxim C_νH₁₂.CONH₂ [114°-115°] which is readily converted by dilute H₂SO₄ into the \$-isoxim [136° 137°].

into the B-180xim [130*—137*].

Camphor C₁₀H₁₀O (0.669) (iii. 204).

Menthone C₁₀H₁₀O (206°) (iii. 204).

Palegone C₁₀H₁₀O (130°—131° under 60 mm.).

(Beckmann a. Pleissner, A. 262, 1; Wallach, A. 272, 122; Semmler, B. 25, 3515). S.G. 22. 9323 (B. a. P.); R₄ 45·55 (B. a. P.); [a]_D 22·89 (B. a. P.). Pulegone is the chief constituent of Spanish oil of pennyroyal (Mentha pulcgium). It is a dextrorotatory colourless liquid, having an odour of peppermint, and rapidly becoming yellow on exposure to the air.

Reactions. - With HBr it combines forming a lævorotatory ([a]_p = -33·8) addition compound C₁₀H₁₆O.HBr [40·5°]. When heated with ammonium formate, Wallach (A. 272, 123) failed to obtain a base isomeric with fenchylamine and thujonamine, a mixture of bases being formed. Slow exidation with KMnO, gives rise to acetone and \$\beta\$-methyl-adipic acid [84.5°]. Rapid oxidation with the same reagent yields a γ-valero-lacton-γ-acetic acid (Semmler, B. 25, 3516). Pulegone combines with hydroxylamine to form pulegonoxim $C_{10}H_{18}NO_2$ [157°]. The oxim contains one molecule of H_2O more than camphoroxim. It is levorotatory ([a]_D -83.4) and forms a hydrochloride [117-118°], a benzoyl ester [137°-138°], and an acetyl ester [149°]. On heating its hydriodide pulegonamine C10H18O.NH is formed.

Pulegone hydrobromide C10H10O.HBr [40.5°] is levorotatory; it forms an oxim [38°] which becomes converted on standing into normal pulegonoxim [157°]. Pulegone hydrobromide, on treatment with moist silver or lead oxide, loses HBr, pulegone being regenerated. Distillation with zinc dust gives rise to an oil which resembles menthone in every respect but the melting-point of its oxim (85° instead of 59°).

Constitution. - From the results of oxidation

experiments carried on under various conditions with KMnO, Semmler (B. 25, 3519) attributes to pulegone the constitution:

Puleone is the name given to a compound isomeric with camphor, obtained by Barbier (B. 25, 110c), from pennyroyal oil, described as boiling at 222°-223°, and possessing the following physical properties: S.G. 9482; 23 9293; [a]₀+29·15. Its oxim C₁₀H₁₀.NOH is an oil $[\alpha]_0 + 29.15$. Its oxim $C_{10}H_{10}$.NOH is an oil (170° under 48 mm.) yielding a liquid anhydride C₁₀H₁₅N on treatment with dilute H₂SO₁. Chromic acid mixture oxidises it to carbonic. acetic.

and propyl-succinic [89°-91°] acids.

Tanacetone C₁₀H₁₀O (195°-196°; 84.5 at 13 mm.), identical with the thujone of Wallach (A. 272, 109; Bruylants, B. 11, 450; Semmler, B. 25, 3343, 3519; Wallach, l.c.). S.G. 26 9126 (S.). R. 44.54 (S.).

(S.). R. 44-54 (S.). Tanacetone occurs in tansy, sage, wormwood, possesses an optical rotatory power amounting to +38° 30' in a 2-dcm. column.

Reactions .- Sodium in alcoholic solution reduces it to tanacetyl alcohol (92.5° at 13 mm.). With alkaline hypobromite it yields bromoform and tanacetogen-dicarboxylic acid (113.5° at 15 mm.). Oxidised with KMnO, it yields tanaceto-carboxylic acid, which exists in two modifications, the a and & thujal etonic acids of Wallach (l.c.), [75°-76°] and [78°-79°] respectively. Heated with ammonium formate, it gives the acetylamine (198°-199°), the same body being formed when tanacetoxim (see below) is reduced with sodium and alcohol. The hydrochloride of this base on dry distillation yields tanacetene (172°-175°), a hydrocarbon of the formula $C_{10}H_{10}$, identical with Wallach's thujene. Tanacetone reacts with hydroxylamine to form tanacetoxim $C_{10}H_{10}$. NOH [51·5°] (135°-186° at 22 mm.), which yields tanacetylamine on reduction, while treatment with dilute alcoholic H_{10} SO, converts it into a cymidine (Pr.NH₂:Me:1.3:4), which gives carvacterol with nitrous acid. Tanacetophorone $C_{10}H_{10}$ O (89°-90° at 13 mm.). R_{10} SO. When tanacetogen-dicarboxylic acid (produced by the action of NaBrO upon tanaceto-carboxylic acid, is heated with soda-lime, tanacetophorone is formed. It has ketonic properties, and combines with hydroxylamine.

Constitution.—Semmler (B. 25, 3519) suggests for tanacetone and tanacetogen-dicarboxylic acid the formulæ

Sobrerone C₁₈H₁₈O. Pinol. (183°-184°) (Wallach, A. 253, 254; Armstrong, C. J. Proc. 1890, 100). S.G. $\frac{29}{5}$ 953 (W.); $\mu_{\rm b}$ 1469 (W.). Sobrerone is obtained from the mother-liquors accumulated in the preparation of pinene nitrosochloride; also by boiling sobrerol with dilute H₂SO₄ (Armstrong, Le.).

Reactions.—It combines readily with Br to form a dibromide [94], from which, on treatment with alcoholic potash, sobrerone is regenerated. Sobrerone and its dibromide yield terebie acid [175°-176°] on oxidation with KMnO, HNO, produces the same result. It forms a nitroso-chloride [103°] which, by the action of bases, is readily converted into nitrolamines, egsobrerone-nitrol-pierdidne [164°] and sobrerone-nitrol-benzyl-amine [133'-131°]. The dibromide C₁₈H₁₀O.Br₂ [91°] (143°-144° at 1 mm.) yields on treatment with alcoholic potash, in addition to sobrerone, its glycol-ether C₁₀H₁₀O(OC₂H₃)₂ [52°-53°]. Sobrerone-glycol-diacetate is easily obtained by heating the dibromide to 150° with lead acetate in glacial acetic acid solution. When heated at 100° for three hours with formic acid, sobrerone dibromide is converted into pinene.

Constitution.—Its behaviour towards bromine and nitrosyl chloride and its molecular refraction indicate the existence of one ethylene linking, while its indifference towards acid chlorides, hydroxylamine, phenylhydrazine and 11. Srender it probable that the O- atom is united to two different C- atoms. From these facts, and from its behaviour on oxidation, Wallach (.1. 253, 259) assumes the constitution

Sobrerol C₁₀H₁₀O₂. [150°] (Sobrero, C. R. S. 66; Armstrong, C. J. Proc. 1890, 100; C. J. 59, 315). Sobrerol is obtained by oxidising French and American turpentines in

sunlight. It occurs in two optically active forms, both melting at 150°, and on allowing a mixed solution to crystallise inactive sobrerol. [181°] separates out. When boiled with dilute H₂SO, it loses 1 mol. of H₂O, sobrerone—identical with Wallach's pinol—being formed.

Eucalyptol C₁₀II₁₀O (176°) (Jahns, B. 17, 2941; Bouchardat a. Voiry, C. R. 106, 663). Identical with cincol, spicol, cajeputol, and terpan (B. a. V.).

Myristicol C₁₀H₁₀O (224°) (Wright, B. 6, 1320; Gladstone, C. J. 23, 147; 25, 1; Brühl, B. 21, 471). S.G. ¹² 9446 (G.). R_s 46-42 (G.). Myristicol is a dextrorotatory alcohol, obtained from the ethereal oil of nutneg, Myristica aromatica. It yields a chloride with PCl_s and beconverted into cymene by the action of ZnOl₂.

Absinthol C_{1a}H_{1.}O (217°) (Beilstein a. Kupffer, B. 6, 1183; Wright, Lc. 1320; Gladstone, C. J. 45, 241; Brühl, B. 21, 471). S.G. 33 9128 (G.). R_A 44·62 (G.). Absinthol is obtained from oil of wormwood, and is dextrorotatory. It is converted by ZnCl₂ and P₂S₃ into cymone. In what form the oxygen exists is at present unknown.

Constitution of the terpenes.

I. Pinene. The following facts must be taken into consideration:

1. Dry pinene combines with one molecule of hydrogen chloride to form a saturated compound, from which hydrogen chloride is with-drawn with difficulty, the resulting hydrocarbon being a solid camphene. Moist pinene combines with 21ICI, yielding dipentene-dihydrocalboride. This also is saturated. The formation of both these compounds is undoubtedly attended by isomeric change, inasmuch as pinene cannot be recovered from either of them; but on removal of the elements of hydrogen chloride a new hydrocarbon results.

2. Pinene seems to combine with two atoms or with four atoms of bromine, according to the method of operating. By adding bromine to a cooled solution of pinene in carbon tetrachloride, Wallach has obtained a crystalline dibromide C₁₀H₁₈Br₂ [170°]. The yield is, however, very small, about 7 p.c. of the hydrocarbon employed (A, 264, 1). By shaking up a solution of pinene in chloroform, with an excess of sodium hypobromite, acidified with hydrochloric acid, so as to liberate the bromine, and immediately afterwards determining the unabsorbed excess of bromine, Telden obtained results which pointed to the union of the terpene with four atoms of bromine. The combination is, however, very unstable, and hydrogen bromide is soon evolved (C. J. 53, 882). Schtschukaroff finds that a chloroform solution of pinene takes up, in the dark, four atoms of bromine, but the bromide formed is unstable, and quickly gives off hydrogen bromide, thus C10H1.Br. HBr + C10H15Br. (B. 23, 432, Ref.; J. pr. 47, 191-6).
3. Pinene combines with NOCl to form a

3. Pinene combines with NOCl to form a saturated compound which is not an oxim but a nitroso compound, and yields up the NO.Cl by the action of aniline, with liberation of an optically inactive pinene.

4. By addition of two atoms of bromine to pinene, and subsequently heating the product alone, or, better, with aniline (Oppenheim, B. 5.

629), cymene is formed.

5. In contact with slightly diluted mineral acids, or when heated above its boiling-point, pinene is gradually converted into an optically inactive mixture of dipentene with terpinene, terpinolene, and polymerised terpene ('colo-

phene').
6. When heated to a temperature short of visible redness, pinene yields a considerable quantity of isoprene C_aH_s, together with a notable amount of meta-xylene.

7. Pinene submitted to oxidation yields about 1 p.c. of its weight of p-toluic or terephthalic acid. This is perhaps due to the presence of a little cymene. It must, however, be remembered that the oxidising agent usually employed is either nitric acid or acidified chromic liquor, and hence that the pinene is first changed into dipentene or one of the other hydrocarbons referred to above (5). When nitric acid is used oxalic acid is the most abundant product, accom-

Beckurts, B. 18, 826). By treatment with chromate and sulphuric acid pinene yields much acetic acid, together with some terebic acid and

8. Natural pinene rotates the plane of polarisation to the right or to the left. therefore must be supposed to contain an asymmetric atom of carbon.

In order to epitomise these facts many formula have been proposed. The most important fall under two classes—namely, those in which pinene is represented as a dihydrocymene, and those in which a cross- or para-linkage is assumed.

Of the former class, the first example is the formula given many years ago by Oppenheim (B. 5, 98)-

This kind of formula is now attributed with greater probability to limonene, and it must be remarked that of the possible formulæ of this type there are only four which contain an asymmetric carbon atom and iso-propyl.

It has been shown that cymene, with waich pinene is closely connected, contains iso- and not normal propyl (Widman, B. 24, 439). Hence pinene and its isomerides are believed also to be isopropyl compounds.

Formula containing cross- or para- linkages have been proposed as follows:-

II. Limonene.—1. Dry limonene combines with one molecule of hydrogen chloride, but unlike the hydrochloride derived from pinene the resulting compound is optically active and is not saturated, as it combines with halogens. with nitrosyl chloride, and, in the presence of moisture, with a second molecule of hydrogen chloride (Wallach, A. 270, 188). Limonene in the presence of water or alcohol readily yields dipentene dihydrochloride [50°], identical with the product formed from pinene. The dihydrochloride is optically inactive.

2. Limonene unites with four atoms of bromine, forming a crystalline tetrabromide.

3. Limonene unites with one molecule of nitrosyl chloride. The product, of which two (stereo?) isomerides occur, gives the reactions of an oxim.

4. Limonene readily yields abundance of cymene identical with that which is obtained from pinene (Oppenheim, B. 5, 628).

5. Limonene is polymerised by heat much less readily than pinene, and is not convertible into camphene.

6. Limonene vapour at a low red heat yields isoprene in the same way as pinene.

7. Limonene oxidised by nitric acid or by chromate yields oxalic, acetic, terebio or terpenylic acids according to circumstances, usually without any trace of toluic or terephthalic acid.

8. Limonene is dextro- of lavo-rotatory.

mixture of equal volumes of the active hydrocarbons constitutes dipentene, which, on account of its peculiarities, quite different from those of its components, was long regarded as a distinct hydrocarbon.

The formula which agrees best with the characters of limonene is either I. or II. given

above (see Pinene).

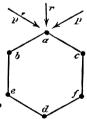

In both of these there is an asymmetric carbon atom, and as the mono-hydrochloride is optically active while the dihydrochloride is inactive, these compounds will probably be represented by the following formula:-

Limonene nitrosochloride deprived of the elements of hydrogen chloride yields a compound which has been identified with carvoxim. If the following formule be assumed for carvacrol and carvol, the interrelation of these compounds is obvious.

The corresponding formula for limonene should be No. II., but if that correctly represents the constitution of the hydrocarbon, the production of the nitrosochloride, or of the oxim from it, must be attended by isomeric change involving a re-distribution of the hydrogen and of the double linkages. Thus:

The oxim is optically active.

The very ready conversion of pinene into dipentene (= limonene) is a point of considerable importance, and it appears probable that the products formed by the action of heat and acid oxidising agents are in reality derived, not directly from pinene, but from the isomeric hydrocarbon into which it is first converted. The splitting up of pinene by heat into isoprone has been regarded (Wallach, A. 239, 48; Collie, B. 25, 1111) as supporting the formulæ already given VI. and VII., in which a para-or cross linkage is adopted. But remembering that isoprene is converted by polymerisation, not back again into pinene, but into dipentene, this evidence is of little importance. On the other hand, the difficulties involved in the assumption of a cross link in a cycloid of six carbon atoms are very considerable. In any closed ring of carbon atoms, the stability of the ring is easily accounted for upon simple mechanical principles. For if we consider six carbon atoms situated at the angles of a regular hexagon, and each attracted to its two neighbours on either side, whatever be the forces of attraction between them the resultant of those forces will have the effect of urging each carbon atom toward the centre of the figure. Thus, if the carbon atom a is attracted towards the carbon atom b with a force represented by p, and towards c with a force represented by p', in the figure, the resultant of these two pressures will be r, which acts towards the centre; and so with each of the five other atoms.

This conception is, of course, independent of any hypothesis concerning the fourth unit of valency, and the formula has no reference to the well-known 'centric' formula. The modern hypothesis according to which the carbon atom is supposed to be situated at the centre of a regular tetrahedron while the radicles with which it is united are placed at the angles of the same supplies no distinction between the force and the direction of the unit of affinity. The difference of specific volume observed between carbon compounds of the aromatic and fatty series seems to indicate that carbon atoms in the former are more closely united together. but it appears that no compounds are known in which the specific volume of carbon differs very greatly from its normal value. Hence it appears probable that the carbon atom, in uniting with other atoms, preserves a nearly constant distance from them, and in the figure above to suppose that a is combined with d as firmly as with b or c requires the assumption that a carbon atom is capable of acting through a distance twice as great in one case as in another. If this is possible, and we imagine the force of attraction between a and d to be as great as between a and b or c, then, unless c acts upon e and b acts upon f at the same time with the same force the figure will be changed from the hexagon to a double square.

A compound of this kind would be incapable of many of the changes which are characteristic of pinene, and a second cross linkage between c and e, or between b and f, would be impossible. Hence the following formulæ, which are attributed by Wallach to nitrosopinene and pinylamine cannot be accepted even if a single diagonal is allowed in the formula of pinene.

Formulæ III. and IV. now remain to be considered. So far as the writer is aware, formulæ of this type have not been proposed for any of the terpenes. Nevertheless there is much to be said in favour of an expression of this kind for a compound so unstable as pinene, which appears to be incapable of withstanding the action of heat or of contact with any reagent without isomeric change. For example, the conversion of pinene into dipentene, terp nene, and terpinolene may be explained with the minimum amount of hypothesis by the following formulæ, in which the tendency towards the conversion of an unsymmetrical into a symmetrical molecule is clearly shown. The question as to the relative positions of the methyl and propyl groups is left open.

The conversion of pinene into dipentene through the dihydrochloride is readily shown.

Such a formula for pinene also explains the extreme instability of its tetrabromide.

III. CAMPHENE. Camphene behaves towards all reagents-such as bromine and nitrosyl chloride—as a saturated compound, but with hydrogen chloride it unites, forming a compound which in external appearance resembles pinene monochloride, but differs from that compound by its instability. When camphene is oxidised by chromic acid it yields camphor, but when treated with permanganate a glycol is formed. This compound crystallises in odourless small monoclinic prisms, which sublime at temperatures above 100° (192° ca.). Its most characteristic property is seen in its reaction with dilute acids, whereby water is separated and a compound isomeric with camphor formed. This reaction appears to indicate the existence of one ethylenic bond in camphene (G. Wagner. B. 23, 2307). Brühl (B. 25, 160) also finds, as the result of his latest determinations of the molecular refraction and dispersion of camphene, that this hydrocarbon contains one ethylenic linkage. Wallach (B. 24, 1555) upon other grounds appears to hold the same view. phene is, however, so closely connected with camphor that the constitution of the latter compound when settled may serve as a guide in determining the constitution of the former. The formula for camphor given by Kekulé (B. 6, 931) was based upon the supposed intimacy of its relation to cymene and carvacrol.

There can be no serious doubt of its character as a ketone, inasmuch as it yields an oxim, though it gives no compound with NaHSO₃; but the action of dehydrating agents upon camphor is very complicated, and there can be no doubt that the production of cymene is attended by isomeric change. Armstrong a. Kipping (C. J., Jan. 1893) have shown that among the products of the action of strong sulphuric acid upon camphor

there is a considerable quantity of acetylorthoxylene (O.H.Me.Me.Ac, Me:Me:Ac = 1:2:4). From observation of its molecular refraction Brühl (B. 21, 467) suggests a formula containing a para- linkage, either

The former of these two formulæ has also been used by Wallach (B. 24, 1555). These expressions are equivalent to representing camphor as a derivative of tetramethylene.

A formula of a different character has been suggested by Armstrong a. Miller (B. 16, 2260) (v. vol. i. p. 670), and another of somewhat similar type by Collie (B. 25, 1114):

Camphor by oxidation with nitric acid yields camphoric acid in large quantity, and as the characteristic and chief product. Camphoric acid is therefore probably derived from camphor by an operation of a simple kind without con-stitutional disturbance. The following formula proposed by Collie (B. 25, 1116) has been shown to possess a very high degree of probability (Walker, C. J., April 1893):

This formula sufficiently accounts for the chief facts concerning camphoric acid, viz. that it is a saturated dibasic acid, which readily yields the anhydride by heating; that it is optically active, and when treated with hydrogen iodide yields tetrahydro- and hexahydro-

m-xylene.

From this formula are deducible the following formulæ for camphor and camphene:

This formula for camphene explains pretty well all its relations, except its derivation from pinene, if either of the formulæ containing a para-linkage be adopted. The chief objections to such formule are stated above.

J. Bredt (B. 26, 3047) has recently proposed formulæ for cymphene, camphor, and camphoric acid, which are derived from a pentamethylene ring.

Synthesis of Terpenes.

Von Baeyer in a series of papers has shown that various dihydro-derivatives of benzene and its homologues may be synthetically produced. Starting with succino-succinic ester, this compound, by treatment with dilute sulphuric acid. yields diketo-hexamethylene, and this, by reduction with sodium-amalgam, gives the corresponding glycol. This glycol possesses the characters of a sugar, and has been named chinite or quinite (B. 25, 1037). It occurs in two isomeric forms, which by treatmens with hydrogen bromide yield two dibromohexamethylenes. Both of these by heating with quinoline yield dihydrobenzene (B. 25, 1840), a liquid which has nearly the same boiling-point as benzene, but combines with HBr and with Br. It also reduces permanganate. By a corresponding series of processes dihydro-p-xylene was obtained from dimethylsuccino-succinic ester (B. 25, 2122). Dihydrop-xylene (134° circa) smells of turpentine, unites with hydrogen bromide, but forms no crystallisable nitrosite.

In order to produce a dihydrocyruene it is necessary to start from the methyl-propyl com-This compound of succino-succinic ester. pound was obtained by heating the sodium compound of the monopropyl ether with methyl iodide (B. 26, 233). Methyl-isopropyl-dihydrobenzene boils at about 174. It smells like tur-pentine and resinifies in the air. It decolourises permanganate and unites with bromine, forming an uncrystallisable bromide. Although closely resembling a terpene, however, it is obvious that this hydrocarbon is not identical with any natural terpone known, containing, as it does, no asymmetric carbon. It may be identical with terpinene. The relations of the paradibromohexamethylene, or of its alkyl derivatives, to the corresponding hydrocarbon is shown in the following formulæ (B. 25, 1840, 2122):

TERPENYLIC ACID C,H,2O,. [72°] (Fittig); [58°] (Wallach). Formed, together with terebic acid, by oxidising oil of turpentine and other terpenes with chromic acid mixture (Hempel, B. 8, 357; A. 180, 77; Fittig a. Kraft, A. 208, 71). Formed also by oxidising pinol hydrate [131^o] with KMnO₄ (Wallach, A. 259, 318). Monoclinic prisms (containing aq).

Reactions. - 1. Yields acetic acid and CO₂ on

further exidation by chromic acid.-2. On dry distillation it yields teracrylic acid (218°), a very little oxy-heptoic lactone (212°) and other bodies (Amthor, J. pr. [2] 42, 388).—3. Reduced by HI and P to \$\beta\$-isopropyl-glutaric acid (Schryver, C. J. 63, 1344).

Salts.—BaA'₂. Amorphous powder, v. e. sol. water. Converted by boiling with baryta into barium diaterpenylate Ba(C₈H₁₃O₈)₂ aq. which separates in needles on heating the cold saturated solution and is v. sl. sol. water. On adding an acid the liberated disterpenylic acid at once changes to its lactone, terpenylic acid. -CuA'₄ xa₁...-AgA'. Crystalline mass. Silver diaterpenylate AgC₈H₁₃O₄ is ppd. by adding AgNO₄ to a solution of barium diaterpenylate.

Ethyl ether EtA'. [38°]. (305° i.V.).

Monoclinic crystals; a:b:c=1.051:1:381; $\beta=50^{\circ}$ 58'. V. sol. alcohol and ether, sl. sol. cold water. Sodium converts it into (α)- and

cold water. Sodium converts it into (α)- and (β)-diterpodilactone $O_{1,1}^{-1}O_{2,.}^{-1}$ (154°).

(α)-Diterpodilactone $O_{1,1}^{-1}O_{2,.}^{-1}$ [154°].

Formed as above (Fittig, A. 256, £13). Long, needles (from water), m. sol. alcohol. Yields CaO_{1,1}H_{2,1}O, 6aq, Ag₂O_{1,1}H_{2,1}O, and BaC_{1,1}H_{2,1}O, 6aq erystallising in monoclinic prisms; a:b:c=935:1:595; β=65°54', which, when decomposed by HCl and immediately extracted with ether wields (a)-diterpolactonic acid C. H...O. [160°]. yields (a)-diterpolactonic acid $C_{15}H_{24}O_8$ [160°]. This acid decomposes above 160° into water and its lactone.

(β)-Diterpodilactone C₁₅H₂₂O₃. [135°]. A product of the action of Na on terpenylic ether (Fittig, A. 256, 122). Needles, in. sol. alcohol. Converted by baryta into (β)-diterpolactonic acid [187°] and (β)-diterpoxylic acid C₁₈H₂₀O₂. (8)-diterpolactonic acid forms trimetric crystals; a:b:c = .732:1: 259 and is re-converted by heat into the lactone. (3)-Diterpoxylic acid forms the salts BaA" 33aq, CaA", and Ag.A".

(a)-Diterpylic acid C, al. O, (a)-Diterpodilactone carboxylic acid. [2169]. An interpolacid card.

mediate product of the action of Na on terpenylic ether. Needles, m. sol. alcohol. Converted by boiling HClAq or by heating above 216° into

(a)-diterpodilactone.
TERPILENE v. TERPENES.

TERPILENOL C₁₀H₁₈O. [c. 32°]. (c. 130° at 50 mm.). S.G.c. 95. H.C. (inactive) 113,318; (active) 102,923 (Louguinine, C. R. 107, 1165). Got by saponification of the terpilene acetates C10H18HOAc or terpilene formates C10H18CH2O2 by alcoholic potash (Latont, A. Ch. [6] 15, 205). Crystals, insol. water, v. sol. oil of turpentine, alcohol, and ether. Boils with decomposition at 220°. Occurs in several forms varying in their action on polarised light.

Reactions.-1. HCl forms (1.0H1.2HCl [48°], Reactions.—I. Hot forms \(\text{L}_0,\text{H}_1\) \(\text{2}\) Hold [48], which is inactive even if the terpilenol were active.—2. Alcohol and HNO, give \(\text{C}_1\text{H}_1\text{O}_3\) \((\text{L}_1\text{O}_4\) \((\text{L}_1\text{O}_4\) \((\text{L}_1\text{L}_1\text{O}_4\) at 100° forms the acetyl derivative or terpilene acetate.

C₁₀H_MOAc or .971. V.D. 6.6. derivative Acetys aerivative C_{0,6}H₁₆OAc or C_{0,6}H₁₆HOAc. (220°). S.G. 2 '971. V.D. 6·6. Obtained by heating terpilene with HOAc at 150°. Liquid (Bouchardat a. Lafont, C. R. 102, 1555).

Formyl derivative $C_{10}H_{17}O.CHO$. [a]_D = -69° 25'. S.G. 2 999. Formed from oil of turpentine and cold formic acid (Lafont, C, R.

106, 140). By heating with water at 100° 65 p.c. of the ether is saponified.

TERPIN v. TERPENES.

TERPINEOL v. TERPENES.

TERPYLONIC ACID C₉H₁₄O₈. [135°]. A product of the oxidation of turpentine by chromic acid mixture (Schryver, C. J. 63, 1328). Needles, v. e. sol. water, m. sol. ether. Differs from camphoronic acid in electrical conductivity.

TETANINE v. PTOMAÏNES.

TETRADECANAPHTHENE C14H20. TETRADECANAPHTHERE Co. 1. Cor.). S.G. 2 839. Occurs in petroleum from Baku (Markownikoff a. Ogloblin, J. R. 15, 339). Dihentul. [4:50]. n-TETRADECANE O₁, H₁₀. Diheptyl. [4:5°]. (253°). S.G. § '775; § '76s. Formed by heatmyristic acid with HI and P (Krafft, B. 15, 1700). Got also by the action of Na on n-heptyl iodide (Krafft, B. 19, 2223; Sorabji, C. J. 47,

Reference. - DI-BROMO-TETRADECANE.

TETRADECENOIC ACID C₁₄H₂₅O₂ i.e. C₆H₁₃.CH:C(C₅H₁₁).CO₂H. Amylhexylacrylic acid. Formed by the action of alcoholic potash on cenanthol (Perkin, B. 15, 2803; 16, 211). Liquid, boiling in vacuo at 275° to 280°.

TETRADECENOIC ALDEHYDE C, H20 i.e. CH₃(CH₂), CH:C(CHO)(CH₂), CH₃. (278°). S.G. 15° 849. Formed by the action of alcoholic potash or of ZnCl₂ on conanthol (Perkin, C. J. 43, 47). Oil, not solid at -20°. Forms crystalline C₁, H₁₀, ONa HSO₂. Yields hexoic and heptoic acids on oxidation

TETRADECENYL ALCOHOL (282°). S.G. 13 852. Formed by reducing the preceding aldehyde with sodium amalgam (Perkin, B. 15, 2808). It is also a product of the action of sodium-amalgam on a solution of cenanthol in HOAc (Perkin, C. J. 43, 68). Oil. May be reduced to C₁₁H₃₀O.

Acetyl derivative C₁H₂OAc. (285°-290°). S.G. 15 °868. Combines with Br (2 atoms).

TETRADECINENE $C_{14}H_{26}$ i.e. $CMeiC.C_{11}H_{22}$. $[6.5^{\circ}].$ $(134^{\circ}$ at 15 mm.). S.G. $\frac{6^{\circ}5}{4}$ ·8064; $\frac{15^{\circ}3}{4}$ 28000. Formed from tetradecylene bromide and alcoholic potash at 150° (Krafft, B. 17, 1372; 25,

TETRADECOIC ACID C₁₁H₂₀O₂ i.s. C₃H₁₁.CH(C₇H₁₈).CO₂H. (300²-310²). Got by the action of moist Ag₂O on the corresponding aldehyde (Perkin, C. J. 43, 74). Liquid, not solid at -10°.

Tetradecoic acid v. Myristic ACID. Reference. - OXYTETRADECOIC ACID.

TETRADECOIC ALDEHYDE 0,1H₂O i.e. C.H₁₁,CH(O,H₁₃).CHO. [30°]. (267°). S.G. ³⁶/₃₀° 827. A product of the action of Na on an ethereal solution of cananthol (Perkin, C. J. 43, 71). Tables, v. sol. alcohol. Reduces ammoniacal AgNO₃. Yields heptoic, hexoic, and acetic acids on oxidation.

Isomeride v. Myristic aldehyde.

n-TETRADECYL ALCOHOL C_{1,}H₁₀O. [88°]. (167° at 15 mm.). S.G. \(\frac{9}{2} \) *8153. Formed by reducing myristic aldehyde (Krafft, B. 16, 1720). Acetyl derivative C_{1,4}H₂₀OAc. [18°]. (176° at 15 mm.).

Tetradecyl alcohol C₃H₁₁.CH(C₇H₁₃).CH₂OH. (270°-275°). S.G. $\frac{15}{15}$ 8368. Formed by reducing the corresponding aldehyde or the alde-

hyde C, H20 (Perkin, B. 15, 2811; C. J. 43, 76). hyde C₁H₂₀U (Ferkin, B. 20, 2011) — Liquid, solidifying at -10°. Acetyl derivative C₁H₂₀OAc. S.G. 15 ·856. Oil, not solid at -10°. n-TETRADECYLENE C₁H₂₃ i.e. (c. 278°).

CH_:CH_C, H_B. [-12°]. (127° at 15 mm.) S.G. 2 '7852; \frac{1}{2}' '7745. Formed by distilling tetradecyl palmitate at 500 mm. (Krafit, B. 16, 3021). Liquid.

Bromide v. DI-BROMO-TETRADECANE. TETRADECYLENE GLYCOL v. Di-iso-BUTYL

TETRADECYL-MALONIC ACID C₁₇H₃₂O₃ i.e. C₁₁H₂₅CH(CO₂H)₂. [118°]. Formed by boiling its nitrile with alcoholic potash (Hell a. boiling its nitrile with alcoholic potash (Hell a. Jordanoff, B. 24, 988). White powder (from HOAc), insol. water, v. sl. sol. ether, sl. sol. cold alcohol. At 150°-170° it is split up into CO₂ and palmitic acid.—Ag,A": white pp.

Anide C₁₁H₂₀CH(CO₂H)(CONH₂). Pearly scales. At c. 140° it yields palmitic amide.

Nitrile C₁₁H₂₀CH(CO₂H).CN. [76°]. Formed by heating p-bromo-palmitic ether with alcoholic KCr. Silker plates (from HOAc)

alcoholic KCy. Silky plates (from HOAc). **n-TEFRA-ICOSANE** C₂H₃₀. [51°]. (213° at 15 mm.). S.G. 70° 763°, 748. Formed by the action of HI and P on C₁H₃₀. CCl., C₄H₁, made from the ketone obtained by distilling barium stearate with barium heptoate (Krafft, B. 15,

TETRA-ICOSOIC ACID C₂₃H₁₇.CO₂H. [72·5°]. Occurs in the soap got by heating carnaüba wax with aqueous NaOH (Stärcke, A. 223, 307). Crystalline powder, v. sol. hot alcohol.--PbA', [111°]. Sol. toluene and hot HOAc.

TETRAZOLE N\left\(\sigma_{\text{CH,NH}}^{N'=N}\). [155°]. Formed by treating amido-phenyl-tetrazole carboxylic acid with alkaline KMnO, followed by HNO, (Bladin, B. 25, 1412). Plates (from toluene). Reddens blue litmus.

TETRAZYL-HYDRAZINENH, NII.C NII.C [199°]. Formed from amido-tetrazotic acid by diazotisation and reduction by SnCl, (Thiele, A. 273, 155). Yellowish crystalline aggregates, v. sol. hot water. — B"2HCl. [176]. Acctoactic ether forms CMc.NIL > N.C. N. N. N. [215]

crystallising in needles.

TETRIC ACID Clu H₁₂O₄ i.e.

CH₂:C(OH).CMe CO CMe.C(OH):CH₂

CH₂:C(OC) CMe.C(OH):CH₂

CH₂:C(OC) CMe.C(OH):CH₂

(Nef. A. 266, 92) or CH₂CO.C(CO₂H):CH₂Acetyl-acrylic acid. [189°]. (262°). S. 1·5 at 14°. Electrical conductivity: Walden, B. 24, 2027. Got by heating CH₂CO.CMeBr.CO₂Et at 100°, but not by heating the isomeric acid CH₂Br.CO.CHMc.CO₂Et (Nef; cf. Pawloff, B. 16, 448). Formed by suggestive action of heminal 486). Formed by successive action of bromine and alcoholic potash on methyl-acetoacetic ether (Demarcay, C. R. 87, 351; 88, 126). Triclinic prisms (from water), v. sol. hot water, alcohol, and ether. Gives a violet-red colour with FeCl., PCl, gives rise to several compounds boiling between 169° and 185° which take up chlorine forming O₂H₂Cl⁴₂O (Pawloff, Bl. [2] 45, 181; C. R. 97, 99). Demarcay obtained oily C₄H₂Cl⁴₂O(?) which united with Cl and-Br forming O₄H₂Cl⁴₂O [48°] and C₄H₄Cl₂Br₂O [67°]. Resinified by dilute HClAq at 150°. Potash-Vor. IV. (Demarcay, C. R. 87, 351; 88, 126). Triclinic Vot. IV.

fusion gives formic and propionic acids. Distillation with lime forms methyl ethyl ketone.

Sodium-amalgam has no action.

Salts.—(NH₄)₂A". Crystals, v. sol. water.

—Na₂A" 6aq.—K₄A".—BaA" 3aq. Needle's, v. o.
sol. water.—BaA" 2aq.—Ba₂(OH)₂A". Sl. sol.
water.—CaA" 2aq.—MgA" 10aq.—ZnA" aq.—
CuA".—Ag₂A". i Needles, sl. sol. water.

Ethyl ether CO-CH₂>0 (?).

(180° at 70 mm.) (Moscheles, B. 21, 2607).

Amide C, H, NO... [212°]. Got by heating the acid with alcoholic NH.

TETROLE CYANURAMIDE v. Nitrile of

PYRROLE CARBOXYLIC ACID.

TETROLIC ACID C₄H₁O₂ i.e. CH₃·C:C.CO₂H. Butyrolic acid. Mol. w. 84. [77]. (208). Formed by boiling β -chloro-crotonic acid or β chloro-iso-crotonic acid with dilute potash (Geuther, Z. 1871, 215; Friedrich, A. 219, 343; Kahlbaum, B. 12, 2338). Formed also by the action of Na and CO2 on allylene chloride (Pinner, B, 14, 1081).

Preparation .- From acetoacetic ether and PCl, the product being freed from POCl, by heating to 115', mixed with water, and freed from chloro-crotonic acid by distillation with steam. The residue is treated with alcoholic potash (Fittig a. Clutterbuck, A. 268, 96; cf. Friedrich, A. 219, 322).

Properties .- Plates (from ligroin). May be sublimed. V. e. sol. water, alcohol, and ether. Not reduced by sodium-amalgam to erotonic acid (F. a. C.; cf. Aronstein, B. 22, 1181). Slightly volatile with steam.

Reactions. - 1. Br forms di-bromo-crotonic acid [120°], which is reduced by sodium-amalgam to tetrolic acid. Bromine also yields C, H, Br, O2. [97°] (Pinner). 2. HBr forms bromo-crotonic acid [91°] .- 3. Heated with conc. KOHAq it forms acetone. - 4. Fuming HClAq at 15° in a few weeks converts it into β -chloro-crotonic acid [94.5°] .- 5. Boiling with Na and McOH yields butyric acid (A.). - 6. Chlorine forms C, H, Cl, O2. 7. On heating with iodine in CHCl, in scaled tubes it yields di-iodo-erotonic acid (B. 26, 843) .-8. Split up at 211° into CO, and allylene. -9. KMnO, forms acetic acid.

Namo, torms accue acid.
Salts.—NaA'. Crystalline.—KA' (dried at 100°). Prisms (from alcohol). - NH,A'. -LiA' aq. —MgA', 3aq. -BaA', 3aq. —CaA', 3aq. Small needles.—ZnA', 2aq (Lagermark, J. R. 12, 290). —ZnA', 2aq (Fittig). Groups of prisms.—CdA', 4aq.—PbA', aq. S. 1-5 in 92 p.e. alcohol at 20°.

alcohol at 20°.

Chloride C.H. OCl. Fuming liquid, carbonised by heat. Quickly decomposed by water (Lagermark, Bl. [2] 35, 171).

DI-TETROLUREA v. CARBONYL-PYRROL. TETROLE-URETHANE v. Ethyl ethyl of

PURROLE CARBOXYLIC ACID. TEUCRIN C₂₁H₂₁O₁₁ or C₂₁H₂₀O₁₁. [230°]. A glucoside occurring in Tenerium fructicans, a plant used in Sicily as febrifuge. Extracted by alcohol (Oglialoro, G. 9, 440; 13, 498). Slender yellow prisms. Boiling dilute nitric acid forms anisic, tartaric, and oxalic acids. Boiling dilute H2SO, yields glucose and a yellow insoluble

residue TEWFIKOSE. [a]_D = 53·1°. A sugar occurring in the milk of the Egyptian buffalo (Bos bubalus). Yields glucose on hydrolysis (Pappel a. Richmond, C. J. 57, 759), v. Sugars.

THALICTRINE. Macrocarpine. Occurs in Thalictrum macrocarpum (Hanriot a. Doassans, Bl. [2] 84, 83). Yellow needles, insol. water, sol. alcohol and ether. Resembles aconitine, but is less poisonous.

THALLIN v. OXY-QUÍNOLINE."

THALLIUM. Tl. At. w. 203-64. Mol. w. 407-28 as gas at c. 1700° (v. infra). Melts at 293-9° (Crookes, C. J. 17, 123; cf. Lamy, A. Ch. [3] 67, 385). Boils at full red heat. S.G. pressed 11-88, cast 11-81, in wire 11-91 (Crookes, L.c.; cf. Lamy, L.c.; Worther, J. pr. 91, 385; de la Rive, C. R. 56, 588). V.D. 232-7 at 1636°, 203-7 at 1728° (Biltz a. V. Meyer, B. 22, 725). S.H. -0325 (Lamy, L.c.); 0335 (17°-100°) (Regnault, A. Ch. [3] 67, 437). C.E. (linear) 00003021 at 40°, 00003135 at 50° (Fizeau, C. R. 68, 1125). E.C. 5-225 at 0° (Hg at 0° = 1) (Bénoit, P. M. [4] 45, 314; cf. Matthiossen, P. 118, 431). H.C. [Tl²,0] = 42,240 (Tk. 3, 354). Latent heat of fusion c. 1010 for 203-6 g.-u/Heycock a. Neville, C. J. 65, 35). The characteristic green line of the emission spectrum has the wave-length 5347 according to Huggins (T. 1864. 139), 5349-6 according to Mascart (Ann. de Vécol. norm., 4, 7 [1867]), and 5349-5 according to Thalén (Determin. des long. d'onde des raies métalliques (Upsala, 1868)). Concerning the emission spectrum of Tl v. also Crookes, Pr. 12, 530; Nicklès, C. R. 58, 132; Kirchoff a. Bunsen, A. 155, 230, 366; Lockyer a. Roberts, Pr. 23, 344; Liveing a. Dewar, Pr. 27, 132; Hartley a. Adeney, T. 1884. 104; Becquerel, C. R. 99, 376; Wilde, Pr. 53, 369.

Historical.—In 1861 Crookes was preparing

Historical.—In 1861 Crookes was preparing Se from the flue-dust of a sulphuric acid manufactory at Tinkelrode in the Harz mountains, when on distilling the impure Se he obtained a residue which showed a marked single green line in the spectrum; this line was not known to belong to the spectrum of any element, hence Crookes supposed that the impure Se contained a new element. Crookes isolated the element towards the end of 1861, and called it thallium. (from \$\theta \text{Ab} \text{d} = \text{a} \text{green bud} \text{) c. C. N. 3, 193, 303}. Lamy (A. Ch. [3] 67, 385) noticed a new green line in the spectrum of a leaden chamber deposit about the same time as Crookes was investigating the cause of the line he had observed; in 1862 Lamy isolated a specimen of the metal which Crookes had obtained a few months before.

Occurrence. — Never uncombined. Compounds of Tl are widely distributed, but only in very small quantities. The sulphide occurs in minute quantities in many specimens of copper pyrites and iron pyrites (v. Crookes, C. J. 17, 112; Lamy, Lc.; Wöhler, A. 142, 263; Carstanien, J. pr. 102, 65; Gunning, Ar. N. 3, 86); also in native sulphur from Lipari and Spain. Compounds of Tl are found in small quantities in many ores of As, Bi and Hg, and in preparations from these ores; also in commercial Se and Te, probably as selenide and telluride (v. Crookes, Lc.; Röppler, Am. S. [2] 35, 420; Herapath, Ph. 4, 302; Werther, J. pr. 89, 129). Some specimens of Lepidolite contain small quantities of Tl compounds (v. Schrötter, W. A. B. 48 (ii.) 734; 50 (ii.) 268). A Swedish

mineral called crookesite was found by Nordenskjold to contain from 16·3 to 18·55 p.o. Tl as selenide, along with selenides of Cu and Ag (Bl. [2] 7, 409). Small quantities of TlCl are found in some mineral springs and in the saline deposits from such springs (v. Böttger, J. pr. 89, 378; 90, 22; 96, 294). Traces of Tl alum have been found accompanying the double sulphates of Cs, Li, and Rb in alumite from the island of Volcano (Cossa, Acad. dei Lincei [3] 2). Small quantities of Tl compounds have been noticed in carnallite, sylvine, and kainite (Schramm, A. 219, 374). Many specimens of commercial sulphuric and hydrochloric acids contain traces of Tl compounds (v. Crookes, l.c.).

Tl compounds (v. Crookes, L.c.).

Formation.—(Crookes, L.c.; or T. 1872.)—1.

By reducing Tl_CO₂ by fusion with KCN.—2. By electrolysis of Tl_CO₃ covered with water.—3.

By electrolysis of Tl_SO₄.—4. By heating Tl_CO₄ in a covered crucible.—5. By ppg. by zinc from solution of a thallous salt to which excess of NH₂Aq or NaOHAq has been added.

Preparation.—The most economical source is the flue-dust from sulphuric acid manufactories where pyrites or sulphur containing Tl compounds has been used. Many specimens of flue-dust contain no Tl compounds; in some specimens 8 p.c. Tl has been found, but only in a very few does the quantity amount to 25 p.c. Tl (Crookes). After having been heated to dull redness, to remove any HCl, the dust is well stirred in wooden tubs with its own weight of boiling water and allowed to settle for 12 hours; the liquid is siphoned off, and the residue is again stirred with boiling water and let settle; the mixed liquids are ppd. by a considerable excess of conc. HClAq; the pp., which is crude TICI, is well washed on a calico filter and squeezeddry. About 68 lbs. crude TlCl were thus obtained from 3 tons flue-dust (Crookes, T. 1872). The crude TICl is heated with its own 18/2). The crude 1101 is neated with its own weight of pure cone. H₂SO₄ in a Pt dish till all HCl and most of the H₂SO₅ are removed; the TlHSO₄ is dissolved in c. 20 times its weight of water, the solution is nearly neutralised by CaCO₂, filtered, ppd. by cone. HClAq, and the TlCl so obtained is well washed, and is then boiled for a few minutes with (NH_i)₂SAq; the pp. of Tl₂S is filtered off, well washed with water containing H₂S, and dissolved in dilute H.SO.Aq; the solution is boiled to remove H.S, ammonia is added in slight excess, and after boiling the solution is filtered and crystallised; (NH₄)₂SO₄, being much more soluble in water than Tl₂SO₄, remains in solution when Tl.SO, crystallises out.

If small quantities of Tl are to be prepared

If small quantities of Tl are to be prepared from Tl,SO,, the salt is dissolved in c. 20 times its weight of water, the solution is acidulated with H SO,, and electrolysed, Pt electrodes being used. If large quantities of Tl are to be prepared, Tl,SO, is placed in a deep porcelain dish (holding about 4½ litres) and covered with water (c. 3 kilos Tl,SO, are used at a time) and plates of pure zinc are arranged vertically around the sides of the vessel; heat is applied, and the whole of the Tl separates in a few hours as a spongy mass easily detached from the zinc by shaking... The spongy Tl is washed several times, pressed by the fingers, and then fused with KCy in a porcelain crucible to get it into a

tump (for details v. Crookes, I.c.; v. also Gun-

ding, J. pr. 105, 843).

Crookes (l.c.) gives several methods for preparing pure Tl. If the starting-point is comparing pure Tl. If the starting-point is com-mercial Tl₂SO₄, he recommends to dissolve this salt in water, to saturate the cold solution with pure H.S. filter, heat to boiling, and pour into boiling, dilute, pure HClAq; to filter while hot, and allow to cool; to wash the TlCl that crystal- lises out, by decantation, till the washings are free from H.SO., and to purify by re-crystallising twice from water. The TICI thus obtained is dried, mixed with pure Na₂CO₂, and projected, in small successive portions, into molten pure KCy in an unglazed porcelain crucible; reduction to metal is rapid. After cooling, the contents of the crucible are treated with water, the ingot of TI is boiled for some time in water, dried, and fused over a spirit lamp (coal-gas should not be used on account of the S compounds in it) in an unglazed porcelain crucible, with free access of air and frequent stirring with a piece of unglazed porcelain, to facilitate oxidation, and the metal is poured into a porcelain mould.

Properties .- A white metal without any tinge of blue; when fused under coal-gas, liquid Tl is exactly like Hg; may be highly polished by rubbing under water; very sott, may be cut with the nail, or scratched by lead. Less tenacious than lead; does not become brittle between -18° and its m.p.; very malleable, Lamy (A. Ch. [3] 67, 385) says that plates $\frac{1}{15.000}$ mm. thick

can be obtained; can be squeezed, but not drawn, into wire; very inelastic. Tl crystallises very easily in octahedral forms; it crackles like tin when bent; a wire of Tl seems amorphous when prepared, but under water it soon becomes crystalline. Tl quickly tarnishes in air; the film of oxide formed protects the mass of metal. The metal may be kept unchanged for years under water that has been deprived of air (v. Böttger, D. P. J. 197, 374). The melts easily (at 294°) without first becoming pasty; it expands considerably before melting is complete, and con-tracts much on cooling. TI boils below white heat; it may be distilled in a current of H. Pieces of the metal may be welded together by pressure at the ordinary temperature. Tl is nearly as diamagnetic as bismuth. Tl gives an intense green colour to a non-luminous flame (v. infra, Detection). Heated in air, Tl readily burns to Tl.O; it combines with S, Se, P, Cl, Br, I, &c., when heated with these elements; it dissolves in solutions of most acids (v. Reactions). The compounds of Tl are very poisonous, producing symptoms like those of lead poisoning.

The at. w. of Tl has been determined (1) by The at. w. of Ti has been determined (1) by ppg. Cl as AgCl from TlCl by AgNO, Aq (Lamy, A. Ch. [3] 67, 385 [1862]; Hebberling, A. 134, 11 [1865]); (2) by ppg. I from TII by AgNO, (Werther, J. pr. 92, 136 [1864]); (3) by converting Tl, SO, into BaSO, (Lamy, Lc.; Hebberling, Lc.); (4) by converting Tl into TlNO, (Crookes, T. 1873. 277); (5) by determining S.H. of Tl (Lamy, Lc.; Regnault, A. Ch. [3] 67, 437 [1862]); (6) by determining V.D. of TlCl (Roscoe, Pr. 27, 426).

The mol. w. of Tl in the gaseous state is double the at. w.; in other words, the gaseous molecule is diatomic (Biltz a. Meyer, B. 22, 725). Ramsay (C. J. 55, 521) determined the depression produced in the vapour pressure of Hg by dissolving Tl in that solvent; assuming that equal volumes of dilute solutions contain equal numbers of molecules, and that the mol. w. of liquid Hg is 200, the results obtained by R. indicated the molecule of Tl dissolved in Hg to be monatomic.

Tl is distinctly a metallic element; no compounds have been isolated wherein Tl certainly forms part of the negative radicle, although there are indications of the existence of such compounds (v. THALLIUM DIOXIDE, p. 680); the compounds which TIBr, TICl, and TII, form with alkali halides may contain TI in the negative radicles. TI is the last element in the odd-series family of Group III.; this family comprises Al, Ga, In, and Tl. The element Tl also shows marked resemblances to the alkali metals; and in its physical properties it is more like lead than any other element. The position assigned to Tl by the periodic classification of the elements clearly indicates the relations between this element and other elements. The relations of Tl (III .- 11) to Al (III.-3) should be similar to those of Hg (II.-11) to Mg (II.-3), and also similar to those between Pb (IV.-11) and Si (IV.-3). The re-semblances between the compositions and properties of the oxides of Hg and Mg on the one hand, and of the oxides of Pb and Si on the other hand, are shown only in the highest oxides of these elements: there is Hg.O but no Mg.O. there is PbO but no SiO; HgO and MgO are basic, PbO, and SiO, are feebly acidic. Neverbasic, 100, and 310, are feely availed than HgO and PbO₂; these lower oxides, Hg₂O and PbO, are basic; Hg₂O feely, and PbO strongly, basic. Hence it is likely that the resemblances between the exides of Tl and Al will be shown in the highest exides. This supposition is confirmed; TlO₃ and Al₂O₃ are basic, forming salts M₂X₃, where X = the radicle of a dibasic acid; these oxides are more basic than PbO₂ and SiO₂, but less basic than HgO and MgO. As Hg and Pb form lower oxides than HgO and PbO₂, and these lower oxides are more basic than HgO and PbO, so Tl will likely form an oxide lower than Tl,O. and this oxide will be more basic than Tl₂O_{3,7} Tl forms the strongly basic oxide Tl₂O. Then consider the position of Tl in series 11. Consider the oxides of the members of this series: the lower oxides Hg₂O, PbO, and Bi₂O₂ are basic; the higher oxides HgO, PbO₂, and Bi₂O₄ pass from basic (11gO) to feebly acidic (PbO₂ and Bi₂O₃); therefore it is probable that the higher oxide of Tl will be less basic than HgO, but that it will not be acidic; Tl2O2 is a feebly basic oxide.

If the chlorides of series 11 are considered, the position of Tl in III .- 11 is seen to be justified: HgO gives HgCl., which can be gasified unchanged, PbO, gives PbCl., which is very easily decomposed by heat, no chloride corresponding with Bi,O, has been isolated; therefore sponding with D₁O, has been isolated, therefore Ti₂O₂ will probably give a chloride more stable towards heat than PbCl₄, but less stable than HgCl₂. TlCl₄ is decomposed by heating to c. 80° into TlCl and Cl. Hg₂O gives HgCl, PbO gives PbCl₃, and Bl₂O₄ gives BiCl₄, and these chlorides can all be gasified unchanged; there-

fore the chloride of Tl corresponding with Tl.O will probably not be decomposed by heat; TiOl has been gasified unchanged. The relations between the elements Hg, Tl, Pb, Bi, and Mg, Al, Si may be summarised in the expressions Tl: Hg: Pb = Al: Mg: Si; and Tl: Hg = Pb: TlBi: Pb. (For a further working out of the relations of Tl. v. Mendeléeff, C. N. 1880. 2; v. also Alkalis, metals of the, vol. i. p. 114; and Earths, metals of the, vol. ii, p. 424.) The atom of Tl is monovalent in the gaseous molecule TlCl: the V.D. of no other compound of Tl has been determined.

Reactions and Combinations .- 1. Exposed to air or oxygen, a film of Tl2O is at once formed; when heated in air or O to somewhat below redness (c. 300°) Tl burns to Tl₂O₃, and at a higher temperature this gives Tl₂O and O (Lamy, A. Ch. [3] 67, 385). Moist ozone acts on Ti giving TlO.H. - 2. A compact piece of Ti does not decompose boiling water, decomposition begins at a red heat; but spongy Tl, as ppd. by zinc, dissolves in water forming TlOHAq. -3. Tl dissolves in solutions of most acids, forming thallous salts Tl, X, where X = 2Cl, 2NO3, SO4, &c.-4. Tl combines with sulphur and selenion (v. sulphides and selenides). 5. Forms alloys with many metals (v. alloys). 6. Forms compounds with antimony and arsenic (v. antimonide and arsenide) .-7. A phosphide is formed by heating Tl in vapour of phosphorus (v. phosphide) .- 8. Combines with chlorine, bromine, and iodine, when heated with these elements (v. chlorides, bromides, and iodides -9. Tl ppts. the noble metals, also copper, lead, and mercury from solutions of salts of these metals (Reid, C. N. 12, 242).

Detection and Estimation.—TI is best de-

tected by the intense green colour which the metal and its compounds give to the non-luminous flame of the Bunsen lamp; according to Lamy (l.c.) 1 mgm. can be detected by the use of the spectroscope; if induction sparks are used it is said that $\frac{1}{80,000,000}$ mgm. can be detected (Cappel, P. 139,628). This generally estimated as Th or The So,; it can also be determined volumetrically by KMnO₄Aq (Willm, Z. 1863.

Thallium, alloys of. Several alloys of Tl were prepared by Carstanjen in 1867 (J. pr. 102, 82) by heating the metals together. Many of the alloys are soft, and most of them readily tarnish in the air; the alloy with ; pt. Sb is fairly hard; and those with Bi and Pb, Bi and Cd, and Bi and Sn are hard and brittle. Alloys are described with Al, Sb, Cd, Cu, Pb, Mg (v. also Mellor, C. N. 19, 245), Hg (v. also Crookes, l.c., and Regnauld, C. R. 64, 60), K, Na, and Zn; also with Bi and Od, Bi and Pb, and Bi and Sn.

Thallium, antimonide of. A hard, grey, crystalline solid was obtained by fusing together Tl and Sb in the ratio Tl: Sb; with cold dilute H.SO.Aq the substance gave off SbH, (Carstanjen, l.c.)

Thailium, arsenide of. Carstanjen (l.c.) obtained a white, crystalline, soft substance by fusing Tl and As in the ratio Tl: As; with cold

Thallium, bromides of. The compounds compounds the simplest formulæ of which are Tl₂Br₂ and TlBr₂. As none of the bromides has been gasified, the formulæ are not necessarily molecular; but from the analogy of TiCl, the formula TIBr probably represents the composition of the gaseous molecule of this compound.

THALLOUS BROMIDE TIBr. (Thallium mono. mide.) TI reacts very slowly with Br. bromide.) Thallous bromide is obtained, as a white pp., by adding HBrAq or solution of a bromide to solution of a thallous salt; almost insoluble in water (Willm, A. Ch. [4] 5, 28). TlBr melts at 458° to a brownish-yellow liquid, which solidifies to a yellow solid (Carnelley, C. J. 33, 278).

Thomsen gives H. F. [Tl,Br] = 41,290 (Th. 3, 354).

THALLIC BROWIDE TIBr₃. (Thallium tribromide.) Prepared by adding Br to TIBr sus-

pended in water until solution is effected, and evaporating in vacuo. TlBr, forms a yellow crystalline solid; it is very deliquescent, becoming gradually brown and giving off Br. Very soluble in water, also in alcohol. Reduced to TIBr by SO, Aq and other reducing agents (Willm, l.c.). Thomsen gives H.F. [Tl,Br,Aq] = 56,450(Th. 3, 354). TIBr₃ combines with NH₃ to form TIBr₃.3NH₃; a white solid that gives off NH₃ and Br at 100°, and when more strongly heated leaves TIBr (W., l.c.). Also combines with NH₄Br and KBr, forming TlBr, NH, Brand TlBr, KBr. 2aq (W., l.c.; Nicklès, C. R. 58, 537). Rammelsberg (P. 146, 597) described 2TlBr₃.3KBr. 3aq.

Thallum dibbonide Tibr₃, which sade TLBr₄). Obtained in long, yellow, needles by adding Tibr to boiling Tibr₄Aq, in the ratio Tibr₄Tibr₃, and cooling. Not decomposed at 100°; water forms TiBr₃Aq and Tl₂Br₃ (v. infra) (W., l.c.).

Thallium sesquisseomide Tl₂Br₃, or TIBr₄-3TiBr = Tl₁Br₆. (Thallo-thallic bromide.) Orange-red hexagonal leaflets; obtained by adding HBrAq to a mixture of a thallous and a thallie salt in solution; also by adding TIBr to TlBr, Aq, or by adding a little water to TlBr, (3TlBr₂ + Aq = Tl₂Br₃ + TlBr₃Aq) (W., Lo.). Thallium, chlorides of. Tl and Cl combine

to form at least four compounds: TlCl, Tl,Cl,

TICl, and TICl,

Thallors Chloride TiCl. Mol. w. 239-01.
Melts at 427° (Carnelley, C. J. 33, 277). Boils at 708°-719° (C. a. Williams, C. J. 33, 284). S.G. 7-02, after fusion (Lamy, J. 15, 184). V.D. at 830° to 1025° = 117.8 (Roscoe, Pr. 27, 426). 11 530 16 163 = 117 (168566; 77. 27. 25). S. 19 at 0°, 27 at 16°, 28 at 16:5°, 16 at 63° (Hebberling, A. 134, 15). H.F. [Tl,Cl] = 48,580; [Tl,Cl,Aq] = 38,480 (Th. 3, 354). Formation.—1. By heating Tl in Cl, keeping

the Tl in excess .- 2. By boiling powdered Tl in HClAq, and dissolving the film of TlCl that forms in much boiling water.—3. By adding

SO, Aq to TlCl, Aq.

Preparation. — HClAq, or solution of a chloride, is added to the solution of a thallous salt; the white curdy pp. that forms is washed with cold water, dissolved in a large quantity of boiling water, and the salt that separates as the solution cools is purified by two or three recrystallisations from boiling water (Crookes, C. J. 17, 112).

Properties and Reactions.—A white, crystal-line solid; resembling PbCl, but separating from solution in hot water in smaller and less shining crystals than PbCl. Becomes slowly

violet coloured when exposed to light (Hebberling, A. 134, 15). Melts at 427° to a clear vellow liquid, which solidifies to a white crystalline Very slightly soluble in water (v. supra); mass. less soluble in water containing a little HCl; insoluble in alcohol; insoluble in ammonia; soluble in hot Na₂CO₃Aq, KOHAq, or Na₂SO₄Aq. Hot conc. sulphuric acid forms Tl₂SO₄ and HCl; oxidisers such as ClAq, aqua regia, KMnO,Aq and HClAq, form TlCl₃, Tl₂Cl₃, or TlCl₂ (v. these chlorides). TlCl is reduced to Tl by zinc and sulphuric acid, also by adding aluminium to TiclAq at 90° (Cossa, Acad. dei Lincei [3] 2). Fusion with sodium hydrogen sulphate produces Tl.SO₄ (Krause, D. P. J. 217, 323; Nietzki, D. P. J. 219, 262).

Combinations.—1. With platinic chloride to form 2TICl.PtCl₁ (= Tl.PtCl₂); obtained, as a pale-yellow, crystalline powder, by mixing solutions of TlCl and PtCl₁; this salt is extremely insoluble in water, one part dissolving in 15,585 parts water at 15°, and in 1948 parts boiling water (Crookes, l.c.) .- 2. With mercuric chloride, to form TlCl.HgCl2; white lustrous chrome, to form 11Cl.HgCl₂; white lustrous needles, separating from a hot solution of TlCl in HgCl₂Aq; all HgCl₂ is removed at 200° (Carstanjen, J. pr. 102, 141; Jörgensen, J. pr. 12] 6, 82).—3. With ferric chloride to form 3TlCl.FeCl₂; small red prisms; obtained by adding TlCl to a hot solution of FeCl₂ in HClAq, and crystallising the red pp. from hot cone. HClAq; decomposed to its constituent salts by water (Willer, 4, 144, 3.50).—4 With chromic water (Wöhler, A. 144, 350) .- 4. With chromic chloride, to form 3TlCl.CrCl3 (v. Neumann, A. 244, 328). -5. According to Lepierre a. Lachaud (C. R. 113, 196), a conc. solution of chromium trioxide reacts with TICl to form small red prisms of CrO, TICl [CrO.(OTI)Cl], which are decomposed by water to TlCl and CrO,Aq.

THALLIC CHLORIDE TICI, Mol. w. not certainly known; from analogy of AlCl, GaCl, and InCl, the formula TlCl, is probably molecular.

Formation .- 1. By heating TICl with hot aqua regia and evaporating the solution in Cl (Willm, A. Ch. [4] 5, 28).—2. By dissolving treshly ppd. TlO₃H₂ in HclAq. adding HNO₂Aq, and evaporating in Cl.—3. By heating TlCl at its melting-point in Cl; it is doubtful whether the product is pure TlCl₂, or contains also TlCl₂ or Tl₂Cl₂ (Lamy, l.c.).

Preparation .- Cl is passed into water containing TICl in suspension until a little of the solution ceases to give a turbidity with PtCl,Aq; excess of Cl is removed by a stream of CO., and the solution is evaporated in vacuo. Crystals of TlCl, H2O separate, which lose water at c. 40°

(Werther, J. pr. 91, 385).

Properties and Reactions. — The hydrate forms large colourless prisms; the dehydrated salt is a white crystalline solid. Werther (l.c.) also obtained a hydrate 2TlCl.15H2O from a solution of TlCl₂ prepared as described. Cl begins to be given off at c. 50° to 60°; at 100° a mixture of TlCl and chlorides intermediate a mixture of TICI and enforteds intermediate between TICI and TICI, remains (Werther, *l.c.*; Lamy, *l.c.*). TICI, is very deliquescent; it dissolves very easily in water. Thomsen gives [Tl,Cl²,Aq] = 89,250 (Th. 3, 354). On diluting a concentration of the considerable conside aqueous solution considerable quantities of TIO.H, and HClAq are formed. Reducing agents, such as SO., form TlCl.

Combinations.-1. With ammonia to form TiCl., 3NH, (Willm, A. Ch. [4] 5, 28). A white, crystalline powder. Obtained by passing NH, over TiCl,; by adding an alcoholic solution of NH, to TiCl, suspended in absolute alcohol; or by boiling TlO, H, with cone. NH, ClAq, ppg. by NH, Aq, washing with alcoholic ammonia, then with absolute alcohol, and drying in vacuo. The compound is anchanged in air; water forms NH₄ClAq and Tl₂O₄; when heated NH₄, NH₄Cl, and N are given off and TlCl remains. Dissolves in HClAq, forming TlCl, 3NH, Cl. With ammonium chloride to Ticl, 3NH, Cl; obtained by adding NH, Cl to a solution of TlO, H, in HClAq, and evaporating in vacuo; large, white, quadratic crystals, probably with 2H.O (Rammelsberg, P. 146, 597; p. also Nicklès, J. Ph. [4] 1, 25) .- 3. Compounds with potassium chloride, caesium chloride, and rubidium chloride, TlCl_x-3MCl, xaq, have been obtained (v. Rammelsberg, l.c., also W. 16, 709; Godeffroy, Zeit. des allganein. österr. Apothekerver. 1880 No. 9; Neumann, A. 244, 348; Willm. Neumann (l.c.) also describes a compound of TICl, with beryllium chloride .- 4. Willm (l.c.) describes a compound with cupric chloride, 2TlCl_s.CuCl_s.-5. According to Nickles (C. R. 58, 537) TICl, forms a compound with ether and hydrochloric acid, to which he gives the composition TlCl, Et,O.HCl.H,O; it is described as a yellow fuming liquid.

Thallium dichloride TlCl, (or TlCl.TlCl. = Tl.Cl.). Lamy (A. Ch. [3] 67, 402) obtained a yellow, slightly hydroscopic, easily fusible solid, to which he assigned the composition TICL, by heating Tl and TlCl in a stream of Cl so that the product always remained liquid, and allow ing to cool when saturated; the substance gave off Cl, and Tl₂Cl₃ remained.

Ti,Cl,; THALLIUM SESQUICHLORIDE TIGL, 3TICL = TI Cl. (Thatlothallic chloride.)

Formed by heating dry TICl, somewhat above 100° as long as Cl is given off; the brown liquid cools to a clear yellow, crystalline mass (Lamy, l.c., p. 403). Also formed by the direct combination of Cl with molten Tl (L., l.c.); also by ppg. a solution containing a thallous and a thallic salt by HClAq (Willin, l.c.). Also obtained by dissolving Tl or TlCl in aqua regia, evaporating, heating till Cl ceases to be given off, and crystallising from water slightly acidified with aqua regia (Lamy, l.c.; Crookes a. Church, C. N. 8, 1). According to Werther (J. pr. 91, 390) the product of this reaction, dried at 100°, is a mixture of compounds of TiCl and TiCl_a, besides Tl₋Cl_a. Tl₋Cl_a crystallises in yellow, hexagonal leaflets: unchanged in air; melting between 400° and 500° to a dark-brown liquid that solidifies with much contraction, forming a yellowish mass with S.G. 5.9 (Lamy, l.c.). Very slightly soluble in water; S. 26 at 15°, 29 at 17°, 1.9 at 100° (Crookes; Hebberling, A. 134, 21). The solution is said to show the reactions both of thallous and thallie compounds. Heated above 500° Cl is given off compounds. Heated above 500°C is given off; heating in H₂S produces Tl₂S, S, and HCl (Hebberling, l.c.). Heating in NH, produces TlCl, NH₂Cl, and N (Crookes a. Church, C. N. 8, 1). Tl₂Cl, reacts with KOHAq to form TlO₂H₂, TiCl, and KCl.

OTHER THALLO-THALLIC CHLORIDES. According to Werther (J. pr. 91, 890), two compounds

besides TLCl, are obtained by evaporating TlCl in aqua regia, heating till Cl ceases to be given off, crystallising from water slightly acidified with abua regia, and drying at 100°. To these with aqua regia, and drying at 100°. To these compounds W. gives the formule 3TlCl.4TlCl, = Tl,Cl, and TlCl.15TlCl, = Tl,cl, and TlCl.15TlCl, = Tl, and TlCl.15TlCl, = Tl, and TlCl.15TlCl, = Tl, and TlCl.15TlCl, = Tl, and TlCl.15TlCl, = Thallium, oyanide of; v. vol. i. p. 347.

Thallium, ferrocyanide of; v. vol. ii. p. 337.
Thallium, fluorides of. Only one fluoride of TI has been isolated with certainty; there are indications of the existence of another.

THALLOUS FLUORIDE TIF. Formula probably molecular, from analogy of TlCl. Prepared by dissolving Tl,CO, in HFAq, evaporating to dryness, heating gently to remove HF, and crystallising from water; forms white, lustrous, regular octahedra (Büchner, J. pr. 96, 404). TIF is also said to be formed as a white sublimate by heating Tl₂O in HF gas (Kuhlmann, C. R. 58, 1037). Sol. in water: S. = 80 at 15°, and increases with increase of temperature; solution in water has alkaline reaction; somewhat sol. in alcohol. A hydrate TIF.H.O forms in monoclinic crystals by evaporating a solution of Tl₂O or Tl₂CO₃ in HFAq; it is deliquescent, and acts on glass (Kuhlmann, l.c.; Willin, A. Ch. [4] 5, 5). A compound with fluorhydricacid, TIF.HF - THF₂. is obtained by evaporating a solution of TlF in HFAq over H.SO. Decomposed above 100° to TlF and HF. V. sol. water; S. = 100 at ordinary temperature: the solution has an acid reaction (Büchner, l.c.).

THALLIO FLUORIDE. By digesting TIO,II, with RFAq, and also by adding HFAq to TI(NO₈),Aq, Willm (A. Ch. [4] 5, 5) obtained a dark olive-green solid, becoming brown when heated, and melting to an orange-yellow liquid that became white on cooling, insoluble in water and in cold HClAq. This substance was probably thallie fluoride, or perhaps a thallothallie fluoride; no analyses are given.

Thallium, hydride of. Horapath (Ph. 4, 802) supposed that a compound of Tl and H existed; but Crookes (C. J. 17, 132) failed to obtain any compound either by the interaction of an acid with Tl-Zn alloy, or by heating Tl in a stream of H; the escaping H burnt with a green flame, but this was found to be due to particles of Tl carried by the stream of H.

Thallium, hydroxides of. Tl forms three compounds with O and H, namely, TIOH, TIO.H

(or TlO.OH), and TlO,H,.
THALLOUS HYDROXIDE TIOH. (Hydrated thallous oxide Tl₂O.H₂O.) Mol. y. not known with certainty. Thomsen (Th. 3, 354) gives H.F. [Tl₂O,H'O] = 3,230.

Formation.—1. By dissolving T1 in water containing air, and evaporating.—2. By decomposing Tl₂So₄Aq by BaOAq, filtering, and evaporating.—3. By the interaction of CaOAq and Tl₂C₄O₄Aq.—4. By dissolving Tl₂O in water and evaporating.

Preparation .- 1. Tl ppd. by zinc is allowed to oxidise in warm, moist air, and the oxide is dissolved in boiling water; these operations are repeated till a saturated hot solution is obtained, and this solution is evaporated a little, filtered from any Tl₂CO, that may have separated, and allowed to crystallise (Crookes, O. J. 17, 132).— 2. Tl₂SO₄Aq is mixed with the proper quantity

of BaOAq, and the solution, filtered from BaSO, is crystallised in vacuo; this method is tedious, and there is much difficulty in getting rid of all BaO.—3. Thin plates of Tl are suspended over a shallow dish containing absolute alcohol, within a bell-jar from which air has been exhausted, and pure O is passed into the jar, the temperature being kept at 20°-25°; after several hours or days, C.H.TlO is formed as an oil in the dish; excess of alcohol is removed by to warm dry air till all water and alcohol are

removed (Lamy, A. Ch. [3] 67, 385).

Properties and Reactions. — Pale-yellow, prismatic crystals. At 100° in air, or in vacuo over H₂SO₄ at the ordinary temperature, the crystals become black from formation of Tl₂O₅ without altering their crystalline form. Easily soluble in water; Thomsen (Th. 3, 354) gives [TIOH,Aq] = - 3,155. The solution in water resembles KOHAq and NaOHAq in its properties; it is strongly alkaline, absorbs CO2, ppts. heavy metals as hydroxides or oxides, feels soapy to the touch, stains the skin, neutralises acids, &c. The solution absorbs a little O on heating; when evaporated to dryness and the residue re-dissolved, a little Tl.O. generally re-

THALLIC HYDROXIDES. Two thallie hydroxides. are known, TlO.OH and TlO,H3.

I. Monohydrated thallic oxide, TlO.OII = Tl2O3.H2O. Mol. w. not known with certainty.

H₂O₃, H₂O. Mol. W. not known with certainty. Formation.—1. By ppg. TlCl₃Ag by alkali and drying at 100° (Lamy, A. Ch. [3]67, 385).—2. By passing ozonised air through TlOHAq (Schönbein, J. pr. 93, 35).—3. By the action of H₂O₃Aq on Tl; according to Weltzien (A. 138, 129) a mixture of TlOH and TlO.OH is thus obtained .- 4. Various oxidisers -- e.g. KMnO Aq, hypochlorite solutions, &c .- convert TlOH into TIO.OH (Schönbein, l.c.) .- 5. By electrolysing a neutral or ammoniacal solution of Tl2(SO4) or Tl(NO3)3; the hydroxide separates on the posi-

tive (Pt) electrode (Flemming, J. Z. 1869, 292).

Preparation.—TICl, Aq is ppd. by a slight excess of KOHAq or NH, Aq, the pp. is thoroughly washed, and dried at 100° (Iamy, A. Ch. [3] 67, 397; Crookes, C. J. 17, 132; Werther, J. pr. 91, 388). The air-dried pp. has the composition TIO.OH (Carnelley a. Walker, C. J. 53, 88).

Properties and Reactions .- A brown powder ; insoluble in water and dilute alkali solutions. Heated to c. 60° begins to lose water; completely dehydrated at 115°, according to Werther (J. pr. 91, 385), but the residue contains some TLO. as well as Tl₂O₃ (cf. Birnbaum, A. 138, 133). According to Carnelley a. Walker (C. J. 53, 88). dehydration is complete at 230°, and the residue is Tl₂O₂, which is stable to 360°. Dissolves in HClAq, forming TlCl3; in conc. acid Cl is given off and some TICl is produced. Dissolves in dilute H2SO, Aq; with conc. acid some O is given off. H_SU_Aq; with cone. acid some U is given off. Dissolves in SO_Aq, As_O_Aq, hot tartaric acid solution, and boiling oxalic acid solution, in each case forming a salt of Tl_O. TlO.OH dissolves in warm cone. NH,ClAq, giving off NH, and forming TiCl_3NH,; on adding water Tl_O, is ppd. as a black powder (Willm, A. Ch. [4] 5, 5).

II. Trinydrated thallic oxide, TlO.H. —
TlO.BH O. Formed as light hown, lustrose.

Tl.O.3H.O. Formed, as light-brown, lustrous,

microscopie, hexagonal plates, by dissolving TlO.OH in molten KOH, fusing for some time, cooling, washing with hot water, then with alcohol, and drying at 100°. Insoluble in water. Not decomposed at 340°; soluble in dilute acids (Carnegie, C. N. 60, 113).

Thallium, iodides of. TI combines directly with I. At least two compounds are known:

TII and Tl₂I₁; TII₁, and probably one, or perhaps more than one, other compound of TII and TII₃, seem also to exist.

THALLOUS IODIDE TII. (Thallium monoiodkile.) Mol. w. not known with certainty, but
formula TII is probably molecular from analogy
of TICl.

Formation. — 1. By heating together Tl and I in the ratio Tl:I.—2. By adding KIAq to solution of a thallous salt.

Preparation.—KIAq is added to a dilute solution of a thallous salt, and the yellow pp. is thoroughly washed with water and dried at 100° (Lamy, A. Ch. [3] 67, 405; Crookes, C. J. 17, 137).

Properties and Reactions.—A citron-yellow powder; melts at 439° (Carnelley, C. J. 33, 278), and boils at 800°-806° (C. a. Williams, C. J. 33, 284). S.G. 7-072 at 15-5°, after fusion 7-04-75 at 14-7° (Twitchell, Clarke's Table of Spec. Grav. [2nd edit.] 35). Very slightly soluble in water. Determinations of solubility vary considerably; Werther (J. pr. 92, 130) says that 1 pt. requires 20,000 pts. water to dissolve it at 15°, and Crookes (l.c.) gives solubility as 1 in 450 of water at 15° (v. also Hebberling, A. 134, 16). Crookes says TII is somewhat more soluble, Hebberling says it is decidedly less soluble, in KIAq than in water.

When heated to c. 190° TII becomes red, and when it melts a red liquid is formed which solidifies to a red crystalline mass having the composition TII (Hebberling, *l.c.*, p. 18); the red variety is also obtained by crystallising from hot KOHAq (Willm, A. Th. [4] 5, 28); also by crystallising from hot KC.H.Q.Aq (Werther, *l.c.*). The red form of TII is produced by adding KIAq to a warm cone, solution of a thallous salt (Hebberling, *l.c.*, p. 16). Red TII crystallises in octahedral forms (W., *l.c.*). The red variety alowly changes on keeping to the yellow form.

When freshly ppd. yellow TlI is exposed to the sun's rays it becomes green and crystalline without any change in composition. The green variety of TlI is somewhat more soluble in hot water than the yellow form; it crystallises from hot water in green microscopic crystals that are very refractive. The green variety changes is hastened by heating in water containing I or KI, but not by heating with pure water. When strongly heated, green TlI becomes red (v. Knösel, B. 7, 576, 893).

TII is decomposed by warm HNO, Aq, with separation of I. It is dissoived, without I being separated, by ClAq or agua regia; Willm (l.c.) supposes that an iodochloride is formed. Fusion with KCN produces TI (Werther, l.c.).

THALLIG IODIDE TII, This compound has the individual with cartainty. Pay treating

THALLIG IODIDE TIL. This compound has not been isolated with certainty. By treating TI with an ethereal solution of I, Nickles (C. R. 88, 537) obtained a brown liquid from which brown needles gradually separated. These crys-

tals may have been TlI,; no analyses are given.

Double sales of TII, with alkali iodides have been prepared by digesting TII with solutions of I and alkali iodides in ether; these salts have the composition TII, MI.xH.O, where M = NH, and K (v. Mic'des, J., Ph. [4] 1, 25; Willm, A. Ch. [4] 5, 5; Rammelsberg, P. 146, 597). A compound TII, CuI_NNI, is described by Jörgensen (J. pr. [2] 6, 82).

THALIUM SERQUI-IODIDE TI₂I₃ or TII₄.3TII = TI₄I₄. (Thallothallic iodide.) Black, lustrous needles; insoluble in water, slightly soluble cold alcohol, decomposed by boiling alcohol; decomposed slowly at ordinary temperature, quickly on heating; obtained by long-continued heating yellow TII with excess of IAq (Knösel, B. 7, 576, 893).

OTHER THALLO-THALLIC IODIDES. By evaporating a solution of TII in HIAq, in presence of I, at 70°, small, brown, rhombic, crystals were obtained by Jörgensen (l.c.). The composition of the crystals is represented by J as 6TII.TII, or perhaps 5TII.TII,. The same compound is said to be obtained by digesting TII with an ethereal solution of I. Heating to c. 100°, drives off I, and leaves yellow TII; boiling alcohol, and also KIAq, withdraws I, forming TII.

Thallium, oxides of. Two oxides have been isolated, TLO and TLO; there is evidence in favour of the existence of a third oxide, probably

That bous oxide TI₂O. (Thatlium monoxide.)

That bous oxide TI₂O. (Thatlium monoxide.)

Mol. w. not known with certainty. [\$\mathbb{P}\$\text{?},0] = 42,240 (Th. 3, 354). Prepared by heating TI in air to not above 100° (to prevent formation of Ti₂O₃); also by heating TIOH to 100° out of contact with air; also by heating Ti₂O₃ to full redness. A black powder; melting at c. 300° to a dark-yellow liquid, which acts on glass, forming a silicate of Tl. Ti₂O absorbs moisture from the air, forming TIOH; it dissolves easily in water, forming a strongly alkaline solution of TIOH (v. Thallous hydroxide, p. 678). Soluble in absolute alcohol, forming C,H₂OTI, a colourless, heavy oil (S.G. 3:55); this oil is decomposed by a little water with separation of TIOH (v. Thallous hydroxide, Preparation, No. 3, p. 678). (Crookes, C. J. 17, 128; Lamy, A. Ch. [3] 67, 385). Tl₂O is reduced to Tl by heating to redness in II, or in CO, or with Mg (Winkler, B. 23, 788).

THALLE OXIDE TI₂O₂. Mol. w. not known with certainty. Prepared by ppg. a thallie salt with KOHAq or NH₂Aq, washing the pp. thoroughly, drying, and heating it to c. 260° (Crookes, Lc., p. 132). Also formed by burning Tl in air to a light below redness; at a lower temperature the product is chiefly TI₂O, and at a full red heat TI₂O₃ is decomposed to TI₂O and O (Lamy, Lc.). TI₂O₃ is also formed by passing an electric current (from a couple of Grove cells) through neutral TI₂SO₂Aq, using Pt₃electrodes, Tl deposits on the negative electrode, and TI₂O₄ forms, as a brown cake, on the positive slectrode; the H₂SO₂Aq formed should be neutralised from time to time by NH₂Aq (Crookes, Lc.). For other methods of formation v. Wöhler (A. 146, 263, 375), and Willm (A. Ch. [4] 5, 19). TI₂O₃ is a brownish-black solid; insoluble in water Melts at c. 760° (?) (Carnelley a. O'Shea, C. J.

Tl.SO, Aq and giving off O. Soluble cold HClAq, forming TiCl, Aq, and some TiCl with evolution of Cl. Takes fire in dry H₂S, forming Tl₂S, (Carstanjen, J. pr. 102, 65). A mixture of Tl₂O, and S takes fire, when struck (Böttger, J. pr. 90, 27). Reduced by heating in H or CO to Tl.O, and then to Tl. Tl.O, absorbs NH, when heated in that gas; no definite compound has been isolated. For compounds with H.O v.

THALLIC HYDROXIDES, p. 678).

THALLIUM DIOXIDE (?TIO2). When a rapid stream of Cl is passed into conc. KOHAq, holding freshly ppd. TlO.OH in suspension, a violetcoloured solution is obtained; mineral acids added to this solution form thallous salts, and give off O, or Cl with HClAq. Carstanjen (J. pr. 101, 55) supposed the violet solution to contain a thallate of potassium. Piccini (G. 17, 450) obtained a violet pp. by adding Ba(NO_s)₂Aq to the violet solution; analyses of this pp. were not satisfactory, but the results indicated that an oxide of Tl of the composition TlO, is formed by the method described. Piccini says that the same violet solution is obtained by electrolysing 30 p.c. KOHAq, using a plate of Tl as anode; also by digesting 1 pt. KOH with 4 pts. KClO.

in water, and adding Tl₂SO₄.

Thallium, phosphide of. No compound of Tl and P has been isolated with certainty. According to Crookes (C. J. 17, 135), the black substance formed by passing P hydride into an moniacal Tl. SOrtq is a phosphide of Tl. Carstanien (J. pr. 102, 80) failed to obtain a phosphide by reducing Tl_aPO₄ by C or II, or by heating the elements together. Flemming (Bi. [2] 10, 35) noticed that a thin, black coating formed on molten Tl when pieces of P were thrown on to it; by heating solution of a thallous salt with P in a scaled tube, he obtained a black solid. perhaps a phosphide, and also a phosphite and hydride of P (cf. Willm, A. Ch. [4] 5, 5). Thallium, platino-cyanide of; v. vol. ii. p.

Thallium, salts of. Two series of salts are formed by replacing the H of acids by Tl; thallous salts, Tl,X, and thallic salts, Tl,X, where X = SO,, CO,, 2NO,, 2IO,, 2FO, &c. The chief thallous salts of oxyacids are arsenates, carbonates, chlorate and perchlorate, chromate, dichromate and trichromate, dithionate and trithionate, hypophosphite, iodate and periodate, molybdates, nitrate, phosphates, selenite and selenates, silicates, sulphates and sulphite, tellurate, thiosulphate. The principal thallic salts are arsenate, iodate and periodate, nitraie, phosphates, sulphates (v. CARRONATES, NITRATES, SULPHATES, &c.). Several double salts of both series are also known.

Thallium, salts of oxyacids of. pounds of this kind have been isolated with certainty, but there is evidence in favour of the existence of salts of the hypothetical thallic acid, probably analogous to plumbates (v. Thallium

DIOXIDE, supra).

Thallium, selenides of. Tl Se has been isolated; another selenide, perhaps Tl₂Se₂, pro-

bably exists.
THALLOUS SELENIDE Tl.Se. Mol. w. not known. Obtained by fusing the elements toge-

ther in the ratio 2Tl:Se (Willm, A. Ch. [4] 5, 5; Carstanjen, J. pr. 102, 79); also by ppg. Tl.CO.Aq by H.Se (Kuhlmann, Bl. [2] 1, 330). A grey, lustrous, crystalline solid; melting at c. 840° (Kuhlmann, l.c.). Dissolves in H.80,Aq and HClAq, giving off H.Se.

THALLIO SELENIDE (? Tl.Se.). By fusing the elements together in the ratio 2Tl.3Se, Carstanjen (l.c.) obtained greyish-black prismatic crystals, resembling Sb; not acted on by dilute H.SO,Aq; decomposed by hot conc. H.SO, with separation of Se and evolution of SO, composition of this substance has not been deter-

mined.

Thallium, silicofluoride of, Tl2SiF. tained by dissolving Tl.CO, in H.SiF.Aq, and evaporating. Colourless, regular, octahedra (Werther, J. pr. 91, 385). According to Kuhlmann (Bl. [2] 1,330), the crystals are Tl_SiF, H O. Easily soluble in water. Volatile without decomposition, according to Kuhlmann (l.c.).

Thallium, sulphides of. TLS and TLS, have been isolated, and also probably more than one

compound of these two sulphides.

THALLOUS SULPHIDE TLS. Mol. w. not known.

Formation.—1. By fusing the elements toge ther in the ratio 2Tl:S (Carstanjen, J. pr. 102, 76).—2. By ppg. an alkaline solution of a thallons salt by H.S.—3. By ppg. slightly acidified Tl.SO, Aq by H.S. (Hebberling, A. 134, 11).— 4. By heating an alkaline solution of a thallous

salt with Na₂S₂O₃ (C., l.c.).

Preparation.—A cold, fairly cone., aqueous solution of Tl.SO, is acidulated with a trace of H.SO,Aq, and saturated with H.S, and the bluish-black pp., consisting of microscopic crystals, is washed with H.SAq and dried over H.SO.

(Hebberling, l.c.).

Properties and Reactions.—Prepared by ppn. from slightly acidulated Tl.SO,Aq, Tl.S forms very minute, blue-black, lustrous tetrahedra; prepared by heating together Tl and S it is a black, crystalline, brittle solid; prepared by ppn. from alkaline solutions it is a black amorphous solid. When the amorphous solid is dried, and strongly heated, it melts, and After melting. S.G. is 8°0 (Lamy, J. 15, 185).

H.F. [Tl',S] = 21,660 (Th. 3, 354). Moist ppd.

Tl.S oxidises in air to Tl,SO₄. On long continued heating Tl₂S is completely decomposed (Lamy, l.c.). Tl₂S is insoluble in solutions of (lamy, t.c.). 11.50 is insoluble in soluble in soluble as alkalis, alkali sulphides, carbonates, and cyanides; it dissolves readily in H₂SO, Aq and HNO, Aq, and less readily in HClAq. By ppg. from a very dilute solution of a thallous salt, and dialysing, when the solution of a thallous salt, and dialysing, the solution of a solution o Winssinger (Bl. [2] 49, 452) obtained a reddishbrown aqueous solution of colloidal Tl.S

Combination .- By passing H.S into Tl, SO, Aq containing As,O,Aq, and acidulated with dilute H.SO,Aq, Gunning (Ar. N. 3, 86) obtained a red pp. of Tl₂S.As₂S₃; the same compound was obtained by mixing a solution of As,S, in NH,Aq with an ammoniacal solution of a thallous salt. Heat decomposes the compound into its constituent sulphides; alkali solutions dissolve out

As,S., leaving Tl.S.

Thallic sulphide Tl.S.. Obtained as a black, amorphous, easily fusible, solid, by melting Tl with excess of S, and removing uncom-

bined S by heating out of contact with air (Carstanjen, J. pr. 102, 65). Below 12° Tl.S., is hard and brittle; above 12° it is so soft that it may be drawn out like pitch. It dissolves in warm dilute H₂SO₂Aq without separation of S. Strecker (J. pr. [2] 2, 162) obtained a lustrous, brownblack pp. by passing H.S into a solution of a thallic salt mixed with sodium tartrate and excess of NH, Aq, followed by boiling; this pp. was Tl, S, according to Strecker. When H.S is passed into an aqueous solution of a thallic salt, the pp. is a mixture of Tl₂S and S. Tl₂S₂ combines with potassium and sodium sulphides, forming Tl.S. K.S and Tl.S. Na.S. These compounds are obtained by fusing together 1 pt. Tl.SO, 6 pts. S, and 9 pts. K₂CO₃ or Na₂CO₃, and washing the fused mass with water. The K compound is more stable than the compound of Na; when heated it melts, and then gives off S, leaving K.S and Tl.S; it is not changed by water or alkali solutions, but is decomposed by mineral acids (v. Schneider, A. 135, 215; cf. Krüss, B. 19, 2738). These compounds may be regarded as KTlS₂ and NaTlS₂, that is, as salts of a hypothetical thio-thallic acid.

THALLO-THALLIC SULPHIDES. By adding (NH₁), SAq to a solution of Tl₂Cl₃, a black pp. is obtained which is more fusible than Tl.S, and after melting solidifies to large greyish-black prisms. This pp. contains Tl and S. Similar substances are formed by heating together Tl.S and Tl2S3, and by melting Tl with more S than 2Tl:S, and less than 2Tl:3S; Carstanjen (J. pr. 102, 65) gave the formule 5TLS.3TLS₃ = Tl₁₀S₄, and Tl₂S.TLS₃ = Tl₅S₄, and Tl₂S.TLS₃ = TlS to compounds obtained in this way. By heating Tl₂S₄Na₂S (v. supra) with water, Schneider (A. 135, 215) obtained a compound to which he gave the formula

 $Tl_2S.2Tl_2S_3 = Tl_2S_3$

Thallium, sulphocyanide of; v. vol. ii. p. 352. Thallium, thiosalts of. The compounds of TLS, with K2S and Na.S may be regarded as K and Na thiothallates (v. THALLIC SULPHIDE, M. M. P. M.

THALLIUM ETHIDE TIEt. Has not been

obtained in the free state.

Ethylo-chloride TlEt,Cl. S. 2.76 in the cold; 3.37 at 92°. S. (alcohol) 33 at 78°. Formed from TlCl, and ZnEt, in ether (Hartwig, A. 176, 257). Scales (from water), explodes salts forming: TlEt₂NO₃, S. 5:67 at 70', exploiding at 230'°, exploding at 250° and converted by BaI, into TlEt₄I, S. 1, exploding at 195°.—
(TlEt₄)₂PO₄, S. 23-7 in the cold; 20.7 at 75°.—
(TlEt₄)₂PO₄, S. 23-7 in the cold; 20.7 at 75°.—

exploding at 189°.—TiEt,OA orystallising in needles [212°] (245°), exploding if rapidly heated. Ethylo-hydroxide TlEL,OH. S. 15-1 in the cold; 8 at 88°. Formed from (TlEL,).SO, and baryta. Silky needles (from water). More and baryta. Silky needles (from water). More sol. cold than hot water, forming an alkaline solution. Does not unite with CO₂, but forms the above salts with other acids.

THAPSIC ACID C, H₂₀O₂. [124°]. Obtained from the root-bark of *Thapsia garganica*. The bark is extracted with ether, which leaves on evaporation an amber-coloured resin. The resin dissolves in potash with evolution of heat, and the solution, on acidification, yields a neutral resin, n-octoic acid and thapsic acid.

alkaline solution on standing deposits potassium thapsate (Canzoneri, G. 13, 514). White scales (from alcohol), nearly insol. water and benzene, sol, alcohol and ether.

Salts .- K.A" zaq. Prisms .- BaA" (dried at 120°). Crystalline pp.—Ag.A": amorphous.

at 120°). Crystalline pp.—Ag,A": amorphous. Anhydle;de $C_{10}H_{20}O_s$. [71°]. Crystalline powder (from benzene). Antide $C_{c_1}H_{c_2}O_s$. [163°]. THEBAINE $C_{10}H_{c_1}O_s$. [193°]. S.G. 1·8. [a]₁ = -219° in 97 p.c. alcohol at 15°; = -230° in CHCl₃; S. (ether) · 7 at 10°; S. (isoamyl alcohol) 1·67 in the gold · S. (houseast feet 1.4). hol) 1:67 in the cold; S. (benzene) 5:27 in the cold (Kubly, J. 1866, 823). Occurs in opium to the extent of about :6 p.c. (Pelletier, J. Ph. 21, 569; Couerbe, A. Ch. [2] 59, 155; Kane, A. 19, 9; Anderson, A. 86, 179; Hesse, B. 3, 367; A. 153, 47; 176, 196). Prepared by treating the aqueous extract of opium with Na,CO, or lime, exhausting the filtrate with other, agitating the ether with dilute acetic acid, and pouring the acid liquid into dilute KOHAq. The pp. is collected after 24 hours, warmed with dilute alcohol and dilute HOAc is added till just acid. The alcohol is evaporated off at 50°, papaverine and narcotine removed by filtration, and thebaine acid tartrate ppd. by adding powdered tartaric acid to the filtrate. The tartrate is re-crystallised from water (Hesse, A. Suppl. 8, 262). Thebaine may also be obtained by adding NaOAc to a solution of the hydrochlorides of the opium alkaloids, allowing to stand, filtering, evaporating, again filtering, and adding sodium salicylate. After 24 hours thebaine salicylate crystallises (Plugge, Ar. Ph. [3] 24, 993; 25, 343).

Properties .- Colourless leaflets (from dilute alcohol) or prisms (from conc. alcohol). Tasteless. Alkaline in reaction. Very poisonous. Begins to sublime at 135°; at 160° the sublimate contains needles, onbes, and prisms (Blyth). V. sol. alcohol and chloroform. Ppd. by alkalis and alkaline carbonates, the pp. being slightly soluble in NH, Aq and lime-water. Conc. H.SO, gives a deep-red solution. Boiling dilute H.SO, converts it into thebenine and thebaïcine. Hot conc. HCHAq at 90° yields McCl and morphothebañae (Howard, B. 17, 527). III \q gives McI (2 mols.) (Howard a Roser, B. 19, 1597). Bromine-water forms C18H28BrNO3, a flocculent pp. converted by excess of Br into C19H20Br3NO3, a yellow pp. Solutions of its salts give a pp. of the dichromate

on adding K.Cr.O..

Salts.—B'HClaq. Large trimetrio prisms.

S. 63 at 10°. [a] = -168·32 + 2·33p. —

B'_2H_2PtCl_2aq. Amorphous pp., quickly chan-B_{211,2}ttol₂2ad. Amorphous pp., questy changing to orange prisms. Decomposed by boiling water (O. De Coninck, Bl. [2] 45, 131).—B'₂H₂C₂O₅6aq. S. 1·03 at 10'.—B'H₂C₂O₅aq. S. 23 at 20'.—B'C₄H₂O₈aq. Prisms, very soluble in hot alcohol. S. 77 at 20'.—Meconate B'₂C₂H₂O₅6aq. White prisms (from alcohol).— B' H. FeCy. (Plugge, Ar. Ph. [3] 25, 793).

Methylo-iodide B'MeI. Crystallises from

alcohol in prisms (containing EtOH), m. sol.

water.

Ethylo-chloride B'EtCl. Needles. Ethylo-iodide B'Etl. Needles (from alcohol) (Howard, B. 17, 527)

Benzylo-chloride B'C,H,Cl. Crystals.

Morpho-thebaine C₁,H₁,O₂N [191°]. Obtained by heating thebaine with strong aqueous HCl or

HBr, McCl (or EtCl) being split off; the yield being 50 p.c. of the thebaine. Yellowish crystals. Soluble in alcohol, ether, and benzene, sparingly in water. It dissolves in H2SO, to a colourless solution.

Salts.—B'HCl. Small glistening crystals, sol. water, insol. alcohol.—B'HR' fine silky needles.—B'HNO, 2aq: small white crystals, v. sol. water and alcohol.—A',H,SO, 7aq: small small should. The crystals, v. sol. water, insol. alcohol. The oxal at e is a sparingly soluble amorphous pp. The picrate is a yellow pp. which melts under water. Insoluble pps. are produced with potassium ferrocyanide, ammonium molybdate, HgCl₂K₂I₂, K₂Cr₂O₃, and bismuth-potassium iodide.

Acetyl derivative C₁,H_{1e}AcO₃N. [183°]: glistening plates (Howard, B. 17, 529).

Ethylo-iodide *B'Etl. Crystallises from

acetic acid.

Methylo-iodide B'MeI. Dimetric tables, insol. alcohol, sol. HOAc.

Benzulo-chloride *B'C.H.Cl. Needles, m. sol. water, sl. sol. alcohol (Howard a. Roser, B. 19, 1596).

Thebenine C₁₀H₂₁NO₃. Formed by boiling thebaine with HClAq (S.G. 1.04) (Hesse, A. 153, 69). Amorphous. Insol. benzene and ether, st. sol. boiling alcohol. Conc. H₂SO₄ forms a blue solution. V. sol. KOHAq.—B'HCl 3aq. S. 1. Plates.—B'₂H₂HgCl, 2aq. Very long efflorescent solution. V. soi. AUIIIII.—B INCOMP.

Plates.—B',H,HgCl, 2aq. Very long efflorescent prisms.—B',H,SQ, 2aq. Plates, insol. cold water.

—B'H,C₂O₄ aq. Prisms, sl. sol. hot water.

Thetaicine. Formed by boiling thebaine or

thebenine with conc. HClAq (Hesse). Yellow amorphous pp., insol. ether, benzene, and water, sl. sol. hot alcohol, v. sol. KOHAq. Conc. H. SO. forms a dark-blue solution. The salts are resinous.

Theine v. Caffeine. THEOBROMINE C,H,N,O, i.e.

CO NMe.C:CH.NMe Mol. w. 180. methyl-xanthine. S. 062 at 17°; .7 at 100°. S. (alcohol) '02 at 17°; '2 at 78°. S. (ether) '006 in the cold; '17 at 35°. S. (boiling CHCl.) 1. Occurs in the seeds of Theobroma cacao to 1. Occurs of 13 to 46 p.c. (Woskresensky, A. 41, 125; Glasson, A. 61, 335; Keller, A. 92, 71; Rochleder, A. 71, 9; 79, 124; Strecker, A. 118, 151). Formed by heating the lead salt of xa hine C₄H₂PbN₄O₂ (4 pts.) with MeI (5 pts.) for twelve hours at 130° (Fischer, B. 15, 454; A. 215, 311). Prepared by ppg, the aqueous extract of the seeds with lead acetate, filtering, removing excess of lead by ILSO,, adding MgCO,, evaporating to dryness, and extracting with alcohol (Dragendorff, Ar. Ph. [3] 12, 1). Got also by freeing cacao from oil by pressure, adding slaked lime, and extracting with 80 p.c. alcohol (Schmidt a. Pressler, A. 217, 287).

Properties.—Minute trimetric crystals, sl. sol. hot water, alcohol, and ether. Tastes bitter. At 184° it begins to sublime; at 170° (Blyth) or 290° (S. a. P.) it yields a crystalline sublimate. Very slowly attacked by pure HNO. (Franchimont, R. T. C. 6, 223). Not attacked by boiling KOHAq. Its salts are more or less easily de-composed by water. Ammoniacal AgNO, gives a gelatinous pp. which dissolves on warming, and deposits, on boiling, crystalline C,H,AgN,O₂ (Strecker). Theobromine is ppd. by sodium phosphotungstate (Wolfram, O. J. 36, 406; Fr. 18, 346).

Reactions.-1. Yields methyl-parabanic acid on exidation by CrO₈.—2. KClO₃ and HClA₂ at 50° yield methyl-alloxan and methyl-urea (Fischer, A. 215, 304). Chlorine-water yields amalic acid.—3. Will not combine with MeI to form a methyloiodide. But in presence of dilute alcoholic KOH it reacts with MeI, forming caffeine, even in the cold; better at 100°. But the reaction is never complete, some theobromine being decomposed.—4. Conc. HCl has no action below 200°. At 250° it decomposes it, producing formic acid, carbonic acid, ammonia, methylamine and sarcosine, C,H₈N,O₂+6H₂O
= 2CO₂+NMeH₂+2NH₃+C₃H,NO₂+CH₂O₃; the
NH₃ and NMeH₂ occur in the proportion indicated by the formula (Schmidt, A. 217, 298). Boiling aqueous Ba(OH), effects in 40 hours the same decomposition.—5. HNO, forms CO, methyl-parabanic acid and methylamine, but no ammonia.

Salts .- B'HClaq. Rosettes of needles .-B'HBr aq. Tables. — B'₂H₁PtCl₃ 4aq. — B'₂H₂PtCl₅5aq. — B'HAuCl₁. — B'₂HNO₃. — Manulu black prisms, de-B'HOAc. -B'2H2I8. Nearly black prisms, B'HOAc.—B'_H,I,. Nearly black prisms, decomposed by alcohol (Jörgenssen, Z. [2] 5, 675).—B'HAg(NO₃). Silvery needles, v. sl. sol. water.—C,H,AgN,O₂13aq.—Ba(C,H,N₄O₂). (dried at 105°). Got by adding the obromine to barytaat 105°). Got by adding the obromine to barytawater (Maly a. Andreasch, M. 4, 379). Needles (from hot water).

Bromo-theobromine C,H,N,O2Br. From theobromine and bromine (Fischer, A. 215, 305). Crystalline powder. Sl. sol. hot water. HČl, but reppd. by water. Sol. aqueous NaOH, not in NH3. Does not give an ethoxy-derivative with alcoholic KOH (unlike bromo-caffeine). After warming with ammonia it gives with ammoniacal AgNO, a silver salt that can be converted by EtI into bromo-ethyl-theobromine C,H_sEtN₄O₂Br, whence alcoholic KOH forms eth - oxy - ethyl - theobromine C,H_sEtN₄O₂(OEt) [153°] as needles. Boiling HCl converts this into EtCl and oxy - ethyl - theobromine C,H_aEtN,O.(OH), whence bromine and alcohol form the di-ethyl derivative of tri-oxy-di-hydroethyl-theobromine C,H,EtN,O,(OH)(OEt),[152°] This body on treatment with hot dilute HCl gives methylamine and apo-ethyl-theobromine (?); and with chlorine at -10° forms hypothyl-theobromine $C_1H_2N_3O_3$ [142°].

Methyl-theobromine is CAFFEINE.

Ethyl-theobromine C,H,EtN,O₂. [above 270°]. Formed from C,H,AgN,O₂ and EtI (Philips, B. 9, 1308). Small crystals, m. sol. hot water. Weak

THEOPHYLLIN C, H, N,O, i.e.

CO NH.C:CH NMe [264°]. Occurs in alco-

holic extract of tea, from which it may be separated by means of its Ag salt (Kossel, B. 21, 2164). Monoclinic tables (containing aq, v. e. sol. warm water and very dilute ammonia. May be sublimed. When evaporated with chlorinewater it yields a scarlet residue, which is coloured violet by NH,Aq. MeI converts its Ag salt into cafferne. KClO, and HClAq yield dimethyl-alloxan.

Salt.—AgC,H,N,O, laq. Amorph which may be crystallised from NH,Aq. Amorphous pp.,

A name given by Crum-THETINES. Brown and Letts to compounds of the form CO.H.CH.SR.OH or their anhydrides CHrSR₂ where R is a hydrocarbon radicle; v. ĊO-Ò DI-ETHYL-THETINE and DI-METHYL-THETINE.

THEVETIN C₃₄H₈₄O₂₄3aq. [170°]. S. 8 at 14°. a = -85.5°. A poisonous glucoside occurring in the kernels of Thevetia nereifolia (Blas, J. 1868, 768; De Vrij, R. T. C. 3, 167; Warden, Rh. [3] 12, 417). Crystalline powder, v. sol. hot water and alcohol, insol. ether. Sol. acids and alkalis. Lævorotatory. Conc. H₂SO, gives a dirty-brown colour. Decomposed by boiling dilute HClAq into glucose and theveresin C48H70O1, 2aq, a white powder [140°], v. sl. sol. cold water, sol. alkalis.

THIACETIC ACID v. THIO-ACETIC ACID. THIALDINE C. H, NS. i.e.

NH CHMe.S CHMe. Mol. w. 163. [43°]. Formed by passing H2S for four hours into a soluformed by passing H₂S10 rotar hours into a solu-tion of aldehyde-ammonia (1 pt.) in water (15 pts.), and a little NH₂Aq (Wöhler a. Liebig, A. 61, 2; Hofman, A. 103, 93; Brusewitz a. Cathander, J. pr. 98, 315). Monoclinic crystals (from ether-alcohol). May be distilled with steam. V. sl. sol. water, v. sol. alcohol, v. c. sol. ether. Boilsol. water, v. sol. alcohol, v. c. sol. ether. Boiling dilute H.SO, forms thio-acetic aldehyde. KMnO, forms CH., CH(SO, K). (Guareschi, B. 11, 1384, 1692). Boiling AgNO, Aq forms aldehyde. Hofinan, A. 103, 93). I in KI forms amorphous (CHM-9S, (Hassbender, B. 20, 460).

Salts.—B'HCl. Prisms, v. sol. water.—B'HBr.—B'HCl. B'HNO,—B'H.SO,- Prisms.—

B'H,PO, aq. Needles, v. sol. water.

THIAZOLE N CH.S. (116.8° cor.). S.G.

17 1.1979; 17 1.1998. Formed by the action of boiling alcohol on the diazo-compound of amidothiazole, obtained from di-chloro-di-ethyl oxide and thio-urea (Hantzsch a. Popp, B. 21, 2582; A. 250, 274). Formed also from N CH:CH and the corresponding a-bromo-thiazole by reduction with zine-dust and HOAc (Schatzmann, A. 261, 12). Mobile liquid, very volatile, hygro-A. 261, 12). Mobile liquid, very volatile, hygroscopic, and highly refractive. Miscible with water, alcohol, and ether. Insol. KOHAq. Smells like pyridine. Neutral in reaction.—Salts.—B'2H_PtCl₂ 2aq.—B'HAuCl₄. [250°].—B'C,H_NAO., [151°].—B'HHgCl₄. [104'].—B'HgCl₄. [204°]. Crystalline pp., sl. sol. water.

 μ -Amido-thiazole $N \ll_{CH}^{C(NH_2).S}$ ane. Thiazylamine. [90°]. Formed by the action of chloro-acetic aldehyde on thio-urea (Traumann, A. 249, 36). Prepared by boiling CH_Cl.CHCl.OEt (1 pt.) with thio-urea (1 pt.) and water (5 pts.). Yellowish plates, sl. sol. water, alcohol, and ether. Strong base.—B'HCl aq. Needles.—B'H.PtCl. Yellow tables.

Acetyl derivatibe. [203]. Needles.

Thiazo-

Acetyl derivative. [203°]. No THIAZOLE TRIAZOLE (so called)

 $CH \stackrel{S-C:N}{\diamond} CH$. Formed by the action of HClAq on methyl-nitroso-imido-thiazoline (Näf, A. 265, 123). Liquid, v. sol. water. Alkaline;

reduces Fehling's solution. Nitrous acid reproduces nitroso - methyl - imido - thiazoline. -B'HCl 2aq. [220°]. Needles.—B'HBr 2aq.
THIENONE is DI-THIENYL KETONE.

THIENVIK IS DI-THIENYIK RETONE.

DITHIENYIC, H.S., i.e. C.H.S.C.H.S. [88°].

(266° cor.). Formed on passing thiophenethrough a sed-hot tube (Nahnsen, B. 17, 789,
2197). Plates (from alcohol). Conc. H.SO.,
gives a reddish-brown solution with deep-green
fluorescence. On warming with isatin and
H.SO, it gives a violet-blue colour.

Sulphonic acid C.H.S.(SO) H. Got be-

Sulphonic acid C8H3S2(SO3H). Got by heating with H2SO, (20 pts.) at 100°. Yields a

crystalline BaA', aq.

Reference.—Hexa-bromo-dithienyl.

THIENYL-ACETIC ACID C,H,S,CH,CO,H. [76°]. Formed from C.H.S.CH(OH). CO.H [115°], HIAq, and P (Ernst, B. 19, 3281). Crystalline, sol. hot water, alcohol and ether. - Ba'A, (dried at 130°). Crystals .- AgA': pp.

Reference.—OXY-THIENYL-ACETIC ACID.
THIENYL-ACRYLIC ACID C,H.SC C,H,SO, Formed C.H.S.CH:OH.CO.H. [138°]. boiling thiophenic aldehyde with NaOAc and Ac.O (Biedermann, B. 19, 1855). Needles (from water), sol. hot water and alcohol, FeCl, gives an amorphous orange pp. -AgA': white pp.

THIENYLAMINE v. AMIDO-THIOPHENE. THIENYL-BROMO-ETHANE Вкомо-THIENYL-ETHANE

THIENYL BROMO-ETHYLENE v. BROMO-THIRNYL-ETHYLENE

THIENYL BROMO METHYL KETONE

ω-Bromo-aceteMienone. C.H.S.CO.CH.Br. Formed by adding Br (2 at.) to thionyl methyl ketone (1 mol.) dissolved in CS, (Brunswig, B. 19, 2891). Pungent yellow oil, may be distilled in vacuo. V. sol. alcohol and other. Solidified in vacuo. by cold. Alcoholic NII, forms a deep-blue colour. Oxidised to (a) thiophenic acid [126.5°]. Anilina yields C,H,S.CO.CH,NHPh [80°].

Thienyl di-bromo-methyl ketone C.H.S.CO.CHBr. [c. 0°]. Formed from thienyl methyl ketone and Br. Pungent oil, almost

insol. ligroïn. (B)-THIENYL-CARBINOL O.H.S.CH.OH. (207° cor.). Formed by shaking (B)-thiophenic aldehyde with aqueous potash (Biedermann, B. 19, 639). Liquid. HCl forms C,H,S.CH,Cl, a pungent oil boiling with partial decomposition

at 175 THIENYL CHLORO-ETHANE v. Culoro-THIENYL-ETHANE

THIENYL-CHLORO-ETHYLENE v. CHLORO-THIENYL-ETHTLENE.

(a)-THIENYL CHLORO-METHYL KETONE 6.H.S.CO.CH.Cl. [47]. (259° cor.). Formed by chlorination of thienyl methyl ketone (Peter, B. 18, 539). Pungent white crystals. Yields (a)-thiophenic acid on oxidation.

C.H.NS THIENYL ETHYL AMINE C.H.S.CHMe.NH. (186). Got by reducing the oxim of thienyl methyl ketone in alcoholic solution by adding sodium amalgam and HOAa (Goldschmidt a. Schulthess, B. 20, 1700). Liquid, sol. water. Absorbs CO, from the air.— B'HOAc. Needles, v. e. sol. water.

[95°]. Needles. Benzoyl derivative. THIENYL ETHYL KETONE C.H.S.CO.C.H. Propiothicnone. (228° cor.). Formed from propionyl chloride, thiophene, and AlCl. (Krekeler. B. 19, 677). Liquid. Hot conc. H.SO, forms propionic and thiophene (a)-sulphonic acids Chromic acid mixture yields (a)-thiophenic acid Oxim C,H,S.CEt:NOH. [56°].

THIENYL DIETHYL PHOSPHINE

(C,H,S)PEt,. (225°). Formed from thienyl-chloro-phosphine and ZnEt, in ethel (Sachs, B. 25, 1517).

Ethylo-iodide (C.H.S.PEt,I. Methylo-iodide (C.H.S.PEt,MeI. [122°]. White powder, v. sol. water insol. ether.

THIENYL-GLYCOLLIC ACID v. OXY-THIENYL-ACREIG ACID

(a)-THIENYL-GLYOXYLIC ACID

C,H,SO, aq i.e. C,H,S.CO.CO,H. [91°]. Formed by oxidising thienyl methyl ketone with alkaline (837; Bradley, B. 19, 2115). Formed also, together with thiophene (a)-carboxylic acid, by oxidation of (a)-cthyl-thiophene by alkaline KMnO₄. Crystals (containing aq, possibly as C₄H₄S.C(OH)₂.CO₂H), who lives my water. Melts at 59° when hydrated. May be extracted by ether. from its aqueous solution. If a drop of crude benzene, followed by H₂SO₄, be added to its solution in HOAc, a brown colour is formed, which on addition of more H₂SO₄ passes through blue-green, green, violet, red, and bluish-violet to blue.

Reactions .- 1. On heating it splits up into CO₂ and thiophenic aldehyde.—2. On heating with di-methyl-aniline and ZnCl₂ it yields the leuco-base of a green dye C4H2S.CH(C6H4NMe2)2. -3. PCl, forms thiophenic chloride.

-3. PCl, forms thiophenic chloride.

Salfs. — BaA'₂aq. Slender efflorescent needles, v. sol. water.—CaA'₂2aq.—CuA'₂2aq.—ZnA'₂2aq.—AgA'aq: amorphous pp., probably C,H₃S.C(OH)₂CO₂Ag.

Methyl ether McA'. [28·5°].

Ethyl ether Eth'. (265° uncor.). Oil.

A mide C,H₃S.CO.CO.NH_{...} [88°]. Needles, almost insol. water, v. sol. alcohol and ether.

Oxim C,H₃S.C(NOH).CO₂H. [146°].

Hantzeh R 24 48). Slewler white needles

(Hantzsch, B. 24, 48). Slender white needles. Exhibits Liebermann's reaction (Bradley, B. 19, 2119).—BaA', 1',aq.—AgA': amorphous pp.—
MeA' [105°]. Converted by NaOMe and MeI into liquid C₄H₃S.C(NOMe).CO₂Me. — EtA'. [123°]. Needles.

Acetyl derivative of the oxim. [87°].

Phenyl-hydrazide

C,H,S.C(N,HPh).CO,H. [165°]. Deen-vellow needles (from ether).

Heference.—NITRO-THIENYL-GLYXXYLIG ACID.
THIENYL HEXYL KETONE C₁₁H₁₆SO i.e.
C₁H₃SO.O₄H₁₃. (304° cor.). Formed from
thiophene, heptoyl chloride, and AlCl₄ in ligroin
(Schleicher, B. 19, 664). Yellow oil, yielding
(a) thiophenic acid on oxidation. Conc. H₂SO₄ forms thiophene (a)-sulphonic and heptoic acids.

Oxim [49°]. -Crystals (from alcohol).

THIENYL-INDOLE C₁₂H_uNS i.e.

C,H, < CH >C.C,H,S. [162°]. Formed by heating the phenyl-hydrazide of thicnyl methyl ketone with ZnCl₂ (Brunck, A. 272, 201). Lightyellow needles, insol. water, v. sol. ether, m. sol. alcohol. Colours pine-wood, moistened with HCl, bluish-violet. Yields C, H, Br, NS [278°] and C, H, CH(C, H, NS), [245°]. — B'C, H, NO, [187°]. Dark red plates, v. sol. alcohol.

Nitrosamine C, H, (NO)NS. [241°].

DI-THIENYL KETONE (C.H.S),CO. (326° uncor.). Formed from thiophene, COCl, and AlCl. Obtained also by distilling calcium And Alois Obsained also by discharge and a state of the s

THIENYL MERCAPTAN (C.H.S).SH. (166°). Got by reducing thiophene (a) sulphinic acid with zinc and HClAq (Biedermann, B. 19, 1616). Got also in small quantity from succinic acid and P₂S₅ (V. Meyer a. Neure, B. 20, 1757). Stinking oil, volatile with steam.—AgS.C₄H₂S.

Methyl ether (C,H,S)SMe. (186°).
DI-THIENYL METHANE C,H,S,: i.e.

CH₂(C₄H₂S)₂. (267°). Got by adding H₂SO₄ to a solution of thiophene and methylal in HOAc (Pcter, B. 17, 1345). Oil, smelling like oranges, Volatile with steam. Gives a red colour with isatin and H.SO

(a)-THIENYL METHYL KETONE C_sH_aSO i.e. C.H., S.CO.CH., Acetothicnone. (213° cor.).
S.G. 21 1167. Formed from thiophene, AcCl, and AlCl., (Peter, B. 17, 2643; Biedermann, B. 19, 636; Bradley, B. 19, 2115). Formed also from C.H., (HgCl)S and AcCl (Volhard, A. 267, 178). Liquid, smelling like acctophenone. Gives a blue colour with isatin and H_2SO_1 . Oxidised by $KMnO_4$ to (α)-thienyl-glyoxylic and thiophenic acids. Mercuric chloride and NaOAc form the compound (CH₃.CO.C.H₃S)HgCl₂ crystallising in white needles. Oxalic ether (1 mol.) and NaOEt give C₄H₃S.CO.CH₂.CO.CO₂Et [42°], which forms large yellow crystals, converted by boiling alcoholic hydroxylamine hydrochloride into the compound $C_4H_4S.C \leqslant_{N}^{CH:C.CO_2Et}$

CO.Et.C $\stackrel{\text{CH:C.C.}_4H_2S}{N}$ crystallising in colour-less needles [489] (Angeli, $B.\ 24,\ 232$).

Oxim C₀H₀S(NOH). [112°]. Phenyl-hydrazide C₀H₀S(N₂HPh). [96°]. Reference.-BROMO-, CHLORO-, IODO-, and

NITRO-THIENYL METHYL KETONE

THIENYL PHENYL - AMIDO - METHYL XETONE C,H,S.CO.CH,NHPh. [80°]. Formed by mixing C,H,S.CO.CH,Br with aniline in alcohol (Brunswig, B. 19, 2892). Plates. Yields a nitrosamine C₄H₄S.CO.CH₂.NPh(NO) [81°], and acetyl derivative C,H,S.CO.CH,NPhAc [142°].

ŤHIENYL PHĖNYL KETONE C₁H₂S.CO.C₂H₃, [55°]. (c. 300°). Formed by the action of AlCl, on a mixture of thiophene and BzCl (Comey, B. 17, 790). Formed also by heating C,H,(HgCl)S with BzCl at 100° (Volhard, A. 267, 179). Long needles (from dilute alcohol), insol. water. Gives a blue colour on heating with isatin and H₂SO₄. Yields thiophene and benzoic acid on heating with soda-lime.

Oxims C₁H₄S.CPh:NOH. Hydroxylamine

forms two stereo-isomeric (?) oxims [98°] and [114°] (Hantzsch, B. 23, 2332; 24, 59).

THIENYL-PHENYL-METHANE

CH2Ph.C4H3S. (265°). Formed by the action of H₂SO, on a mixture of thiophene and benzyl alcohol dissolved in HOAc (Peter, B. 17, 1346).

Thienyl-di-phenyl-methane CHPh.:C,H,S. [63°]. (330°-340°). Formed from thiophene, di-phenyl-carbinol, and P.O. (Levi, B. 19, 1624).

Plates (from alcohol) or needles (from ligroin), v. sol. HOAc, alcohol, and ether. Crystallises from cold benzene in needles C, H, SC, H, [48°]. THIENYL ISOPROPYL KETONE

C.H.S.CO.CHMe.. (282° cor.). Formed from isobutyryl chloride, thiophene, and AlCl, (Krekeler, B. 19, 675). Liquid. Yields (a)-thiophenic acid on oxidation. Fuming H.SO, reacts with formation of the sulphonic acid C.H.(SO,H)S.CO.CHMe., which yields the salts BaA', PbA', xaq, and is converted by phenyl-hydrazine into C.H.(SO,N,H,Ph)S.C(N,HPh).CHMe... cystallising from hot water in plates.

Oxim C₁H₃S.C(NOH).CHMe₂. [108°]. Pearly plates (from dilute alcohol).

THIENYL STYRYL KETONE v. STYRYL THIENYL RETONE.

THIRM'L DISULPHIDE (C,H,S),S₂. [56°]. Formed by atmospheric oxidation of a solution of thenyl mercaptan in alcoholic NH₂ (Meyer a. Neure, B. 20, 1757). Needles.

Meure, B. 20, 1757). Needles.

THIENYL SULPHOCYANO - METHYL

KETONE CH. (SCy). CO. C., H., S. [88°]. Formed
from CH., Br. CO. O., H., S. and KSCy in alcohol
(Brunswig, B. 19, 2893). Plates (from ether), sl.
80, water and ligroin, m. sol. alcohol.

DI-THIENYL-THIOPHENE C₁SH₂(C₄SH₃)₂. [147°]. (357°). V.D. 8°6. One of the products of the passage of benzene and sulphur-vapour through a red-hot tube (Renard, C. R. 112, 49). Yellowish needles (from alcohol), m. sol. benzene. H_SO₄ forms a rose-coloured solution, turned violet and finally blue on heating. Fuming H₂SO₄ at 120° forms a trisulphonic acid, which yields (O₁H₂S₄(SO₃)₃)₂Ca₃ at an amorphous powder, v. sol. water. Fuming HNO₄ at 160° forms C₁₂H₄S₂O₄ [313°], crystallising in white plates, v. sl. sol. benzene. Br forms C₁₂H₂Br₂S₂[282°], and amorphous C.H. Br S.

amorphous C_{1,2}H_{1,8}C₃, Third S_{1,2}C_{1,2}S_{1,2}S₂S₃ and amorphous C_{1,2}H_{1,6}S₃.

THIENYL TOLYL KETONE C_{1,2}H_{1,0}SO i.e.
C₀H<sub>1,Me.CO.C,1H₂S. Formed from o-toluic chloride, thiophene, and AlCl₂ (Ernst, B. 19, 3279). Oil. Yields an oily oxim.

THIO-. This prefix is employed to denote the replacement of O by S. Most inorganic salts</sub>

THIO. This prefix is employed to denote the replacement of O by S. Most inorganic salts of thio-acids are described under the heading of the oxy-salts; thus thio-carbonates are described under Carbonates. In some cases thio-salts are described under the heading of the characteristic element of the salts: thio-arsenates are to be found under Ausenic. Certain thio-salts are described under headings placed in their strictly alphabetical position; for instance, Thiosulphates. Thiocyanides are described as Sulphocyanides.

The following addition should be made to the sub-article Thio-oxyorhiophosphates (p. 147). By heating metallic chlorides or sulphides with excess of P.S. Glatzel has prepared a number of tetrathio - oxyorthophesphates, i.e. salts of the hypothetical acid H.PS. (Zeit. für anorg. Chemie, 4, 186). These salts are crystalline—generally green to black in colour; they are burnt in air, giving off SO₂; some are decomposed to sulphides and P.S., but the mercuric and arsenic salts distil unchanged when heated out of contact with air. These salts are insol. en dilute acids; they are decomposed by strong acids. G. isolated the thiophosphates of Sb. As, Bi, Cd, Cu(ous), Fe(ous), Pb, Mn, Hg(io), Ni, Ag, Tl, Sn(ous), and Zn; he sould not obtain the salts of Ca, K, Na, or Sr.

THIOACETAMIDE CH., CS.NH., [108°]. Formed from acetonitrile and H.5 (Bernthsen, A. 192, 46), and from acetonitrile and H.5 (Bernthsen, A. 192, 46), and from acetamide and P.S. (Hofmann, B. 11, 340). Monoclinic plates, v. sol. water and alcohol, m. sol. ether. Hgo forms HgS. AgNo. gives AgS. CuSO, and Pb(OAC), give, on boiling, CuS and Pis. HgCl, forms a crystalline compound. A promo facetoacetic ether forms CH., C(NH).S.CH., CO.CH., CO.Et. [94°]. and

gives Ag.S. CuSO, and rolOAc), give, on coling, CuS and Pigs. HgCl, forms a crystalline compound.

of brome aceteacetic ether forms CH, C(NH).S.CH, CO.CH, CO, Et [94"], and finally SCH: C.CH, CO, Et (239°), the ether of methyl-thiazyl-acetic acid [121"] (Steude, A. 261, 36). The ether melting at 94° is converted by warming with water into the compound CH, CO.S.CH, CO.CH, CO, Et (155° at 15 mm.), whence H, SO, forms an acid C, II, SO, [168°].

THIO ACETIC ACID C. H. SO i.e. CH., CO.SH. Mol. w. 76. (93°). S.G. 1º 1·074. Prepared by distilling acetic acid with P.S. (Kekulé, A. 90, 311; Ulrich, A. 109, 272; Kekulé a. Linnemann, A. 123, 273). Obtained also from AcCl and KSH (Jacquemin a, Vosselmann, J. 1859, 354), by heating lead acetate with Na,S.O., (Fröhde, Z. 1866, 543), and by the action of KSH on an alcoholic solution of PhSAc (Kekulé, Z. [2] 3, 196). Colourless liquid, turning yellow on keeping. Smells like acetic acid and H.S. Not solid at -17°. M. sol. warm water, v. sol. alcohol and ether. Violently attacked by fuming HNO. PCl. yields AcCl. PSCl., and HCl. Its neutral solutions give pps. with AgNO. and HgCl., which quickly turn black. Molten ZnCl., forms CMciS.; CMc [225°], which may be crystallised from hot alcohol (Bongartz, B. 19, 2182). HCl passed into a mixture of thio-acetic acid and benzoic aldehyde forms (CH., CO.S.), CHPh [148°], crystallising from hot ether in slender needles.

Salts. -KA'. Crystals, v. sol. water and alcohol. -NaA' haq. - BaA', 2 aaq. - SrA', 2 aq. - CaA', 2 aq. - PbA', Silky needles (from hot water or alcohol). Quickly decomposes, with separation of PbS.

Methyl ether MeA'. (96°). Formed by heating AcBr with Me₂S at 100° (Cahours, Bl. 25, 562; Wallach a. Bleibtren, B. 12, 1062). Formed also from AcCl and Pb(SMe)₂ (Obermeyer, B. 20, 2920).

Ethyl ether Eth. (116° i.V.). Formet from AcCl and NaSEt (Saytzeff, Z. [2] 4, 642; Beckmann, J. pr. [2] 17, 461). Formed also from PhOAc and NaSEt (Seiffert, J. pr. [2] 31, 468). Colourless liquid, with alliaceous odour. Oxidised by AgMnO, to acetic acid and ethane sulphonic acid.

n-Propyl ether PrA'. (136°).

Isopropyl ether PrA'. (126°).

Isobutyl ether CH₂PrA'. (149°).

Anhydride v. Acetyl sulphide.

Thio-acetic acid CH₂CS.OH.

Amide v. Thioacetamide.

Anitide CH_xCS.NHPh. [75°]. Formed from CH_xCCl:NPh and H_zS (Leo, B. 10, 2134). Prepared by heating acctanilide with P.S. at 100° (Hofmann, B. 11, 339; Jacobsen, B. 19, 1071). Yellowish needles (from water). So, NaOHAq and reppd, by acids. On oxidation with alkaline K_xFeCy_o it yields ethenyl-amidophenyl mercaptan. MeI forms C,H_xNSMeI or (CH_xCS.NPhMe)HI [139°), which yields an aqueous solution from which AgNO_x at once

ppts. AgI, and which is converted by AgCl into ppts. AgI, and which is converted by AgCl into C.H.NSMeCl, whence (C.H.NSMeCl), PtCl, may be got (Bernthsen, A. 192, 56). NaOEt forms CH. C(SMe):NPh, whence Mel yields the ether CH. C(SMe):NPh (245°) (Wallach a. Bleibtreu, B. 12, 1061; 13, 529), which is decomposed by Mel at 100° into methyl thioacetate and methyl-aniline. NaOEt and EtBayield the corresponding CH. C(SEt):NPh, a heavy oil, insol. alkalis, split up by warm HClAq into thioacetic ether and aniline. 'Ethyl-iso-thioacetanilide' yields (C.H.H.NS).H.PtCl. (C10H18NS),H,PtCl6.

Methyl anilide CH, CS.NMePh. [59° (290°). Formed from AcNMePh and P₂S, (Wallach, B. 13, 528). Monoclinic tables, v. sol.

o-Toluide CH, CS.NHC, H, [68°]. Yields CH, C(SEt):NC, H, Me (262°), an oil which reacts

with bases forming amidines and EtSH.
p-Toluide [132°]. Yields oily
CH, C(SEt):NC,H, (273°) (Wallach a. Wüsten, B. 16, 147).

Xylidide CH, CS.NHC, H, Me. [80°] (G.); [95°] (Jacobsen). Formed by heating acetyl-xylidine with P,S, on the water-bath (Gudeman,

B. 21, 2551). V-Cunidide CH₃.CS.NHC,H₂Me₃.

Prisms (Jacobson a. Elley, B. 22, 907).

(a) Naphthalide CH₃.CS.NHC₁₀Π₁. [96°].

Tables. Formed from naphthyl-acetamidine and CS₂ (Bernthsen a. Trompetter, B. 11, 1760).

(3)-Naphthalide. [146]. Needles or plates (Jacobsen, B. 21, 2627). Oxidised by K, FeCy.

to C, H, S CMe [81°].

Tri-thio-ortho-acetic acid CH₃.C(SH)₃.

Ethyl ether CH₃.C(SEt)₃. Formed from mercaptan, CHCl₃, and N₁₁OH at 100° (Laves, B. 25, 854). Brownish liquid. Ox KMnO, and H.SO, to the trisulphone. Oxidised by

Benzyl ether CH₃.C(SC,H₃)₃. [46°]. Formed from benzyl mercaptan, CHCl₂, and (2 p.c.) NaOHAq (Laves). Crystals, v. sol. CHCl₃, m. sol. alcohol.

THIO-ACETIC ALDEHYDE. On passing H.S into an aqueous solution of aldehyde, crude thioacetic aldehyde separates as an oil, which solidifies at -8° , and then melts at -2° . This oil [V.D. 60 (H = 1)] is a mixture of thioacetic aldehyde and its polymerides, and may be represented, in a state of vapour, as $C_2H_4S + C_0H_{12}S_3$ (Pinner, B. 4, 258; Klinger, B. 9, 1893; 10, 1877; 11, 1023). On distillation, or on passing HCl through the liquid, it is converted into the polymeric tri-thio-tri-acetic aldehyde.

Tri-thio-tri-acetic aldebyde C.H.S., Mol. w. 180. [46°]. V.D. 89.7 (calc. 90) (Hotmann, B. 3, 589; Z. [2] 6, 699). Formed by passing H.S into an acid solution of aldebyde (Klinger; of. Weidenbusch, 4. 66, 152; Crafts, C. R.54, 1279). Formed also from parallelyde and H₂S. White needles, sol. alcohol and ether. Smells like garlic. AgNO₂ added to its alcoholic solution forms crystalline C₈H₁₂S₃2AgNO₂. Chlorine forms ethylidene chloride (Pinner, A. 179, 21). KMnO₄ oxidises it to CH₂CH(SO₄H), and oxysulphides, including C₄H₁₂S₂O₅ [217°], which crystallises from hot water in needles (Guareschi, A. 222, 301). Zinc permanganate values of M. S.O. which deep at weather the control of the control produces CaH12SaO, which does not melt below

245°, C,H₁₂S,O, [112°-116°], and C.H.S.O. [228°-231°] (cf. Baumann, B. 26, 2074). (a)-Tri-thio-tri-acetic aldehyde C.H. S. i.c. CHMe S.CHMe S. [102°]. (247°). V.D. 6 (air = 1). Formed by the long-continued action of H.S on a mixture of equal parts of water, conc. HClAq'andaldehyde. Long prisms (from acetone). Reduced by HI to Et₂S₂. Oxidised by KMnO₄ to C₄H₁₂S₂O₄ [284°] (S. 1 at 100°; '116 at 20°), and C₄H₁₂S₂O₄ or C₂H₄ SO₂C₂H₄ SO₂. which softens at 340° and is converted by MeI into C_uH₁₈S₁O_a [302°]. Yields crystalline C_aH₁₂S₂AgNO₃ and C_aH₁₂S₂AgNO₃.

 (β) -Tri-thio-tri-acetic aldehyde $C_*H_{12}S_*$. [126°]. (247°). V.D. 6·0. Formed by the action of AcCl or H.SO, on its (a)- isomeride. Prepared by passing H.S into a mixture of aldehyde (1 pt.) and alcohol previously saturated with HCl (3 pts.) (Baumann a. Fromm, B. 22, 2600; 26,2074). Long needles (from alcohol). Oxidised by KMnO, to the same sulphones as the (a)isomeride. Reacts with MeI, yielding SMe₃I. Distillation with Cu forms \(\psi\)-butylene.

Ostination with Cut forms q-butylene. Forms crystalline C₄H₁₂S₄AgNO₂ and C₄H₁₂S₃AgNO₂.

(γ)-Tri-thio-acetic aldehyde C₄H₁₂S₂, [76°].

(242°). Formed, together with C₅H₁₂NS₃, by boiling thialdine sulphocyanide with water (Marckwald, B. 19, 1827; 20, 2817). Needles (from alcohol), insol. water, v. sol. ether and CS. Volatile with steam. Sol. conc. H.SO. and reppd. by water. When mixed with EtI (4 pts.) and left for some weeks it suddenly (4 pts.) and left for some weeks it studently changes to a crystalline mass of the (β)-isoneride. C₄H₁,S₅3AgNO₃. Plates, v. sol. water. Yields Ag₂S on boiling with alcohol.

'Di - thialdehyde thiocarbimide' C₅H_pNS₂. [138°]. Formed as above. Needles, n. sol. ether. Yields C₅H_pNS₂AgNO₂ v. sol.

nh. sol. ether. Hens Ostanovasor water, and (C₃H₂NS₃).PtCl₂.

Di-thio-acetic orthoadehyde. Ethyl ether CH₃.CH(SEt)₂. Formed by passing HCl into a mixture of acetic aldehyde and EtSH (Baumann, B. 18, 884). Mobile oil. THIOACETIC ANHYDRIDE v. ACETYL SUL-

THIO-ACETONE *CH, CS.CH, A product of the action of H,S on acetone, and formed also when CMe₂(SEt)₂ is heated above 160' (Baumann a. Fromm, B. 22, 2592). Volatile oil, with very persistent and disagreeable smell. Unstable.

Duplo-thioacetone C₆H₁₂S₂ i.e. S<CMe₂>S. V.D. 5.08 (calc. 5.11). (184° cor.). Formed by heating acetone with P.S. at 125° (Wislicenus, Z. [2] 5, 324; Autenrieth, B. 20, 375). Formed also by heating tri-thio-tri-acetone at 200° for some time (Fromm a. Baumann, B. 22, 1043). Oil. Its alcoholic solution gives a white pp. with HgCl₂. Reduced by sodium-amalgam to isopropyl mercaptan (Spring, Bl. [2] 40, 69). Oxidised by a 5 p.c. solution of KMnO, to the disulphone SO₂ CMe₂ SO₂ [220°-225°].

Tri-thic-tri-acetone U₂H₁₈S₂ i.e.

S<CMe. S CMe. [24°]. (130° at 15 mm.). Formed, together with C13H28S4 [171°], by passing H,S into a cooled mixture of acetone and cone. HClAq (Fromm a. Baumann, B. 22, 1037, 2597). Needles (from alcohol); insol. water, v. sol. alcohol and ether. Boils, with much decomposition, at 225°-230°. Gives a white pp. with HgCl2 and a yellow pp. with lead acetate. Potassium permanganate and H₂SO₄ yield the trisulphone SO₂ CMe₂ SO₂ CMe₂ [302°] and

SCMe₂·SO₂CMe₂ [208°].

Duplo-di-thio-acetone (Me₂CS₂)₂. (c. 243°). Formed from acetone and yellow ammonium sulphide in the cold (Willgerodt, B. 20, 2467). Dimetric crystals, a:c=1: 868, insol. water. Partially decomposed on distillation.

Di-thio-orthacetone. Di-ethylether CMe (SEt)2. Acetone-cthyl-mercaptol. (191°). Formed by passing dry HCl into a mixture of acetone (1 pt.) and mercaptan (2 pts.) (Baumann, B. 18, 887). Liquid.

Di-phenyl ether CMe, (SPh),; v. Dr-PHENYL-PROPYLIDENE DISULPHIDE.

THIOACETONURAMIC ACID v. ACETONYL

THIOCARBAMATE

THIO - ACETOPHENONE C.H.CS.CII, [119.5°]. Formed by the action of alcoholic ammonium sulphide on acetophenone (Engler, B. 11, 930). Colourless leaflets or needles, insol. water, sl. sol. alcohol, v. sol. ether. May be sublimed.

THIO-ACETYL-TOLUIDINE v. Toluide of

THIO-ACETIC ACID.

THIO-ALLOPHANIC ACID. Ethyl ether C.H.aN.SO. i.e. NH.CO.NH.CO.SEt. [180]. Formed by heating urea with Cl.CO.SEt at 80°-90° (Peitzsch a. Salomon, J. pr. [2] 7,477). Pearly needles (from water), v. sl. sol. cold water and alcohol. Aqueous NH, at 100° forms biuret and mercaptan. Boiling baryta-water gives allophanic acid and mercaptan. Aniline yields di-phenyl-biuret and mercaptan.

Isoamyl ether NH_CO.NH.CO.SC.H.,.. [176]. Needles (Schöne, J. pr. [2] 32, 251). AcCl yields an acetyl derivative [859]. Phenyl ether [2189] (Gattermann, A.

244, 43).

Isothio-allophanic ether NH2.CS.NH.CO2Et. [170°-175°]. Formed by the action of thio-urea on COCl.CO.Et (Peitzsch, B. 7, 896). Prisms (from alcohol).

Di-thio-allophanic ether NH, CS.NH.CO.SEt. Formed from KSCy, alcohol, and HCl (Blankenhorn, J. pr. [2] 16, 358). Pearly prisms, insol. cold water, sol. hot ether. Alcoholic NII, at 150° forms thio-urea. Baryta-water yields

mercaptan, CO., and thio-urea.

DI-THIO-AMMELIDE C₃H₁N₁S₂ i.e.

C₃N₄(NH₂)(SH)₂. S. 3 at 100°. Formed by boiling pseudosulphocyanogen C₃HN₅S₂ with KSH or ammonium sulphide solution (Jamieson, A. 59, 339; Ponomareff, J. R. 8, 222). Small needles, nearly insol. cold water, alcohol and ether, v. sol. aqueous ammonium sulphocyanide. Acid in re-

aqueous ammonum sulphocyanide. Acid in reaction, decomposing carbonates.

Reactions.—1. Yields cyanuric acid when heated with HClAq.—2. NH,Aq forms melamine C,H,N, by heating in a Scaled tube.

Salts.—NaHA"1\frac{1}{3}aq. Tables.—KHA"2aq.

White prisms, v. e. sol. water and alcohol.—
MgH_A"_6aq.—CaH_A"_2aq.—BaH_A'"_5aq.—BaH_A'"_5aq. Monoclinic crystals, sl. sol. cold

water.—SrH,A",4aq.—AgHA". Flocculent pp. insol. water.

insol. water.

Methyl ether C₃N₄(NH₂)(SMe), [2007].

Formed by heating C₃N₄(SMe), with alcoholic NH₄ for five hours at 100° (Hofmann, B. 18, 2756). Trimetric tables, v. al. sol. water, v. sol. alcohol. Boiling cone. HClAq forms MeSH, cyanuric acid. and NH₄.—B'HAuCl₄. Needles.

Ethyl ether EfA". [112°]. Formed by heating tri-thio-cyarpine ether with alcohol NH₄ at 180° (Klason, J. fr. [2] 33, 298). Trimetric prisms. Converted by acids into ammelide.

Isoamyl ether (0₂H_{11),2}A". [82°].

Di-thio-methyl ammelide di-methyl ether Cy₂(NHMe)(SMe), [175°]. Formed by heating Cy₃(SMe), with aqueous NMeH₄ (Hofmann, B. 18, 2761). Needles or prisms (from dilute alcohol).

dilute alcohol)

THIO-AMMELINE C.H.N.S i.e.

C(SII) N.C(NII₂) N. S. 77 at 100° (K.)

Formed by adding HCl to an aqueous solution of dievan-diamide and ammonium sulphocyanide or devan-duame and am some supprocyanic pat 100° (Rathke, B. 18, 3106; 20, 1059; 23, 1675). Formed also from C₂N₄(NH₂)₂Cl and KSH (Klason, J. pr. [2] 33, 296) and by heating \(\psi\$-sulphocyanogen with cone \text{NHAq at 100°} (Ponomareff, C. R. 80, 1384). Needles, sl. sol. hot water, v. sol. acids and alkalis. Yields a canary-yellow pp. on boiling with ammoniacal CuSO,. Cone. HClAq at 130° yields cyanuric acid, H₂S, and NH₂. Ethylene bromide forms crystalline C₃H₁N₃SHBr. Conc. NH₂Aq at 200° forms melamine. Boiling NaOHAq yields ammeline. Ammoniacal silver nitrate ppts. C₂H₁N₂SAg and C₄H₂N₃SAg₂. Bromine added to a solution of thio-ammeline in HBrAq forms S₂(C₃N₃(NH₂)₂)₂, which dissolves in alkalis, and is split up by boiling with acids into ammeline, thio-ammeline,

Salts. B'IINO. Needles. B'H2SO.3aq.
B'H2C.O.aq. Needles, v. sl. sol. cold water.
Methyl ether MeA'. [268°]. Formed by heating tri-methyl tri-thiocyanurate for five hours with conc. alcoholic NH, at 160° (Hofmann,

B. 18, 2757). Tables (from water).—B',H,PtCl,. Ethyl ether EtA'. [165°]. Isoamyl ether C,H,A'. [178°]. Reference.—TRI-PHENYL-THIO-AMMELINE. THIO-ANILINE v. DI-AMIDO-DI-PHENYL SUL-

THIOANISOIC ACID (so called) C10H14SO4. Got by boiling anethol with HNO, (S.G. 1.1), distilling the product and shaking the fraction 215°. 245° with cone. NaHSO,Aq and some alcohol (Städeler a. Wächter, A. 116, 163). Crystalline (containing 2aq), v. e. sol. water, alcohol, and eiher.—NH,A'aq.—NaA' aq. S. 15 in the cold.—BA', 2aq.—MgA', 5ad.—AgA'. Plates, m. sol. water.

THIOBENZAMIDE v. Amide of THIOBENZOIC

(a)-THIO-BENZOIC ACID CaH, CO.SH. Mol.

w. 138. [c. 24°].

Formation.-1. From BzCl and alcoholic K.S (Engelhardt a. Latschinoff, Z. [2] 4, 353). 2. By boiling EtOBz, PhOBz, and Bz.O with alcoholic KSH.

Properties .- Yellow oil or white crystalline mass with unpleasant smell, volatile with steam. Decomposed by distillation. V. sol. alcohol and

ether. Its solutions, when exposed to air, deposit crystals of Bz₂S₂. Nitric acid also oxidises it to benzoyl disulphide. A neutral solution

it to benzoyi disulphide. A neutral solution gives with CuSO₄ a greenish-yellow pp., turning bright red; the pp. then containing Bz₂S₂.

Salts.—KA'. Large prisms (from alcohol), v. sol. water.—NaA'.—BaA'₂ zaq. Laminæ (from alcohol).—PbA'₂.—AgA'. v Yellowisho white pp.

Methyl ether C_cJ₂.COSMe. (232°).

Formed from Pb(SMe)₂ and EzCl (Obermeyer, B. 2020).

20, 2922).

20, 2922).

Ethyl ether Eth'. (243°). Formed by the action of BzCl on Pb(SEt), in presence of ether (Tütscheff, Petersb. Acad. Bull. 5, 295), and got also by bolling AgA' and Etl, and from PhOBz and NaSEt (Seiffert, J. pr. [2] 31, 471). Oil, with unpleasant smell, sol. alcohol and ether. Belling alcoholis VOM. Boiling alcoholic KOH forms KOBz and KSEt. Alcoholic KSH yields KSBz and KSEt. Oxidised by AgMnO, to benzoic and ethane sulphonic acids

(Beckmann, J. pr. [2] 17, 464).

Isoamyl ether C₃H₁A'. (271°).

Phenyl ether PhS.B2'. [56°]. Formed from phenyl mercaptan and BzCl Schiller a. Otto, B. 9, 1635). Needles (from benzene)

Di-nitro-phenyl ether C_sH₃(NO₂)₂A'.

[118°]. Formed from (a)-chloro-m-di-nitro-benzene, alcoholic KSH, and BzCl (Willgerodt, B. 18, 328). Needles (from alcohol).

Benzyl ether C,H,A'. [39·5°]. Formed from benzyl mercaptan and BzCl (Otto a. Lüders, B. 13, 1286). Triclinic crystals, yielding

PhCH. SO.H on oxidation. p. Tolyl ether C,H,A'. [75°] (S. a. O.).

Annydride v. BENZOYL SULPHIDE.

(B)-Thic-benzoic acid CaH5.CS.OH. Formed by boiling thiobenzoic aldehyde with nitric acid (S.G. 13) (Fleischer, A. 140, 234). Needles (containing ½aq), sol. alcohol and benzene. More sol. hot water than benzoic acid. When heated strongly it blackens without melting .- BaA'24aq.

Small nodules, v. sol. water and ppd. by alcohol.

Amide C. H. CS. NH. Thiobenzamide. [116°]. Formed by passing H2S into an alcoholic solution of benzonitrile containing a little NH, and heating on a water-bath (Cahours, C. R. 27, 329; Bernthsen, B. 10, 1241; A. 192, 49; Gabriel a. Heymann, B. 23, 157). Formed also by heating benzylamine (2 mols.) with S (1 mol.) at 180° (Wallach, A. 259, 304). Long needles (from hot water). Decomposed by HgO, yielding HgS and benzonitrile. Sodium-amalgam acting on its alcoholic solution forms amorphous thiobenzoic aldehyde, benzonitrile, benzylamine, and benzoic aldehyde. Iodine added to its alcoholic solution reacts with formation of di-benzenyl-azo-sulphim

 $C_{e}H_{s}.C \underset{N}{\overset{N.S}{>}} C.C_{e}H_{s}, \text{ crystallising} \quad \text{in long}$

colourless needles [90°] converted by boiling H_SO, into a base C₁,H₁,N₂ [71°], which yields B'_2,H_2,PtCl₄ (Hofmann, B. 2, 645; B. 25, 1587; Wanstrat, B. 6, 335). Zinc and HCl reduce thiobenzamide in alcoholic solution to benzylamine. Hydroxylamine forms C₆H₅.C(NOH).NH₂. Ethylene bromide at 100° forms the compound C.H. (S.C(NH)C.H.),2HBr [233°] decomposed by boiling water into C,H₁(SBz)₂ (Gabriel a. Heymann, B. 24, 783). Chloral (1 mol.) forms, on warming, a compound C,H₂Cl,NSO or C,H₂Cl,NS

silky plates [104°], sl. sol. water, v. sol. alcohol (Spica, G. 16, 182).

Anilide C.H., CS.NHPhor C.H., C(SH):NPh. Thiobensanilide. [102°]. Formed by the action of P.S. (1 pt.) on benzanilide (2 pts.), and by heating phenyl-benzamidine or s-di-phenyl-benzamidine CPh(NPh)(NPhH) with H.S or with CS₂ (Bernthsen, B. 11, 503; A. 192, 31). Formed also by passing H₂S into a solution of C₄H₄.CCl:NPh in benzene (Leo, B. 10, 2133), and from benzophenone oxim and P2S, (Dodge, A. 264, 184). Obtained by heating benzyl-aniline 264, 184). Obtained by heating benzyl-aniline (1 mol.) with S (2 at.) at 220° as long as H₂S escapes (Wallach, A. 259, 301). Thin prisms (from EtOAc), nearly insol. boiling water, v. sol. alcohol and ether. V. sol. KOHAq. Converted into benzanilide by heating with dry PbO or with alcoholic potash at 150°. Yields benzenyl-o-amido-phenyl-mercaptan on dry distillation, on baction with S and alcoholic returnest in alkaling heating with S, and also on treatment in alkaline

solution with K₂FeCy₆ (Jacobsen, B. 19, 1068). Hydroxylamine yields C₆H₂.C(NOH).NHPn. o-Toluide C₆H₃.CS.NHC₆H₄Me [1:2]. [86°]. Formed by melting BZNHC₆H₄Me with P₂S₅. (Stieglitz, B. 22, 3160). Yellow, six-sided prisms (from benzene). Hydroxylamine in alcohol forms, on heating, C.H. C(NOH).NHC,H, [147°], crys-

tallising in needles.

p-Toluide. [129°]. Formed in like manner (Miller, B. 22, 2405), and also by the action of H.S on C₆H.,CCl:NC,H, (Leo, B. 10, 2134; Pfitzinger a. Gattermann, B. 22, 1065), and by heating p-tolyl-benzamidine with CS₂ (Bernthsen a. Trompetter, B. 11, 1759). Long yellow needles, insol. water, v. sol. alcohol, ether, and

Xylide C, H, CS.NHC, H, Mo. [90°]. Formed by heating the benzoyl derivative of (4,2,1)-xylidine with P_2S_3 (Gudeman, B. 21, 2552). Small needles (from alcohol). Oxidised by

 K_sFeCy_s to oily $C_sH_2Me_2 < N > CPh$.

Di-phenyl-amide C,H,CS.NPh, [151]. Triclinic crystals (Bernthsen, A. 192, 37).

(a) Naphthallide v. vol. iii. p. 474.

Di-thio-benzoic Acid C₆H₂.CS.SH. Formed by adding an alcoholic solution of K₅S to C₆H₂.CCl₄ (Engelhardt a. Latschinoff, Z. [2], 4,455; Klinger, B. 15, 862). Heavy, red oil, v. sol. alcohol and ether. Its dilute ethereal solution is crimson. Resinifies when exposed to air. —PbA'₂. Thin orange-red needles (from alcohol or xylene).—HgA'₂. Golden plates (from alcohol).—AgA'. Brown pp., insol. water and benzene. References. — Oxy-THIO-BENZOIO ACID and

AMIDO-THIO-BENZAMIDE.

(a)-THIO-BENZOIC ALDEHYDE CaHs. CHS. Bensylidene sulphide. Formed by passing H.S into an alcoholic solution of benzoic aldehyde (Laurent, A. Ch. [3] 1, 292; Klinger, B. 9, 1895; 15, 863; Böttinger, B. 12, 1056), or of hydrobenzamide (Cahours, C. R. 25, 457). White amorphous powder, softening at 85°, decomposed at a higher temperature. Insol. water and cold alcohol, v. e. sol. benzene and chloroform. Does not combine with KHSO, or HCy. Potash-fusion yields benzyl mercaptan. heating with copper it forms Cus and s-di-phenylethylene. Alcoholic KSH on heating forms Ph.CS.SK and di-benzyl disulphide. Thioglysollic soid forms C.H. CH(S.CH, CO,H), [124°]

(Bongartz, B. 21, 479).

(β)-Thio-benzoic aldehyde (C_cH₁.CHS)_x.

[225°]. Formed from the (a) isomeride by treatment with AcCl, EtI, or a little iodine in benzene (Klinger, B. 10, 1877). Prepared by penzene (Klinger, B. 10, 1877). Prepared by passing H_S into a mixture of benzoic aldehyde and alcoholic HCl (Baumann a. Fromm, B. 22, 2604). Needles. Crystallises from benzene as (C.H.-S), C.H., and gives off its benzene at 130°-140°. V. sol. hot HOAc. m. sol. alcohol. On heating with copper-powder it yields CuS and di-phenyl-ethylene. di-phenyl-ethylene. An oily compound (C,H,S),H,S is formed, together with benzyl disulphide and di-thio-benzoic acid, by the action of alcoholic KSH on benzylidene chloride (Klinger, B. 15, 864). This compound yields benzoic acid on treatment with dilute HNO,

(γ)-Thio-benzoic aldehyde C₆H₅CHS. [167°]. Occurs in the benzene mother-liquor in the preparation of the (B) - isomeride (B. a. F.). Small pointed needles, much more sol. benzene and chloroform than the (β) -modification, sl. sol. alcohol and ether. Its crystals do not contain benzene of crystallisation. By adding iodine to its solution in benzene it is changed to the

(β)- isomeride.

Thio-benzoic orthaldehyde C₆H₃.CH(SII).

Methyl ether C, H, CH(SMe)2. Formed by passing HCl into a mixture of benzoic aldehyde and MeSH (Bongartz, B. 21, 487). Oil. Oxidised by KMO, to C₆H, CH(SO₂CH₈), [163°].

Ethyl ether C₆H₅, CH(SEt), Oil (Bau-

mann, B. 18, 885).

p-Bromophenylether CuH.,CH(SCuH,Br). [80°]. Silky needles (Bau-

mann, B. 18, 885).

Reference .- NITRO-THIO-BENZOIC ALDEHYDE. THIO-BENZOPHENONE C.H. CS.C.H.

Formed by heating CSCl2 (5g.) with benzene (25 g.) and AlCl_a (9 g.) (Bergreen, B. 21, 337). Reddish-brown oil, v. sol. ether, benzene, and hot alcohol. Decomposed by distillation. acts with hydroxylamine, forming Ph2C:NOII and with phenyl-hydrazine, with production of CPh2:N2HPh.

Thio - benzophenone (CSPh₂)_z [146·5°]. Formed from CCl₂Ph₂ and K₂S (Engler, B. 11, 922). Small white needles. Converted by CrO₄ and HOAc into benzophenone. Does not react with hydroxylamine or phenyl-hydrazine.

THIO-BENZOYL-(a)-NAPHTHYLAMINE v.

THIO-SELL PARTY OF CPH. H.S. i.e. THIOBENZPINACONE C. H.S. i.e. CPh. H.S. S. CPh. H. CPh,(SH).CPh,(SH) or CPh,H.S.S.CPh,H. [151°]. Formed from benzophenone by the action of alcoholic ammonium sulphide (Engler, B. 11, 922) or P.S. (Japp a. Roschen, C. J. 49, 479), and, together with thiobenzophenone, by the action of KSH on C_aH_a.CCl_xC_aH_a (Behr, B. 5, 970). Formed also by the action of alcoholic KSH on (C_eH₃) CHCl, and of P₂S₃ on di-phenyl-carbinol. Slender needles (from alcohol), v. sol. CS. In alcoholic solution it is converted by finely-divided copper into tetra-phenyl - ethane CHPh. CHPh.

THIO-BIURET C.H.N.OS. Formed by boiling carbimido-urea ('amidodicyanic acid') with ammonium sulphide (Wunderlich, B. 19, 452). Needles (containing aq). Sol. hot water and alkalis, v. sl. sol. ether. Gives a white pp Vol. IV.

with copper salts. By ammoniacal AgNO, it is converted back into carbimido-urea.

THIO-BUTTRIC ACID C.H.SO i.e. CH₃CH₂CH₂CO.SH. (180°). Formed by distilling butyric acid with P₂S₃ (Ulrich, 4. 109, 280). Liquid with disgusting smell, v. sl. sol. water, v. sol. glochol₂-PbA'₂. Small crystals (from hot water).

(from hot water).

Thio-isobutyric acid. Methyl other
C₃H₁₀SO i.e. Pr.CO.SMe. (c. 142°). V.D. 57°5.

(Obermeyer, B. 20, 2022). Oil.

THIO-ISOBUTYRIC ALDEHYDE PrCHS. (70°-90°). A product of the action of S on isobutyric aldehyde at 180° (Barbaglia, G. 18,

(a)-THIO-CARBAMIC ACID NH..CO.SH. This acid, set free by adding acids to a solution of its ammonium salt, splits up at once into COS and ammonia. The ammonium salt COS and ammonia. The ammonium sair NH_CO.SNH₄ is prepared by passing gaseous COS into alcoholic NII₄ (larthelot, J. 1868, 160) or into NII₄Aq at 0° (Schmidt, B. 10, 191; Kretzschmar, J. pr. [2] 7, 474). It forms colourless crystals, v. c. sol. water, m. sol. alcohol, insol. ether. The dry salt becomes pollow in air, forming ammonium sulphocyanide. The dry salt forms thio-urea when heated in a sealed tube at 135°. Thio-urea is also formed when Pb(OH)2 is added to its cold aqueous solution. HgO forms, in the cold, ammonium cyanate (Fleischer, B. 9, 438). Water at 100° forms NH₄SH and (NH₄)HCO₃. FcCl₃ gives a red liquid, and finally a red pp. (Mulder, **2**. 168, 228).

Methyl ether NIL.CO.SMe. Formed, together with a small quantity of the (B)isomeride, by adding HCl to a solution of potassium sulphocyanide in boiling McOH (Blankenhorn, J. pr. [2] 16, 375). Monoclinic prisms (from ether). Decomposed by alcoholic NH₂ into MeSH and urea. Aniline at 100° forms

into MeSH and urea. Amuno MeSH, s-di-phenyl-urea and NH₃.

NH CO.SEt. [102°] (Pinner, 102°) B. 14, 1083); [108°] (F.). Formed in like manner (B.) and also by passing NH, into Cl.CO.SEt (Salomon, J. pr. [2] 7, 256) and by the action of EtBr on NII, CO.SNH, (Fleischer, B. 9, 991). Plates, v. sol. hot water, alcohol, and ether. Decomposed at 150° into mercaptan and cyanuric acid. P₂O₅ converts it into ethyl sulphocyanide.

Isoamyl ether CO(NH₂).SC₅H₁₁. [107°]. From CO(SC₅H₁₁)Cl and NH₂ (Schöne, J. pr. [2] 32, 247). Glittering plates (from ether). Sol. hot water, but decomposed by boiling water.

Gives amorphous pps., insol. water, alcohol, and ether with AgNO₃, HgCl₂ and PtCl₄.

Reactions.—Alcoholic NH, forms urea and amyl mercaptan.—2. Alcoholic KOH forms K₂CO₃, NH₃ and amyl mercaptan.—3. Heated with aniline it forms NH₃, HSC₃H₁₁, and diphenyl-urca.

(B) Thio-carbamic acid NH2.CS.OH.

Methyl ether NH, CS.OMe. [48°] . Formed by the action of alcoholic NH, on MeO.CS.SMe or on MeO.CS.SEt (Salomon, J. pr. [2] 8, 115).

Ethylether NH, CS.OEt. Xanthogenamids.

[38°]. Formed by the action of NH, on zantho-genic ether EtS.CS.OEt, on MeS.CS.OEt, and on (EtO.CS),S, (Debus, A. 72, 1; 75, 121; 82, 258; Chancel, J. 1851, 513; Salomon a. Maintz, J. pr. [2] 8, 114). Monoclinic prisms, al. sol. water, miscible with alcohol and ether. Decomposed on distillation into mercaptan and eyanic acid. Boiling KOHAq resolves it into syante acid. Boiling Koriaq resolves it into alcohol and potassium sulphocyanide. P.O. forms ethyl sulphocyanide (Correl, J. pr. [2] 10, 34). Nitrous acid passed into water containing xanthogenamide in solution forms crystalline C.H., N.SO. CuSO, followed by HCIAq ppts. C.H., NOSCuCl as a white crystalline powder, nearly insol. water, sol. hot alcohol. Compounds of CuCl with 2, 3, and 4 mols. of xanthogenamide may be obtained. KI added to a boiling alcoholic solution of (C₃H,NOS)₂CuCl forms crystals of (C₃H,NOS)₂CuI and (C₄H,NOS)₂CuI. Compounds (C₃H,NOS)₂3GaSCy and C.H. NOSCuSCy may also be prepared (Debus). Isovaleric aldehyde in presence of HCl and alcohol forms C,H,,CH(NH.CS.OEt),[108°] (Bischoff, B. 7, 1083). B - Iodo propionia acid forms NH, CO.S.CH,CH,CO.H [147-5°], which yields CaA', 3aq, BaA', 2aq, and Ag,A" (Langlet, B, 24, 3849). \$-Iodopropionic acid and Ac,O yield sinapano propionio acid CO S CH2 CH2 [159°], v. sol. hot water, converted by HgO into the mercaptide of β -thiolactic acid.

Isobwyl ether NILCS.OCH,Pr. [36°].
Tables (from alcohol or ether) (Mylius, B. 5, 976; Blankenhorn, J. pr. [2] 16, 380).
Isoamyl ether NILCS.OC,II, Oil (Johnson, C. J. 5, 242).

(Johnson, C. J. 5, 242).

Di'shio-carbamic acid NH...CS.SH. Mol. w.

93. The ammonium salt NH...CS.SNH, is formed by passing NH, (from 150 pts. NH,Cl) into 95 p.c. alcohol (600 pts.) containing CS. (96 pts.) (Mulder a. Bettink, J. pr. 103, 178; cf. Zeiso, A. 48, 95; Debus, A. 73, 26). It is also formed by heating (NH,) CS,. On gradually adding HClAq to a cooled cone, solution of the ammonium salt the free acid separates as colourless needles, v. sol. water, alcohol, and ether; acid in reaction. An alcoholic solution of the acid gradually decomposes into CS, and the NH, salt. An aqueous solution of the acid decomposes on heating into H.S and HCyS. The di-thio-carbamates also split at 100° into H.S. and sulphocyanides. An alcoholic solution of lodine decomposes NH_CS.SNH, forming EtNCS and EiNH, (Hofmann, Z. [2] 5, 671). Ammonic di-thio-carbamate treated with HGl and solution of I gives crystals of the bisulphide (CSNH). Where I was a long to the bisulphide (CSNH). S₂(CS.NH₂)₂ (Klason, J. pr. [2] 36, 62). FeCl, added to a solution of the NH₄ salt gives a black pp. turned white by excess. AgNO, gives a yellow pp., turning black. A solution of aldehyde forms carbothialdine ?IH, CS, SN(C,H,),. Benzoic aldehyde, isovaleric aldehyde, and acrolein form analogous bodies.

Salts.—NH.A'. Deliquescent lemon-yellow prisms. On heating with KOHAq it forms K₂S, KSCy, and NH.—CuA'₂. Yellow powder, insol. water.—PbA'₂. White pp., blackening on boiling with water.—ZnA'₂; white pp.

Ethyl ether NH.CS.SEt. Mol. w. 121.

[42°]. Formed by passing H.S under pressure into ethyl sulphocyanide at 100° (Jeanjean, J. 1866, 501; Salomon a. Conrad, J. pr. [2] 10, 29). Trimetric crystals (from ether), insol. water, v. e. sol. alcohol. Alcoholic NH, or KOHAq in the

cold forms mercaptan and ammonium sulphocyanide.

Isopropyl ether NH. CS.SPr. [97].
Trimetric plates (Gerlich, A. 178, 82).
Acetyl derivative of the ethyl ether
NHAc.CS.SEt. [123]. Formed by heating thio-acetic acid with ethyl sulphocyanide (Chanlaroff, B. 15, 1987). Yellow needles (from alcohol), v. sol. hot water. Decomposed by distilla-tion into thio-acetic acid and ethyl sulphocyanide. Boiling baryta-water forms mercaptan and acetic acid. Hot dilute HClAq forms NH..CS.SEt.

Isothiocarbamic ether v. DI-ETHYL-(a)-THIO-CARBONATE. A mide.

THIO-CARBAMIDE v. THIO-UREA.

THIOCARBAMYL SULPHIDE C,H,N2S, i.e. (NH₂CS)₂S (?) Very unstable oil, got by adding HCl to its ammonium salt. Quickly decomposes into CS₂, sulphur, H₂S, and ammonium sulphocyanide. The ammonium salt C.H.₂(NH₁), N.S.₃ is a product of the action of CS. on alcoholic NH₂ in the cold (Zeise, B. J. 4, 98; Hlasiwetz a. Kachler, A. 166, 137). It forms colourless prisms, v. sol. water, m. sol. alcohol, sl. sol. ether. The moist salt slowly decomposes into H.S and ammonium sulphocyanide. The cupric salt CuC, II, N, S, is canary-yellow.

Thiocarbamyl disulphide C.H.N.S (NH_CS) S₂. Formed by the action of Cl on a solution of the ammonium salt of the preceding body, and on ammonium di-thio-carbamate (Debus, A. 73, 27). Perrly plates, v. sol. hot alcohol, insol. water. Decomposed by boiling water into CS, ammonium sulphocyanide,

THIOCARBIMIDES. Mustard oils. Compounds RN:CS. Essential oil of mustard is allyl thiocarbimide. They are formed by the action of CSCl₂ on primary amines (Rathke, A. 167, 218), and by the action of aqueous HgCl₂ on the dithiocarbamates RNH.CS.SNH₂R obtained by heating primary amines with CS, and alcohol or ether (Hofmann, B. 1, 171; 2, 452; 7, 811; 8, 106; Rudneff, J. R. 10, 188). Methyl sulphocyanide is partially converted into methyl thocarbimide by heating at 180°. Allyl sulphocyanide changes to the mustard oil on boiling. Thiocarbinides are also got by distilling alkyl cyanates with P₂S₃ (Miohael a. Palmer, Am. 6, 258). The thiocarbinides are pungentials. They are reduced by Zn and HClAq to amines and CH₂S, whereas sulphocyanides yield HCy, mercaptans, and other products. Amines convert thiocarbimides into thio-ureas; thus aniline combines with phenyl thiocarbimide, aniline combines with phenyl thiocarbimide, forming s-di-phenyl-thio-urea. Alcoholic potash, or alcohol at 100° forms thio-carbamic ethers NIH.CS.OF& (Hofmann, B. 2, 117; Schiff, B. 9, 1316). Water at 200°, or HClAq at 100°, forms amine, CO₂, and H.S, while with sulphocyanides it yields Et₂S, CO₂, and NH₃. Conc. H₂SO₄ forms amine and COS. HNO, forms amine and CO, whereas with the isomeric sulphocyanides it forms a sulphonic acid. Hydroxylamine unites with thiocarbimides, forming oxy-thio-ureas NIHR.CO.NH.OH. (Tieman, R. oxy-thio-ureas NHR.CO.NH.OH (Tiemann, B. 22, 1939). Chlorine unites with PhN:CS, forming unstable (PhNCS)2Cl2 whence boiling water

forms (PhNCS),0 [118°], crystallising in yellow needles (Helmers, B. 20, 786).

THIOCARBIMIDO-ACETIC ACID C,H,NSO, i.e. CH₄(N:CS).CO₄H. Formed by boiling thichydantoin with HClAq (Volhard, J. pr. [2] 9, 6), and by boiling isoamyl sulphocyano-acetate with and by bolling isosamy supprocyano-acetate with fuming HClAq (Classeon, B. 10, 1952; Heintz, A. 136, 232). Trimetric plates, v. e. sol. hot water. Oxidised by HNO, to H.SO, and oxalic acid. Weak acid.—BaA', aq. Four-sided prisms, sl. sol. cold water. Benzoic aldehyde and NaOHAq (1 mol.) react, forming the compound CHPh:C(CO₂Na).S.CO.NII₂, which crystallises with 1½ aq and is converted by HCl into CO.S NH.CO>C:CHPh [242°] (Andreasch, M. 10, 73).

THIOCARBIMIDO-BENZOIC ACID v. m-AMIDO-BENZOIC ACID.

THIOCARBONIC ACID.

Thiocarbonates v. vol. i. p. 703. The thiocarbonic ethers that have not been treated of in former articles are described below.

Methyl thiocarbonates v, vol. iii. p. 399.

Methyl iso-dithiocarbonate CO(SMe), (169°). Formed by warming methyl sulphocyanide with H₂SO₄ (Schmitt a. Glutz, B. 1. 166).
Ethyl thiocarbonates v. vol. ii. p. 520.
Ethylene thiocarbonates v. vol. ii. p. 493.

di-ethyl di-thio-di-carbonate C.H. (S.CO.Et). Formed by heating C.H. Br. with KS.CO.Et in alcohol (Welde, J. pr. [2] 15, 52). Thick oil, converted by alcoholic potash into C₂H₄(SH)₂ and KO.CO.Et.

Isobutyl di-thio-carbonic acid CH., Pr.O.CS. II. Salts.-NaA'. Formed from C,H,ONa and CS., Yellowish white needles, v. e. sol. water and alcohol.—KA'. Needles (from alcohol), S.G. 12 1:371 (Clarke, B. 11, 1505). Chlorine gas passed into its aqueous solution forms oily (CH₂PrO.CS)₂S₂ (Mylius, B. 5, 976).

Ethyl ether Eth'. (228°).

Isobutyl ether CH.Pr.O.CS.SCH.Pr. (249°). S.G. 12 1009 (Mylius, B. 5, 975).

Isoamyl ether CH₂l'1 (265°-270°) (Mylius).
Isoamyl di-thio-carbonic soid CH, Pr.O.CS.SC, H,...

C.H.,.O.CS.SH. Oil, with unpleasant smell. Salts.-KA'. Formed from fusel oil, KOH, and CS₂ (Balard, A. Ch. [3] 12, 307; Erdmann, J. pr. 31, 4; Desains, A. Ch. [3] 20, 505; Johnson, C. J. 5, 142). Gives a lemon-yellow pp. with CuSO₄.—PbA'₂. Plates. Iodine forms oily

(C,H,10.CS),S,... Di-isoamyl s-di-thio-carbonate CO(SC,H,1),... (281°) (Schmitt a. Glutz).

Cetyl di-thiocarbonate v. vol. i. p. 728. Iso-butyl-tri-thio-carbonic acid C₄H_aS.CS₂H. Formed from C, H, SNa and CS2 (Mylius, B. 6, 816). The Na salt crystallises in yellow needles, v. sol. alcohol and ether.

Isobutyl ether (C.H.S),CS. (287°). Got by heating aqueous K.CS, with isobutyl iodide.

Yellow oil with faint odour.
Di-isoamyl-tri-thiocarbonate Di-isoamyl-tri-thiocarbonate (C,H,S)₂CS. (247°). S.G. 88 (Husemann, A. 126, 297). Oil,

with unpleasant smell.

Di-allyl tri-thio-carbonate (C,H_sS)₂CS. (170°-175°). S.G. 94. Formed from allyl lodide and Na₂CS, in the cold (Husemann, A.

126, 269). Pungent yellow oil, with offensive odour.

THIOCARBONYL - ACETOACETIC ETHER CS:CAc.CO.Et. [156°-162°]. Formed from thio-carbonyl chloride and acctoacetic ether (Bergreen, B. 21, 347). Yellow needles, sl. sol, ether

THIO CARBONYL DI AMIDO DI BENZOIO

ACID v. m-AMIDO-BRYZOIG ACID.
THIOCARBONYL BENZOYL - ACETIC ETHER CS:CBz.CO₂Et. [164°]. Formed from CSCl, and benzoylacetic ether (Bergreen, B. 21, Yellow needles, sol. alcohol-chloroform. THIO CARBONYL CHLORIDE b. Sulpho-

Thio-carbonyl tetrachloride v. Pen-chloro-

chloride of CARBON.

METRYL-MERCAPTAN.

THIO . CARBONYL . ETHYL . o . AMIDO. PHENOL C,H, NEt CS. [112°]. 300°). Formed from ethyl-o-amido-phenol and CSCl₂ (Seidel, J. pr. [2] 42, 449, 457). Insol. water and dilitic NaOHAq, m. sol. cold alcohol. HClAq at 170° forms ethyl-amido phenol, CO,

and H2S. PCl, yields CH CO CCJ. THIO - CARBONYL - METHYL - AMIDO-PHENOL $C_0H_1 < N_0^{MO} > CS$. [128°]. (above 300°). Formed by the action of CSCl, on methylo-amido-phenol (Seidel, J. pr. [2] 42, 452). Needles, insol. water, sl. sol. cold alcohol.

THIO CARBONYL - DI - (β) - NAPHTHYL-THIO - UREA $C_{19}II$, $N < \stackrel{CS}{C(NC_{10}II)} > S$. [152°]. Formed from di-(B) - naphthyl-thio-ures and CSCl₂ in benzene (Freund a. Wolf, B. 25, 1466). Stellate groups of needles, m. sol. hot benzene. Melts at 152' with evolution of gas, forming a solid melting at 224°

THIO-CARBONYL-DI-p-TOLYL-THIO-UREA C,H,N:C \left\(\frac{N(C,H,)}{S}\right\)CS. [109°]. Formed from di-p-tolyl-thio-urea [172°] and CSCl2 in ether (Freund a. Wolf, B. 25, 1465). Yellowish needles, v. sol. hot alcohol and ether. Converted by HgO

into carbonyl-di-tolyl-thio-urea [112°].
THIOCHRONIC ACID C, H, S, O, C_o(OH)(SO_oH)(SO_oH)₀. Formed by adding tetra-chloro-quinone to a cone. solution of K_sSO_o (Hesse, A. 114, 313; Graebe, A. 146, 40). Yellow trimetric prisms, v. sol. hot water, insol. alcohol. Coloured brownish-red by FeCl, Reduces AgNO, Converted into hydroquinone disulphonic acid by heating with water at 135', or by boiling with

Euthiochronic acid C.H.S.O. i.e. Cu(OH)2O2(SO2H)2. Di-oxy-quinone disulphonic acid. Formed by boiling thiochronic acid with KOHAq. Deliquescent yellow heedles, v. sol. water and alcohol. Reduced by tin and HClAq to C_aH_aS₂O₁₀, which yields Na₂A" 2aq and K₂A" 2aq, which are re-oxidised in aqueous solution by air to euthiochronates.—Na, A'aq (dried tion by air to cutinocuronates.—rat, a "aq qureu at 150").—K,A'"2aq. Minute lemon yellow prisms, v. sol. water.—K,HA'"aq. Small orangered four-sided prisms.—Ba,A'"4aq. Ochreyellow pp.—Ag,A'': a morphous pp.

(a) THIO - CINNAMIC ACID C,H,80 i.e.
C,H,CH:CH.CO.SH. Formed from cinnamoyl

chloride and Pb(SEt), the resulting oily ether

being boiled with alcoholic KSH (Engelhardt, Z.

[2] 4, 359).—KA'. Crystallins. (β)-Thio-cinnamic acid. Amide C₀H,S.NH₂.
 [112°]. Formed by passing H₂S into a solution

of cinnamic nitrile in alcoholic NH₄ (Rossum, Z. 1866, 362; Krüss, B. 17, 1768). Cplden plates.

(a) THIO-CINNAMIC ALDERYDE (C, H, S), 167°]. Formed by passing H,S into oil of

cinnamon dissolved in alcoholic HCl (Baumann a Fromm, B. 24, 1452). Crystalline, v. e. sol. a Fromm, B. 24, 1452). benzene, sl. sol. alcohol.

(β)-Thio-cinnamic aldehyde (C,H,S), [213]. Formed at the same time as the (a)-isomeride. Prisms, v. sl. sol. cold benzene and alcohol.

Thio - cinnamic orthaldehyde. Phenyl ether C. H.CH:CH.CH(SPh). [81°]. Formed by passing dry HCl into a mixture of cinnamic aldehyde and phenyl mercaptan (Baumann, B. 18, 885). Needles (from ligroin).

p-Bromo-phenyl ether CHPh:CH.CH(S.C₈H,Br)₂. [107°]. Needles (from sleehel or ether)

alcohol or ether).

Glycollyl ether CHPh:CH.CH(S.CH., CO, H), [143°]. Formed from cinnamic aldehyde and thioglycollic acid (Bongartz, B. 21, 481). Plates (from water). Zinc-dust in alkaline solution converts it into CHPh:CH.CH, S.CH, CO.H [77°], crystallising from dilute alcohol in plates.

TRI.THIO-CITRIC ETHER C,H,O(CO.SEt)3. Formed from tri-phenyl citrate and NaSEt in presence of ether (Seiffert, J. pr. [2] 31, 470). Oil, smelling like mercaptan.

THIO-COUMARIN C. II.

Formed by heating equal parts of coumarin and P.S. at 120°; the yield is 50 p.c. Also by heating o-coumaric acid with P.S. Long yellow needles, v. sol. alcohol, ether, and benzene; insol. water. Sublimable. By heating with aqueous alcoholic KOH it is reconverted into coumarin. Unlike coumarin it readily reacts with hydroxylamine and with phenyl-hydrazine (Tiemann, B. 19, 1661).

THIO-CRESOL v. TOLYL MERCAPTAN.
THIO-CROCONIC ACID C.H.O.S, probably

SC < C(OH), CO < Formed by saturating a warmsolution of potassium croconate treated with 2 mols. of HCl, with II_sS.—BaA" 2aq: brownish-yellow amorphous pp., v. sol. dilute HCl, which after some time changes to reddish - brown crystals with violet reflex, incol. dilute HCl (Nietzki a. Benkiser, B. 19, 299).

THIO-CUMINIC ACID. Amide C₁₀H₁₆NS 6.6. C₃H₁, C₅H₄, CS.NH₂. Formed by passing H₂S and the latest control of the contro

into a solution of cuminic witrile in alcoholic NH, (Czumpelik, B. 2, 185). Needles, v. sol. hot alcohol. Converted in alcoholic solution by iodine into C₂₂H₂₂N₂S [45°] crystallising in prisms (Wanstrat, B. 6, 322).

THIODICYANDIAMIDINE v. GUANYL THIO-

THIOCYANIC ACID v. SULPHOCYANIC ACID. THIOCYANO- v. SULPHOCYANO-.

DI-THIO CYANURIC ACID Cy3(SH)2(OH) aq. Preparation .- An alcoholic solution of KCyS is mixed with the calculated quantity of HCl, filtered from KCl, and evaporated at 40°. The residue is extracted with strong NH,Aq and

BaCl, is added to the filtrate. The barium salt

gradually separates in globular crystals (Klason, J. pr. [2] 33, 121). Yield, very small.

Properties.—White scales (from hot water).
Sol. NaOHAq. A solution of the potassium salt gives pps. with AgNO, HgCl, and Pb(OAc),

Reactions .- 1. Conc. HCl at 130° gives cyanuric acid and H₂S.—2. Cold KMnO₄Aq and hot HNO₂Aq form cyanuric acid.—3. *Iodine* forms

(HOC₃), S, as a white crystalline powder.

Salts.—KH₂A'''. Silvery mass of microscopic prisms.—BaHA'''2aq.

Tri-thio-cyanuric acid Cy₃(SH)₃. Formed by warming powdered C,N,Cl₃ (1 mol.) with concurrence WEH (4 mol.) aqueous KSH (4 mols.) (\hat{H} ofmann, \hat{B} . 18, 2196; Klason, J. pr. [2] 33, 116). Minute prisms, when ppd, from dilute solutions; amorphous, from conc. solutions. Nearly insol. hot water, alcohol and ether. Not decomposed at 200°. FeCl, gives no colour in solutions of the acid, but in conc. solutions of the K salt it gives a white pp. and a yellow solution.

Reactions. -1. HClAq at 130° gives cyanuric acid and H.S. -2. Alkaline KMnO₄ at 20° gives cyanuric acid. -3. Warm IINO₄ forms cyanuric acid. -4. At 360° it gives off CS₂ and some

HUyS and leaves melem $C_6H_6N_{10}$.

Salts.— $K_3A'''3aq$.— K_3H_A''' , 6aq.—Na H_2A''' .

Crystals, v. sol. wator.—BaHA'''3aq. Yellow crystals, ppd. by addition of BaCl2 and NH_Aq.—
BaH_A''',2aq. Prisms,m. sol. water.—SrHA'''5aq.

aH₄A"'₂2aq. Prisins, in. sol. water. -CaHA"'5aq. Prisins, in. sol. water. Methyl ether Mc₄A"'. [189°]. heating methyl sulphocyanide with a few drops of HClAq at 100° (flofmann, B. 13, 1351; 18, 2197, 2755, 2774; 19, 2065). Hexagonal crystals. An alcoholic solution of ethylamine at 100° forms Cy₈(NHEt)(SMe)₂ [114⁹] while at 140⁹ it yields Cy₄(NHEt)₂SMe [84⁹]. Alcoholic NH, forms, in like manner, Cy₈(NH.)(SMe), and Cy₈(NH.)₂SMe. Ethyl ether Ft, A.". [27⁹]. (350⁹). Formed from Cy₂Cl₃ and NaSEt. Colourless tablets (from HOAc) appropriate healthclick NH = 1500⁶ in 1900.

HOAc) converted by alcoholic NH, at 180° into Cy₃(NH₂)(SEt)₂ [112°] (crystallising in trimetric forms; a.b.c = 669:1:301, v. sol. ether), accompanied by Cy₃(NH₂)₂(SEt)₂ [165°], which is insol.

cther (Klason, J. pr. [2] 33, 208).

Anylether (C,H₁₁)₃A'''. Oil. Yields
Cy₂(NH₂)(SC₃H₁₁)₂ [82°] and Cy₃(NH₂)₂SC₃H₁₁ [1780].

Phenylether Ph3A". [97°]. Prisms (from HOAc).

p-Tolyl ether (C,H,),A". [114°].
THIO-DI-ETHYL-ANILINE v. TETRA-ETHYL-DI-AMIDO-DI-PHENYL SULPHIDE.

C.H. CH:CEt THIO-ETHYL-COUMARIN

[94°]. Formed by heating (a)-ethyl-coumarin with P.S. at 120° (Aldringen, B. 24, 8462). Yellowish-red plates, sol. alcohol. May be sublimed.

THIO-ETHYLENE GLYCOL v. ETHYLENE

THIO FORMIC ACID H.CO.SH (?) [120°]. Formed by the action of H.S on lead formate (Wöhler, A. 91, 125; Limpricht, A. 97, 361), but not from P.S. and formic acid (Hurst, A. 126, 68). E.mall transparent crystals (from alcohol) with alliaceous odour, insol. water. May be sublimed. According to Nicol (Pr. E. 10, 425) a solution of thioformic soid, got from

PbA', and H2S, rapidly decomposes, yielding formic acid.

Salts .- H.CC.SK. Formed from CHCl, and alcoholic K2S (Nicol, T. E. 29, 531). Needles. sol. water and alcohol, nearly insol. dilute alco-AgNO, added to its aqueous solution forms a white pp., turning black on standing. HNO, yields S and formic acid. HgO also gives formic

•acid.—(H.CO.S).Pb.

Anilide H.CS.NHPh. Thioformanilide. [137°]. Formed from dry phenyl carbamine and H_2S (Hofmann, B. 10, 1095, 1238). Formed also by passing dry H.S over di-phenyl-formamidine NPh:CH.NHPh at 150° (Bernthsen, A. 192, 35). Prepared by warming formamidine (5 pts.) with P.S. (3 pts.), the yield being 60 p.c. of the theoretical (Hofmann, B. 11, 338). Thin plates (from water), partially decomposed on distilla-tion into H.S and phenyl carbamine. Its solution tastes bitter. Decomposed by hot KOHAq into aniline, H₂S, and formic acid. Heated in a sealed tube at 180° it yields C₁H₁₂N_{.S} [140'] v. sol. alcohol (Nicol, B. 15, 211). NaOEt and EtBr yield oily CH(SEt):NPh (c. 235°) (Wallach a.

Wüsten, B. 16, 145).

o-Toluide H.CS.NHC,H, [96°]. Got by heating formyl-toluide with P₂S₃ (Senier, C. J. 47, 762).

p-Toluide. Yellow needles.

Xylide HCS.NHC, H, Me. [105°]. Small needles (from alcohol) (Gudeman, B. 21, 2549).
Thio-orthoformic acid. Ethyl ether

CH(SEt), Formed by boiling chloroform with aqueous NaSEt (Gabriel, B. 10, 186; Claesson, J. pr. [2] 15, 174). Oif, with nasty smell, partly decomposed on boiling. Oxidised by HNO₃ to ethane sulphonic acid. Fuming HClAq yields

formic acid and mercaptan

Benzyl ether CH(SC,H,), [98°]. Formed from NaSC,H, and chloroform (Dennstedt, B.

11, 2265). White crystals.

Phenyl ether CH(SPh)₃. [39·5°]. Trimetric tables. Oxidised by potassium permanganate to PhS.CH(SO₂Ph)₂ [176°] (Laves, B. 23,

1416; 25, 347).
Reference.—Chloroformic acid.

THIO-FORMIC ALDEHYDES

Thio-formic paraldehyde (CH₂S)₃. Methylene sulphide. Mol. w. 138. [216°]. V.D. 5°08 (obs.).

Formation.—1. By heating Na S with methylene iodide (Husemann, A. 126, 293). - 2. By reducing CS₂ with Zn and HClAq (Girard, A. 100, **306**).—8. By the action of H₂S on formic aldehyde or trioxymethylene.

Preparation.—By saturating a mixture of formic aldehyde (2 vols.) and conc. HClAq (4 vols.) with H₂S (Baumann, B. 23, 67).

Properties .- Prisms, smelling like onions. Insol. cold water, sl. sol. alcohol and ether, m. Sol. accord water, Sl. sol. accord and ether, In. sol. benzene and CS. May be sublimed. Oxidised by KMnO, to a trisulphone and also C.H.S.O. crystallising in colourless needles.—Forms: C.H.S.2ARNO. C.H.S.ARNO. ARNO. ARRO. ARRO.

Thio-formic orthaldehyde. Ethyl ether CH₃(SEt)₂. (184°) (C.); acetic, benzoic, cinnamic, o-oxy-benzoic, and o₂ (180°) (F.). S.G. ¹² ·987. Formed from CH₂, m., and p-nitro-benzoic aldehydes melt at 108°, and NaSEt (Claesson, J. pr. [2] 16, 176). Liquid 124°, 146°, 148°, 123°, 130°, and 162° respec-(184°) (C.);

with unpleasant smell. Oxidised by HNO, to ethane sulphonic acid. KMnO, and H₂SO₄ yield CH₂(SO₂O₂H₃)₂ (Fromm, A. 253, 155). Thio-formic metaldehyde (CH₂S)₃. [176°]. Formed, as a white amorphous substance, on

warming an aqueous or alcoholic solution of hexamethyle e-amino saturated with H₂S (Wohl, B. 19, 2344). Insol. most solvents. Decomposed when heated above its melting-point

Di-thio-formic paraldehyde (C₃H₃S₂O), aq. Dithioglyceric aldehyde. [82°]. (180°-185°). Formed by passing H.S into a solution obtained by electrolysis of dilute glycerin (Renard, A. Ch. [5] 17, 307). Amorphous waxy mass, sol. warm water, insol. alcohol and other

(a)-THIO-FURFURALDEHYDE [128]. Formed, together with the (β)-isomeride, by passing H.S into a solution of furfuraldehyde (10 g.) in alcohol (100 c.c.) and HClAq (20 c.c.) at -5° (Baumann a. Fromm, B. 24, 3593). Crystals, v. e. sol. alcohol and chloroform, insol. water.

(β)-Thio-farfuraldehyde (C,H,SO), [229°]. Needles, v. sl. sol. alcohol, v. sol. chloroform.

Thio-furfuraldehyde (C.II.SO), [n = 20 to 24]. Mol. w. (by Raoult's method) 2182. Formed by mixing an alcoholic solution of furfuraldehyde with alcoholic ammonium sulphide (Cahours, A. 69,85; B.a.F.). White crystalline powder, softens at 80° and is melted at 91°. Thiofurfuraldehyde is decomposed by warm aniline, yielding furfuraldehyde and H.S (Schiff, B. 19, 2153). THIO-GLYCERIN v. GLYCERIN.

THIO-GLYCOL v. ETHYLENE MERCAPTAR. THIO-GLYCOLLIC ACID CH_(SH).CO2H.

Sulphydro-acetic acid.

Formation.—1. By reducing the compound CISO...CHCl.COCl with tin and HClAq (Siemens, B. 6, 659).—2. By adding CH.Cl.CO.H (1 mol.) to cone. KSHAq (2 mols.) (Claesson, A. 187, 113).—3. By the action of H.S on glyoxylic acid in presence of Ag₂O (Böttinger, A. 198, 215).—4. By boiling thiohydanton with barytawater (Andreasch, B. 12, 1385).—5. Together with HSCy, by the decomposition of rhodanic acid C₂H₂NS₂O with baryta-water (Ginsberg a. Bondzynski, B. 19, 113).

Properties .- Oil, miscible with water, alcohol, and other. Decomposes when quickly heated. Very dilute FeCl₃ gives a fugitive indigo-blue colour, changed by a few drops of NH₃Aq to dark red and then to violet. Excess of FeCl, oxidises it to di-sulphido-di-acetic acid S₂(CH_xCO₂H)₂, which is also readily formed by atmospheric oxidation of the alkaline solution. A solution of the K salt added to CuSO, gives a bluish-black pp. reduced by further addition of the K salt to the white cuprous salt Cu2(S.CH2.CO2H)2. HCl passed through a mixture of thioglycollic acid and acetoacetic ether gives rise to crystalline CO_EL.CH_CMe(S.CII_CO_H)_ [96°] (Bongartz, B. 21, 485). Acetyl-propionic acid forms, in like manner, CO_H.CH_2.CH_2.CMe(S.CM_2.CO_H)_a 1514]. Aldehydes react, forming the compound CliH(S.CH_xCO_xH)_x, compounds which are produced either on standing, on warming, or on treatment with ZnCl_xor dry HCl (Bongartz, B.19, 1981; 21, 479). Such compounds obtained by using acetic, benzoic, cinnamic, o-oxy-benzoic, and o-,

tively. Thioglycollic acid reacts with ketones in presence of ZnCl, or HCl, forming acids CRR'(S.CH, CO, H)2: such compounds obtained from acetone, acetophenone, and benzophenone

from hectone, acctophenone, and benzophenone melt at 135°, 139°, and 164° respectively.

Salts.—KHA"aq (from water).—KHA"
(from alcohol). Decomposes KCO₃, forming H₄(SK).CO₃K.—BaA" 34q; crystalline pp.—BaH₂A"₂; gummy.—CdA".—Hg(SCH₂CO₃H).

Reedles or flat prisms, v. sol. hot water and alcohol.—H₂C(S.CH₂CO₂),BaH₂. Minute crystals.—Hg₃M₂C(O₄),AlH₃.—Hg₃Mh₄A"₂.—HgA"₂.—HgA"₃.—Bi(HA")₃. [c. 33°].

Yellow pp.—Cu₃H₂A''₂. White pp.—Cu₃BaA''₂.—Ag₂A''.—Ag₂(NH₄)A''(NO₃).—Ag₂HgA''₂.

Ethyl ether EtA'. Formed by boiling

Ethyl ether EtA'. Formed by boiling thioglycollic acid with alcohol and a little thioglycollic acid with alcohol and a little H₂SO₄ (Claesson, A. 187, 116). Oil with nasty smell. Slowly decomposed by boiling into H₂S and S(CH₂CO₂Et)₂. Alcoholic HgCl₂ ppts. ClHg.S.CH₂CO₂Et, converted by excess of the ether into Hg(S.CE₂CO₂Et)₂ (Wislicenus, A.

146, 145).

Ethyl derivative CH. (SEt). CO.H. Formed by mixing CH. Cl. CO.Et with NaSEt and alcohol (Claesson, B. 8, 120). Liquid, v. sol. alcohol and ether, m. sol. water. Decomposed by heat, but may be distilled with steam. -by heat, but may be distilled with steam. KA'.—BaA'.2—CaA'.2—MgA'.2 aq. —ZnA'.2 aq. —CdA', aq. [85°].—CoA'.2 aq. [90°].—NiA'.2 aq. —CuA'.2 aq. —AgA'aq. Crystalline pp. Ethyl ether of the ethyl derivative CH_(SEt).CO.Et. (188°). S.G. 2 1-0169. Oil. Converted by Etl at 120° into crystalline CH (SET).

CH_(SEt_I).CO_Et.

Ethyl ether of the isoamyl derivative CH₂(SC₅H₁₁).CO₂Et. (230°). S.G. \$ 9797. Oil.

Phenyl derivative v. PHENYL-THIO-GLY-

COLLIC ACID.

Benzyl derivative CH_Ph.S.CH_CO_H. [59°]. Formed from CH_Cl.CO_H and benzyl mercaptan (Gabriel, B. 12, 1641). Flat tables. Yields Eth' (275°-290°) and the amide CH₂Ph.S.CH₄.CONH₄ [97°] crystallising in flat plates.

Phenyl-phenyl derivative

C.H.Ph.S.CH. CO.H. [170°]. Crystals.

Amide CH.(SH).CO.NH... A product of the passage of H.S through an alcoholic solution of chloro-acetamide containing a little NH₃ (Schulze, Z. 1865, 73). Groups of small prisms.

Ethyl derivative of the amide
CH₁(SEt).CONH₂ (4⁴). Formed from

CH₄(SEt).CONH₂. [44°]. Formed from CH₄(SEt).CO,Et and ammonia. Thin prisms. Reference.—NITROSO-THIO-GLYCOLLIC ACID.

THIO-GLYCOLLICORTHALDEHYDE. Ethul derivative of the ether CH_(SEO.CH(OEt), (169°). Formed from CH_Cl.CH(OEt), and NaSEt (Autenrieth, B. 24, 162). Volatile in steam.

Phenyl derivative of the ethyl ether CH₂(SPh).CH(OEt)₂. (273°). Got in like manner.

THIO-HYDANTOIC ACID C.H. N.SO. i.e. NH, CS.NH.CH, CO, H or NH. C(NH).S.CH. CO.H. Formed by heating sodium chloro-acetate in aqueous solution with thio-urea (Maly, A. 189, 380). Crystalline powder, sl. sol. water, v. sol. acids and alkalis. Decomposed by heat. Converted into thio-

hydantoin by warming with Na.CO.Ac or

HClaq. THIOHYDANTOIN C.H.N.BO i.e.

CS < NH.CH₂ or C < NH.CH₂.

Formation .- 1. By heating this-ures with chloro-acetic acid or chloro-acetamide (Volhard, A. 166, 383; Mulder, B. 8, 1264; Maly, A. 168, A. 100, 505; Mutters B. 0, 1204; Mary, A. 105, 133; B. 10, 1853; Claesson, B. 10, 1352).—2. By heating thioglycollic acid (2 mols.) with cyanamide (1 mol.) in aqueous solution (Andreasch, B. 13, 1421; M. 1, 442).

Preparation .- Thio-urea (50 g.) dissolved in water (500 c.c.) is mixed with chloro-acetic acid (62 g.) in water (50 c.c.), heated to 90°, cooled, and mixed with the calculated quantity of NaOH

(Andreasch, M. 8, 414).

Properties .- Long needles (from hot water). insol. alcohol and ether. Decomposes about 200°. Since it cannot be desulphurised by HgO, Liebermann (A. 207, 132) suggests that it does

not contain the group CS.

Reactions.—1. Chlorine passed into its cooled reactions.—I. Chaorine passed into its cooled solution in HClAq forms thio-oxy-hydantoin (Kramps, B. 13, 788).—2. Br forms di-bromothio-hydantoin.—3. KClO₃ and HCl yield C₃H₃KN₂SO₃, crystallising in monoclinic tables, S₁. 17 at 22°; 23°3 at 100°, converted by nitrous acid into SO₃H.CH₂.CO₂H, and by baryta-water into sulpho-acetic acid and urea (Andreasch, B. 13, 1423; M. 4, 131). -- 4. Baryta-water forms thioglycollic acid and dicyandiamide. - 5. Boiling HClAq forms thiocarbimido-acetic acid.

Salts.—Ag.C.H.N.SO.—B'.H.SO. Plate -B'HNO. B'HCl.—B'H.C.O. aq. Prisins.-B'₂H₂PtCl₆. -B'C₆H₂N₃O₅. Minute yellow needles.

References. -Di-Bromo- and Nitroso-thio-

HYDANTOÏN.

DI-THIO-HYDROQUINONE CaH4(SH)2. [98°]. Formed by reducing benzene p-disulphonic chloride with tin and HClAq (Körner a. Mon-Formed also from G. 6, 142). selise, (C, H, (NH2))2S2 by diazotisation, treatment with potassium xanthate, and saponification of the product with alcoholic potash (Leuckart, J. pr. [2] 41, 205). Six-sided plates, slowly oxidised by

THIO-ISATYDE v. ISATYDE.

THIO-LACTIC ACID CH,.CH(SH).CO,H.

a-Sulphydro-propionic acid.

Formation. -1. From a-chloro-propionic acid and KHS (Schacht, A. 129, 1; Lovén, J. pr. [2] 29, 368). -2. By the action of H2S on silver achloro-propionate or silver pyruvate (Böttinger, A. 188, 320; B. 9, 404, 804, 1061; 11, 1561; 18,

486).

Preparation.—By saturating a solution of adding conc. HClAq pyruvic acid with H,S, and adding conc. HClAq

and zinc (Lovén).

Properties. —Syrup, miscible with water, alcohol, and ether. May be distilled in vacuo. Its odour is unpleasant. FeCl, gives a transient indigo colour, and then oxidises it to sulphido-dipropionic acid. CuSO, gives a violet solution; a smaller quantity of CuSO, ppts, the cuprous salt. Cobalt acetate and air gives a brown colour. '

Salts.—BaA', (at 130°). Gummy mass.— Hg(S.CHMe.CO,H), — Hg(S.CHMe.CO,K), zaq. Hg(S.CHMe.CO),Ba 2]aq. — AgS.CHMe.CO,H.

-Bi(S.CHMe.CO.H). - Pt(S.CHMe.CO.H). CuS.CHMe.CO.H. Yellow pp. -PbC.H.O.S.

Ethyl ether Eth'. Oil. Yields
CuS.CHMe.CO.Et as a yellowish powder.

THIO-DILACTYLIC ACID v. SULPHIDO-DI-

PROPIONIC ACID.

THIO-MALIC ACID C.H. SO. Formed from brome-succinic acid and aqueous KSH at 110³ (Carius, A. 129, 6). Deliquescent mass, oxidised. by dilute HNO, to sulpho-succinic acid.—BaA".
—Ag_A". Bulky pp., readily blackening.

THIO-MESITOL v. Таг-метиуь-рнемуь мег-

CAPTAN. THIO-DI-METHYL-ANILINE METHYL-DI-AMIDO-DI-PHENYL SULPHIDE.

THIO-METHYL-COUMARILIC ETHER C₁₂H₁₂SO₂ i.e. C₆H₄ < CMe SC.CO.SEt.

Formed from methyl-coumarilic ether and P.S. (Hantzsch, B. 19, 2400). Yellow needles (from alcohol), v. sol. ether.

THIO-(a)-METHYL-COUMARIN C, II, SO i.e. C.H. CH; CMe. [122°]. Formed by heating (a)-methyl-coumarin with P2S3 at 120° (Aldringen, B. 24, 3460). Yellow needles, insol. water, v. sol. alcohol. Converted by alcoholic potash into (a)-methyl-coumarin.

THÍO-METHYL-DI-PHENYL-AMINE v. METHYL-IMIDO-DI-PHENYL SULPHIDE.

THIO-METHYL-URACIL C₅H₆N₂SO CS NH.CMe CH (?). S. .054 at 21°. Formed by the action of alcoholic potash on the needles which separate after some days from a solution of thio-urea (1 mol.) and acetoacetic ether (1 mol.) in alcohol to which a little HCl has been added (Nencki a. Sieber, J. pr. [2] 25, 72; List, A. 236, 1; Behrend, B. 19, 219). Plates, v. sl. sol. ether. Decomposed at 280°.

Reactions.-1. The K salt reacts with EtI Reactions.—1. The K salt reacts with EH forming C,H,N,SOMe [220°], which yields C,H,A,gN,SO.—2. Chloro-acetic ether forms C,H,N,SO(CH,CO,Et) [143°], which yields C,H,N,SO(CH,CO,Et) [143°], which yields C,H,N,SO(CH,CO,ET) [140°].—2. Br forms methyl-uracil, and finally di-oxy-methyl-uracil. Cl acts in like manner, forming C_H_cCl_2N_2O_3. -3. On warming with lead hydrate in strongly alkaline solution it is converted into methyl-uracil. Account Hollag at 150°, cone. NH₂Aq at 150°, and Account Hollag at 150°, and Account Hollagan Hollag

- (C₃H₃N₂SO)₂H₃ - C₃H₄N₂N₃SO - C₄H₄Cl₃N₂SO - C₄H₄N₂N₃SO 2aq - C₅H₄N₂KSO 3aq - C₅H₄N₂KSO 3aq - THIONAMIC ACID. H. Rose (I'. 33, 235;

42, 415) found that SO2 and NH, combined in equal volumes, when dry NH, was mixed with excess of dry SO, to form a yellowish white solid, which quickly decomposed in solution, or moist air, giving (NH₄)₂SO₄ and ammonium salts of other sulphur oxyacids. Rose concluded that the substance was SO₂NH₃ from the fact that it was formed by combining equal volumes of the two gases; if this empirical formula is accepted the compound may be 90, NH, H or SO.OH.NH, When dry SO2 was mixed with excess of dry When dry SO₂ was mixed with eacens of all NH₂, Rose found that 1 vol. SO₂ combined with 2 vols. NH₂; the product—an amorphous, white solid—may be SO₂.NH₂.NH₄ or SO.ONH₄.NH₂.

M. M. P. M.

THIONAMIDE. By passing NH, into cooled S.Cl., Schiff (A. 102, 111) obtained a white solid which was decomposed by warm water to (NH.), SO, Aq. The solid contained NH.(Cl.; Schiff regarded it as a mixture of this salt with SO(NH.).; he did not attempt to separate the supposed thionamide from NH.Cl.

M. M. P. M. (a)-THIO-NAPHTHOIC ACID.

Amide CuH, CS.NII. [126°]. Formed from (a)-naphthoic nitrile and alcoholic ammonium sulphide at 30°-353 (Hofmann, B. 1, 40; Bamberger, B. 21, 54). Crystals, v. sol. alcohol.

Tetrahydride of the amide

CH_CH_>C₀H_xCS.NH. Formed by digesting a solution of tetrahydride of (a)-naphthonitrile in alcoholic ammonia saturated with H₂S for some days at 30°-40° (Bamberger a. Bordt, B. 22. 629). Dark-yellow oil.

(β)-Thio-narhthoic acid. Amide C₁₀H_{1.}CSNH_{2.} ['49°]. Formed from (\$\beta\$)-naph-thonitrile and ammonium sulphide at 35°-40° (Bamberger a. Bockmann, B. 20, 1115). Noedles, v. sol. alcohol. Dissolves in hot water, being slowly converted into the nitrile.

THIO-NAPHTHOL v. NAPHTHYL MERCAPTAN. THIO-DI-NAPHTHYL-AMINE v. IMIDO-DI-

NAPHTHYL SULPHIDE. THIONATES. Salts of the tilionic acids (q. v., p. 698). Four series of thionates are known; a fifth probably exists: M2820 = dithionates; M.S.O. - trithionates; M.S.O. - tetrathionates; M.S.O. pentathionates; and probably M.S.O. hexathionates. The thionates are formed by the action of alkalis on the liquid obtained by passing H.S into saturated SO, Aq; also by the oxidation of sulphites, thiosulphates, and mixtures of these, and in other reactions (cf. Thionic acids, p. 698). For general qualitative reactions of thionates and thiosulphates v. Debus (C. J. 53, 298).

DITHIONATES, M.S.O., MuS.O., and Mus.(S.O.), (Hyposulphates.) The alkali salts are formed by the interaction of a dilute solution of I in KIAq and dilute NaHSO, Aq (Spring a. Bourgeois, Bl. [2] 46, 151; Sokoloff a. Mattscheffski, B. 14, 2058); also by the reaction of KMnO, Aq on thiosulphates in acetic acid solution, or on sulphites or trithionates (Hönig a. Zatzek, M. 4, 738; Fordos a. Gélis, J. Ph. [3] 36, 113). The Ba salt is formed by passing SO₂ into water holding MnO₂ in suspension, filtering, and adding BaOAq (for more details v. DITHIONIC ACID, p. 698); most of the other dithionates are obtained by the interaction of BaS,O,Aq and sulphates; several have been prepared by digesting H.S.O.Aq with metallic hydroxides. The difficulties are sol. water; the salts of the alkali and alkaline earth metals are not readily decomposed either in solution or as solids; solutions of most of the other salts are decomposed by heat, giving off SO₂ (v. Klüss, A. 246, 179, 284; Geuther, A. 226, 232).

Dithionates give off SO, when heated to redness, leaving normal sulphates; thus M.S.O. = SO₂ + M₂SO₄; this reaction is characteristic; so also is the reaction of H.SO.Aq or HClAq with boiling solutions of dithionates, whereby H,SO,Aq is formed and SO, is given off, without separation of S.

Ammonium dithionate (NH_a)₂S₂O₆. Obtained by decomposing the Ba salt in solution by (NH_d)_SO₄Aq, filtering and crystallising. S.G. 1.704 (Topsoë, C. C. 4, 76). Klüss (A. 246, 179, 284) gives formula 2Am₂S₂O₆, aq, and says the salt crystallises in monoclinic needles. Very sol. water; insol. alcohol. Aquedus solution may be boiled without change. Forms double salts with AmCl (Fock a. Klüss, B. 24, 3017); also with the dithionates of Al, Cd, Co, Cu, Fe,

Mn, Ni, and Zn (K., l.c.).

Barium dithionate BåS₂O₈, 2aq. Formed by passing SO₂ into water at c₄0° holding coarselypassing SO₂ into water at the order of the mode, is dissolved (MnO₂ in suspension, till the MnO₂ is dissolved (MnO₂ + SO₂ + Aq = MnSO₂Aq; and also MnO₂ + 2SO₂ + Aq = MnS₂O₄Aq, filtering if necessary, adding BaOAq to alkaline reaction (MnS₂O₄Aq + BaO₂H₂Aq = BaS₂O₄Aq + MnO₂H₂), [Min2.04.4] + Ba0.H.2.41 = Da5.3.0.4.4 + Min2.12.1, filtering from MnO.H., evaporating, and recrystallising from water (cf. Stas, Chem. Proport. 117). White prisms; S. 24.75 at 18°, 90.9 at 100°, 100°6 at 102° = b.p. of saturated solution; insolalcohol. The crystals effloresce in air, losing 2H₂O; a hydrate with 4H₂O is obtained by slow evaporation (v. Heeren, P. 7, 55; Gay-Lussac, A. Ch. [2] 10, 312; Baker, C. N. 36, 203; cf. Spring a. Bourgeois, Bl. [2] 46, 151. For crys-Spring a. Boürgeois, Bl. [2] 46, 151. For crystalline form v. Senarmont, J. 1857. 142; Rammelsberg, P. 58, 295; von Lang, W. A. B. 45 [2] 27). Schiff (A. 105, 239) described double salts with MgS.O₆ and Na.S.₂O₆ (cf. Kraut, A. 118, 96); Bodländer (Chem. Zeit. 14, 1140) described a double salt with Rb.S.Q₆; and Klüss (4. 246, 179, 284) double salts with Ag.S.O₆ and Tl2S2O6.

Many of the other dithionates are prepared

from the Ba salt.

Potassium dithionate K.S.O. Prepared from a solution of the Ba salt by adding an equivalent quantity of K.SO. in solution, warming, filtering, and evaporating; also by boiling ing, filtering, and evaporating; also by boiling K_xSO_xAq with MnO_x filtering, and separating from K_xSO_x by fractional crystallisation (K_xSO_x) is much less sol. water than K_xS_xO_x). White, hexagonal crystals; unchanged in air; decrepitates when heated and then gives off SO_x and leaves K_xSO_x; S.G. 2.277 (Topsoë, Bl. [2] 19, 246). The crystals rotate the plane of polarisation of light an augmons solution is entically tion of light; an aqueous solution is optically

tion of light; an aqueous solution is optically inactive (Pape, P. 139, 221). S. c. 6 at ordinary temperature, c. 66 at 100°; insol. alcohol (Heeren, P. 7, 55).

Solium dithionate Na, S.O., 2aq. Prepared similarly to the K salt. Also formed, according to Bunte (B. 7, 646), by heating Na.Et.S.O. for some time at 100° (Et.S. distils off). Large, lustrous, rhombic prisms; unchanged in air, B.G. 2:175 at 11° (Baker, C. N. 36, 203). S. 47·6 at 16°; 90 9 at 100°; insol. alcohol. Solution is slowly reduced by sodium-amalgam to Na.SO.AQ (Spring, B. 7, 1161). Kraut (A. 117, 97) described a hydrate with 6H.O.

Dithionates of the following metals have

Dithionates of the following metals have Dithionates of the following metals have also been described (the figures indicate the references): Al (1) (3); Be (3); Bi (3); Cd (1) (2) (4); Ca (1) (4) (5); Cr (3); Co (1) (2) (3) (4); Cu (3); Fe (1) (3) (4); Fb (1) (4) (5); Li (2) (4); Mg (1) (4) (5); Mn (4); Hg (1) (2) (3); Ni (2) (4) (5); Rb (6); Ag (1) (2) (4) (5); Sr (2) (4); Tl (3); Sn (8); U (3); Zn (1) (2) (4).

TRITHIONATES M¹₂S₂O₆ and M¹¹S₂O₆. The

TRITHIONATES M'-S,O, and M'-S,O. The alkali salts are formed by digesting cono.

MHSO,Aq with S at 50°-60° (6MHSO,Aq+2S-2M,S,O,Aq+M,S,O,Aq+3H,O)(Pelouze,A.Ch.

[3] 79, 85); also by heating dilute MHSO,Aq, or keeping the solution for a long time in a closed tube (Saint-Pierre, C. R. 62, 632); by passing SO, into M,SAO,Aq (2M,S,O,Aq+8SO,-2M,SO,Aq+S,O,A passing SO₂ into $M_2S_2O_3Aq$ ($2M_2S_2O_3Aq + 3SO_2 = 2M_2S_2O_4Aq + S)$; by passing SO₂ into M_2SAq (Chancel a. Diacon, J. pr. 90, 35; Rathkg, J. pr. 95, 11); by the interaction of I and a mixture of M_2SO_3 and M_2SO_3 in solution ($M_2SO_3Aq + M_2S_2O_3Aq + I_2 = M_2S_2O_4Aq + 2MIAQ$) (Spring, B. 7, 1157); by the interaction of boiling water on $AgKS_2O_3$ or $HgNa_2(S_2O_3)_2$, whereby $K_2S_2O_4Aq$ or $N_2S_2O_3Aq$ is formed, along with AgS_2O_3 or $HgS_2S_2O_3Aq$ is formed, along with AgS_2O_3 or $HgS_2S_2O_3Aq$ is formed, along with AgS_2O_3 or $HgS_2S_2O_3Aq$ is formed, along with R₂S₂O_aAq or Na₂S₂O_aAq is formed, along with Ag₂S or HgS (Spring, L.c.); by reacting on M₂SO₂Aq with S₂Cl₂ (Spring, B. 6, 1108); by decomposing M₂S₂O₂Aq by a non-oxidising acid, e.g. by H₂SO₄ (Spring a. Levy, Bull. de l'Acad. roy, de Belge, 42, 108); by heating (NH₂)₂SO₄ with P₂S₃, Spring (B. 7, 1158) obtained a little (NH₂)₂SO₆, along with much (NH₂)₂SO₆ some NH, polysulphides, and P compounds; K2S3O6 is also obtained from Wackenroder's solution.

The trithionates are soluble in water; they very readily decompose; heated with water they give off SO, deposit S, and form sulphates in solution. Addition of excess of CuSO,Aq to solution of a trithionate causes ppn. of CuS and

evolution of SO, (Spring, B. 6, 1108).

SELENOTRITHIONATES M.SeS.O. are described dithio-triselenates under Selenates (p. 434). Potassium trithionate K2S3O8. A conc. solution of K2S2O3 is formed by dissolving the salt in 8 pts. water and 1 pt. alcohol till the alcohol separates from the aqueous solution; SO₂ is passed into this solution at 25°-30°, solid K₂S₂O₃ being added from time to time, till the liquid is yellow and smells of SO₂; the crystals that separate are dissolved in water at 60°-70°. the solution is filtered from S, mixed with eight times its volume of 84 p.c. alcohol, warmed gently, and allowed to crystallise (Plessy, A. Ch. [3] 20, 162; for other methods of preparation v. Langlois, A. Ch. [2] 79, 77; Rathke, J. 1864. 164; Chancel a. Diacon, C. R. 56, 710). White rhombic needles (Baker, C. N. 36, 203). Very sol. water, insol. alcohol. Aqueous solution gives K₂SO₄Aq, SO₂, and S when heated. Debus (C. J. 53, 313) found that K₂S₃O₆Aq slowly changes at the ordinary temperature, giving K,30,Aq, states at the ordinary temperature, giving K,30,Aq, K,28,O,Aq, and K,53,0,Aq without separation of S. According to C. a. D. (l.c.), K,5,O,Aq interacts with K,5,Aq to give only K,5,O,Aq; with H,S the products are K,SO,Aq, K,28,O,Aq, and S (Debus, C. J. 53, 329). Sodium-amalgam reacts (Readily, producing KNaS₂O₃ and KNaSO₃ (Spring, B.7, 1161).

The other trithionates that have been iso-

The other trumonates that have been isolated are those of Ba (Kessler, P. 74, 253); Pb (K., l.c.; Chancel a. Diacon, O. R. 56, 710); Na (K., l.c.; Rathke, J. fr. 95, 13; Villiers, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); Rather, C. R. 106, 1356); and Zn (Fordos a. Gélis, A. Ch. 1312); and Rather, C. R. 106, 1356); and Rather, Ra

TETRATHIONATES M',S,O, and M''S,O,.
The alkali salts are formed by triturating M,S,O, with I, adding a little water and pouring into

atcohol (von Klobukoff, B. 18, 1869; Eliasberg, B. 19, 322; Fock a. Klüss, B. 23, 2429); the Pb salt is formed by the prolonged interaction of I and PbS_O, also by the interaction of H_SO_Aq and a mixture of PbS_O, with PbO₂ (Chancel a. Diacon, J. pr. 90, 55); tetrathionates are also formed, according to Spring a. Levy (Bull. de l'Acad. roy. de Belge, 42, 108), by the interaction of thiosulphates and ferrous or cuprous salts, KMO_Aq, hypochlorites, or KClO₃ dissolved in H_SO_Aq. K_S_O₄ is obtained by neutralising Wackenroder's solution by KC_H_O₂ (v. Debus, G. J. 53, 278; cf. Curtius a. Henkel, J. pr. [2] 37, 137). The tetrathionates are c. sol. water, but insol. alcohol; aqueous solutions are generally decomposed on evaporation.

Potassium tetrathionate K.S.O., Formed by adding I, little by little, to cone. K.S.O., Aq till a permanent reddish-brown colour is produced, dissolving the crystals that separate in warm water, filtering from S, adding alcohol till the pp. that forms is re-dissolved, and allowing to crystallise (Kessler, P. 74, 253). Spontaneous decomposition of cone. K.S.O., Aq gives K.S.O., and S (Debus, C. J. 53, 311). Perfectly dry K.S.O., ac ne be kept unchanged in a dry atmosphere; but in ordinary air, after a time, SO., is formed; an aqueous solution of K.S.O., Slowly changes to K.S.O., Aq., K.S.O., Aq., K.S.O., Aq., and SO., (D., l.c.). BrAq reacts to form H.SO., Aq. S, and KBr; but if the BrAq is added very gradually the S that is formed combines with residual K.S.O., to form K.S.O., Aq., and H.S is then passed in, K.S.O., and S are formed, and the S combines with unchanged K.S.O., to form K.S.O., (D., l.c.). Sodium-amalgam forms KNaS.O., Aq (Spring, B. 7, 1161).

The other tetrathionates that have been isolated are those of Ba (Lewes, C. J. 39, 69; Fordos a. Gólis, A. Ch. [3] 32, 66; Curtius a. Henkel, J. pr. [2] 37, 137); Cd (Kessler, P. 74, 253); Gu (Chancel a. Diacon, C. R. 55, 510); Fe (F. a. G.); Pb (K.; C. a. D.); Na (K.; von Klobukoff, B. 18, 1869); Sr (K.); and Zn (F.

PENTATHIONATES M',S,O, and M''S,O,. Wackenroder, in 1845 (A. 60, 189), asserted that the liquid formed by passing H,S into SO,2Aq contained pentathionic acid H,S,O,; other chemists confirmed his results, and prepared a few salts of the acid (v. Lenoir, A. 62, 253; Fordos a. Gélis, A. Ch. 13] 22, 66; Kessler, P. 74, 257; Ludwig, Ar. Ph. [2] 85, 9; Chancel a. Diacon, C. R. 56, 710. At a later time the existence of pentathionates was denied, chiefly by Spring (B. 12, 2254; 13, 924; 15, 2618), but upheld by Kessler (B. 13, 424; v. also Takatmatsu a. Smith, B. 13, 1076). In 1881 Lewes (C. J. 89, 68) seemed to have isolated BaS,O, and K,S,O, but Spring failed to confirm his results. Shaw, however (C. J. 43, 357), repeated Lewes's experiments, and obtained K,S,O. In 1888 Debus (C. J. 53, 278) made an elaborate investigation of Wackenroder's solution, and prepared K,S,O, therefrom. Curtius a. Henkel (J. pr. [2] 37, 187) assert that Wackenroder's solution contains acid tetrathionates, in which the ratio of S to Ba is greater than 48:Ba, and that these have been mistaken for pentathionates. But Debus's experiments seem to have settled

the dispute in favour of the existence of pentathionates. Ammoniacal AgNO₂Aq gives very distinct brown colouration, followed by a black pp, with pentathionates; this reaction distinguishes them from salts of other 8 oxyacids (v. Debus, Lc., p. 297).

Lc., p. 297),

Potassium pentathionate 2K₂S₂O₆, 3aq.

Debus (C. J. 53, 294) prepared this salt from Wackenroder's solution (v. p. 699) by adding the salt of the salt from the sal 16:66 g. KC.H.O. previously fused) to 43 c.c. of the solution of S.G. 1343; the KC.H.O. was dissolved in as little water as possible acidulated with a few drops of acetic acid; the solution was placed in a large flat dish in a current of air until the liquid had evaporated; the crystalline residue (weighing 26 g.) was repeatedly pressed between filter-paper, and then dissolved in 50 c.c. water + 1 c.c. H.SO., at 40°; the minute quantity of S that separated (c. '005 g.) was filtered off, and the filtrate was allowed to crystallise in a flat dish. The crystals that separated (18.75 g.) were a mixture of K.S.O. and K2S3O4; they were dried by placing them on blotting paper, and the crystals of pentathionate were picked out (5.75 g. were obtained), crystallised twice from water acidulated with a little H.SO,Aq, and dried over H.SO. The crystals H_SO,Aq, and dried over H_SO. The crystals of pentathionate form four-sided rhombic plates, or six-sided star-like plates; those of tetra-thionate form six-sided prisms, with pyramids only on one end, and with the side on which only of one char, and with the sale of which they rest much developed. Lewes (C. J. 39, 75) described three salts: K₂S₂O_a, K₂S₂O_a, H₂O, and K₂S₃O_a, 2H₂O; Debus's salt was 2K₂S₂O_a, 3H₂O. According to Fock a. Klüss (B. 23, 2428), this is the only salt that exists (cf. D., l.c., p. 297). The salt can also be obtained by passing H.S into

Crystals of $2K_sS_0O_a$ 3H_O begin to decompose, when kept in a stoppered bottle, after a month or so, giving eventually a yellow, pulpy mass of $K_sS_0O_a$, S, and water; the decomposition is caused by water in the interstices of the crystals. By powdering finely, washing with dilute alcohol, and placing over H_sS_0 , Debus (l.c. p. 295) kept the salt unchanged for two or three years. $2K_sS_0O_a$ 3H_O dissolves in c. 2 parts water, forming a clear, neutral solution, which soon decomposes with separation of S and formation of $K_sS_0O_a$ 4Q (D., l.c., p. 311); addition of a drop of dilute KOHAq to the solution causes separation of S (p. 291); $H_sS_0O_a$ 4 produces $K_sS_0O_a$ 4 and $K_sS_0O_a$ 4 are formed in the solution (p. 328); SO_2 produces $K_sS_0O_a$ 4 and $K_sS_0O_a$ 4Q (p. 332); the salt is insoluble in alcohol.

K.S.O.Aq acidulated with H.SO.Aq (D., l.c., p.

Barium pentathionate BaS_aO_a . 3aq; obtained by Lewes (C. J. 39, 68) by partially neutralising Wackenroder's solution by BaOAq, crystallising over H_aSO_a , pouring off from BaS_aO_a , and again crystallising.

Copper pentathionate CuS, O., 4ac; obtained by Debus (i.e., p. 300) in blue, prismatic crystals, by adding Cu(C,H,O,),Aq to Wackenroder's solution and allowing to evaporate. Debus probably obtained zinc pentathionate, but not in a pure state (i.e. p. 290)

in a pure state (l.c., p. 299).

HEXATHIONATES. By adding KC,H,O,Aq
to the mother-liquor from K,S,O, and K,S,O,
(v. supra), evaporating in a current of air, dis-

solving in water with a little H.SO.Aq, allowing to evaporate in portions, and collecting the crystals separately, Debus (C. J. 53,301) obtained a salt in which the ratio of S to O was almost 68:60, as required by potassium hexathionate.

os:oo, as required by points tarm necessariance.

M. M. P. M.

THIONESSAL v. Tetra-phenyl-menophene.

THIONIC ACIDS. The acids H.S.O., where

z=2, 3, 4, 5, and probably 6, are generally called thionic acids, and are distinguished as di-, tri-, &c., thionic acid. The acids are known only in aqueous solutions: most of these solutions readily oxidise to H_SO_Aq. Dithionic acid is produced by the action of certain oxidisers on H_SO_Aq; dithionates are formed by oxidising sulphites and thiosulphates; trithionates are formed when mixtures of sulphites and thiosulphates are oxidised, also when SO, Aq interacts with alkali thiosulphates; tetrathionates result by the action of certain oxidisers on thiosulphates. These processes may be represented diagrammatically as follows (the actual re-actions are much more complex):

(1) 2H₂SO₃Aq + O = H₂S₂O₆Aq + H₂O; (2) 2M₂SO₃Aq + O = M₂S₂O₆Aq + M₂O; M₂S₂O₃Aq₂ + 3O = M₂S₂O₆Aq; (3) M₂S₂O₃Aq + M₂S₂O₃Aq + O = M₂S₂O₆Aq;

(4) M₂SO₂Aq + M₂SO₄Aq + SSO₂Aq = 2M₂S₂O₆Aq + S; 2M₂S₂O₄Aq + SO₂Aq = 2M₂S₂O₆Aq + S; (4) 2M₂S₂O₄Aq + O = M₂S₁O₆Aq + M₂O₅. After passing H₂S for a long time into nearly saturated H₂SO,Aq, the solution contains H₂S₂O₆, much H₂S₄O₆, H₂S₅O₆, and probably H₂S₆O₆, along with H₂SO₄, dissolved solloidal S, and a little S in suspension. This solution is known as Wackenroder's solution (Wackenroder, A. 60, 180 [1845]). It has been examined by many chemists; a very thorough investigation was made by Debus in 1888 (C. J. 53, 278; where references will be found to other memoirs). The solution examined by Debus was prepared by passing a slow current of H2S into 480 c.c. nearly saturated SO2Aq at a little above 0° for two hours, keeping in a stoppered bottle for forty-eight hours at the ordinary temperature, passing in H₂S for two hours, after forty-eight hours again passing in H₂S, and repeating these treatments until the liquid no longer smelled of SO, after standing for a couple of hours at the ordinary temperature (about two weeks were required before the action was completed). liquid thus obtained contains a large quantity of S, partly as a hard brittle solid, partly as a soft and gummy mass, and partly in suspension in minute particles which pass through filter paper; the liquid remains milky after filtration, and does not become clear on standing for two or three weeks (regarding the variety of S its solution, v. Sulphur, Allotropic forms of, p. 608). Debus (l.c., p. 348) thinks that the product of the direct interaction of SO, Aq and duct of the direct interaction of SC₂Aq and H₂SA₂A₁B₃C₄Aq); that part of this H₂S₁O₄ reacts with excess of SO₂Aq fo form H₂S₂O₄Aq and H₂S₂O₄Aq (PH₂S₂O₄Aq + H₂SO₄Aq + H₂ H. S.O.Aq forms H.S.O.Aq (? H.S.O.Aq + H.S.O.Aq = H.S.O.Aq + H.SO.Aq) (D., Lc., p. 838); that the H.S reacts with H.S.O.Aq to form H.O and S, part of the S combining, as it is formed, with H.S.O.Aq to form

H.S.O.Aq, H.S.O.Aq and H.S.O.Aq, and part

remaining in solution as colloidal S. If H₂S is passed into Wackenroder's solution, more H₂S₂O₂ is formed; and if the passage of H₂S is continued until all reaction ceases the thionic acids are decomposed, and the final product or S = 2 H₂O₂ = 1. products are S and H₂O, so that the equation SO₂Aq + 2H₂SAq = 3S + 2H₂OAq correctly represents the interaction of SO₂Aq with H₂SAq so far as the final products are concerned (v. D., l.c., p. 351).

Solutions of the thionic acids more or less rapidly decompose, the final products being H,SO,Aq, SO,Aq, and S; oxidisers such as Cl or HNO,Aq—in some cases air is sufficient convert them into H,SO,Aq; reducers, such as Na amalgam, produce H2S2O3Aq, sometimes also H₃SO₃Aq, and in some cases H₂SAq. None of the acids has been isolated apart from water; salts of all are known (v. Thionates, p. 695). The acids are all dibasic.

Regarding the constitution of the thionic acids v. Mendeléeff, B. 3, 870; Michaelis, A. 170,

31; Spring, D. 6, 1108; Debus, C. J. 53, 351.

DITHONIC ACID IL S.O. Aq. (Hyposulphuric acid.) A solution of this acid is formed by suspending coarsely-powdered MnO₂ in water, and passing in SO₂ while the liquid is kept at c. 0°; filtering, adding BaOAq to alkalino reaction, and filtering from BaSO, and MnO,H2; evaporating, crystallising out BaS, Og. 2aq, and decomposing this salt in solution by the equivalent quantity of H_SO, Aq ; filtering from BaSO, and evaporating in vacuo till a liquid of S.G. 1.347 is obtained (MnO₂ + 2SO₂Aq = MnS₂O₄Aq; MnO₂ + SO₂Aq = MnSO₄Aq) (Spring a. Bourgeois, Bl. [2] 46, 151). If evaporation is continued beyond this concentration, H.SO, Aq and SO, are formed; the same decomposition occurs when H.S.O.Aq is evaporated by heat. H.S.O.Aq is reduced by Zn and HClAq to H.SO.Aq at 0° (Otto, A. 147, 187); it is oxidised to H.SO.Aq by Cl, HNO₂, KClO₃ and HCl &c.; it slowly oxidises in air (cf. DITHIONATES, p. 695). Thomsen (Th. 2, 259) gives the following heats of Set (11.2, 2.3) gives the browning factor of formation of $H_{S_0}O_1^2Aq := [S^2,O^3,Aq] = 211,080$; $\{2SO^2,O_1Aq\} = 68,920$; $\{2SO^2,O_1Aq\} = 53,520$; for the heat of oxidation of $H_1S_1O_1Aq$ to H_2SO_1Aq he gives $(S_2O_5\Lambda q + O = 2SO_3\Lambda q) \quad [S^2O^3\Lambda q, O]$ = 78.710.

TRITHIONIO ACID H.S.O.Aq. A dilute solution of this acid is formed by decomposing K.S.O.Aq by the equivalent quantity of HClO.Aq or H.S.F.Aq, and filtering from KClO or K.S.F. (Langlois, C. R. 10, 461; 62, 812; Kessler, P. 74, 250). The dilute solution cannot be evaporated, even in vacuo, without partial decomposition, with formation of SO₂ and S; when heated it rapidly changes to H.SO,Aq, SO₂ and S. The dilute solution is colourless and odourless, and has a sour and bitter taste (cf. Tarthionates, p. 696). The K salt, from which the acid solution is obtained, may be prepared by dissolving K₂S₂O₂ in water containing one-eighth part of alcohol, adding the containing one-eighth part of alcohol, adding the salt till the alcohol separates from the aqueous solution, passing in SO,, with addition from time to time of a little K.S.O., temperature being kept at 25°-30°, till the liquid is yellow and smells of SO, setting aside till crystals separate, and re-crystallising from warm water (filtering from separated S) (Pleasy, A. Oh. [3] 11, 183). TETRATHIONIC ACID H.S.O.Aq. PbS.O.Aq is decomposed by the equivalent quantity of H.SO.Aq (not by H.S., which reacts with H.S.O.), and the filtrate from PbSO. is concentrated on the water bath, and then in vacuo over H.SO, (Fordos a. Gelis, C. R. 115, 920). PbS O may be prepared by pouring a solution of 2 pts. Na, S O, 5H, O in much warm water into a dilute warm solution of 3 pts. lead acetate, and thoroughly washing the ppd. PbS2O, with warm water, adding water enough to partially dissolve the PbS₂O₂, then adding 1 pt. I, and letting stand for some days, with frequent shaking, filtering from PbI₂, evaporating and crystallising (2PbS₂O₂+2I+Aq=PbS₂O₃Aq + PbI₂).

H₂S₂O₈Aq is colourless and odourless; it has

a sour taste. Dilute H2S4O6Aq may be boiled without change, but the conc. solution decomposes to H.,SO,Aq, SO., and S. Dilute HClAq or H,SO,Aq does not interact with cold H,S,O,Aq; H₂SO₄Aq does not interact with cold H₂S₁O₄Āq; on warming H₂S is given off; HNO₂Āq or Cl rapidly oxidises II₂S₁O₄Aq to H₂S₂O₄Aq or Cl rapidly oxidises II₂S₂O₄Aq to H₂S₂O₄Aq or Cl retarrationates, p. 696). Thomsen (Th. 2 262) gives the following data for II.F.:—[S',O,Aq] = 192,430; [2SO²S₂O,Aq] = 50,270; [2SO²Aq,O] = 53,490. Pentathitonic acid H₂S₂O₂Aq, and Hexathinonic acid H₂S₂O₂Aq. These acids very probably exist in Wackguroder's solution (v. supra., 698), as salts of H₂S₂O₃, and probably also of H₂S₂O₃, have been obtained from that solution; solutions of the acids have not been isolated

solutions of the acids have not been isolated (v. Pentathionates, p. 697, and Hexathionates,

697). THIONINE. The group $S \longrightarrow C_uH_u(NII_J)$. N. P. M. THIONINE. The group $S \longrightarrow C_uH_u(NII_J)$. N. THIONINE.

i.e. $C_uH_u(NH_u) < \sum_{N}^{S} > C_uH_u:NH$ (Bernthsen a. Goske, B. 20, 931).

 $\textbf{THIONOL} \ C_{12} H_7 NSO_2 \ \textit{i.e.} \underbrace{S}_{C_6 H_3 (OII).N} C_6 H_3 > 0.$ Formed by heating imido-di-phenyl sulphide with dilute H₂SO₂ at 150°-160° (Bernthsen, A. 230, 188). Brownish-red powder, which acquires green lustre on rubbing. Insol. cold water, sol. acids and alkalis, forming a violet solution. Yields di-oxy-imido-diphenyl sulphide (q. v.) on reduc-tion.—B'2H2SO4. Green needles.—B'BaO (dried at Plates with green lustre.-B'Ag O'(dried at 100°). Brown amorphous pp. .

THIONOLINE v. OXY-AMIDO-IMIDO-DIPHENYL SILPHIDE.

THIONURIC ACID C.H. N.SO. i.e.

CO NH.CO CH.NH.SO, H. Formed by the

simultaneous action of NH, and SO, on alloxan in aqueous solution (Liebig a. Wöhler, A. 26, 268, 314, 331). Formed also by warming nitrosobarbituric acid with ammonium sulphite (Baeyer, A. 127, 210). Crystalline mass of needles, v. sol. water. Decomposed by boiling water into uranil and H₂SO₂. Reduces ammoniacal AgNO₃ to a mirror.—(NH₃A"aq. Four-sided tables, al. sol. cold water. At 200° it yields (NH₃)₂SO₄ and zanthinine (Finck, A. 132, 298).—(NH₃HA". White needles.—CaA". Prisms.—PbA"aq.

THIONYL-m-AMIDO-BENZOIS ACID

SO:N.O.H..CO.H. Mathyl ether MeA'. [57°]. (212° at 100 mm.). Formed from methyl m-amido-benzoate

and SOCl, (Michaelis, A. 274, 250). Yellow crystalline mass, v. sol. ether and benzene.

Ethyl ether EtA'. Oil. THIONYL-DIAMIDO-DI-PHENYL-ETHYL-ENE C.H.(C.H.N.SO).. [2022]. Formed from di-amido-stilbene and SOCl. (Michaelis, A. 274, 265). Red needles, m. sol. benzene and CHCl., THIONYL-AMIDO-PHENOL. Ethyl de-

rivative C. H. (OEt). N:SO. [82°]. (220° at 200 mm.). Fortyed from p-amido-phenetol and SOCl. (Michaelis, A. 274, 246). Light-yellow needles, v. sol. ether. Slowly decomposed by water.

THIONYL-AMYLAMINE SO:NC,H₁₁. (87° at 60 mm.). Formed from amylamine (103°) in ether and SOCl₂ (Michaelis, A. 274, 191). Oil, decomposed by water.

THIONYL-ANILINE C.H.N.SO. (200°), S.G. 15 1.236. Formed from aniline in benzene solution and SOCl. (Michaelis, B.23, 3480; 24,745). Liquid with peculiar odour, sol. alcohol. Converted by alkalis into aniline and sulphite. Chlorine forms tri-chloro aniline [78°]. Conc. HClAq also forms aniline and SO₂. The compound C₆H₁Br₈N:SO [750] is the superior and the compound C₈H₂Br₈N:SO [750] is the superior and superior aniline and SO₂. [75°] is formed from tri-bromo-aniline in benzene and SOCl₂. The compounds [1,2]C₃H₁Cl.N.SO [-8], [1:3] C₆H₂Cl.N.SO (233°) and [1:4] C₆H₂Cl.N.SO [36°] (237°) are formed in like manner. o., m., and p. Thionyl-bromo-anilines melt at 4°, 32°, and 61° respectively (Michaelis, 4.274, 201). This problem of the composition of the compositi A. 274, 221). Thienyl-tetra-bromo-aniline melts Thionyl-p-iodo-aniline [54°] and [4:2:1] at 78°. C.H. I. N:SO [74°] are also crystalline.

ference.-Nitro-thionyl-aniling THIONYL BROMIDE SOBr. v. Sulphub oxy-

BROMIDES, p. 617.
THIONYL-ISOBUTYLAMINE C.H.NSO i.e. CHMe₂.CH₂.N:SO. (116°). Formed from SOCl₂ and isobutylamine in other (Michaelis, A. 274,

191). Liquid, with pleasant smell.
THIONYL CHLORIDE SOCI, v. SULPHUR

OXYCHLORIDES, p. 617. THIONYL-CUMIDINE C.H.Pr.N:SO. (158°). Got from SOCI, and the cumidine obtained from isopropyl-benzene by nitration and reduction (Michaelis, A. 274, 239). Oil, not decomposed by boiling water.

Thionyl-\psi-cumidine CaH_Mea.N:SO. [-10°].

(246°). Oil, v. sol. alcohol and ether.

THIONYL ETHYLAMINE EtN:SO. Formed by adding SOCI, to an ethereal solution of ethylamine cooled below 0° (Michaelis, B. 24, 756).

.C.H.Me.N:SO. Volatile with THIONYL-MESIDINE [-11°]. (241°). S.G. ¹⁴ 1·121. steam (Michaelis, A. 274, 240).

THIONYL-METHYLAMINE MeN:SO. (59°). Liquid (Michaelis, A. 274, 187).

THIONYL-METHYL ANILINE

SO(C.H. NHMe)₂. [154°]. Formed from SOCl, and methyl-aniline in ethereal solution in preand methyl-amment extension as the sence of AlCl. (Michaelis a. Godohaux, B. 23, 3019). Colourless needles, v.* sol. alcohol. Yields a nitrosamine SO(C_bH., NMe.NO), [171°].

THIONYL-(a)-NAPHTHYLAMINE C₁₆H. N:SO. [33°]. (226° at 100 mm.). Formed from (a)-naphthylamine in benzene and SOCI. (Michaelis, A. 274, 253). Reddish yellow needles, slowly converted by water into naphthylamine. sulphite.

Thionyl-(β)-naphthylamine [53°]. Needles. The thionyl derivative of bromo-(\$\beta\$)-naphthyl-

amine [63°] melts at 118°.

THIONYL-o-NITRO-ANILINE C₆H₄N₂SO₃ i.e. C₆H₄(NO₂).N:SO. [62°], the m-compound melts at 63°, while the p-isomeride melts at 70° (Michaelis, A. 274, 225).

THIONYL-NITRO-MESIDINE "C.H10N2SO3 i.e. C. HMe. (NO.). N:SO. [77°]. Got from nitro-mesidine [74°] (Michaelis, A. £74, 241). Light yellow needles, v. e. sol. benzene.

Thionyl-di-nitro-mesidine. [127°]. Formed

from di-nitro-mesidine [193°

THIONYL-NITRO-NAPHTHYLAMINE C₁₀H₆(NO₂).N:SO. Nitro-naphthylamines [191°] and [119°] yield thionyl derivatives melting at 89° and 135° respectively (Michaelis, A. 274, 258).

THIONYL-NITRO-TOLUIDINE C,H,N,SO, 4.e. C.H.Me(NO.).N:SO. The compounds from (2,1,4)-nitro-toluidine [75°] and (3,1,4)-nitro-toluidine [114°] melt at 44° and 39° respectively (Michaelis, A. 274, 232).

DI.THIONYL-PHENYLENE-DIAMINE

C_aH₄(N:SO)₂. The m- and p- compounds melt at 44° and 116° respectively (Michaelis, A. 274, 261).

THIONYL-PHENYLETHYL-AMINE
PhCH₂CH₂N:SO. (172° at 25 mm.). Liquid,

decomposed by water into SO, and base. SO, passed into its othereal solution forms amorphous PhCH, CH, NH. SO,H, whence benzoic aldehyde yields PhCH, CH, N(SO,H). CHPh.OH [114] (Michaelis, B. 26, 2167).

THIONYL-PHENYL-HYDRAZINE v. Action

of SOCl₂ on Phenyl.-Hydrazine.
THIONYL-PHENYL-PROPYLAMINE

CH2Ph.CH2.CH2.N:SO. Formed from phenylpropylamine hydrochloride and SOCl2 (Michaelis a. Jacobi, B. 26, 2161). SO₂ passed into its ethereal solution forms the amorphous compound NH(SO₂H).C₂H_aPh, which reacts with benzoic aldehyde forming SO₂H.N(CHPh.OH).C₂H_aPh (106°).

THIONYL-PROPYLAMINE PrN; SO. (104°). Smells like bleaching-powder (Michaelis, A. 274,

190).
THIONYL-TOLUIDINE C.H.Me.N.SO.

Formed from toluidine and SOCI, The o-compound is liquid (184° at 100 mm.). The m-compound is liquid (220°). The p- isomeride [7°] pound is liquid (220'). The p-isomerate [1] (c. 224°) may be crystallised by cooling (Michaelis a. Herz, B. 23, 3482; 24, 753; A. 274, 231). The thionyl derivatives of (3,1,4)- and (5,1,2)-bromo-toluidines melt at 47° and 50° respectively.

bromo-toluidines melt at 47° and 50° respectively.

THIO-ORCIN C_aH_aMe(SH)₂. [35°]. Formed
by reducing C_aH_aMe(SO_aCl), with tin and HClAq
(Gabriel, B. 12, 1640).—PbO,H_aS₂.

THIONYL-XYLIDINE C_aH_aMe_aN:SO. The
(1,2,4)- compound [-9°] (131° at 20 mm.),
(13,4)- compound (238°), and (1,4,2)- isomeride
[-8°] (119° in vacuo) are all oily (Michaelis, A.
274, 287). Thionyl-fluoro-xylidine (144° at 45 mm.) is also an oil.

THIO-OXALIC ACID. Ethylether C.H., SO, i.e. CO.Et. CO.SEt. (217° cor.). S.G. 2 1-145. Formed by the action of Cl.CO.CO.Et. on mercaptan (Morley a. Saint, C. J. 43, 400). Colourless liquid with faint odour like garlic. Colouriess inquite with a late of the composed by KOHAq into mercaptan, alcohol, and oxalate. Alcoholic KOH (1 mol.) forms EtSH and CO_Et.CO_K. Water slowly decomposes it, forming oxalic acid, alcohol, and mer-

aptan. Dry NH, forms mercaptan and CO,Et.CONH.

(β)-Thio-oxalic acid NH₂CS.CO₂H. The salt C₂H,KNSO₂ is formed by the action of cold conc. KOHAq on the ethers. It crystallises in needles, v. sol. water and decomposed by evaporating. The free acid is unstable.

Tating. The free acid is unstable.

Amide of the methyl ether.

NH_CS.CO_Me. [86°]. Formed by passing dry
H_S into Cy.CO_Me (Weddige, J. pr. [2] 7, 79;
9, 133; 10, 193). Light-yellow crystals, sol.

water, alcohol, and ether.

Amide of the ethyl ether NH_CS.CO_Eta-Mol. w. 133. [64°]. Formed in like manner. Lemon-yellow crystals. Re-converted by boiling with alcohol and Pb(OH), into cyanoformic ether. Methylamine and ethylamine form the crystalline compounds CO(NHMe).CS.NH2 and CO(NHEt).CS.NH2 respectively.

Amide of the isobutyl ether

NH₂.CS.CO₂C₄H₉. [58°]. Lemon-yellow crystals, sl. sol. water.

Di-amide CO(NH2).CS.NH2. Formed from CO, Et. CS. NH., and alcoholic ammonia (Weddige, J. pr. [2] 9, 137). Lemon-yellow needles (from alcohol), sl. sol. water.

Di-thio-oxalic acid. Amide CS(NH2).CS(NH2). Hydrogen rubeanide. Mol. w. 120. Formed, together with yellow Cy.CS.NH2, by combination of cyanogen with H.S (Wöhler, P. 3, 177; Völckel, A. 38, 315). Formed also by passing cyanogen into an alcoholic solution of NaSH and ppg. by HCl (Wollner, *J. pr.* [2] 29, 129; Ephraim, *B.* 22, 2305). Prepared by passing H2S into an ammoniacal solution of CuSO, which has been decolourised by KCy (Formanck, B. 22, 2655). Small yellowish-red crystals, sl. sol. water, sol. alcohol and ether. Dilute KOHAq forms oxalic acid, conc. KOHAq forms KCy and KCyS. Boiling HClAq forms oxalic acid. MeI and MeOH at 150° form SMe, I. Alcoholic hydroxylamine hydrochloride (2 mols.) forms $C_2(NH_2)_2(NOH)_2$ and H_2S . Benzoic aldehytic, acting on a boiling solution, forms a compound [209°] which is apparently

CHPh<S>C.C≤S>CHPh (Ephraim, B. 24,

1027) PbC₂H₂N₂S₂: orange pp. (Wallach, B. 13, 528). Yields PbS on boiling with water.

Anilide CS(NHPh).CS(NHPh). Formed from oxanilide by successive treatment with PCl, and H2S (Wallach, B. 13, 527). Golden plates.

Di-methyl-di-amide D1. methyl. d2. amrae CS(NHMe). CS(NHMe). [140°]. Formed from thiocyanic acid, alcohol, and methylamine (Wallach, 4. 262, 360). Yellow crystals, sl. sol. alcohol. Converted by NaOEt and propyl chloride into C(NMe)(SC₂H₁).C(NMe)(SC₂H₂) (170°-175°).

Di-ethyl-di-amide CS(NHEt).CS(NHEt). [58°]. Formed in like manner. Yellowish-red crystals, insol. water. Converted by NaOEt and Etl into C(NEt)(SEt).C(NEt)(SEt) (126°-129°).

Di-amyl-di-amids

CS(NHC,H₁₀).CS(NHC,H₁₀). [60°]. Formed from thiocysnic acid, alcohol, and amylamine (Wallach, A. 262, 362). Red prisms.

Di-bensyl-diamide CS(NHCH,Ph).CS(NHCH,Ph). [115°]. Formed

from thiocyanic acid, alcohol, and benzylamine. Yellowish-red crystals, al. sol. warm alcohol. Hexa-thio-ortho-oxalic acid. Ethyl ether

C.(SEt). Formed from C.Cl. and NaSEt (Classon, J. pr. [2] 15, 212). Heavy oil. THIO-OXY- v. SULPHYDRO-.

THIO-PARABANIC ACID. Methyl derivative v. METHYL-THIG-PARABANIC ACID. Allyl derivative C.H.N.SO, i.e.

 $_{\text{CS}}$ $\stackrel{\text{NH.CO}}{\stackrel{\text{CO}}{\sim}}$ $\stackrel{\text{CO}}{\sim}$ Oxalyl - thio - sinaminc. [90°]. Formed by warming the dicyanide of allyl-thio-urea with dilute H₂SO₄ (Maly, Z. 1869, 260). Lemon-yellow needles, m. sol. cold water.

THIOPHENE C,H,S i.e. SCH;CII cor.). V.D. 3-0 (calc. 2-9). S.G. 22 1-062; \$1-0884; \$\frac{1}{2}\$1-0705 (R. Schiff, B. 18, 1601). S.V. 84-9. \$R_{\infty}\$ 41-4 (Nasini a. Scala, G. 17, 70). H.C.p. 670,900 (Berthelot a. Matignon, C. R. 111, 1200). 10; Bl. [3] 4, 252). H.F. -14900. Critical temperature 317° (Pawlewski, B. 21, 2141). Critical pressure 47.7 atmospheres. Occurs in coal-tar benzens to the extent of about 5 p.c.

(V. Meyer, B. 16, 1471).

Formation .- 1. In small quantity by passing acetylene through boiling sulphur (V. Meyer a. Sandmeyer, B. 16, 2176).—2. By heating succinic anhydride with P.S.,—3. By heating sodium succinate with P.S., the yield being 50 p.c. of the theoretical amount (Volhard a. Erdmann, B. 18, 460). It is not beauty the heating 18, 454). It is not formed by heating s-di-bromo-succinic acid with P2S3 or P2S3 (Ossipoff, J. R. 20, 245). -4. By heating crythrite with P.S. (Paul a. Tafel, B. 18, 688). -5. From its (α)-carboxylic acid, which is obtained by heating mucic acid with BaS (Paul a. Tafel, B. 18, 456).-6. In small quantities by passing Et2S through a red-hot tube (Meyer, B. 18, 217) .- 7. In small quantities by passing ethylene, coal-gas, or ligroin-vapour over heated iron pyrites. -8. In small quantities by heating P2S3 with crotonic acid, with n-butyric acid, with paraldehyde, or with ether (Meyer).

Isolation .- 20 pts. commercial 'pure ' benzene is shaken for four hours with 1 pt. of H.SO. The acid is diluted with two or three times its weight of water and treated at once with steam. Nearly pure thiophene passes over. Yield, about 3, p.c. by volume of the H₂SO, used (Schulze, B. 18, 497).

Properties.—Liquid with faint odour, not decomposed below 335°. Not solid at -20°. Greatly resembles benzene. Oxidised by HNO3 with great violence. On shaking with isatin and H₂SO, it yields a blue colouring matter (indophenine). Not affected by boiling with sodium. Benzene that contains thiophene gives a bright-blue colour to H.SO, containing nitrous a origin rouge corour to m. So, containing introdus acid. Thiophene (10 g.) shaken with alcohol (100 g.), cold saturated HgCl₂ solution (1,000 g.), and NaOAc (70 g.) dissolved in water (130 g.) forms a white pp. containing C₄H₂(HgCl)S₄, which containing the containing that the states of the containing that the states of the saturated lines are also below in white states. which crystallises from alcohol in white plates [188°], and C,H₂(HgCl),S, a white powder, insolateohol (Volhard, A. 267, 172). The compound C,H₃(HgCl)S is converted by AcCl into a thienyl worthyl between and by I into methyl ketone and by I into di-iedo-thiophene. Thiophene combines with CHPh, and with dibromo-di-(8)-naphthyl oxide (Liebermann, B. 26, 853).

Reactions.—1. Chloral and H₂SO₄ yield CCl₂CH(C₁H₂S)₂.—2. BzCl and AlCl₂ form thienyl phenyl ketone.—3. Phenyl-glyoxylio acid and H₂SO₄ form C₁₂H₂NSO₂, which dissolves in chloroform with crimson, and in H₂SO₄ with the chloroform with crimson, and in H₂SO₄ with purple colour.—4. Cl and Br yield chloro- and bromo- derivatives.—5. H.SO, forms a brown solution containing a sulphonic acid, and slowly decomposes the thiophene, forming H.S., SO, and an amorphous pp.—6. II₂SO, and KNO form a compound called 'nitroso-dithiophene'

HO.N C.H.S O (?), ppd. by water as a dark insoluble powder (Liebermann, B. 20, 8231) .-7. Passed with PCl, through a red-hot tube it 7. Passed with PCl₂ through a red-hot tube it forms C₁H₂S.PCl₂ (218°) which is decomposed by water into C₁H₂S.P(OH)₂ [70°] and is converted by Cl into C₁H₃S.POCl₂ (259°) and by water into C₁H₃S.PO(OH)₂ [159°] (Sachs, B. 25, 1514).—8. Diazobenzene chloride and AlCl₃ forms (\$\textit{\theta}\)-phenyl-thiophene [57°] (Möhlau a. Berger, B. 20.2001).

References .- AMIDO-, BROMO-, DI-BROMO-DI-NITRO-CHLORO-, TRI-CHLORO-NITRO-, IODO-, IODO-NITRO-, and NITRO- THIOPHENE.

THIOPHENE (a) CARBOXYLIC ACID

C,H,SO, i.e. SCH CH. Thiophene 'B'carboxylic acid. [126.5°]. (260° cor.). H.F. 85,400. H.C.p. 591,900 (Stohmann, J. pr. [2] 43, 12). Formed by adding sodium-amalgam to a mixture of Cl.Co.Et with (a)-iodothiophene, with di-iodo-thiophene, or with di-bromo-thiophene (Nahnsen, B. 17, 2192; 18, 2304; Bonz, B. 18, 1900). 2306). Formed also by heating mucic acid with BaS for 6 hours at 205°, the yield being 12 p.c. of the theoretical (Paal a. Tafel, B. 18, 456). Obtained by oxidation of (a)-ethyl-thiophene (Schleicher, B. 18, 3017), of (a)-propyl-thiophene (Ruffi, B. 20, 1740), of thienyl methyl ketose (Peter, B. 17, 2645; 18, 542), and of thienyl ethyl ketone (Ernst, B. 20, 518) with alkaline KMnO.

Properties .- Slender white needles (from water) or long flat needles (by sublimation), v. sol. hot water, sl. sol. cold, v. e. sol. alcohol and ether, m. sol. chloroform, sl. sol. ligroin. a blue colour on warming with isatin and H₂SO₄ (indophenine reaction). Yields thiophene on bistilling with lime. Yields a di-bromo-derivative [211].

uve [211].

Chloride C.H.S.COCI. Liquid, smelling like benzoyl chloride.

A mide C.H.S.CONH₂. [174°] (Meyer, A. 236, 210). Prisms, m. sol. ether. Phenyl thio-C.H.S.CO.NH.CO.NHPh. forms carbimide [206°]

Anilide C.H.S.CONHPh. [140°]. Formed by the action of phenyl cyanate on thiophene in presence of AlCl. (Leuchart a. Schmidt, B. 18, 2340). Iridescent plates.

Amidoxim C.H.S.C(NOH).NH. [92].

Formed by the action of hydroxylamine on the

nitrile (Meyer, A. 236, 213). Long prisms (from benzene).

Nitrile (192°) (D.); (200° cor.) (Peter, B. 18, Fermed by distilling thienyl-glyoxylic acid with aqueous hydroxylamine (Douglas, B. 25, 1311).

Tetrahydride SCH(CO.H).CH. [51°]. H.F. 114,900. H.C.p. 700,400. Formed by reducing the acid, in alkaline solution, with sodiumamalgam (Ernst, B. 19, 3278; 20, 518). Plates or needles (from ligroin), v. e. sol. water and alcohol, v. sol. ether. Volutile with steam. or needles them agreem, the steam alcohol, v. sol. ether. Volutile with steam. Much decomposed on distillation. Reduces ammoniacal AgNO. Salts.—CaA', 3aq. Crystalline, sol. water.—AgA'. M. sol. water. Methyl ether MeA'. ether EtA'. Liquid. (c. 206°). Ethul

Thiophene (β)-carboxylic acid

S<CH:CH (γ)-Thiophenic acid. [136°]. S. 44 at 17°. Formed by the action of alkaline KMnO, on (β) -methyl-thiophene (Muhlert, B. 18, KMnO₄ on (β)-methyl-thiophene (Muhkert, B. 18, 3008) or (β)-ethyl-thiophene, the yield being about 8 p.c. (Damsky, B. 19, 3284). Needles (from water), sol. ether, votatile with steam. Gives the indophenine reaction.— CaA'₂ 3aq. S. (of CaA'₂) 7-92 at 14·5°.—BaA'₄ (dried). S. 11·54 at 17°.—AgA'. Needles or plates, v. sl. sol. Aq. Amide CiH₃S.CONH... [178°]. Converted by phenyl cyanate into CiH₃S.CO.NH.CO.NHPh. 1206°1.

1206°

Thiophene 'a'-carboxylic acid. (258° cor.). This is a mixture of the (α)- and (β)- acids. It is got by saponifying the mixed nitrile which is formed by distilling a mixture of potassium thiophene (a) and (β) sulphonates with KCy (V. Meyer, B. 16, 2174; 18, 2315; Bonz, B. 18, 2308). Formed also by oxidising a mixture of (a) -methyl-thiophene (2 pts.) and (3) methyl-thiophene (3 pts.) and by slow evaporation of an aqueous solution of the mixed thiophene carboxylic acids in the cold (Egli, B. 18, 548; V. Meyer, B. 19, 2891; A. 236, 221). Volatile with steam. Can be separated into the (2)and (β)- acids by crystallisation.
Thiophene dicarboxylic acid

SCC(CO,H):C(CQ,H). [270°]. Formed by oxidising the corresponding di-methyl-thiophene with alkaline KMnO, (Grünewald, B. 20, 2586). Formed also by oxidising (\$\beta\$)-methyl-thienfl methyl ketone (Gorlach, A. 267, 153). Long needles (from water), v. e. sol. ether. Not yolatile with steam. Resorcin at 200' forms a fluorescein which exhibits yellowish-green fluor-escence in alkaline solution.—PbA".—BaA". Crystals, sl. sol. cold water.—Ag.A". White pp. Methyl ether Mo.A". [59.5°]. Plates.

Thiophene dicarboxylic acid

s<c(CO,H):CH

Formation,—1. By oxidation by alkaline KMnO, of dl-methyl-thiophene from coal tar (Messinger, B. 18, 567), from (a)-ethyl-thienyl methyl ketone, from (a)-ethyl-thiophene (a)-carboxylic soid (Schleicher, B. 18, 3020), from methyl-thienyl methyl ketone (Demuth, B. 18, 8025), and from (a)-methyl-thiophene carboxylic acid (Levi, B. 19, 656).—2. By saponifying its nitrile, which may be got by fusing potassirm

thiophene disulphonate with KCy (Jackel, B. 19, 191).—8. By saponifying its ether which is got by the action of sodium-amalgam on a mixture of di-bromo-thiophene and ClCO.Et (Bonz. B. 18, 2306).

Properties.—Crystalline powder, v. sl. sol. cold water, sol. ether. Not melted at 300°. Does not give the fluorescein reaction.

Salts. — BaA" aq. Crystalline, v. sl. sol. cold water.— CaA" Baq.—Ag;A": white pp.

[1620

cor.]. Formed by reducing the acid in alkaline solution by sodium-amalgam (Ernst, B. 19, solution by sodium-amalgam (Ernst, B. 19, 3275). Plates, v. sol. water, sol. ether. Roduces hot ammoniacal AgNO, Hot conc. IL_SO, cvolves CO (1 mol.).—BaA"; scales.—Ag_A": white powder.—Ma_A". Oil.

Thiophene dicarboxylic acid

S<CH——Q.CO₂H. Formed by oxidation of

S<CH - C.CO the corresponding di-methyl-thiophene by alkaline KMnO, (Zelinsky, B. 20, 2022). Needles, sl. sol. cold water. Decomposes and partially Methyl ether Me, A". [36°].

Thiophene tri-carboxylic acid C.SH(CO.H), Formed by oxidation of di-methyl-thienyl methyl

ketone with KMnO₄ (Messinger, B. 18, 2302).

Methyl ether Me₄A". [118°] Plates, v. sol. alcohol and ether.

References .- Bromo- and Iodo- THIOPHENE CARBOXYLIC ACID and NITRO-THIOPHENIC ACID.

THIOPHENE GREEN C., H., N., S. The leucobase C, SII, CII (OH) (C, H, NMe.), is got by heating thiophenic aldehyde with di-methyl aniline, ZnCl., and a little alcohol at 100° (I.evi, B. 20, 513). It crystallises in needles [98°], 20, 513). It crystames in needes (vo.), and is readily oxidised to thiophene green C₁BH_xC(OH)(C₄H₁NMc₂)₂, which is an oil and forms the salts (C₂H₂N₂S)₂ZnCl₂2aq, B'H₂SO₄, B'₂3H₄C₂O₄2aq, and B'2C₄H₂N₂O₇, crystallising in scates with coppery lustre.

Leuco-thiophene green v. TETRA-METHYL-DI-AMIDO-DI-PHENYL-THIENYL-METHANE.

THIOPHENE (a)-SULPHINIC ACID C,H,S.SO,H. [67°]. Formed by the action of zinc-dust on an alcoholic solution of thiophene sulphonic chloride (Weitz, B. 17, 800). Needles, v. sol. water, alcohol, and ether. Gives the indophenine reaction.—BaA', 2aq. White plates, v. sol. water,—ZnA', 2aq. AgA'. Crystalline pp.
THIOPHENE 'a'-SULPHONIC ACID

C.II.S.SO.H. Formed by shaking thiophene (20 g.) dissolved in ligroin (2,000 c.c.) with H.SO. (300 c.c.) for 2 hours (V. Moyer a. Kreis, B. 16, 2172; Biedermann, B. 19, 1615). Deliquescent mass. Yields thiophene on distillation. It is doubtless a mixture of the (a) and (b) acids.

NaA'aq.—BaA', 3aq.—CaA', —PbA', aq. Very soluble powder.—AgA' 3aq. Plates (Weits, B. 17, 796).

Ethyl ether EtA'. Oil. Chloride C.H.S.SO.CL [28"]. (above 200"). Oil or colourless crystals.

Amide C.H.S.CONH. [142°] (Langer, B. | 17, 1568). Needles (from water).-C.H.S.CO.NHAg. Pearly scales.

Anilide C.H.S.CONHPh. [96°L

Thiophene (8)-sulphonic acid

s CH:CH CH:C.SO.H Formed by the action of sodium-amalgam on di-bromo-thiophene (β)sulphonic acid, which is got by sulphonation of di-bromo-thiophene (Langer, B. 17, 1567; 18, 558). Obtained in like manner from iode-thiophene sulphonic acid, and from tri-bromothiophene sulphonic acid (Rosenberg, B. 18, 1776). Crystalline solid, v. sol, water. Gives a blue colour with isatin and H.SO₄.—BaA'₂.

Chloride C,H₃S.SO₂Cl. [43°]. Plates, v. sol. ether, insol. ligroïn.

Amide C₄H₃S.SO₂NH₂. [148°]. Tables. Thiophene disulphonic acid C₄H₂S(SO₃H)₂.

Formed by reduction of di-bromo-thiophene '\$\beta'\$ - di-sulphonic acid by sodium - amalgam (Langer, B. 18, 554, 1114; Rosenberg, B. 18, 3030). Crystalline, v. sol. water. -- BaA" 2 aq.

30.00. Crystaline, v. soi. witter.—Dax. 2; ad. Chloride C,H.S(SO,D.)., [1409]. Scales. A mide C,H.S(SO,NH.).. [e. 280°]. Needles. Thiophene disulphonic acid C,H.S(SO,H).. Formed by reducing iodo-thiophene (aB)-disulphonic acid with sodium-amalgam (Langer, B. 18, 560).

Amide C,H2S(SONH2)2. [142°]. Plates.

Gives the indophenine reaction.

Thiophene disulphonic acid C₄H₂S(SO₄H)₂. Formed from lead thiophene sulphonate and fuming H₂SO₄ (Jackel, B. 19, 185, 1066). Crystalline, v. sol. water and alcohol.—K₂A"aq: prisms, v. sol. water .- Na A" 3aq. Needles, v. sol. water. -BaA" 3aq. Flat prisms, sl. sol. water.—Ruh" 4aq. Blue needles.—Ag,A".

Chloride C,H₂S(SO₂Cl)₂. [77.5°]. Needles

(from ether).

Amide C₄H₂S(SO₂NH₂)₂. [211·5]. References.—DI-BROMO-, IODO- and NITRO-

THIOPHENE BULPHONIC ACID.

THIOPHENIC ACID v. THIOPHENE CARB-OXYLIC ACID

THIOPHENIC ALDEHYDE C, H, S.CHQ. (198° cor.). S.G. 21 1:215. Formed by distilling (a)-thienyl-glyoxylic acid (Biedermann, B. 19, 637, 1853). Formed also by the action of all S on CHCl CH_CH_ (Hantzsch, B. 22, 2838). Oil, smelling like benzoic aldehyde. Oxidised

by air to thiophene (a)-carboxylic acid. Oxim C.H.S.CH(NOH). Thiophene synal-doxim. [128°]. Needles (from ether). Con-verted by NaOHAq into thiophene carboxylic nitrile (Hantzsch, B. 24, 47). Yields an acctyl-derivative [75°-80°]. NaOMe and MeI in MeOH yield C₄SH₃.CH<0 [120°], crystallising in tables; converted by dilute H2SO, into the aldehyde and (3)-methyl-hydroxylamine (Goldschmidt a. Zanoli, B. 25, 2588). Phenyl cyanate in ether forms C.SH.CH:NO.CO.NHPh [70°], crystallising in needles.

Oxim C₄H₂SCHNOH. Thiophene anti-aldoxim. Formed by the action of hydroxyl-amine hydrochloride, NaOHAq and Na₂CO₂ on the aldehyde (Goldschmidt a. Zanoli, B. 25, 2590). Converted by phenyl cyanate into C.SH., CH; NO.CO.NHPh [144°], whence N2OH

forms CaSHa.CH:N.NHPh [46°]. o-Tolyl cyanate forms C,H,S.CH:NO.CO.NH.C,H, [60°].

Phenyl hydrazide O,SH,CH:N,HPh.
[134:5°]. Needles (from alcohol).

THIOPHENIC IMIDO-ETHYL ETHER

C₁I₁,S₂C(OE₂):NH. The salt B'HCl is formed by the action of dry HCl on the nitrile of thiophene emboxylic acid (Douglas, B. 25, 1312). It is crystalline, and is converted by hydroxylamine into C₄H₃S.C(OEt):NOH [67°].
THIOPHENINE is AMIDO-THIOPHENE.

THIOPHENOL v. PHENYL MERCAPTAN.

THIOPHENURIC ACID C,H,NSO, [172°]. Exercted in the urine of rabbits after injection of sodium thiophene (a)-carboxylic acid (Jaffé a. Levi, B. 21, 3458). Prisms, resembling hippuric acid (from water), v. sl. sol. ether, v. sol. alcohol. Split up by boiling baryta-water into glycocoll and thiophene (a)-carboxylic acid. - BaA', 2aq.

Needles, v. sol. water.— CaA', raq.— AgA'.
THIO-PHENYL-ACETIC ACID. A Amide C_sH_s.CH_c.CS.NH_c [98°]. Formed by heating phenyl-acctamide (3 pts.) with P.S. (2 pts.), and also by allowing a solution of phenyl-acetonitrile in alcoholic ammonium sulphide to stand for some days (Bernthsen, B. 11, 503; A. 184, 292). Trimetric crystals (from alcohol), decomposed on distillation into H.S and C.H.CH.CH.CN.

Reactions.-1. Boiling NH, Aq forms phenylacetamide. - 2. HgO forms phenyl-acetonitrile. 3. Zn and HClAq form phenyl-ethyl-amine (Colombo a. Spica, B. 8, 821). — 4. Benzoic aldehyde forms oily C. II. N.S. (?) — 5. Sodiunamalgam forms Ph.CH. CH. NII. and a compound C, H2, NS, [108]. -6. Indine added to a hot alcoholic solution forms C₁₆H₁,N.3 [42°],—7. MeI forms (CH.Ph.C(NH).SMe)HI [139°], which gives rise to (C₉H₁₁NS) H₂PtCl₆ - 8. EtI forms (C₁₀H₁₁NS) HI [116°], which is v. e. sol. water, and yields, on treatment with NaOHAq, the free base CH.Ph.C(NII).SEt, which is an oil that quickly decomposes into mercaptan and phenyl-acetonitrile. The salts (C₁₀H₁₃NS)HCl [c. 120°], B'₂H₂PtCl₀ [below 130°], and B'HBr are crystalline.—9. Aniline forms the compound CH..Ph.C(NH.):NPh.

THIO'- PHENYL - ALLOPHANIC ACID v. PHENYL-THIO-ALLOPHANIC ACID.

THIO - DI - PHENYL - AMINE v. IMIDO-DI-PHENYL SULPHIDE.

THIO . PHENYL . CARBAMIC ACID v. PHENYL-THIO-CARBAMIC ACID.

THIO - DI - PHENYL KETONE v. THIO-RENZOPHENONS.

THIO - LA - PHENYL - METHYL - AMINE v.

METHYL-IMIDO-DI-PHENYL SULPHIDE.

DI-THIO-PHTHALIC ACID C. II. (CO.SH).
The salt K.A" is formed by dissolving KSH (2 mols.) in an alcoholic solution of phenyl phthalate (1 mol.). The free acid splits up at once into H.S and thiophthalic anhydride (Schreder, B. 7, 706).

(a) - Di - thio - isophthalic acid. The K salt, formed by the action of KSH on phenyl isophthalate, crystallises in yellow needles.

Ethyl ether Et₂A". Formed by adding water to the hydrochloride of C_cH₁(C(NH).SEt)₂ (Luckenbach, B. 17, 1435). Small needles.

(β) - Di - thio - isophthalic acid. Amids C_cH₁(CSNH₂)₂. [200°]. Formed by heating isophthalic nitrile with alcoholic ammonium

sulphide (L.). Needles, sol. hot alcohol. Reconverted into the nitrile by lead acetate. Boil-

ing KOHAq forms isophthalic acid.

THIO.PHTHALIC ANHYDRIDE C.H.SO. i.e. $C_eH_{\bullet} < \stackrel{CO}{CO} > S$. [114°]. (284°). Formed by the action of KSH on phthalyl chloride, or on phenyl phthalate (Graebe a. Zsehokke, B. 17, 1175). Formed also by the action of As.S. on phthalyl chloride (Rayman, Bl. [2] 47, 898). Plates, v. sol. hot alcohol, ether, and chloro-form, sl. sol. water. Volatile with steam. Sol. alkalis and converted by long, boiling with alkalis into phthalic acid. Ammonia forms phthalimide. Resorcin and H2SO, give a thiofluorescein, the alkaline solution of which is deep red with green

THIO-PHTHALIDE $C_0H_1 < CO > S$. Formed by heating C,H,Cy,CH2.SCy with conc. HClAq for 5 hours at 180° (Day a. Gabriel, B. Thin needles (from dilute alcohol).

THIO-PHTHALIMIDINE C.H.NS i.e.

C₄H₄C(NH) S or C₄H₄Cy.CH₂SH. [62°].

Formed by warming o-cyano-benzyl sulphocyanide with 'H₂SO₄ at 65° (Day a. Gabriel, B. 23, 2481). Formed also by adding KSHAq to o-cyano-benzyl chloride in alcohol. Needles, which darken in air, v. sol. alcohol and ether. Boiling NaOHAq forms thiophthalide. added to its alcoholic solution forms $C_{16}H_{16}S_{3}$, crystallising from nitrobenzene in needles with green lustre. - B'HCl. Needles. - B'2H2PtCle. Orange - yellow prisms. - B'HI. Needles. Picrate: slender needles.

THIOPHTHENE C,H,S, i.e. CH-C-CH-CH-CH-S.C.S.CH (225° cor.). Formed by distilling citric acid (1 pt.) with P.S. (2 pts.), adding NaOHAq, and distilling with steam (Biedermann a. Jacobson, B.19,2444). Oil, not solid at -10° . Gives the D. 19, 2344). On, not some at -10°. Gives the indephenine reaction. — BC₀H,N₂O₂, [133°]. Yellow needles, v. sol. alcohol and benzene. Reference.—TETRA-HORON-THIOPHTHEME. THIOPHYLLINE C,H₄N,O₂, [264°]. Occurs, in small quantity, in extract of tea (Kossel, B.

21, 2164). Crystals (containing aq), more sol. water and alcohol than theoleomine, v. sol. NH₃Aq. Forms salts with acids. On evaporation with chlorine-water it leaves a scarlet residue, turned violet by NH₃Aq.—C,H,AgN₃O₂.

Amorphous, converted by MeI into caffeine

C,H,MeN,O, [229°].
(a) - THIO-PROPIONIC ACID C,H,OS. Methyl ether CH₃.CH₂.CO.SMe. (120°). V.D. 51·23. Formed from propionyl chloride and lead mercaptide in the cold (Obermeyer, B. 20, 2922).

(8) Thio-propignic acid Et.CS.OH. salt NaA'aq formed by boiling propionitrile with alcoholic ammonium sulphide is crystalline

(Dupré, Bl. [2] 29, 304).

Amide EtC(NH).SH. [42°]. Formed by heating propionamide (5 mols.) with P₂S, (1 mol.) Formed by in benzene for a short time (Hubacher, A. 259, 229). Yellowish plates, v. e. sol. benzene. THIO-ISOPROPYL-COUMARIN C₁₂H₁₂SO i.e.

C.H. CH:C(C,H.,). [81°]. Formed by heating isopropyl-coumarin with P.S. at 120° (Aldringen,

B. 24, 3463). Reddish-yellow needles, sol. hot alcohol, al. sol. ether.

THIO - PRUSSIAMIC ACIDS. By heating ammonium sulphocyanide there is formed, besides thio-urea, dithiodiprussiamic acid C.H., N.S., a yellowish-white powder, sl. sol. hot water; thiodiprussiamic acid C_eH_sN₁₀S, amorphous, m. sol. hot water; and ammonium dithiotriprussiamate C₉H₁₃N₁₃S₂, which crystallises from water. The first acid gives no colour with FeCl₂, the two other bodies give a red colour. The lead salts of these acids dissolve in hot water.

THIOTETRAPYRIDINE, so called,

 $C_{20}H_{18}N_{1}S$ (?). [155°]. Formed by heating nicotine (1 pt.) with sulphur (6 pts.) at 150° till the mass is chrome-green (Cahours a. Etard, Bl. [2] 34, 452). Yellow prisms (from alcohol).—B'2HCl.— B'HHgCl₃.—B'H.PtCl₃: yellow amorphous pp.
THIO - PYROCATECHIN v. OXY-PHENYL

MERCAPTAN.

THIO-PYROMUCIC ACID. Amids

C₄H₃O.CS.NII₂. [127°]. Formed by passing H₂S into a solution of furfuronitrile in alcohol-ether (Douglas, B. 25, 1314). Yellowish crystals, sl. sol. cold water, v. sol. alcohol.

THIO-PYRUVIC ACID. The compound (C₃H₄O₂S)C₃H₄O₃ [87°] soparates as a powder when II.S is passed into pyruvic acid (Böttinger, A. 188, 325). It is v. e. sol. water and is converted by boiling HIAq into CH3.CH(SH).CO2H.

Boiling water forms H.S and thiopyruvic acid.
DI-THIO-RESORCIN C. H. (SH). Mol. w. 142. [27°]. (243°). Formed by reducing the sulphochloride C₆H₄(SO₂Cl)₂ with tin and HClAq (Patschke, J. pr. [3] 2, 418, Körner, G. 6, 140). Crystals, smelling like some geraniums. Pb(OAc)2 added to its alcoholic solution ppts. orange $C_4H_1S_2Pb$, whence McI forms $C_8H_4(SMe)_2$ (278°) (Obermeyer, B. 20, 2927).

THIO.RUFIC ACID C₁₀H₁₁S₃O₄. Formed by the action of CS₂ on a mixture of NaOEt and acetoacetic ether (Norton a. Oppenheim, B. 10, 701). Pearly orange scales, nearly insol. water. -NaA': brick-red needles. - CaA'2: red needles.

THIO SALICYLIC ACID RENZOIC ACID

THIOSINAMINE v. ALLYL-THIO-UREA.
THIO-SUCCINIC ACID. Anhyo Anhydride $C_2H_4^* < \stackrel{CO}{CS} > 0$. 'Sulphosuccinyl.' [31°]. (225°). Formed by adding succinyl chloride dissolved in benzene or CS₂ to an aqueous solution of Na₂S. Got also by distilling succinic acid (100 g.) with P₂S₃ (100 g.) (Auger, A. Ch. [6] 22, 333). White crystals. Its aqueous solution gives off H₂S on heating. Phenylhydrazine forms CO₂H.C₂H.C₂C(SH):N.NHPh [120°] and C₂H.(CO₁C(N₂HPh)) O [216°], which on distillation changes to succinyl-phenyl-hydrazine (155°]. Phenyl-hydrazine also produces C₂H.(CO.N.H.Ph)₂ [219°] (Zanetti, C. C. 1889, 668). Sodium-amalgam forms C₄H.NaSO₂, converted by phenyl-hydrazine acetate into Formed by adding succinyl chloride dissolved converted by phenyl-hydrazine acetate into CO,H.C.H.,CH:N,HPh [c. 175°].

Di - thio - succinic acid C,H. (CO.SH).

Di thio succinic acid C.H. (CO.SH). The salt K.A.", got by boiling succinyl-phenol with KSH in alcohol, crystallises in minute needles. needles, v. sol. water, alcohol, and ether (Weselsky, B. 2, 518). Its aqueous solution is decomposed by spontaneous evaporation. Acids split it up into H₂S and thiosuccinic anhydride (v. supra).

Ethyl ether C.H.(CO.SEt)... (271°). Formed from di-phenyl succinate (42 g.) and sodium mercaptide (30 g.) in dry ether in the cold (Seiffert, J. pr. [2] 81, 469). Oil, smelling of garlic.

THIO. SUCCINURIC ACID C₅H₈N₈SO₂. [211°]. Formed by heating succinic anhydride with thiourea at 140° (Pike, B. 6, 1105). Yellowish powder, insol. alcohol and ether, sl. sol. water and HOAc. Decomposed by alkalis into thiourea and succinic acid.

• (a) - DI - THIO - TEREPHTHALIC ACID C₁H₂S₂O₂i.e. C₂H₁(CO.SH)₂. Formed by the action of alcoholic KSH on di-phenyl terephthalate (Schreder, B. 7, 708). Amorphous, v. al. sol. alcohol.

(β) - Di - thio - terephthalic acid. Amido C_aH₁(CS.NH_.)₂. [263°]. Formed by heating terephthalic nitrile with alcoholic ammonium sulphide (Luckenbach, B. 17, 1430). Yellow amorphous powder, insol. alcohol. Boiling with lead acetate reproduces the nitrile.

lead acetate reproduces the nitrile.

THIOSTUPHATES. Salts of the hypothetical thiosulphuric acid H₂S₂O₃. These salts were called hyposulphites before the isolation of the true hyposulphites (M₂S₂O₄, p. 592). Na₂S₂O₅, 5aq is still, however, commonly known as sodium hyposulphite. Thiosulphates are formed by boiling normal alkali sulphites in solution with S; (M₂SO₂Aq + S = M₂SO₂Aq); caustic alkali solutions and milk of lime also give thiosulphates by boiling with S. Thiosulphates are produced by the action of air, SO₂, or K₂Cr₂O₄Aq on the alkali and alkaline earth polysulphides in solution (M₂S₂Aq + 3O = M₂S₂O₄Aq + 3S; 2M₂S₄Aq + 3SO₄Aq = 2M₂S₂O₄Aq + 9S;

solutions and milk of lime also give thiosulphates by boiling with S. Thiosulphates are produced by the action of air, SO., or K.Cr.O.Aq on the alkali and alkaline earth polysulphides in solution (M.S.Aq + 30 = M.S.O.Aq + 3S; 2M.S.Aq + 3SO.Aq = 2M.S.O.Aq + 9S; 2M.S.Aq + 4M.Cr.O.Aq + H.O = 5M.S.O.Aq + 4Cr.O.Aq + H.O = 5M.S.O.Aq + 4Cr.O.Aq + H.O = 5M.S.O.Aq + 4Cr.O.Aq + 1157) by heating (NH.).2SO. with P.S. got a large quantity of (NH.).2SO. along with (NH.).2SO. and Some (NH.).2SO. along with (NH.).2SO. and Compounds; and by the interaction of H.S and SO.NH.ONH, he obtained (NH.).S.O. A little H.S.O.Aq is said to be formed by the interaction of the said to be formed by the interaction of the said to be formed by the interaction of said to be formed by the interaction of said to be formed by the interaction of steam and molten.

S (Myers, A. 129, 351).

The alkali salts, also the Ca and Sr salts, are readily soluble in water; many of the others are insoluble or only slightly soluble; the insoluble salts are often obtained from solutions of the alkali salts by double decomposition. Thiosulphates are decomposed by heating strongly; alkali salts leave a mixture of sulphate and sulphide; other salts also give off H₂S and S. Aqueous solutions of thiosulphates evolve H₂S when boiled, forming sulphates, or sulphides if the metal of the thiosulphate is ppd. by H₂S.

Aqueous solutions of thiosulphates are decomposed by dilute mineral acids, with separation of S and evolution of SO. Salts of the acid used are formed, and H.S.O.Aq, which then decomposes to H.SO.Aq and S. This reaction has been studied by several chemists (v. Berthelot, C.R. 108, 971; Vaubel. B. 22, 1686, 2703; Vortmann, B. 22, 2307; Foussereau, C.R. 104, 1842). Colefax (C. J. 61, 176) in 1892 examined the interaction of Na.S.O.Aq and acids? he found that when the products of the change are not removed the interaction stops before all the Vol. IV.

H.S.O.Aq is decomposed. C. determined the effects on the velocity and the limit of the reaction of concentration, increasing the relative mass of the acid used, the nature of the acid, temperature, and the presence of SO. in the solution before acidification (reference to older memoirs are given by C.).

Thiosulphates are converted into tetrathionates by the action of 1; oxidisers such as HNOs. KClOs and HClAq, and KMnOsAq produce sulphates. Accordings to Hönig a. Zatzek (M. 4, 738), KMnOs, in solution in acetic acid produces dithionates.

For the general qualitative reactions of thiosulphates compared with those of thionates v. Debus (C. J. 53, 298).

SELENOTHIOSULPHATES M.SeSO, are described Thioselenates, under Selenates (p. 434).

Constitution of thiosulphates. The formula

Constitution of thiosulphates. The formula SO_xOM.SM is generally adopted for the normal thiosulphates of monovalent metals (Odling, C. N. 29, 153; cf. Schorlemmer, C. J. [2] 7, 254; Williamson, C. J. [2] 7, 259). Some chemists, considering the resemblances between thiosulphates and sulphites, have suggested the

formula SO (v. Blomstrand, Die Chemie

der Jetztzeit [Heidelberg, 1869], 258; Buchanan, B. 3, 485; Michaelis, G. O. [5th ed.] 1, 745). The formation of thiosulphates by boiling sulphites with S is readily represented by either formula. according as sulphites are regarded as SO. OM.M or SO.OM.OM. As the balance of evidence is in favour of the formula SO, OM.M, it is likely that the salts formed by adding S to the sulphites are SO_OM.SM. The production of (NII_),S_0, by the interaction of (NII_),SO_ and P_S, (Spring, B. 7, 1158) also confirms the formula SO_OM.SM, inasmuch as a thiosulphate is produced in this reaction from a sulphate (SO, ONH, ONH, giving SO₂ONH₄SNH₄). Spring's synthesis of H₂S₂O₃ from SO₃ and H₂S – for the actual reaction carried out, viz. formation of (NH,)2S,O, by first combining SO, and NH,, and then interacting with H,S, is equivalent to the synthesis of H₂S₂O₂ (v. S., l.c.) - is also in keeping with the formula SO, OM.SM. By warming EtBr with Na2S2O2Aq, Bunte (B. 7, 646) obtained the salt EtNaS,O. This salt is decomposed by dilute acids giving EtSH and SO.,OH.ONa; when heated it gives off Et, S, and SO, leaving Na, SO. These reactions indicate that EtNaS, O, is SO, Na, EtS; hence the formula of Na,S,O, is probably SO,Na.NaS. One of the Na atoms in Na,S,O, is then probably in direct union with an atom of S; and as EtNaS,O, easily gives SO.OH.ONa, along with EtSH, it is likely that the formula of this salt is SO₂ONa.SEt, and hence that the formula for Na₂S₂O₃ is SO₂ONa.SNa. The formula SO₂.OH.SH makes possible the existence of two isomeric salts MM'S₂O₂, viz. SO₂.OM.SM' and SO_2 .OM'.SM; two such salts are known where M = Na and M' = K. (v. Potassium thiosulphate, p. 706).

Ammonium thiosulphate (NH₄)₂S₂O₂. Obtained by the interaction of (NH₄)₂CO₂ and CaS₂O₂Aq, filtering and evaporating (Rammelsberg, P. 56, 298); white, rhombic, deliquescent leaflets, crystallising with xH₂O. Fock a. Klüss (B. 22, 3099; 23, 534) obtained the anhydrous

salt by reacting on SO₂Aq with (NH₄)₂S₂, evaporating at a low temperature and finally over H.SO., and thoroughly drying between filter paper (cf. Arppe, A. 96, 118). The anhydrous salt is not deliquescent (F. a. K.). anhydrous salt is not deliquescent (F. a. K.). Double salts are described by F. a. K. (l.c.; also B. 23, 1753): (1) with CdS₂O₃; (2) with MgS₂O₃; (3) with K,S₂O₉, the salt obtained was SO₂.OK.SNH₄. F. a. K. could not obtain SO₂.ONH₄.SK; (4) with Cu₂S₂O₂ and Cu₂I₄, also with Cu₂I₄ and NH₄I (Brun. C. R. 114, 667); (5) with PbS₂O₃ (Rammelsberg, P. 56, 308); (6) with HgS₂O₄ (R. J.c.).

Barium thiosulphate BaS₂O₂.aq. A white pp. obtained by mixing Ba(C,H₂O₂),Aq and NAS.Co.Ao, and completing non. by alcohol:

pp. obtained by mixing Ba(C₂I₃O₂)₂Aq and Na₂S₂O₃Aq, and completing ppn. by alcohol; loses all water at 170°, at red heat gives

BaS, BaSO, BaSO, and S (H. Rose, P. 21, 437;

Rammelsberg, P. 56, 295).

Double salts. (1) With CdS.O. (Fock a. Klüss, B. 23, 1753); (2) with Cu.S.O. (Cohen, C. J. 51, 38); (3) with PbS.O. (Rammelsberg, P. 56, 308).

P. bb, 308).

Cadmium thiosulphate CdS₂O₂. 2iq (F. a. K.,
B. 23, 534); double salts with (1) Na₂S₂O₃,
(2) K₂S₂O₃, (3) SrS₂O₃ (F. a. K., B. 23, 1753;
Vortmann a. Padberg, B. 22, 2637).

Calcium thiosulphate CaS₂O₃, 6aq. Formed
by mixing hot cone. solutions of CaCl., and

Na.S.O., evaporating under 60°, separating NaCl, which crystallises first, and allowing to cool (Kessler, P. 74, 282). Also obtained by heating CasO, and S with water, or by boiling milk of lime with S, passing in SO,, and crystallising below 60° (Herschel, N. Ed. P. J. 1, 8, 296; 2, 154). Forms large, clear, six-sided, triclinic prisms, that efforcese in air at 40°; S. 100 at 3° (H., l.c.). Conc. solution gives CaSO and S. 8° (H., l.c.). Conc. solution gives CaSO, and S by heating above 60°. Rammelsberg (P. 56, 308) describes a double salt with PbS.O.

Cobalt thiosulphate CoS₂O₂, 6aq (Rammelsberg, P. 56, 398; Fock a. Klüss, B. 22, 8310). A double salt with Na₂S₂O₂ is described by

Vortmann a. Padberg (B. 22, 2637).

Copper thiosulphates. According to von Hauer (W. A. B. 13, 443) an acid cuprous salt Cu.H.(S,O₂), is obtained, in microscopic, goldenyellow needles, by adding conc. CuSO, Aq to Na₂S₂O₃Aq till the liquid is deep yellow, and gently Na_{5,5,2}, and the figure is deep yearlow, and gently warming, washing the pp. with water and alcohol, and drying over H₂SO₄. Double salts of Ou₅SO₂: (1) with BaS₂O₂ (Cohen, C. J. 51, 38); (2) with K₂SO₄ (C., Lc.); Rammelsberg, P. 56, 321); (3) with Ag₂SO₂ (C., Lc.); (4) with Na₂SO₃ (Lenz, A. 40, 99; Siewert, J. 1866, 257; Kessel, Na₂SO₃ (C., Rammelsberg, P. 56, 257; Kessel, P. 56, 257; K B. 10, 1677, 2000; Schütte, J. pr. 70, 249; Vortmann, M. 9, 165)

Iron thiosulphate. The ferrous salt FeS.O. 5aq was obtained by Vortmann a. Padberg (B. 22, 2637) by rubbing BaS.O. with conc. FeSO Aq (the sales being present in the ratio of equal numbers of molecules), filtering from BaSO,, adding a mixture of alcohol and ether, and allowing the green, oily liquid that separated to stand for some days. Small green crystals; very sol. water; solution is decomposed by boiling, with separation of FeS. A double salt with Na,S,O, is described by V. a. P. (i.e.). For accounts of former attempts to prepare pure ferrous thiosulphate v. Fordos a. Gélis (J. Ph. [8] 4, 833); Berthelot (A. Ch.

[5] 2, 58); Vogel (J. pr. 8, 102); Koene (P. 63, 245, 431); Rammelsberg (P. 56, 306).
 No ferric thiosulphate has been isolated.

Lead thiosulphate PbS₁O₂. Obtained by adding Na₂S₂O₂Aq to Pb(NO₂)₂Aq, or Pb(C₂H₂O₂)₂Aq, and washing the pp. with cold water. A white solid; very sl. sol. water; sol. solutions of alkali thiosulphates (v. Pape, J. 1864, 57; Letts, O. J. [2] 8, 424). For reaction with PCl,—giving PbCl, HCl, SO, SOCl, POCl, and probably PSCl,—v. Buchanan (B. 8, 485). Rammelsberg (P. 56, 308) has described double salts with the thiosulphates of NH, Ba, Ca, K (v. also Spring, B. 7, 1157), and Na (v. also Vortmann a. Padberg, B. 22, 2637).

Lithium thiosulphate Li, S,O, Saq (v. Fock a.

Klüss, B. 22, 3096).

Magnesium thiosulphate MgS,O, 6aq. By passing SO, into MgSAq till colourless, boiling MgSO, in SO,Aq with S, or adding BaS,O,Aq to MgSO, Aq and filtering, a solution is obtained which on evaporation at a low temperature gives small, white, prismatic crystals of this salt. small, white, prismatic crystals of this salt. Loses 3H_O at 170°, and gives off SO₂ and S at red heat, leaving MgSO₄ and MgO (Herschel, N. Ed. P. J. 1, 8, 296; 2, 154; Rammelsberg, P. 56, 303; Fock a. Klüss, B. 22, 3310). Double salts (1) with (NH₄)₂S₂O₂, (2) with K₂S₂O₄ are described by R. (l.c.; v. also Kessler, P. 74, 256; also F. a. K., B. 23, 534).

Mangaess thiosulphate MpSO₂, 5aq.

thiosulphate MnS.O. baq. Manganese Formed similarly to FeS.O., 5aq (Vortmann a. Padberg, B. 22, 2637). A double salt with Na.S.O. is described by V. a. P. (l.c.).

Mercury thiosulphates. Neither the mer-curous nor the mercuric salt has been isolated. Addition of a thiosulphate to solution of a mercurous salt ppts. Hg. S; with a mercuric salt, a compound of HgS with the mercuric salt employed is said to be formed (Rammelsberg, P. 56, 314). Double salts of mercurous thiosulphate with (1) (NH,),S,O₂, (2) Cu,S,O₃, (3) Na,S,O₄ are described by Rammelsberg (*l.c.*); and a double salt of mercuric thiosulphate with K,S,O₂ by Vortmann a. Padberg (B. 24, 1351).

Nickel thiosulphate NiS₂O₃, 6aq (Rammelsberg, P. 56, 309; Fock a. Klüss, B. 22, 3310). For a double salt with Na₂S₂O₃ v. Vortmann

Padberg (B. 22, 2637).

Platinum thiosulphate. Not isolated; but Schottländer (A. 140, 200) describes a double

Potassium thiosulphate K₂S₂O₃. Obtained by boiling conc. K₂SO, with excess of S; or by adding hot K₂Cr₂O,Aq to hot K₂S₄Ag, little by

ittle, waiting after each addition till the separated Cr.O. is pure green in colour (2K,S,Aq, +4K,Cr,O,Aq + H,O = 5K,S,O,Aq + 2KOHAq + 4Cr,O.); (Döpping, A. 46, 172; Kessler, P. 74, 274). In either case the filtered solution is evaporated to the crystallising point, and the crystals of K₂S₂O₂.xH₂O are heated to c. 180°. By evaporating at 30°, thin, four-sided, deliquescent prisms are obtained of the hydrated sait 3K,S,O,.H,O (Rammelsberg, P. 56, 29¢; Kessler, Lo.; Fook a. Klüss, B. 22, 8096). This hydrate is very sol. water, but insol. alcohol; it loses all water at c. 180°; heated more strongly it decomposes to K₂S₃ and K₂SO₄ (R., l.c.). Other hydrates are described by D. a. P., l.c. (v. also Plessy, A. Ca. [8] 11, 182; F. a. K., Lo.). The final products of the action of SO, on K₂S₂O₂Aq are K₂S₂O₂Aq, K₂S₂O₂Aq, and K₂S₂O₃Aq (Debus, C. J. 53, 343). Double salts.—(1) with (NH₂)₂S₂O₃ (Fock a. Klüss, B. 23, 534); the salt obtained was

SO, OK.SNH, the isomeric salt SO, ONH, SK SO_{2.}OK.SNH₄, the isomeric salt SO_{2.}ONH_{4.S}K could not be isolated; (2) with Bi₂(S₂O₂)₂ (Carnot, C. R. 83, 338); (3) with CdS₂O₃ (F. a. K., B. 23, 534); (4) with Cu₂S₂O₄ (Cohen, C. J. 51, 38); (5) with HgCy₂ (F. a. K., B. 24, 1351); (6) with HgS₂O₄ (F. a. K., Lc.); (7) with PbS₂O₄ (Rammelsberg, P. 56, 308; Spring, B. 7, 1157); (8) with Ag₂S₂O₃ (Cohen, C. J. 51, 38; Schwicker, B. 22, 1928 describes KAySO₄ NH 1 (20) With N₂ S₂ S₂ 1928, describes KAgS₁O₂, NH₃). (9) With Na₂S₁O₃ two salts are obtained: (i.) SO₂OK.NaS. 2aq, by the interaction of Am₂S₃Aq and NaKSO₃. 2aq; (ii.) SO₂SK.ONa. 2aq, by the interaction of Am₂S₃Aq and KNaSO₂ (v. Sulphites, p. 587); the first salt melts at c. 57° and has S. = 213.7 at 15°, heated with EtBrit gives SO, OK.SEt; the second salt melts at c. 62° and has S, =105°3 at 15°, heated with EtBrit gives SO, ONa.SEt (Schwicker, B. 22, 1728).

Silver thiosulphate Ag,S,O. This salt has probably not been isolated pure. On adding dilute AgNO, Aq to K, S, O, Aq a white pp. is formed, and is dissolved on shaking; addition of more AgNO₃Aq produces a greyish, flocculent pp., which is a mixture of Ag.S.O, and Ag.S. By treating this pp. with NH₃Aq, filtering from Ag.S, exactly neutralising the filtrate by HNO₃Aq, and quickly drying the white flocculent pp. that formed between filter paper, Herschel (N. Ed. P. J. 1, 26, 398; 2, 154) obtained fairly pure Ag,S.O. A white powder; slightly soluble water; solution has a sweet taste; decomposes

readily to Ag₂S and H₂SO₄Aq.

Double salts. Ag₂O and Ag salts generally dissolve readily in solutions of alkali thiosulphates, forming double salts, either of the form 2AgMs,O₃,aq, or of the form Ag,M₄(S₂O₃), 2aq (Herschel, Lc.). (1) With (NH₄)₂S₂O₃; by adding excess of AgCl to (NH₄)₂S₂O₃Aq, and washing the white crystalline pp., 2Ag(NH₄)S₂O₃aq is obtained. Using less AgCl and ppg. the solution by alcohol produces Ag₄(NH₄)₄(S₂O₃), 2aq (H₄, Lc.). (2) With Na₂S₂O₃; addition of AgNO₃Aq, drop by drop, with constant shaking, to Na₂S₂O₃Aq, till a permanent pp. begins to form, followed by addition of alcohol, pps. Ag₂Na₄(S₂O₃), 2aq; the salt is washed with alcohol, and dried in vacuo (Lenz, A. 40, 94); when the mother-liquor from this salt is allowed phates, forming double salts, either of the form when the mother-liquor from this salt is allowed to evaporate 2AgNaS₂O₂, aq is deposited (Her-schel, L.c.; cf. Lenz, L.c.). The second of these salts is much less soluble in water than the saits is muon less soluble in water than the first; it dissolves in Na,S,O,Aq, with formation of Ag,Na,(S,O),.2aq. Both salts are decomposed by boiling their aqueous solutions, with formation of Ag,S. (3) With K,S,O,; two salts are known similar to the sodium salts. Schwicker (B. 22, 1788) describes the compound AgKS.O., NH., Herschel (l.c.) obtained double salts with CaS.O., and with SrS.O.

Sodium thiosulphate Na S.O. 5aq Formation.—1. By boiling Na, SO, Aq with S.—2. By passing SO, into solution of sodium polysulphides.—3. By the action of SO, on soda waste suspended in water, whereby CaS, O, Aq is formed; followed by addition of Na, SO, filtration from CaSO, and appropriate from CaSO, and evaporation.

Preparation.—Na, SO, xaq is dissolved in a little water, the solution is boiled with flowers of sulphur for a considerable time, and filtered; the clear, colourless liquid is evaporated to the crystallising point, and the crystals that separate are purified by recrystallisation from water.

Properties.—Large, white, monoclinic prisms; S.G. 1736 at 40° (Kopp. J. 8, 45; cf. Schiff, J. 12, 41; Smith, Am. J. Pharm. 53, 148). Melts 12, 41; Smith, Am. J. Pharm. 58, 148). Mets at 45° in the water of crystallisation (Kopp. J. 8, 45); at 48.5° (Tilden, C. J. 45, 268). The crystals are dehydrated by keeping in vacuo over H.SO, or by heating to 100°. S. 49.75 at 0°, 69.44 at 20°, 104.16 at 40°, 192.3 at 60° (Kremers, P. 99, 50). An aqueous solution of the salt is easily supersaturated; thus Schiff (A. 113, 350) dissolved 171 parts Na,S,O, 5aq (=108.9 parts Na.S.O.) in 100 parts water at 19.1°, and Kremers obtained a solution of 217.4 parts Na S,O, in 100 parts water at the ordinary temperature. According to Baumhauer (J. pr. 104, 148), a supersaturated solution may be cooled to \$10° without crystallising; addition of a crystal of the salt causes rapid crystallisation, with the evolution of much heat (cf. Parmentier a. Amat, C. R. 98, 735) Solution of Na S.O. 5aq in water is accompanied by the disappearance of much heat; Rudorff (B. 2, 68) says that 110 parts Na.S.O., 5aq dissolving in 100 parts water lower the temperature from 10.7° to -8°, i.e. through 18.7°. Schiff (A. 113, 350) gives the following data for S.G. and compositions of aqueous solutions of Na.S.O. 5aq:-

Na₂S₂O₃. 5aq is insol. alcohol.

According to Jochum (C. C. 1985. 642), a trihydrated salt Na₂S₂O₂. Baq is obtained by adding alcohol to a saturated solution of the ordinary salt, removing the oily liquid that seps. rates, and adding to it 98 p.c. alcohol. According to Parmentier a. Amat (C. R. 98, 785), Na, 8, 0, 5aq is obtained crystallised in needles, melting at c. 82°, by placing a supersaturated

solution of the ordinary salt in a freezing mixture in a closed vessel.

Reactions.—1. Heat decomposes Na.S.O.: the change begins at c. 220° with separation of S, at c. 400° Na,SO, and Na,S, are formed, and at a higher temperature more S is given off, and Na,SO, and Na,S remain.—2. Na,S,O,Aq inter-Na,S,O₆Aq; according to Villiers (C. R. 108, 402) some Na₂S₂O₆ is also formed. With a mix-Ado, to Ad ; seconding to viniers (c. R. 100, 402) some Na_S,O_a is also formed. With a mixture of Na_SO_a and Na_S,O_a in solution I produces NaIAq, Na_SO_aAq and Na_S,O_aAq (Colefax, C. J. 61, 198, 1083).—3. Na.S.O. is oxidised by potassium permanganate colution; in alkaline solutions the oxidation is complete to Na,SO,Aq according to Hönig a. Zatzek (M. 4, 738); Glaser (M. 6, 329) says that the oxidation is also complete in neutral solutions; Luckow (Fr. 32, 53) represents the oxidation, on boiling, either in neutral, acid, or alkaline solution as producing Na,SO₄ and Na,S₂O₅.—4. Acids interact with Na₂S₂O₅Aq, forming Na salts of the acids, and H.S.O.Aq, which then decomposes to H.SO.Aq and S; when the products are not removed from the solution the reaction stops before all the H₂S₂O₂ is decomposed (Colefax, C. J. 61, 176; and v. beginning of article THIOSULPHATES, p. 705).

Combinations.-1. With water (v. supra, Combinations.—1. With water (v. supra, Properties).—2. With various thiosulphates to form double salts. Double salts with CdS.O., CoS.O., FeS.O., PbS.O., MnS.O., NiS.O., Tl.S.O., and ZnS.O. are described by Vortmann a. Padberg (B. 22, 2637); Fock a. Klüss (B. 23, a. Padberg (B. 22, 2637); Fock a. Klüss (B. 23, 1763) also describe that with CdS_{1,0}. Rammelsberg (P. 56, 808) prepared salts with PbS_{2,0}. and Hg_{1,5}0, For a double salt with HgS_{2,0}. Schwicker (B. 22, 1728). For the double salts with K₁S_{2,0}, v. Potassium thiosulphate, double salts, No. (9) (p. 707), and for those with Ag_{2,0}, or an annual double salts, No. (9) (p. 707), and for those with Ag_{2,0}, or annual manual double salts, No. (9) (p. 707).

salts, No. (9) (p. 707), and for those with Ag.S.O., v. Silver thiosulphate, double salts, No. (2) (p. 707). Schottländer (A. 140, 200) describes a double salt 3Na.S.O.,PtS.O., 10aq.

Strontium thiosulphate SrS.O., 5aq. Prepared like the Ba salt (Herschel, N. Ed. P. J. 1, 26, 398; 2, 154; Kessler, P. 74, 274). Fock a. Klüss (B. 22, 3810) describe a salt SrS.O., aq.

Thallium thiosulphate Tl.S.O., A white, crystalline pp., formed by adding Na.S.O., A wite, crystalline pp., formed by adding Na.S.O., aq. thebberling, A. 184, 11). For a double salt with Na.S.O., v. Werther (J. pr. 92, 130); Vortmann a. Padberg (B. 22, 2637); also Jochum (C. C. 1885, 642).

Zine thiosulphate ZnS.O., Prepared by

(C. C. 1885, 642).

Zine thiosulphate ZnS,O., Prepared by double decomposition from ZnSO,Aq and BaS,O.Aq (v. Rammelsberg, P. 56, 295; Fordos a. Gélis, J. pr. 29, 291). For a compound with NH, v. B. (i.c.). For a double saft with Na,S.O. v. Vortmann a. Padberg (B. 22, 2637).

M. M. P. M.

THIOSULPHURIC ACID H.S.O.Aq. acid almost certainly exists in the liquid obtained by adding a gliute weak said to diluta Na.S.O.Aq. the soid and salt being mixed in equivalent quantities; the H.S.O.Aq acon begins to decompose to H.SO.Aq and S. Landolt (B. 16, 2958) has made an extensive investigation into the conditions and time of existence of H_iS_iO_s in solution. Thomsen (Th. 2, 256) gives the thermal data; [SO³Aq,S] = -9310; [SO²,S,Aq] = -1610.

For the salts of H2S2O, v. THIOSULPHATES. M. M. P. M. THIOTOLENE v. Methyl-thiophene. THIO-o-TOLUIC ACID. Amide C.H.Me.CS.NH. [88°]. Formed from o-toluic nitrile (Gabriel a. Heymann, B. 24, 786).

Thio-p-toluic acid. Amide. [168°]. Formed by passing H.S into an alcoholic solution of p-toluic nitrile (Paterzo a. Spica, B. 8, 441). Yellowish needles. Zinc and HClAq yield Zinc and HClAq yield C₆H₄Me.CH₂NH₄

THIO-TOLUÍDINE v. DI-AMIDO-DI-TOLYL SUL-

THIO-p-TOLYL-DI-PHENYL-DI-GUAN-IDINES v. DI-PHENYL-DI-GUANIDO-DI-TOLYL SUL-PHIDE and DI-PHENYL-DI-CARBIMIDO-TETBA-AMIDO-TETRA-TOLYL DISULPHIDE

THIO-TOLYL-DI-PHENYL-THIO-UREA v. DI-PHENYL-DI-THIOURAMIDO-DI-TOLYL SULPHIDE. THIO-URAMIDO-BARBITURIC ACID

 $C_bH_aN_aSO_a$ i.e. $NH_aC(NH).S.CH < CO.NH > CO.NH$ Formed by the action of thio-urea on an aqueous solution of chlore, brome, or di-brome-barbi-turic acid (Mulder, B. 12, 2309; Trzeinski, B. 16, 1057). Formed also by heating alloxan with thio-urea and alcoholic SO, at 100° (Nencki, B. 4, 722; 5, 451). Slender needles, insol. water, sol. hot HClAq. Converted by boiling KOHAq into thio-dialuric acid C,H₄N₂SO₄, 1½aq (?) which yields KA'aq. H₂SO₄ (½ pt.) at 150°-160° forms uro-sulphinic acid C₅H₄N₄SO₂.

THIO-URAMIDO-BENZENE p-SULPHONIC ACID. The salt NH, CS.NH.C, H, SO, K, formed by heating potassium sulphocyanide with amidobenzene p-sulphonic acid at 140°, crystallises from dilute alcohol in aggregates of thin needles (Pellizzari, A. 248, 156).

m-THIO-URAMIDO-BENZOIC ACID m-IHIU-URAMIDU-BERZUIG ACID
NH_CS.NH.C.H. [187°]. Formed from
m-amido-benzoic acid and potassium sulphocyanide (Arzruni, B. 4, 406). Formed also by
allowing a solution of m-cyanamido-benzoic
acid in colourless ammonium sulphide to stand for 24 hours (Traube, B. 15, 2118). Needles. Converted by ammoniacal AgNO, into muramido-benzoic acid. Not coloured by FeCl.

p-THIO UBAMIDO BENZYL-THIO UBEA
NH, OS.NH.C., H., OH., NH. CS.NH., p-w-di-thiuramido-toluene. [176°]. Formed by heating
p-amido-benzyl-amine hydrochloride (1 mol.) with potassium sulphocyanide (2 mols.) in aqueous solution (Amsel a. Hofmann, B. 19, 1289). White needles.

THIO-URAMIDO-BUTYRIC ACID. Anhy-NH:O S-CHEt [200°]. Formed from a-bromo-n-butyric acid and thio-urea (Andreasch, M. 8, 419). Needles, v. sol. hot water.
Thio-uramido-iso-butyric acid. Anhydride

NH:C NH.CO C,H,N,SO i.e. Formed from bromo-isobutyric acid and thio-urea (Andreasch, M. 8, 410). Plates, al. sol. water. Oxidised by HCl and KClO, to urea and a-sulpho-iso-butyric acid.

o-THIO-URAMIDO-CINNAMIC ACID NH_CS.NHC,H_CH:CH.CO_H. [286°-288°].
Got by heating the sulphocyanide of c-amidocinnamic acid C_H_(NH_HSCy)CH:CH.CO_H NH, CS.NH.O, H, CH:CH.CO, H.

(152°) at 115° (Rothschild, B. 23, 3342). V. sol. hot HOAc and NH,Aq.

a-Thio-y-uramido-cinnamic acid C, H, N, SO NH:C(NH2).S.C(CO2H):CHPh. Formed from benzoic aldehyde, thiohydantoin, and NaOHAq (Andreasch, M. 8. 421). Needles (from alcohol), decomposed by alkalis.
p-THIO.+URAMIDO-PROPIONIC ACID

NH:C(NH2).S.CH2.CH2.CO2H. Formed by heating \$\text{\$\text{biodo-propionic}}\$ acid with thio-urea and water and a little NaOH (Andreasch, \$M\$. 6, 831). Small pyramids (containing 2aq), sl. sol. cold water and cold alcohol. Decomposed by baryta into cyanamide and CH2(SH).CH2.CO2H. KClO. and HCl yield β-sulpho-propionic acid.
ωp-DI-THIO-URAMIDO-TOLUENE v. THIO-

URAMIDO-BENZYL-THIO-UREA.

DI-p-THIO-URAMIDO-DI-TOLYL-o-SUL-PHIDE [2:1:4] S(C₆H₂Me.NH.CS.NH₂)₂. Thiop-tolyl-di-thiurea. [121°]. Formed by evaporating to dryness an aqueous solution of di-pamido-di-tolyl sulphide, hydrochloride and ammonium sulphocyanide (Truhlar, B. 20, 669). White amorphous powder. Sol. alcohol and benzene, sl. sol. ether.

THIO-UREA CSN₂H₄ i.e. CS(NH₂), or HS.C(NH₂):NH. Mol. w. 76. [170°]. S. 9 in the cold (Volhard, *J. pr.* [2] 9, 13).

Formation.—1. By heating dry ammonium sulphocyanide for two hours at 170°, cooling to 100°, adding an equal weight of water at 80°, filtering, and allowing to crystallise (Emerson Reynolds, C. J. 22, 1; Claus, A. 179, 113; Smolka a. Friedreich, M. 10, 90).—2. By the action of tin and HCl, or of HI, on persulphocyanic acid C₂H₂N₂S₃ (Glutz, A. 154, 39).— 3. By passing dry H₂S into an ethereal solution of cyanamide (Baumann, B. 6, 1375).-4. By allowing a solution of cyanamide, mixed with yellow ammonium sulphide, to stand for a day (Baumann, B. 8, 26).—5. From cyanamide and thioacetic acid.—6. Together with urea by the action of ammonia on COS (Berthelot, C. R. 94, 1069).

Properties .- Silky trimetric needles, melting repetites.—Shay timetric needles, inclined at 170°. After one fusion it melts at 149° (Prätorius, J. pr. [2] 21, 141). V. sol. water, nearly insol. alcohol and ether. Tastes bitter, not coloured by FeCl₂. According to Armstrong (C. J. Proc. 3, 2), the molecule of this urea is

C.S.N.H.. Reactions.—1. Water at 140° forms ammonium sulphocyanide. Alcohol at 100° acts in like manner (Haller, Bl. [2] 45, 706). -2. An alcoholic solution of nitrous ether quickly conalcoholic solution of netrous ether quickly converts it into ammonium sulphocyanide. — 3. Prolonged heating at 170° also converts it into ammonium sulphocyanide. At 180° it slowly forms guanidine sulphocyanide and ammonium tri-thio-carbonate. Nitrous acid gives off nitrogen.—4. KOH at 100° slowly forms NH₂, KSH, KSCO₂, and a little KCyS. Alcoholic potash acts in like manner (Haller, C. R. 102, 974). H.SO, and HCl act in the same way .- 5. Aqueous H.So, and HCi act in the same way.—5. Aqueous KMnO₄ forms urea and other products (Maly, M. 11, 277).—6. Oxidising agents (e.g. H₂O₂, K₂Cr₂O₂, KNO₂, KMnO₄, and iodine) form S₂(C(NH₂):NH)₂, which has an insoluble nitrate (Storch, M. 11, 452).—7. Ammoniscal AgNO₂ forms urea and Ag₂S.—8. HgO, added to a cold aqueous solution, produces cyanamide.

PbO acts in like manner. At 100° the product is dicyandiamide (Hofmann, B. 2, 605).--Acetoacetie ether reacts forming an ether C,H,N,SO(OEt), which on saponification yields CS NH.CMe CH, v. sl. sol. water (Behrend, B. 19, 219).—10. CCl, COCl forms C,H,Cl,N,S,O, orystallising in slender needles, m. sol. alcohol, sl. sol. water, v. sl. sol. ether; converted by Br into CCl_xSO_xBr (McGowan, C. J. 49, 191; 51, 669; J. pr. [2] 36, 220). CCl_xSO_xCl added to an alcoholic solution of thio urea forms the chloride Cl.CSN H4, which is ppd. on adding ether, while the filtrate contains the compound (CSN₂H₄)₂(CCl₂.SO₂)₂ [125°], which is more sol. alcohol than water, and gives with Br a pp. of CCl, SO, Br. -11. CCl, SO, NH, in alcohol forms flat prisms of (CSN, H,) CCl, SO, H [139°], m. sol. mater and ether, v. sol. alcohol. converted by Br into CCl., SO, Br (M'Gowan, C. J. 51, 667; J. pr. [2] 36, 219).—12. Chloro-accions forms (NH,,CS,NH,CH,,CO,CH,)HCl [126°] (Pawlewski, B.* 21, 402).—13. ClCO, Et forms (NH,,CS,NH,CO,2Et)HCl [117°].—14. CH,Cl.OH gives C2H2N2S, a white amorphous powder, insol. water, nearly insol. all usual menstrua, reconverted into thio-urea by HClAq (von Hemmelmayr, M. 12, 89) .- 15. Di-bromo-succinic acid forms fumaric acid on heating (Nencki a. Sieber, J. pr. [2] 25, 74).—16. A hot cone solution of di-bromo-pyruvic acid forms 'sulphuvinuric acid' C.H. N. SO₂, which crystallises with 2aq, reduces Fehling solution to Cu,O in the cold, and to a copper mirror on warning, and yields the salts CaA'₂, MgA'₂, ZnA', HA'HCl, HA'HBr, and HA'HNO₂ aq (N. a. S.).—17. Bromo-pyruvic ether forms amido-thiazole carboxylic ether $S \leftarrow C(NH_2):N$ [173°] (Steude, A. 261, 30).— 18. Bromo-acctoacetic ether gives μ-amido-thiazyl-acetic ether SCH — C.CH CO.Et. C(NH₂):N. [94°], which yields an acid [c. 130°], split up on fusion into CO, and amido-methyl-thiazole (Steude). a - Chloro - acetoacetic ether forms C.NSMe(NH.).CO.Et [175°] (Zürcher, A. 250, 281).—19. Thio-urea heated with an alcoholic solution of chloro-acetic acid and phenyl-hydrazine forms C₀H₂N₂SO [175°] (Probst, J. pr. [2] 45, 416).—20. Fusion with (3)-iodopropionic acid and a little water forms C, H, N, SO, [176°], which crystallises from water in needles (containing 2aq), sl. sol. alcohol, insol. ether (Andreasch, M. 6, 832).—21. Di-chloro-acctic acid forms thichydautoin. a-Brono-propionic acid forms methyl-thichydautoin (206° uncor.) (Dixon, C. J. 63, 815) .- 22. Aldehyde heated in a sealed tube with thic-urea forms CSN,L,(CHMe), which is al. sol. ether and cold alcohol, and is which is 81. 801. Siner and containing and adecomposed by hot water (heynolds, C. N. 24, 87).—23. Succinic anhydrids at 140° forms C.H.N.SO, [211°].—24. Citraconic anhydrids at 130° forms C.H.N.SO, [223°] (Pike, B, 6, 1104).— 25. Acetyl-acetone and a small quantity of HClAq form CH₂(CMe:N.CS.NH₂)₂HCl [219°]. In presence of excess of HCl the product is CH₂ CMe:N CS [210°] (Evans, J. pr. [2] 48, 503).

Salts .- B'HNO. Crystalline. - B'HCL Formed from the stannous double chloride and

H.S. Crystalline.—B'HI. Tables.—B',NH,Cl. [154°]. Felted crystalline mass (Reynolds, C. J. 59, 385).—B',NH,I. [186°].—B',H,PtCl_s. Yellow prisms, v. sol. water and alcohol. Can be dried at 100°.—B',HPtCl_s. Got when saturated solutions of thio-urea and PtCl, are mixed. Darkred prisms, insol. water, alcohol and ether.—
B'_AuCl. Yellow monoclinic crystals, got by adding AuCl, to a saturated solution of thiourea.—B'TISO,.—B'_2CuSO,. White silky needles. Got by mixing conc. solutions of thio-urea and CuSO, -B', Cu₂(SO₄) 2aq. -B', CuCl. Colourless dimetric crystals, sol. water, but ppd. by HCl and KCl. Alkaline in reaction. Attacked by H.S with difficulty. Does not absorb CO (Rathke, B. 17, 801).-B',Cu,Cl, aq. Ppd. by adding CuCl.Aq to aqueous thio-urea (Rathke, B. 14, 1779; 17, 301). Minute needles, insolwater.—B'_CuCl. Flat needles. Formed by mixing the two preceding salts into which it is decomposed by water.—B'4HgO.—B'₂(HgO)₃ auq. Ppd. by adding neutral Hg(NO₂)₂ to a dilute solution of thio-urea (Emerson Reynolds, 4. 150, 235; Kurnakoff, B. 24, 3956). Crystalline. Loses thio-urea on washing with water.—B'₄HgCl₂: large crystals, v. sol. water.—B'₂HgCl₂: minute needles, nearly insol. water (Claus, B. 9, 227).—B'HgI₂ (Maly, B. 9, 173).—B'HgCyS. Needles, decomposed by heat into dicyandiamide, HCy, and HgS (Nencki, B. 6, 598).—B'_PbCl₂: HCy, and HgS (Nencki, B. 6, 598).—B'_zPbCl_2: needles (Claus, A. 179, 135).—B'Pb(CyS),—B'_SnCl_2.—B'_ZnCl_2: spherical groups of prisms (from water).—B'_ZdSO_.—B'_SiBr_ (Imerson Reynolds, C. J. 51, 202).—B'_ZAg.O 4aq. Crystalline.—B'AgNO_8 (K.).—B'_AgNO_8. [141°]. Silky crystals, sol. hot alcohol (Emerson Reynolds, C. J. 61, 249).—B'_ZAgCl. [171°]. Needles, m. sol. hot alcohol.—B'_ZAgBr. [121°].—B'_ZAgI.—B'_ZAgCl.—B'_ZAgCl. (176°].—B'_ZAgI.—Chloride (CSN_H_)_Cl_2. Formed by passing Cl into a conc. alcoholic solution of thiourea (Claus, A. 179, 139). Formed also by the action of CCl_xSO_Cl, and of ICl, ICl, or POCl_3.

action of CCl₃SO₃Cl, and of ICl, ICl₃, or POCl₃ on thio-urea (M'Gowan, C. J. 49, 191; J. pr. [2] 83, 188). Small needles, v. sol. water, m. sol. alcohol, insol. ether. Decomposed by alkalis, yielding cyanamide. Alcoholic KI removes chlorine, setting thio-urea free. Dilute HNO, forms crystals of (CSN₂H₄)₂(NO₃), which is sl. sol. water, insol. alcohol and ether.

Bromide (CSN₂H₄)₂Br₂. Formed by adding Br to an alcoholic or cold aqueous solution of thio-urea; in aqueous solution excess of Br produces urea (Claus, A. 179, 138; M'Gowan, C. J. 51, 378; J. pr. [2] 36, 216). Crystals. Its aqueous solution deposits S when heated.

Sodium-amalgam reproduces thio-urea.

Iodids (CSN₂H₄),I₂. Formed from thio-urea, I, and alcohol (M'Gowan, J. pr. [2] 33, 192). Priems.

Prisms.

Methylo-iodide (CSN₂H₄)MeI. [117°]. Formed slowly by combination of thio-urea with MeI in the cold (Bernthsen a. Klinger, B. 11; 498). Prisms, v. sol. water and alcohol. gives the chloride, which forms the platino-chloride (B'MeCl),PtCl, aq. Ethylo-chloride B'EtCl. Crystals.

Ethylo-bromide (CSN.H.)EtBr. Hexa-gonal plates (Claus a. Siegfried, A. 179, 145). Decomposes at 100°.

Ethylo-iodides (CSN.H.)Etl. Crystal-

line. Gives with moist Ag2O a base. Boiling aqueous alkalis liberate mercaptan.—B',Et,PtCl. (dried at 100°). Tables.—B'zEtI. Needles (from alcohol) (Claus, B. 8, 41).

Bensylo-chloride (CSN,H,)C,H,Cl. [168°].

Formed from benzyl chloride and thio-urea. Yields unstable benzyl-thio-urea CSN₂H₃C,H₄[72°], which decomposes at 100° into dicyandiamide and benzyl mercaptan (Bernthsen a. Klinger, B. 12, 574).—(CSN₂H₄C,H₄Cl)₂PtCl₄. Compound with oxalic ether

(CSN₂H₄)₂Et C₂O₄. [150°]. Monoclinic crystals (Nencki, B. 7, 780). Decomposed by hot water.

Compounds with amines (CSN₂H₄), NMeH₂Br. [138°]. Formed methylamine hydrobromide and thio-urea in alcohol (Reynolds, C. J. 59, 392). Felted crystals.—(CSN,H,),NEt,H,Br. [134°]. Formed by boiling thio-urea together with diethylamine hydro-bromide and absolute alcohol.— (CSN₂H₄)₃NEt₃HBr.—(CSN₂H₄)₂NEt₄I [135°].

Prisms.—(CSN_H_J_sNEt_Br [160°]. Rectangular prisms (Reynolds, C. J. 59, 388).

Acetyl derivative CSN_H_Ac. Mol. w. 118. [165°]. Formed by heating thio-ures with Ac_O (Nencki, B. 6, 598). Formed also from thio-acetic acid and cyanamide (Prätorius, J. pr. [2] 21, 147). Prisms (from hot water), v. sol. alcohol, m. sol. ether.—B'H₂PtCl_a. Crystalline.

Propionyl derivative (Freytag, J. pr.

[2] 20, 381).

Benzoyl derivative CSN2H3Bz. [170°]. Formed by warming thio-urea (2 mols.) with BzCl (1 mol.) (Pike, B. 6, 755). Got also from benzoyl sulphocyanide and NH₂Aq (Miguel, BL. [2] 25, 252). Needles (from alcohol); sl. sol. cold water. Tastes bitter. cold water. Tastes bitter.
o-Oxy-benzoyl derivative

NII, CS.NH.CO.C. H.OH. [182°]. S. (boiling alcohol) 7. Formed from salicyl thiocarbimide and aqueous NH_s (Miguel, A. Ch. [5] 11, 304).

THIO- URIC ACID v. THIO-URAMIDO-BARBI-TURIC ACID

THIO-VALERIC ALDEHYDE C, II, S. (115°). Formed, together with C5H6S, [95], by heating isovaleric aldehyde (23 pts.) with S (9 pts.) in scaled tubes at 250° for eight hours (Barbaglia, G. 11, 95; B. 17, 2654). Oil with penetrating odour like onions, sol. alcohol and ether. Does

not combine with NaHSO.

Isomeride C₂H₁₀S. [69°]. V.D. (H=1)
50.76. Formed by passing H.S into a dilute aqueous solution of isovaleric aldehyde. Fibrous

crystals (from ether), insol. water.

THIOXENE v. DI-METRYL-THIOPHENE. THIOXYLENOL v. XYLYL MERCAPTAN.

THIOXYL METHYL KETONE v. DI-METHYL-TRIENYL METRYL KETONE.

THORIUM Th. (Thorinum.) At. w. 232. Mol. w. unknown. The m.p. of Th has not been Mol. w. unknown. The m.p. of Th has not been determined; it is certainly very high (Nilson, B. 15, 2541). S.G. 11·1 at 17° (N., Lc., p. 2543). S.H. '02787 (N., B. 16, 161). Crystallises in regular octahedral and hexagonal forms, isomorphous with Si (Brögger, Z. K. 7, 442; cf. Nilson, B. 15, 2546; 16, 162 note). S.V.S. 20·9. Historical.—In 1818 Berzelius announced

the discovery of the oxide of a new element in a rare Norwegian mineral; to the metal of this oxide he gave the name thorium (from THORIUM.

the Scandinavian god Thor). A few years later Berzelius found that the substance he had supposed to be a new earth was really yttrium phosphate. In 1828, however, Berzelius isolated a new earth from another Norwegian mineral: he named the new earth thoria, and the mineral from which it had been prepared he called thorite (P. 16, 385). In 1851 Bergemann discovered a new metal and called it donarium: but this metal was shown to be identical with the thorium of Berzelius by Damour (C. R. 34, 685), Berlin (P. 87, 608), and Bergemann himself (P. 85, 558). In 1862 Bahr supposed he had found a new metal, which he called wasium, but soon afterwards he recognised that the metal was identical with thorium (P. 119, 572; 132, 227). The metal thorium was isolated by Berzelius in 1828 (P. 16, 385); it was also obtained by Chydenius in 1861 (Bl. [2] 1, 130); and in a state

of greater purity by Nilson in 1882 (B. 15, 2537).

Occurrence.—Compounds of Th have been found only in very small quantities in a few localities. Thorite from Lövön in Norway contains c. 59 p.c. ThO, according to Berzelius; an orange-coloured variety of this mineral, orangite, was found by Bergemann to contain 74 p.c. ThO₂; Nilson (B. 15, 2519) found from 50 to 59 p.c. ThO₂ in different specimens of thorite. Small quantities of ThO, have been found in specimens of pyrochlore, monazite, samarskite, euxenite, gadolinite, and orthite. Several minerals containing Th have been discovered by Hidden a. Mackintosh in North Carolina and Colorado; one of these is a silicophosphate of Th, another a silicate of Th and Y, another a silicate of Th and U, and another is a uranate of

Th, Pb, and Y (Am. S. [3] 36, 461; 38, 474).

Formation. — 1. By reducing ThCl, or 2ThCl, KCl, by heating with K (Berzelius, P. 16, - 2. By reducing fused ThCl, 2ThCl. KCl, by means of Na (Chydenius, Bl. [2]

1,130; 6,433; Nilson, B. 15, 2537).

Preparation.—Powdered thorite is evaporated with HClAq to dryness; the residue is heated to render silica insoluble, and treated with water; the solution is filtered and ppd. Ly H₂S; the filtrate from PbS is ppd. by NH₃Aq, and the pp. of crude ThO₂.xH₄O is thoroughly washed and dissolved in HClAq; $Th(C_2O_4)_2$ is ppd. from this solution by $H_2C_2O_4Aq$, and the pp., after being thoroughly washed with boiling water, is decomposed by heating; the crude ThO2 thus obtained is converted into Th(SO₄)₂ by treatment in a Pt basin with conc. H₂SO₄ after being thoroughly moistened with water. The impure Th(SO₄), thus obtained is freed from acid and water by heating, and is dissolved in as little ice-cold water as possible (c. 5 parts are required), and the solution is heated to c. 20°, when Th(SO₄₎₂9H₂O ppts. The Th(SO₄₎₂9H₂O is dehydrated by heating; the Th(SO₄₎₂ is dissolved in the minimum quantity of ice-cold water and the solution is heated to c. 20°; the crystals of Th(SO₄)₂.9H₄O that separate are dehydrated, dissolved in ice-cold water, and the hydrated sulphate is ppd. by heating to 20°. This treatment is repeated a few times, when pure Th(SO₄)₂.9H₂O is obtained. This method of purifying crude sulphate of Th, which is given by Nilson (B. 15, 2521), depends on the great differences between the solubilities in water of

Th(SO₄), and Th(SO₄), 9H₄O; the former, when pure, is soluble in 20.6 parts water at 0°, the latter requires 88 parts water at 0°, and much more at 20°, for solution. The sulphates of the metals present in the crude Th(SO₄), prepared as described are much more soluble in water at 20° than Th(SO₄)_x9H₂O. For other methods of preparing and of Th from thorits v. Berzelius (l.c.), Chydenius (l.c.), Delafontaine (Ar. Sc. [2]

18, 343), and Cleve (Bl. [2] 21, 115).

To prepare Th from pure Th(SO₁), Nilson (B. 15, 2538) dissolved the salt in water, ppd. by KOHAq and boiled, washed the ThO_{...}xH₂O thoroughly, dissolved in HClAq and repud. by KOHAq (to remove all traces of H.SO.); he thoroughly washed the pp. by decantation, dissolved it in HClAq, added KCl, in the ratio 2ThCl.:KCl, evaporated to dryness in a Pt basin. and dried the residue by warming over a flame, stirring constantly, and then powdering and heating again. The dry double salt of ThCl. and KCl was heated to redness in a stream of dry HCl (prepared from conc. H.SO, and sub-limed NH,Cl), HCl was removed by a stream of H. and some of the salt was transferred to a cylinder of wrought iron (fitted with a lid which screwed on), in which a layer of dry NaCl had been placed; pieces of sodium were arranged over the Th-K salt in the cylinder, on these was placed another layer of the Th-K salt, and the cylinder was thus nearly filled with alternate layers of Na and the double salt; the contents of the cylinder were pressed together by a piston which fitted into the cylinder, sufficient dry NaCl was added to fill the cylinder, the lid was screwed on, and the apparatus was heated to full redness for about fifteen minutes; after cooling, the contents of the apparatus were treated with cold water. whereby chlorides were dissolved and the excess of sodium was converted into NaOII and dissolved (the action is apt to be explosive); the thorium was washed with water, then with alcohol, and finally with ether, and dried at 100°.

The yield of thorium by this method is almost equal to that calculated from the equation. For a detailed description of the iron cylinder used for reduction v. Nilson a. Pettersson, W. 4, 554

(on the preparation of Be).

Properties.—Prepared as described, Th forms a greyish-white, glistening powder; the powder consists of small, thin, six-sided, crystalline leaflets; the larger crystals are as white and lustrous as silver, the smaller are grey and less lustrous. The crystals are somewhat brittle. S.G. at 17° 11.1 to 11.23; the latter number referring to the well-crystallised metal (Nilson, B. 15, 2543; 16, 160). S.H. (0° to 100°) ·02787, hence at. heat = 6.4 (N., B. 16, 161). Crystallises in combina. = 6.4 (N., B. 16, 161). tions of regular octahedra and hexahedra; isomorphous with Si (N., l.c., and note, p. 162). S.V.S. 20.9. The emission-spectrum of Th has been mapped by Thalen (Détermin. des Longueurs d'Onde des Raies Métalliques [Unsala, 1868]); the most marked lines are three in the indigo; 4393, 4382, and 4281. Soret (Ar. Sc. [2] 63, 59; [8] 4, 94) found that ThCl,Aq outs off almost the whole of the ultra-violet part of the spectrum.

Th is unchanged in air up to 1000-1200; when heated to a higher temperature it burns to ThO, with production of much white light. Th is readily oxidised by heating in O; on this account some of the metal is oxidised in the process of preparation if the lid of the cylinder does not fit tightly. Nilson's experiments (B. 15, 2541) show that Th does not melt at the full heat of a wind-furnace. Th does not react with water; it combines directly with Cl, Br, I and S. The metal is slowly acted on by H,SO, or HNO, rapidly by HClAq or aqua regia; alkali solutions do not seem to react.

The at. w. of Th has been determined: (1) by analysing Th(SO₄), and hydrates of this salt (Berzelius, P. 16, 898 [1829]; Chydenius, P. 119, 43 [1861]; Delafontaine, Ar. Sc. 18, 343 [1863]; Hermann, J. pr. 93, 114 [1864]; Cleve, Bl. [2] 21, 116 [1874]; Nilson, B. 15, 2527 [1882]; Krüss a. Nilson, B. 20, 1665 [1887]); (2) by analyses of the double Th-K sulphate (Berzelius, l.c.); (3) by analyses of the acetate, oxalate, and formate of Th (Chydenius, l.c.); (4) by determining S.H. of Th (Nilson, B. 16, 153 [1883]); (5) by finding V.D. of ThCl, (Krüss, a. Nilson, B. 20, 1665 [1887]). The mol. w. of Th is not known.

Th is distinctly metallic in its chemical relations; the only oxide that has been isolated with certainty, ThO,, is basic, forming salts ThX_2 ($X-SO_4$, $2NO_3$, &c.). There are indications of the existence of a higher oxide (? Th_2O_3). Thorium forms the last member of the even-series family of Group IV. in the periodic classification of the elements. The members of this family are C, Ti, Zr, Ce, -, Th. The four elements Ti, Zr, Ce, and Th closely resemble one another in their chemical properties; they are also similar to the odd-series family of Group IV., namely, Si, Ge, Sn, —, Pb. For a general account of Group IV. (and more especially of C and Si) v. CARBON GROUP OF ELEMENTS (vol. i. p. 682); for a description of the even-series family (Ti, Zr, Ce, Th) v. TITANIUM GROUP OF ELEMENTS (this yol. p. 749); and for the odd-series family (Ge, Sn. Pb; Si being described in vol. i. p. 652) v. TIN GROUP OF ELEMENTS (this vol. p. 735).

The atom of thorium is tetravalent in the

gaseous molecule ThCl..

Reactions and Combinations (Nilson, B. 15, 2541).—1. Heated in air, oxidation begins at c. 120°, and at much below red heat the metal burns brilliantly to ThO2. -2. Heated in a stream of oxygen, the metal burns to ThO2, with the production of dazzling white light.—3. The burns to ThX, when heated in chlorine, in bromine vapour, or in vapour of iodine.—4. When heated with sulphur part of the S. volatilises, and when the temperature is above the b.p. of S combination occurs with production of much light, ThS, being formed.—5. According to Troost (C. R. 116, 1227). The combines with carbon, when ThO₂ is mixed with C and heated in CO₂ in the electric are (v. Carbide, tafra).—6. Water does not react with Th at any temperature, so far as experiments have seen tried. Nilson (l.c.) gives no details, but says 'Thorium is not changed by water under any conditions.'—7. Sulphuric acid reacts slowly with Th; when dilute, the acid evolves H; when cone. and hot, SO, is given off.—8. The action of nitric acid is slight; the dilute warm acid acts very gradually; conc. acid is almost without action.—9. Hydrochloric acid rapidly dissolves Th, forming ThOL, and giving off H; the action

is most complete with conc. acid.-10. Acua regia dissolves Th easily .- 11. Alkaline solu. tions seem not to react with Th.

Detection and Estimation .- Salts of Th are colourless when the acid is colourless. Alkalis, and also (NH₄)₂SAq, ppt. gelatinous, white ThO₂2H₂O₄ insoluble in excess of the precipitant: alkali carbonates form a white pp. soluble in excess; solution in (NH₄)2CO3Aq becomes turbid at 60°, but goes clear on cooling; saturation of a solution of a salt of Th with K,SO, forms Th(SO,)2.K2SO,2H2O, insoluble in K,SO,Aq, but soluble in water; K,FeCy,Aq ppts. white ThreCy,; oxalic acid and alkali oxalates ppt. white amorphous Th(C₂O₄)₂, insoluble in dilute acids, soluble in solutions of alkali oxa-

lates or NH₄,C₂H₄O₂, especially on warming.

Th is generally estimated by ppn. as
ThO₂,2H₄O or Th(C₂O₄)₂, and subsequent conver-

sion into ThO, by heating.

Thorium, bromide of. The gummy, white mass obtained by Berzelius (P. 16, 385), by evaporating a solution of ThO2.2H2O in HBrAq, was probably ThBr. The hydrated salt ThBr. 10aq seems to have been obtained, from ThO... 2aq, by Jannasch, Locke, a. Lesinsky (Zeit. f. anorg. Chemie, 5, 283).

Thorium, carbide of. By heating an intimate mixture of ThO, and C in the electric arc, in an atmosphere of CO₂, Troost (C. R. 116, 1227) obtained a hard, brittle solid, containing from 8.2 to 9.5 p.c. C, and therefore approximating to the formula ThC₂ (which requires 9.38 p.c. C). S.G. 10.15 at 15°; scratches glass slightly; decomposes cold water, giving off H and strongly smelling hydrocarbons; gradually decomposes in moist air; burns rapidly and brilliantly when heated to redness.

Thorium, chloride of, ThCl,. Mol. w. 378-5-V.D. 172.2 at 1050°-1270° (Krüss a. Nilson, B. 20, 1671). This compound is formed by heating a mixture of ThO, and C in a stream of dry Cl; the ThCl, sublimes in white needles. Kriiss a. Nilson (B. 20, 1675) prepared pure ThCl, by heating Th to incipient redness in a stream of dry, air-free HCl; then raising the temperature to full redness, in order to sublime a little FeCl, formed from the iron in the thorium used; and finally subliming the ThCl, at an incipient white heat. (For details of the apparatus used v. Nilson a. Pettersson, J. pr. [2] 33, 1 [cn preparation of BeCl2]).

ThCl, crystallises in lustrous, white needles; moderately hygroscopic, but remains some hours in the air before deliquescing (K. a. N., Lc.). Does not volatilise at c. 420° (Ohydenius, P. 119, 43). The V.D. found by K. a. N. at temperatures from 1050° to 1270° shows that the formula ThCl, is molecular. K. a. N. got the value 142 for V.D. at 1400°, showing that dissociation had begun. Troest (C. R. 101, 860) obtained values for V.D. of ThCl, at c. 950° considerably lower than those of K. a. N. It is likely that his specimen was not pure, or that the apparatus used contained traces of O sufficient to cause decomposition to ThO, and Cl (K. a. N., *l.c.*, p.

Hydrated thorium chloride ThCl. 8H,0 was obtained by Cleve in thin, white prisms, by con-centrating a solution of ThO. 2H.O in HClAq. allowing to crystallise, and drying over H.SO.

(Bl. [2] 21, 116).

Double salts.—ThCl, combines with potassium chloride to form 2ThCl., KCl.18H.O: obtained by mixing very cone. solutions of the tained by mixing very cone. solutions of the constituents. Forms small, white crystals; v. sol. water, also sol. alcohol; dehydrated by heating in HCl (Cleve, Bl. [2] 21, 116). By heating a dry mixture of ThCl, and NH,Cl in HCl, Chydenius (Bl. [2] 1, 130; 6, 433) obtained a compound with ammonium chloride, which, when crystallised from water in vacuo, had the composition ThCl,.8NH,Cl.8H,O; loses 6H,O at 100°. Cleve (l.c.) prepared a compound with platinic chloride ThCl, PtCl, 12H, O; and Nilson (l.c.) a compound with platinous chloride 2ThCl, 3PtCl, 24H, O.

Thorium, ferrocyanide of, ThFeCy,4H₂O. A white powder; prepared by adding K,FeCy,4Aq to solution of a salt of Th (Cleve, Bl. [2] 21,

116)

Thorium, fluoride of, ThF, 4H,O. Obtained by adding HFAq to ThCl, Aq; the gelatinous pp. becomes powdery after a time (Chydenius, Bl. [2] 1, 130; 6, 433). Loses H₂O at 100°, and 2H₂O at 140°-200°; heated to redness gives ThO₂ and HF. Berzelius (P. 16, 385) obtained a heavy white powder by heating ThO, 2H,O a neavy write powder by neating 110,234,0 with HFAq. Combines with potassium fluoride; Chydenius (l.c.) obtained two salts, (1) ThF, KF by mixing ThCl, Aq with KHF, Aq, (2) ThF, 2KF, 4H, O by boiling ThO, 2H, O with conc. KHF, Aq and HFAq. The isolation of a third salt, 7ThF, 8KF, 6H, O, is doubtful.

Thorium, hydride of. By heating ThO, with excess of Mg powder, in a stream of H, Winkler (B. 24, 885) obtained a grey powder, which gave off H with dilute HClAq, and burnt when heated in O. Analyses of this powder gave 72.86 p.c. Th, 50 p.c. H, 17.57 p.c. Mg, and 9.07 p.c. O. Supposing the ThO, Mg, and H interacted in accordance with the equation ThO, + 2Mg + 2H =ThH2+2MgO, then, from the quantities of ThO, and Mg used, the product would give on and sis 73.77 p.c. Th, 63 p.c. H, 15.45 p.c. Mg, and 10.15 p.c. O. From these data Winkler concluded that a hydride, ThH₂, was formed in the reaction.

Thorium, hydroxides of, v. Oxides and Hy-

DRATED OXIDES (infra).

Thorium, iodide of. The white gummy mass, crystallising after a time, obtained by Chydenius (Bl. [2] 1, 130; 6, 433) by evaporating a solu-

(BL [2] I, 101; 0, 453) by evaporating a solution of ThO₂.2H₂O in HIAq, was probably ThI₄. The substance goes brown in the light.

Thorium, nitride of, By heating ThO₄ or ThCl, in NH₃, also by heating ThCl, and NH₄Cl in HCl, Chydenius (*l.c.*) obtained a small quantities. tity of what he supposed to be either a nitrida. of Th or a compound of the metal with N and

Thorium, oxides and hydrated oxides of. Besides the oxide ThO₂ a peroxide, probably

Th.O., is said to exist.

THORIUM DIOXIDE ThO. (Thoria.) Mol. w. THORIUM DIOXIDE ThO... (Thoria.) Mol. w. not known. Obtained by ppg. a salt of Th by alkali, (NH.), SAq. or KCNAq, drying, and strongly heating; also by decomposing Th(C₀), by heat. A fine, white powder. S.G. 10.22 at 17° (Nilson, B. 15, 2536). S.V.S. 25.87. S.H. (0° to 100°) 0548 (N. a. Pettersson, B. 13, 1459). By heating ThO, with borax in a porcelain oven, Nordenskjold obtained the oxide in microscopic crystals isomorphous with SnO, and ZrO₂ (P. 150, 219). ThO, has not been fused; it is not reduced by heating with C, but when mixed with C and heated in Cl the chloride ThCl is obtained. ThO, does not react with molten alkalis. It is scarcely acted on by acids; warm cone. H₂SO₁, however, converts it into Th(SO₂).

HYDRATES OF THORIUM DIOXIDE. The dihydrate ThO, 2H,O (4 ThO, H,, thorium hydroxide) arate 110.,211.,0 (= 110.,11, thorium hydroxide) is obtained by ppg. a solution of a salt of Th by an alkali, (NH₁)₂SA₃, or KCNAq, washing, and drying at 100°. It forms a hard, white solid. ThO₂2H₄O combines with CO₂ in the air; it dissolves in acids, forming salts ThX₂, where X = SO₁, 2NO₃, &c. Another hydrate, 4ThO₂H₄O (= Th₂O₁OH)₂, thorium metahydroxide) is obtained according to Close (H₁(2), 116) by tained, according to Cleve (Bl. [2] 21, 116), by theating ThO₂ (obtained by decomposition of Th(C,O)₂) with excess of HNO₂Aq or HClAq at 100° till the acid is driven off, adding water, and then ppg. the opalescent solution so obtained by NH, Aq, washing, and drying at 100°. This hydrate is said to be insoluble in dilute acids.

THORIUM PEROXIDE Th2O,. An oxide with this composition is said to be produced by adding H₂O₂Aq and NH₃Aq to a solution of a salt of Th (Cleve, Bl. [2] 43, 53; Lecoq de Boisbau-

dran, C. R. 100, 605).

Thorium, oxysulphide of. By strongly heating ThO₂, obtained from ThO₂, 2H₂O, in CS₂ vapour, Chydenius (Bl. [2] 1, 130; 6, 433) obtained a solid substance to which he gave the composition of the c formula 2ThO. ThS₂ = Th₂O₁S₂. According to Krüss a. Volk (Zeit. f. anorg. Chemie, 5, 75; 6, 49), the compound obtained by heating ThO₂ in CS₂. is ThOS, and the same compound is formed by

heating 2ThCl, KCl in H.3.

Thorium, phosphide of. By heating Th in vapour of P, Berzelius (P. 16, 385) obtained a dark grey, metal-like, lustrous solid, which was changed to Th phosphate by heating in air.

Thorium, platinocyanide of,

Th(PtCy.), 16H,O. Yellow green, orthorhombic prisms (Cleve, Bl. [2] 21, 116).

Thorium, salts of. All the normal compounds which have been isolated by replacing H of acids by Th belong to the class ThX, where X=2NO, 2IO, SO, SO, 3PO, &c.; basic salts also exist. The chief salts of oxyacids are borate, carbonate, chlorate, chromate, iodate and periodate, molybdate, nitrate, oxalate, phophates, selenate and selenites, silicates, sulphate and sulphite, and tartrate.

Thorium, silicofluoride of. By treating ThO₂2H₂O with H₂SiF₄Aq, Cleve (Bl. [2] 21, 116) obtained a semi-transparent, crystalline solid, probably Th(SiF,); insol. in excess of H₂SiF_s; over H_sSO, gave off, HF and SiF_s. Thorium, sulphide of, ThS_s. Obtained by heating Th with S; excess of S sublimes, and

when the temperature passes the b.p. of Sthe elements combine with evolution of heat and light (Nilson, B. 15, 2542; cf. Berzelius, P. 16, light (Nilson, B. 16, 202; 17, Berzenus, r. 10, 385). Also formed by heating ThO₂, obtained from Th(C₂O₂), to white heat in vapour of CS₂ (Chydenius, Bl. [2] 1, 180; 5, 483); but, according to Krüss a. Volk (l.c.), the compound thus formed is ThOS. A black powder. Burns when heated in air, giving off SO₂ and leaving ThO, Not acted on by HClAq or HNO, Aq; aqua regia dissolves the compound, forming Th(SO). Molten KOH forms K,S and ThO; heating in Cl produces ThCl.

Thorium, sulphocyanide of. The salt [? Th(SCy)] is obtained, as a viscid mass, by eva-The salt porating a solution of ThO2.2H2O in HSCNAq. A solution of the compound gives a pp. with HgCy, said to be Th(OH), SCy, HgCy, HgCy, HgO; and the filtrate is said to give crystals of Th(OH)(SCy), 3HgCy, 12H, O (Cleve, Bl. [2] 21, 116) 116). M. M. P. M.

THUJIGENIN C₁₄H₁₂O₇₅or C₂₂H₂₄O₁₄. Occurs in small quantity in Frondes Thujæ, the green parts of Thuja occidentalis (Rochleder a. Kawalier, Sits. W. 29, 10). Minute needles, v. sl. sol. water, sol. alcohol. NH, colours its alcoholic solution green. AcCl forms resinous C14H11AcO1.

THUJIN C₂₀H₂₂O₁₂. Occurs in the green branches of *Thuja occidentalis* (Rochleder a. Kawalier, Sits. W. 29, 10). Minute lemon-yellow four-sided tables, sol, alcohol. Tastes bitter. Its alcoholic solution is coloured vellow by alkalis, is turned reddish-brown by air, gives a yellow pp. with lead acetate, and gives a darkgreen colour with FeCl. Reduces ammoniacal AgNO. Boiling dilute H.SO, turns it first green, then yellow, and splits it up into sugar and thujetin. Boiling baryta-water hydrolyses it in like manner.

Thujetin $C_{28}H_{28}O_{16}$. Yellow solid, nearly insol. water, sol. alcohol and ether. Not altered by dilute HCl or H,SO,. Its alcoholic solution is turned a splendid bluish-green colour by NH, Aq. Gives, in alcoholic solution, a red pp. with lead acetate, and a black colour with FeCl, Boiling baryta-water converts it into thujetic acid $\hat{C}_{2a}H_{2a}\hat{O}_{1a}$, which crystallises in minute lemon-yellow needles, sol. alcohol and ppd. by water.

(B)-THUJOL is TANACETONE.

THUJONE C, H, O. (212°). S.G. 22 .9265. Occurs, together with the terpene C₁₀H₁₆ and lævorotatory fenchone, in the essential oil of thuja obtained by distilling the ends of the branches and the leaves of Thuja occidentalis with water (Schweizer, A. 51, 398; Jahns, Ar. Ph. 221, 748; Wallach, A. 272, 109). Yields an oxim.

Reactions. -1. When heated with ammonium formate it yields a formyl derivative which on C₁₀H₁₁, NH₂ (199°), which forms the salts B'₂H₂PtCl₂ and B'HCl. Thujone amine hydrochloride decomposes on distillation into NH,Cl and thujene $\hat{C}_{10}H_{10}$ (c. 173°), S.G. $\stackrel{20}{\sim}$ 84.—2. KMnO, forms two 'thujaketonic acids.'—3. Br forms C. H. Br.O [122°] (Wallach, A. 275,

179).

(a) Thujaketonie acid C₁₀H₁₆O₂ i.e.
CH₂CO.O₂H₁₇CO₂H. [76°]. S. c. 2·5 at 100°.
Transparent plates. Yields an oxim [c. 186°]. (B) Thujaketonic acid C₂H₁₇(CO.CH₂).CO₂H. [79°]. S. 1·43 at 100°. Small matted needles. On distillation it yields methyl heptyl ketone (186°) S.G. 2° 854, which gives \(\psi\$-cumene dihydride C₂H₁₄ on heating with ZnCl₂ at 100° (Wallach, A. 275, 166). Forms an oxim [106°] which crystalliaes in needles. AgA'; \(\psi\$, et al. acid. which crystallises in needles. -AgA': v. sl. sol. ould water.

THULIUM. This name was given by Cleve in 1879 to the metal of a new earth which he announced to be present in specimens of gado-linite (C. R. 89, 478). The name thulium was derived from Thule, the old name for Scandinavia. The presence of the new earth was more or less confirmed by the work of Nilson (B. 13, 1433), and of Soret (C. R. 89, 251). In 1880 Cleve said he had isolated thulia, and described it as a white earth, giving an emission spectrum characterised by two bright lines 5896 and 5306. and forming solutions of salts which showed two absorption bands 6840 and 4645. To this earth Cleve assigned the formula Tm.O., and he determined the maximum value of the atomic weight of the supposed element to be Tm = 170.7. In 1888 Krüss a. Nilson declared that thulium consists of two distinct elements (B. 21, 1681).

The absolute homogeneity of thulia has been

by no means established (v. METALS, RARE, vol.

iii. p. 245). M. M. P. M. THYME OIL. The essential oil from garden thyme, Thymus vulgaris, contains laworotatory thymene $C_{10}H_{16}$ (160°-165°), thymol $C_{10}H_{14}O$ and a little cymene (Lallemand, A. 102, 119; A. Ch. [3] 49, 155). The oil from wild thyme, Thymus scrpyllum, contains cymene, tryine, Inymus serppeum, contains cymenc, thymol, carvacrol, and a phenol coloured violet by FeCl, (Jahns, Ar. Ph. [3] 16, 277; Febre, C. R. 92, 1290; Buri, Ar. Ph. [3] 12, 485).

THYMO-ACRYLIC ACID v. OXY-GYMYL-

ACRYLIC ACID

THYMOHYDROQUINONE v. HYDROTHYMO.

THYMOL C₁₀H₁₁O i.e. C₅H₂MePr.OH [5:2:1]. Mol. w. 150. V.D. 75·3 (calc. 75) (Eykman, B. 22, 2757). [49·5°] (Reissert, B. 23, 2242). (232°). S.G. § '9941. O.E. (0°-10°) '00085. S. 3. S.C. $\frac{1}{10}$ '3941. C.E. (U-LU') '100000. S. c. S.V. 188-9 (Pinette, A. 243, 46); 189-3 (Ramsay). $R_{\infty} = 76\cdot56$ (Nasini a. Bernheimer, G. 15, 93). H.F.p. (liquid) 69,250; (solid) - 8768. Occurs in essential oil of thyme (Doveri, A. 64, 274. 1.2) 374; Lallemand, A. Ch. [3] 49, 148; A. 102, 119), of horsemint, Monarda punctata (Arppe, A. 58, 42), of *Ptychotis ajowan* (Stenhouse a. Haines, A. 98, 307; H. Müller, B. 2, 130) of Monarda Didyma, of Ammi Copticum (Buri, Ar. Ph. [3] 12, 485), and in the oil from wild thysic (Jahns, B. 15, 819).

Formation. - By boiling diazo-n-cymene with water (Widman, B. 15, 170; 19, 245).

Preparation.—By extracting oil of thyme with NaOHAq, ppg. by HCl, and recrystallising from HOAc.

Properties.-Plates (from alcohol), v. sol. alcohol, ether, and HOAc, v. sl. sol. water. Has a slight odour of thyme and a peppery taste. When solid it is slightly heavier than water, when liquid it is lighter. Not ppd. by adding water to its alcoholic solution. Not dissolved by NH₃Aq, but absorbs NH₃, becoming liquid, but re-solidifying after the NH₃ has escaped. Sol. KOHAq. FeCl, does not colour its aqueous solution. Bromine-water only gives a milkiness. An aqueous solution (1 vol.) warmed first with HOAc (\frac{1}{2} vol.) and then with H.SO, (1 vol.) is coloured reddish-violet, the solution showing two absorption bands at E and D (Wolff, Fr. 22, 96). KOHAq followed by I in KI gives on warming a fugitive red tint (Itallie, Fr. 29, 205). Estimation: Messinger, B. 23, 2754.

Reactions.—1. Decomposed by distilling with P₂O₂ into propylene and m₅cresol.—2. P₂S₃ yields symene (Fittica, B. 6, 938; A. 172, 805). 8. Oxidised by chromic acid to thymoquinone.-4. PCl, yields chloro-cymens. 5. Potash-fusion yields several oxy-acids (Barth, B. 11, 567, 1571).—6. Iodins and potash yield a red amorphous pp. [110°] converted by heat or by amorphous pp. [110] converted by neat of by boiling water into a yellow body [165°] (Messinger a. Vortmann, B. 22, 2316).—7. Boiling POCl, (1 mol.) acting on thymol (1 mol.) forms liquid C₁₀H_{1,0}O, POCl₂ (280°-285°) which is conwhich yields BaA" 4aq and is decomposed by heat into thymol and HPO₃ (Discalzo, G. 15, neas into tryinos and HPO₃ [Discalzo, C. 15, 279).—8. Boiling POCl, acting on thymol (2 mols.) forms (C₁₀H₁₃O₂POCl (330°-340° at 320 mm.), a liquid which is converted by water into $(C_{10}H_{13}O)_2PO.OH$, which is insol. water and yields NaA' [74°] (Kreysler, B. 18, 1705) and BaA'₄5aq. S. 197 at 21°.—9. PCl₅ (1 mol.) acting on thymol (4 mols.) forms $(C_{10}H_{13}O)_3PO$ [59°] crystallising from alcohol in prisms (E. a. L.).—10. SiCl, forms Si(OC, H12), [48°] (450°) L.).—10. Sici, forms Si(OC₁₀H₁₃), [40] (430) crystallising from CHCl₃ in prisms (Hertkorn, B. 18, 1693).—11. Cl.CO.NH₂ reacts forming C₆H₃MePr.O.CO.NH.CO.NH. [190°] (Gattermann, A. 244, 44).—12. C₈H₄(NM_c)(NH₂) [1:4] C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MeP. C. H. MePr. C. H. MePr. C. H. MePr. C. H. MePr. (2. H. MePr. C. H. forms indothymol C₆H₄(NMe₂).N<\(\frac{C_6}{O}\)H₂MePr

[69-5°] crystallising in needles, insol. water and alkalis, forming a blue solution in alcohol, a violet in ether, and a green in HOAc. HClAq decomposes indothymol into thymoquinone, dimethyl-aniline, and NH₄ (Bayrac, BL, [3] 7, 97).

13. Chloral forms C₁₀H₁,OC,HCl₂O [130°-134°) (Mazzara, G. 13, 272).—14. Chloral, conc. H₂SO, and HOAo yield CCl₂CH(C₁₀H₁₂OH)₂ (Jüger, B. 7, 1197).—15. Dilute H₂SO, gradually added to a mixture of benzoic aldehyde (1 mol.) and to a mixture of benzoic aldenyde (1 mol.) and thymol (2 mols.) forms $C_*H_*CII(C_{10}H_{11}.DII)_2$ [146°] which is sol. alkalis and yields a diacetyl derivative [126°] (Russanoff, B. 22, 1943).—16. COCl., passed into an aqueous solution of $C_{10}H_{13}ONa$ forms di-thymyl carbonate ($C_{10}H_{13}ONa$ forms di-thymyl carbonate value [482] (above 1860) and violate covered to the state of the second secon needles [48°] (above 360°) and yields o-oxybenzoic acid when heated with NaOPh at 180° ment with ClCH_CO₂H and NaOHAq produces C₁H_{1,0}CH₂CO₂H [148°] which yields BaA'₂ 2aq PbA'₂, AgA', oily EtA' (290°), and an amide [97°] (Saarbach, J. pr. [2] 21, 159; Spica, G. 10, 342). (Saarbach, J. pr. [2] 21, 159; Spica, G. 10, 342).
19. a-Chloropropionio acid and KOHAq yield
Ch.H., COLHM. CO.H. [48] (Scichilone, G. 12,
50).—20. Thymol (10 g.) mixed with H.SO.
(70 g.) containing nitrous acid gives thymolchroin C., H., N.O., a dark-violet amorphous body
which dissolves in alcohol, ether, CHCl., and
benzene, forming red solutions with pale green
fluorescence. Alkalis turn its alcoholic solutions
blue. Sublimes at 140° civing off violet vanours blue. Sublimes at 140°, giving off violet vapours.

Yields brown amorphous $C_{40}H_{40}Ac_1N_2O_4$ (Brunner a. Chuit, B. 21, 252; cf. Liebermann, B. 7, 1100).—21. By heating with ammonium-zine chloride it is converted into thymylamine $C_{10}H_{12}NH_2$ and di-thymylamine $(O_{10}H_{12})^2NH_2$.

22. Cyanuric chloride converts sodium thymol into (C₁₀H₁X₃C₃N₃O₃ [151°] a yellow crystalline powder, insol. water, sl. sol. alcohol (Otto, B. 20, 2239). \$\frac{4}{23}\$ Aqueous KOH and K₂S₂O₃ form C₁₀H₁₃O₃SO₂OK, which crystallises from alcohol is closed as cills. in slender silky threads (Heymann a. Königs, B. 19, 3307). It is oxidised by alkaline KMnO.

B. 19, 3307). It is exidised by alkaline KMnO₄ to experimine acid C₂H₄Pr(OH).CO.H [4:3:1].

Salts. — C₁₀H₃ONa. Crystalline. Its aqueous solution is ppd. by HgCl₂ and AgNO₃.—
C₁₀H₃O.Hg.HgNO₂.—C₁₀H₃O.Hg.HgOAc (Merck, G. P. 48539; Pharm. Zeit. 1889, 625).—
(O₁₀H₁₃O).Hg₂O (Lallemand).—(C₁₁H₁₃O),Al. Decomposed by heat into propylene and (C₄H₄Mc.O)₃Al., the m-cresylate then splitting up into alumina, m-cresol, di-m-tolyl oxide, and a body C₁₅H₁₄O [200°] S. (alcohol) 17 at 20°; 1 at 78°; S. (benzene) 93 at 21°; S.G. 805; V.D. 208.8, crystallising in pearly plates (Gladstone a. Tribe, C. J. 39, 9; 41, 11).

Acetyl derivative C₁₆H₁₃OAc. (245°).

S.G. º 1.009.

S.G. 2 1.009.

Benzoyl derivative C₁₀H₁₃OBz. [82°].

II.F. 90,480 (Stohmann, J. pr. [2] 36, 9).

Methyl ether C₁₀H₁₃OMo. (216° cor.).

S.G. 9 9531. C.E. (0°-10°) 00083. S.V. 214·3 (Pinette, A. 243, 47). H.F.p. 61,429 [C.O. 94,000; H₂₁O = 69,000] (Stohmann, J. pr. [2] 35, 26). Formed from thymol, KOII, and MeI (Engelhardt a. Latschinoff, Z. [2] 5, 43).

Ethylether C₁₀H₁₃OEt. (227) (Pinette; cf. Jungleisch, Bl. [2] 4, 17). S.G. 9 934. C.E. (0°-10°) 00089. S.V. 240. H.F.p. 68,858 (Stohmann). Yields the ethyl derivative of oxyterephthalic acid on oxidation (Paterno a.

terephthalic acid on oxidation (Paterno a. Canzoneri, G. 9, 460). Decomposes at 3603-400° into thymol and ethylene (Bamberger, B. 19, 1820).

Propyl other C₁₀II₁₈OPr. (243°). S.G. § 9276. C.E. (0°-10°) 00088. S.V. 265·5. Butyl ether C₁₀H₁₃OC₄H₁, (258°). S.G. § 9230. C.E. (0°-10°) 00085. S.V. 289·2. Isoamyl ether C₁₀H₁₉OC₄II₁, (238°-243°)

Nitroso thymol v. Oxim of THYMOQUINONB. Dithymol v. DI-OXY-DICYMYL.

References .- Amido-, BROMO-AMIDO-, BROMO-NITRO-, TRI-CHLORO-, IODO-, IODO-AMIDO-, and NITRO-THYMOL.

DI.THYMOL.ETHANE v. DI-OXY-DI-CYMYL-RTHANE.

THYMOL DICARBOXYLIC ALDEHYDE C₁₂H₁₁O₂ i.s. C₄HMePr(OH)(OHO)₂ [80°]. Formed as a by-product in the pfeparation of thymotic acid by the action of chloroform and NaOH on thymol (Kobek, B. 16, 2104). Needles. Gives a red colour with FeCl.

THYMOL (a)-SULPHONIC ACID

C.H.MePr(OH).SO,H. [92°] (Stebbins, Am. 3,

111). Formed from thymol by the action of

H₂SO, or Cl.SO₂OH at 50° (Engelhardt a. Latschinoff, Z. 1869, 44; 1871, 261). Pearly plates (containing aq), v. e. sol. water. FeCl. colours neutral solutions dark-wolet. Yields

colours neutral solutions dark-wiolet. Yields thymoquinone on oxidation.

Salts.—KA'2½aq. Efflorescent tables, v. e. sol. water.—NaA'2½aq. [167°].—NH,A'2aq. [172°].—CaA'22aq. [157°].—BaA'24aq. Prisms, decomposing at 100°.—PbA'24aq.

Bensoyl derivative C₁₀H₁₂(OB2).SO₂H.

—KA'2aq.—CaA'24aq.—BaA'25aq.—PbA'25aq.

Ethyl derivative C₁₀H₁₂(OEt)SO₂H.

Formed from the K salt, KOH, and EI.—KA'.

Thin plates.—BaA'25aq.—Pates. sl. sol. hot Aq.

Thin plates.—BaA'₂ Saq. Prates, sl. sol. hot Aq.
Isoamyl derivative O₁₉H₁₂(OC₁H₁₁).SO₂H.
—KA'. Needles, v. sol. water. -BaA'₂ Saq.

Thymol (β) sulphonic acid C₁₀H₁₂(OH) SO₃H.

Formed in small quantity by the action of H₂SO₄ on thymol.—KA'aq. Plates, sl. sol. cold water. Coloured violet-blue by FcCl..

Thymol (γ)-sulphonic soid C₁₀H₁₂(OH).SO₄H. Formed by heating thymol with fuming H₂SO₄ at 100° (E. a. L.).—KA'aq. Granular, v. sol. water.—BaA'₂Saq. Tufts of needles, more soluble than the color of the than the (a)-isomeride. Not decomposed at 120°

Bensoyl derivative C₁₀H₁₂(OBz).SO₂H.— KA'3aq. Flat needles, sl. sol. cold water. Ethyl derivative C₁₀H₁₂(OEt).SO₃H.— KA'. Flat needles.—BaA', 3aq. Six-sided tables.

Thymol-sulphonic acid

Ethyl derivative C_aH₂MePr(OEt)SO₂H [1:4:3:6]. Formed by boiling diazo-cymenesulphonics cid with absolute alcohol.—Ban', 3aq: white plates, sol. hot water, sl. sol. cold (Widman,

B. 19, 247).
Thymol sulphonic soid. Methyl derivative C₁₆H₁₂(OMe).SO₃H. Formed, together with an isomeride, by sulphonation of the methyl ether of thymol (E. a. L.; Paterno a. Pisati, B. 8, 440).-KA': large tables.-BaA', 3aq. Nodules, y. sol. hot water. S. 3.94 at 26°.

Thymol disulphonic acid C₁₀H₁₁(OH)(SO₂H)₂.

Formed by sulphonating thymol.—K₂A''1½ac.

Efflorescent needles (from alcohol), v. e. sol.

References. - AMIDO-, BROMO-, and IODO-

THYMOL BULPHONIC ACID.

THYMOQUINONE C10H12O2 i.e. C2H2MePro2 [2:5:4:1]. Mol. w. 164. [45.5°]. (232°). Formed by oxidation of thymol (Lallemand, J. Pormed by oxidation of thymol (Lallemand, J. 1854, 592), of the methyl ether of thymol (Paterno, B. 8, 440), of cymenol (Carstanjen, J. pr. [2] 3, 53; 15, 410), of di-oxy-di-cymylethane (Steiner, B. 11, 289), of carvaorol psulphonic acid (Claus, J. pr. [2] 39, 356), and of amido-thymol (Andersen, J. pr. [2] 23, 172; Armstrong, B. 10, 297; Liebermann a. Ilinski; R. 18, 3144) Velley carvate and the control of the property of the control of B. 18, 3194). Yellow crystals, with pungent odour, v. sl. sol. water, v. sol. alcohol and ether. Reduced by SO, to Evdrothymoquinone. K., SO, at 60° forms crystalline C₁₀H_{1,2}O,SK. Phenyl cyanate forms C₁₀H_{1,2}O:NO.CO.NHPh [132°], crystallising in large yellow needles (Goldsschmidt a. Strauss, B. 22, 3106).

Oxim C_sH₂MePrO(NOH) or C_sH₂MePr(OH)(NO). Nitroso-thymol. [162°] Formed by the action of nitrous acid on thymol (R. Schiff, B. 8, 1500; Widmann, B. 15, 170; Liebermann, B. 18, 3194). Formed also by the action of hydroxylamine hydrochloride on

thymoquinone (Goldschmidt a. Schmid, B. 17. 2061). Slender monoclinic needles, above = 1-987:1:1-8941; β = 94° 57' (Panebianco, G. 10, 78); sl. sol. hot water. Its alkaline solution 10, 78); \$1. 801. NOT WARET. IN BIRKHINE SOLUTION is red. Oxidised by alkaline K₂FeCy₆ to nitrothymol. Reduced by tin and HCl to amidothymol (Liebermann, B. 10, 77). Does not react with SO₂ (Schmidt, J. pr. [2] 44, 521). Fuming HCl forms di-chloro-thymoquinone and chloro-the state of the state of amido-thymol (Sutkowski, B. 19, 2315). KOH and BzCl form C₁₀H₁₂O(NOBz) [110°]. Hydroxylamine (3 mols.) in strongly alkaline solution forms, in 48 hours, a white substance which, if ppd. by HOAc, immediately dissolved in dilute NaOH, treated with an equal weight of a phenol, and exposed to the air, gives a deep-blue colour or pp. turned red by acids (Kehrmann a. Messinger, B. 23, 2818, 3557).

Di-oxim C₁₀H₁₁N₂O₂ i.e. C₁₀H₁₂(NOH),. Formed by boiling an alcoholic solution of nitroso-thymol (1 mol.) with hydroxylamine hydrochloride (2 mols.) and partially neutralising with alkali from time to time. Yellowishwhite granules, decomposing at 235° without melting. Insol. water and NH,Aq, sol. KOHAq.

Chlorimide C.H.MePr by adding a solution of bleaching powder to a cold acidified solution of the hydrochloride of p-amido-thymol (Andresen, J. pr. [2] 23, 169). Pungent oil, volatilising even at 15°. Decomposes at 160°-170°. Volatile with steam. Decomposed by conc. HClAq into chloro-amidothymol and mono- and di-chloro-thymoquinone. Conc. HBrAq behaves in a precisely similar way. Alcohol at 140° converts the chlorimide into thymoquinone. Conc. aqueous SO, reduces it in a few days to hydro-thymoquinone. Reduced by tin and HCl to p-amido-thymol, considerable quantities of hydrothymoquinone being formed at the same time.

Polymeride [201°]. Formed by the action of daylight on thymoquinone (Armstrong, B. 10, 297; Liebermann, B. 10, 2177; 18, 3193). Silky yellow needles (from alcohol), insol. ether. Ohanges to thymoquinone on distillation. Not actacked by SO, at 180°, but reduced by HI and P, or in alcoholic solution, by Zn and HClAq to hydrothymoquinone.

Phenyl hydrazide [249°]. Insol. benzene. Oxim (C₁₀H₁₃NO₂). [263°]. Crystalline, insol. water. Reduced by tin and HCl to amidohydrothymoquinone.

Dioxim (C₁₀H₁₁N₂O₂)_z. [c. 290°]. Powder. May be reduced to di-amido-cymene.

References .- DI - AMIDO-, BROMO-, CHLORO-,

IODO-, and OXY- THYMOQUINONE.

o-THYMOTIC ACID C₁₁H₁,O₂ i.e.

C₄H₄Me(C₄H₂)(OH).CO₂H[6:3:2:1]. Mof. w. 194.

[123°]. Formed by the action of CO₂ upon heated sodium thymol (Kolbe a. Lautemann, A. 115, 205; Kobek, B. 16, 2101). Silky crystals, 115, 205; Kobek, B. 16, 2101). Silky crystals, v. sol. alcohol, other, and benzene, almost insol. cold water. Volatile with steam. Gives a deep-blue colour with FeCl. Yields thymol when distilled with baryta. PCl. acting on the Na sait forms thymotide O₁₁H₁₁O₂ [187°], which is reconverted into thymotic acid by potash fusion (Naquet, Bl. 4, 92).

p-Thymotic acid O₁₁H₁₁O₂ i.s.
O₂H₂Me(C₂H₁)(OH).CO₂H[6:8:4:1].

Formed by heating thymol with aqueous NaOH and CCl₄ (Kobek). White plates, v. sol. alcohol, ether, and benzene, insol. cold water. Not coloured by FeCl₄.

Methyl derivative C.H.Me(C.H.)(OMe).CO.H.

needles (from dilute alcohol).—AgA': pp.

p-THYMOTIC ALCOMOL C, H, O, i.e. C,H,Me(C,H,)(OH).CH,OH. [120°-130°]. Formed O₂H₁Me(C₂H₁)(OH).CH₂OH: [120'-130']. Formed by reducing thymotic aldehyde with sodium-amalgam (Kobek, B. 16, 2098). Amorphous powder, v. sol. alcohol and ether, insol. water.

• p-THYMOTIC ALDEHYDE C₁H₁H₂O₂ i.e.
C₂H₂Me(C₂H₁)(OH)CHO[6:3:4:1]. [133°].

Formed, together with C₂HMe(C₁H₁)(OH)(CHO)₂ (16:3:4:5:1] [80°]. We have in a thread with chlore.

[6:3:4:5:1] [80°], by heating thymol with chloroform and NaOHAq (Kobek, B. 16, 2096). Silky needles, v. sol. alcohol, sl. sol. hot water. On heating with aniline it yields the compound C_sH_zMe(C_sH_z)(OH).CH:NPh [142°] crystallising in yellow needles.

Methyl derivative

C.H.,Me(C.H.)(OMe).CHO. (278°). Formed by methylation of the aldehyde. Oil, yielding an anilide C,H2Me(C,H,)(OMe).CH:NPh [80°] crystallising in transparent tables.

THYMYLAMINE C₁₀H₁₃NH₂. (230°). Formed, together with di-thymylamine, by heating thymol with ammoniacal ZnBr, or ZnCl, and NH, Br or NH, Cl at 350° 360°, the yield being 25 p.c. (Lloyd, B. 20, 1260). Colourless oil.— B'_H, PtCl,: yellow needles. Acetyl derivative Cl, H1, NAc. [112°].

Isomeride v. CARVACRYLAMINE. Di-thymyl-amine (C₁₀H₁₅)₂NH. (340°-345°). Formed as above, the yield being 25 p.c. Oil. Its solution in P₂SO₄ is coloured blue by nitrites or nitrates.—B'₂H₂PtCl₅.

Acetyl derivative (C,0H,3)2NAc. [78°]. THYMYL CYANURIC ACID v. CYANIC ACID. THYMYL CYANURIC ACID v. CYANIC ACID.
THYMYL MERCAPTAN C₁₀H₁₁SH. Thiothymol. (231°). S.G. 989. Formed by heating thymol with P₂S₂, (Fittica, A. 172, 325; Bechler, J. pr. [2] 8, 167). Liquid with pungent odour. Oxidised by HNO₂ to sulpho-toluc acid.
— Hg(SC₁₀H₁₃)₂. Greenish rhombohedra [78°].
— PbA'; golden needles (from alcohol).

THYMYL PHOSPHATE (C_{1.}H_{1,1}), PO₁. [99°]. Formed by heating thymol with POCl₁, the yield being 75 p.c. of the theoretical amount (Kreysler, B. 18, 1705). Colourless needles.

(c. 450°). Formed by heating thymol with SiCl, the yield being 70 p.c. of the theoretical amount (Hertkorn, B. 18, 1692).

TIGLIC ACID C.H.O. i.e. CH., CH.CMe.CO., H. Methyl-crotonic acid. Mol. w. 100. [65°]. (199° i.V.) (Kopp, A. 195, 84). Occurs as a glycerylether in croton oil (Geuther a. Frohlich, Z. 1870, 549; Schmidt a. Berendes, A. 191, 94; B. 10, 835; Ar. Ph. [8] 13, 213), and as isoamyl ether in Roman oil of chamomile (Kobig, A. 195, 101).

Formation.—1. By the action of heat or of conc. H.SO, on angelic acid (Demarcay, B. 9, 1933).—2. By reducing the dibromide of angelic acid with sodium-amalgam (Schmidt, A. 208, 253) .- 3. From CEtMe(OH).CO,Et (derived from oxalic ether, Etl, Mel, and Zn) by treatment with PCl, and saponification of the product

(Frankland a. Duppa, A. 186, 9).-4. By distilling CH, CH(OH).CHMe.CO, H (Rohrbeck, A. 188, 235), or by heating it with HIAq (Rücker, A. 201, 61).-5. By reducing methyl-acetoacetic ether with sodium-amalgam and heating the resulting CH, CH(OH), CHMe.CO, H at 200° (Wislicenus, A, 250, 243).—6. By heating veratrine with alcoholid potash (Wright a. Luff, C. J. 33. 347) .- 7. By heating veratrine with conc. HClAq (Ahrens, B. 23, 2704).

Properties. -Triclinic plates, Properties. -Triclinic plates, v. sol. hot water, alcohol, and other. Smells like benzoic acid. Volatile with steam. Not attacked by sodium-amalgam. Forms with isovaleric acid the double salts CaA'(C,H,O,) 4 aq and

AgA'C,H,O2.

Reactions.—1. Yields acetic aldehyde and acid on oxidation with KMnO, (Beilstein a. Wiegand, B. 17, 2261; Kondakoff, J. R. 20, 523).—2. Potash-fusion gives propionic and acetic acids.—3. Funning III forms an iodovaleric acid [877] (Schmidt, B. 12, 252).—4. HI mixture of CH, CH(OH), CCIMe, CO, H [112°] and CH3.CHCl.CMe(OH).CO2H [75°] (Melikoff, Bl. [2] 47, 166).

Salts.—KA'.—CaA', 3aq. S. (cf. CaA',) 6.4 at 17°.—BaA', 4aq. S. (of BaA',) 18.5 at 16°.— AgA'.

Ethyl ether EtA'. (155°). S.G. 2.942. Isalmyl ether C.H.A'. (205°).

Reference.—Chloro-tiglic acid. "
TIGLIC ALDEHYDE C,H,O. Guaiol. (118°).
V. 2-92. Formed by distillation of gum guniacum (Deville, C. R. 17, 1143; 19, 134; Völckel, A. 89, 346; Herzig, M. 8, 118). Formed also by heating acetic aldehyde (1 mol.) with propionic aldehyde (1 mol.) and aqueous (28 p.c.) NaOAc for 30 hours at 100° (Lieben a. Zeisel M. 7, 53). Pungent oil, miscible with alcohol and ether. Oxidised by air to tiglic acid. Alkaline sodium nitroprusside gives a violet-red colour destroyed by HOAc (Von Bitto, A. 267, 376). Br forms di bromo-valerio aldehyde. Iron and dilute (50 p.c.) acetic acid reduce it to valeric aldehyde (91°), an inactive amyl alcohol CHMeEt.CH₂OH (129°) and tiglic alcohol C₃H₁₀O (c. 130°). Reacts with phenyl-hydrazine, and combines with NaHSO. CrO, forms acetic acid (Gilm, A. 106, 379). Aqueous SO, at 0° forms oxy-pentane disulphonic acid (Haymann, M. 9,

TIGLYL ALCOHOL v. PENTENYL ALCOHOL.

TIN Sn. At. w. 118.8 (v. infra). Mol. w. not known with certainty (v. infra). Melts at 231.68° (Callendar a. Griffiths, C. N. 63, 1); for other data, giving m.p. from 220° to 235°, v. Carthard Melling and Review Points Table (2, 12). nelley's Melling and Boiling-point Tables (2, 12).
Boils between the m.p.s of Ni and Fe, t.e. between 1450° and 1600° (Carnelley a. Williams,
C. J. 35, 566). S.G. c. 73 (determinations vary from c. 7 0 to c. 7.5 (c. Clarke's Table of Specific Gravities [2nd ed.] b). The so-called allotropic variety of tin seems to have S.G. from 5.8 to 6.1 (v. Schertel, J. pr. [2] 19, 822). S.H. (0°-100°) 0559; so-called allotropic tin has S.H. 0545 (0°-100°) (Bunsen, P. 141, 1); S.H. liquid tin (250°-850°) = '0687 (Person, A. Ch. [8] 24, 129). C.E. (linear, 0°-100°) '00002296 (Matthiessen, Pr. 15, 220; v. also Kopp, A. 81, 1; Fizeau, C. R. 68, 1125). T.O. 15·2 (Ag=100) (Wiedemann, P. M. [4] 19, 243). E.C. (Hg at 0?=1) at 16°=8*828 (Kirchoff a. Hausemann, W. 18, 406); at 0°=8*726, at 100°=6*091 (Lorenz, W. 18, 422). Heat of fusion (for 1 kilo.,tin) = 14\text{N52} (Person, 4 Ch. [8] 24 120). For expectations of the A. Ch. [3] 24, 129). For spectrum of tin v. Thalén (A. Ch. [4] 18, 237); Sale. (U. J. [2] 9, 1147); also Hartley a. Adeney (T. 1884 [i.] 118).

Historical.—Tin was known long before the

Christian era. Pliny distinguished plumbum album or candidum from plumbum nigrum; in the fourth century A.D. the former of these substances began to be called stannum, from which

word the symbol Sn is derived.

Occurrence.—Tin has been found in Siberia and in South Australia. Tinstone or cassiterite, consisting essentially of SnO₂, is found in considerable quantities, both in veins and in alluvial deposits, in many parts of the world. Tin pyrites, containing SnS₂ with Cu_sS, FeS, and ZnS, is found in small quantities in various tin veins. Small quantities of SnO, occur in various lithia-micas (Sandberger, J. M. 1878, 291, 657). According to Lockyer (Pr. 27, 279), there are indications of the occurrence of tin in the sun.

Formation .- 1. By ppn. from solution of SnCl, in HClAq by tin; or by tin and iron simultaneously, with a little Fe₂O₃ to neutralise excess of acid (Schultze, B. 23,974).—2. By electrolysis of SnCl, in dilute HClAq. -3. By reduction of

SnO, by heating with C.

Preparation.—Tinstone is cleansed by agitation with water; it is then sorted, stamped or rolled to a certain fineness, and washed. The washed ore is calcined in reverberatory calciners to remove sulphur from the sulphides of Fe that are present in most tin ores; the calcined ore is exposed to the air for some days to insure the oxidation of any sulphides that remain in the ore to sulphates, and it is then washed in water, whereby sulphates of Fe, Cu, &c., dissolve and the tin oxide sinks to the bottom of the vessels. The tin oxide is then separated into lighter and heavier parts by agitation with water; the heavier parts are mixed with charcoal or anthracite, some lime or fluorspar is added as a flux, and the mixture is smelted in a reverberatory furnace. The product of the smelting is purified by melting, when the tin runs off, leaving the less fusible foreign metals behind; this purified tin is again melted, the mosten mass is stirred with billets of green wood for some hours, and is then allowed to partially solidify by cooling, when the metal separates into different strata, which are ladled into moulds: the upper stratum is the purest and the undermost is the least pure. Sometimes the smelting is conducted in a blast furnace. For details v. Tin in Dictionary of Applied Chemistry, vol. iii. p. 834.

Commercial tin generally contains small quantities of As, Ou, Fe, and Pb, and occasionally traces of Sb, Bi, Mn, Mo, W, and Zn. To prepare pure tin, the purest commercial metal is granulated and disapland in commercial. fated and dissolved in conc. HClAq; a little water is very slowly poured into the liquid so as to form two layers, and a plate of tin is placed in the liquid so that part of it is in the upper (less cone.) and part in the under (more cone.) layer. A slight electric current is thus produced,

and crystals of pure tin are deposited on the plate (Hiller, A. 85, 253).

Pure tin was prepared by Bongartz a. Classen (B. 21, 2903) by heating the purest commercial tin (Banca tin) in dry Cl and so forming SnCl., distilling fractionally, and collecting that which passed over at 120°, adding to the SnCl, about four times its volume of water, and then crys. tallised Na,S until the pp. of SnS, that formed was dissolved, then adding NaOHAq about equal to half the quantity of Na S used, allowing to stand for some days, drawing off the clear, almost perfectly colourless liquid into a Pt basin, and passing an electric current through this alkaline liquid, washing the ppd. tin with water, then with absolute alcohol, and drying at 100°. The current was arranged so that it produced c. 2 to 3 c.c. detonating gas per minute from water: c. 2 to 3 g. tin were obtained in 24 hours.

Properties .- Pure tin is a silver-white metal; the commercial metal generally has a slightly yellowish tinge. It is unchanged in pure air; but it tarnishes in the air of large towns from formation of a film of sulphide. Tin is one of the least tenacious metals; a wire 1.6 mm. diameter breaks with a weight of c. 14 kilos. Tin may be hammered into plates c. 0254 mm. thick; the malleability varies much with temperature, at 200° the metal is so brittle that it crumbles when hammereli. Tin readily crystallises; by fusing, allowing to cool partially, and pouring out the still fluid metal, fair-sized crystals are obtained. Crystals are formed by depositing tin by electrolysis. Stolba (J. 1873. 282) covers the outside of a Pt basin, all except a small portion, with wax, places the unwaxed surface of the basin on a plate of amalgamated zinc in a larger porcelain basin, fills the Pt basin with a dilute and not very acid solution of SnCl2 and the porcelain basin with water containing c. $\frac{1}{20}$ part of HClAq; crystals of tin deposit on the bottom of the Pt basin. The forms of the crystals of tin are probably rhombic and quadratic (von Foullon, J. M. 1885 (11) Ref. 266). According to Frankenheim (P. 40, 456), the crystals belong to the regular system; Miller (B. J. 24, 133) obtained quadratic prisms by separating tin by electrolysis. If a piece of tin is brushed over with warm, dilute aqua regia, or with a mixture of warm dilute H₂SO₄Aq and HNO₄Aq, the surface becomes covered with a fretwork of orystals, from the facets of which light is unequally reflected, and the surface appears like watered silk. When a bar of tin is bent a crackling sound may be heard due to the crystals in the inner parts of the bar breaking against one another. When warmed, tin has a characteristic smell.

By exposure for some time to a very low by exposure for some time to a very low temperature (c. -98°) tin crumbles to a grey powder (v. Fritzsche, B. 2, 112, 540); S.G. c. 5·8 to 6·1 (v. Schertel, J. pr. [2] 19, 322). Tin which had been kept for 300 to 400 years was found by Schertel (i.c.) to have become reddishgrey, and so brittle that it was crushed by pressure between the finger-nails; by immersion in boiling water the metal became more coherent and lighter in colour, and the S.G. increased to 7.3 (cf. Oudemanns, P. M. [5] 4, 470).

Tin remains lustrous in pure air at the

ordinary temperature, and also in water; a

greyish-white film of SnO, forms on the surface of tin kept molten in the air; when heated to whiteness in air the metal burns brightly to SnO,. Tin dissolves in HOlAq, forming SnCl, solution; dilute H.SO, Aq has only a slight action, cone. hot H.SO, produces SnSO, and SO,; dilute HNO,Aq dissolves tin, with formation of Sn(NO,)Aq and NH,NO,Aq, cone. HNO, transforms the metal into SnO,. Tin dissolves in hot cone. NaOHAq, forming Na,SnO, solution and giving off H.

When haloid compounds of tin are volatilized in a stream of H and the gas is ignited, the fame shows two cones; the inner cone is blue with SnCl₂, green with SnBr₂, and yellow with SnL₃, and gives a continuous spectrum; the outer cone is carmine-red, and gives a spectrum with two characteristic lines (Salet, C. J. [2] 9,

1147).

Tin is metallic physically, and in most of its chemical relations. The oxide SnO₂ interacts towards several acids as a basic oxide, forming salts SnZ₂ (X = SO₄, &c.); but with conc. KOHAQ or NaOHAQ this oxide reacts as an acidic oxide, forming salts M₂SnO₂. Tin is the third member of the odd-series family of Group IV. in the periodic classification of the elements; it is closely allied to Go and Pb, and less closely to Si; it shows very marked analogies with Ti, Zr, Ce, and Th, which (with C) form the even-series family of Group IV. For details of the chemical relations of tin v. Tin group of elements, this yol. p. 735.

vol. p. 735.

The atom of tin is divalent in the gaseous molecule SnCl, and tetravalent in the gaseous

molecule SnCl.

Supposed allotropic form of tin. The grey brittle powder formed by the action of great cold on tin, and also found in some very old specimens of the metal, is sometimes regarded as an allotropic variety of tin (v. supra). All the specimens of tin, however, which have been observed to undergo this change have contained small quantities of impurities; until the change has been effected with pure tin, and has been proved to occur without any change of mass, the existence of an allotropic variety of tin cannot be said to be established. According to von Foullon (J. M. 1885 [1] Ref. 266) there are three varieties of tin: (1) rhombic, S.G. 6:52 to 6:56; (2) quadratic, S.G. 7:196; (3) grey wittle tin, S.G. 5-781 to 5:809.

Atomic weight of tin. The at. w. has been determined (1) by oxidising Sn to SnO, by HNO, (Gay-Lussac, A. Ch. [2] 80, 163 [1812]; Berzelius, P. 8, 184 [1812]; Mulder, A. 72, 212 [1849]; Vlaanderen, B. J. 1858. 183 [1858]; Dumas, A. Ch. (3] 55, 134 [1859]; van der Plaats, C. R. 100, 52 [1885]; Bongartz a. Classen, B. 21, 2900 [1888]); (2) by ppg. Cl from SnCl, by AgNO,Aq (Dumas, A. Ch. (3) 55, 156 [1859]); (3) by electrolysing SnCl, 2NH, Cl and SnOl, 2KCl (B. a. C., l.c.); (5) by reducing SnO, in H. (v. d. P., l.c. [1885]); (6) by determining S.H. of Sn (Bunsen, P. 141, 1 [1870]); (7) by determining V.D. of, and analysing, SnCl, and SnCl, The older determinations gave values from 115.9 to 117.8. The results of the determinations of B. a. C. are summarised by them (L.c., p. 2909) as follows:—

Number of experi- ments	Method	At weight	Diff. be- tween min. and max. found
11	oxidation of Sn to SnO.	118-7606	•459
16	electrolysis of SnCl, 2NH,Cl	118-8093	-228
10	electrolysis of SnCl2KCl	118-7975	·163
10	electrolysis of SnBr	118-7309	•144

B. a. C. regard the second and third methods as the most trustworthy; in the oxidation of Sn to SnO, the Pt vossel was also slightly acted on, and there was the possibility of a very small loss in dissolving SnBr, in the last method. The mean of the results obtained by the electrolysis of the two double chlorides is 118.8 (O=15-96).

Molecular weight of tin. As the V.D. of tin has not been determined the molecular weight is not known. Ramsay determined the depression of the vapour pressure of Hg caused by dissolving tin therein; assuming that equal volumes of dilute solutions contain equal numbers of molecules of the dissolved bodies, and that the mol. w. of liquid Hg is 200, the results obtained by R. gave the mol. w. of tin as 117.4 in one experiment and 149.5° in another.

Reactions and Combinations.-1. When tin is heated in air or oxygen, a film is formed on the surface, containing both SnO and SnO.; when heated to whiteness tin burns brightly, forming SnO₂ (v. Emich, M. 14, 345).—2. Heated in chlorine, bromine, or iodine, the compounds SnX, and SnX, are formed, according to whether there is excess of tin or halogen. - 3. Tin combines with sulphur, and with selenion, to form SnS and SnSe, when heated with these elements. - 4. Tin probably combines with phosphorus when heated in vapour of that element.—5. Tin forms alloys with many metals (v. Tin, allovs or, p. 720).—6. Water is decomposed by tin at a full red heat with formation of SnO and H.—7. Sulphydric acid has a slight action on tin, in moist air, forming a film of SnS .- 8. Hydrochloric acid dissolves the metal, forming solution of SnCl, and giving off H; the reaction proceeds more rapidly with warm cone. HClAq. 9. Pure cone. nitric acid, S.G. c. 1 55, has no action on tin. When the acid is diluted the products of the reaction vary with the concentration and the temperature; according to Walker (C. J. 63, 845), both Sn(NO₂), and Sn(NO₂), are formed, the quantity of Sn(NO₂), increasing as concentration increases at a fixed temperature; with very dilute acid an increase of temperature causes only a slight increase in the quantity of the stannic salt, but the effect of temperature is very marked with more conc. acid; the pro-portion of stannous to stannic salt formed is only slightly affected by changing the relative masses of tin and acid; when a fairly cone. solution of tin in HNO, Aq is heated, hydrated stannic nitrates, varying in composition, are deposited (v. also Montemartini, G. 22, 384, 397, 426; abstract in C. J. 62, 1402; p. also Hay, C. N. 23, 298; Scott, C. N. 23, 822). Pure

HNO, diluted sufficiently to start the reaction produces chiefly SnO, xH,O (v. Hydrated stannic p. 725). When tin dissolves in HNO,Aq, NH,NO, is formed; the gases evolved are NO, N₂O, and N (v. Ackworth a. Armstrong, C. J. 82, 84),—10. A mixture of nitric and sulphurio oz, oz, —10. A macture of narro and supparto acids, or nitric and hydrochloric acids, produces NH₂OH along with NH₂ (Divers, C. J. 43, 443; D. a. Shimidzu, C. J. 47, 597; cf. Hydroxyl-AMINE, vol. ii. p. 734). With certain proportions of UNO Acids 150. tions of HNO, Aq and H, SO, Aq, Bassett (C. N. 53, 172) obtained Sn(NO₂), in solution, and almost pure N₂O.—11. Dilute sulphuric acid reacts slowly when warmed with tin, forming SnSO, if the tin is kept in excess, and chiefly Sn(SO₄)₂ if the acid is in excess, and giving off Corc. sulphuric acid reacts to form SnSO... or Sn(SO₄), according to the proportion of tin to acid, and evolves H₂S or SO₂, or both, accord-ing to the concentration of the acid and the temperature; with pure hot H₂SO₄, SO₂ is given off, and S separates (v. Calvert a. Johnson, C. J. [2] 4, 435; also Pattison Muir a. Robbs, C. N. 45, 69).—12. Aqua regia dissolves tin, forming SnCl.,-13. Tin reacts with mercuric chloride and bromide. When heated with these compounds. forming SnCl₂ or SnBr₂, and Hg.—14. With sulphurous chloride, SnCl₂ is formed, with production of much heat (Wöhler, A. 73, 374).— 15. Tin dissolves in warm conc. caustic potash, or soda, solution, forming M,SnO, and giving off H .- 16. Fusion with nitre forms K, SnQ.

Detection and Estimation.—H.S ppts. dark brown SnS from slightly acidified solutions of stannous salts; the pp. is soluble in warm yellow ammonium sulphide, forming (NH,), SnS, Aq, from which acids ppt. yellow SnS. AuCl.Aq produces a purple pp., a compound of Sn, Au, and O (v. Purple of Cassius, under Tin oxides and HYDRATED OXIDES, p. 727). H.S ppts. yellow SnS, from acidified solutions of stannic salts; the ppt. dissolves in warm yellow ammonium sulphide, and acids re-ppt. SnS, from this solution. Tin is generally estimated as SnO,.

Tin, alloys of. Tin forms alloys with many

metals. For a general account of the properties of different classes of tin alloys, v. DICTIONARY of Applied Chemistry, vol. iii. p. 837. For alloys of tin with antimony, v. Karmarsch (D. P. J. 123, 267); Kestner (Kast. Archiv, 19, 424); Johnson (Chem. Gazette, 1855. 180); Chaudet (A. Ch. [2] 3, 376); with bismuth and lead, and with bismuth, cadmium and lead, v. vol. i. p. 511; with cadmium, v. vol. i. p. 655; with cadmium and gold, v. Heycock a. Neville (C. J. 59, 936); with copper, v. vol. ii. p. 251 (also Dictionary of Applied Chemistry, vol. iii. p. 888); with copper and lead, v. vol. fii. p. 125 (also French, S. C. I. 8, 36); with iridium, plattnum, and rhodium, v. Deville a. Debray (C. R. 81, 889); with iron, v. vol. iii. p. 53 (also Headden, Am. S. [3] 44, 464); with gold, v. Laurie (P. M.[5] 35, 94); with lead, v. vol. iii. p. 125; with (P. M. [9] 55, 34]; with lead, v. vol. in p. 125; (also Wright a. Thompson, Pr. 45, 461; 48, 25); with mercury, v. infra; with platinum, v. vol. iv. p. 288; with silver, v. W. a. T. (Pr. 48, 25); with sodium, v. Bailey (C. N. 65, 18). Tin alloys with sive in all proportions; the alloys are harder than tin, but softer than mino; they are less

malleable than tin. Many varieties of bronze are alloys of tin with sinc and copper (v. Rudberg, P. 18, 240). Amalgams of tin are readily formed by immersing tin in Hg; the action is more rapid if the Hg is warmed (v. Böttger, J. pr. 1, 305; Joule, Chem. Gasette, 1850. 339, also C. J.

Tin, bromides of. Tin combines with Br to form two compounds, SnBr, and SnBr. The V.D. of the latter has been determined, and the formula SnBr, is molecular; from the analogy of the chlorides it is probable that the formula SnBr, is molecular also. Watts a Bell (C. J. 33, 442) obtained both SnBr, and SnBr, by heating SnO, in Br vapour mixed with CO.

STANNOUS BROMIDE SnBr., (Dibromide of tin.) Obtained by Balard (A. Ch. [2] 32, 337); more fully examined by Rayman a. Preis (A. 223, 323). Prepared by heating tin in HBr gas, allowing the oily liquid so obtained to cool, dissolving the crystals that form in dilute HBrAq, and purifying the solid that separates by distilling it in a stream of N. A crystalline, slightly yellow, transparent solid; melts at 215.5° to a transparent liquid, which solidifies at 215°. S.G. 5.117 at 17°. Carnelley a. Williams (C. J. 35, 563) say that SnBr, boils between 617° and 634°. Partly decomposed by water, with separation of an oxybromide of tin (R. a. P., l.c.). By crystallising a colution of tin in warm conc. HBrAq, R. a. P. (l.c.) obtained the hydrate SnBr_xxH₂O (x=1 or 2), in colourless needles. By cooling a mixture of NH₄Cl and solution of tin in warm conc. HBrAq, the compound SnBr₂.2NH₄Cl.H₂O was obtrined in large rhombic,

porcelain-like crystals (R. a. P., I.c.).

STANNIC BROMIDE SnBr., (Tetrabromide of tin.) Mol. w. 437.8. Melts at 30° (Carnelley a. O'Shea, C. J. 33, 55), at 33° (Rayman a. Preis, A. 223, 323). Boils at c. 201° (C. a. O'S., Lc.), at 203.3° (R. a. P., Lc.). S.G. 3.349 (R. a. P., Lc.). V.D. at 228°-260° = 227-230 (C. a. O'S., l.c.). V.D. at 228°-200° = 221-200 (c. l.c.). Prepared by passing vapour of Br over melted tin in a tube shaped thus

the tin being at b and the Br at a. The tin burns in the Br vapour; the product is distilled backwards and forwards from b to c until the distillate is quite colourless. On cooling the liquid solidifies to colourless. On cooling the liquid solidifies to colourless crystals of SnBr, (C. a. O'S., l.c.). R. a. P. (l.c.) prepared SnBr, by heating tin with Br, and crystallising from SnCl, or SnBr, Cl. SnBr, forms white crystals, which are slowly decomposed in the air; according to R. a. P. (l.c.) the crystals deliquesce to a clear liquid, which when placed over H.SO, deposits crystals of the hydract SnBr, 4H,O. SnBr, is soluble in cold water; after some hours SnO₂.xH₂O is deposited; boiling hastens this change; addition of HNO, Aq to hot SnBr, Aq ppts, all the tin as SnO_xxH,O, with evolution of a little Br (C. a. O'S., l.c.). R. a. P. (l.c.) found that SnBr, absorbs NH,; on heating some NH, was given off, and a yellow sublimate of SnBr, 2NH, was obtained. According to Nickles (C. R. 51, 869), SnBr, combines with ether to form SnBr. Et.O.

Stannibromhydric acid H.SnBr. xH.O. (Bromostannic acid.) This compound was obtained by Seubert (B. 20. 194) by adding 74.1 parts HBrAq (50 p.c. HBr)

to 100 parts SnBr. (i.e. in the ratio 2HBr:SnBr.). A vellow liquid was formed which solidified after a time to a mass of yellow, needle-shaped crystals; the small quantity of mother-liquor was removed by melting and allowing to solidify partially. It is doubtful whether the acid crystallises with 7 or 9H₂O. The acid forms amberyellow needles, probably triclinic; it is very deliquescent; fumes in air, giving off HBr. By adding Na₂CO₂ to H₂SnBr₆Aq, and allowing to evaporate, Seubert (L.c.) obtained sodium stanni-bromide, Na₂SnBr_e.6H₂O, in yellow needles. Several other stannibromides are described by Rayman a. Preis (A. 223, 323); their composition is MSnBr_xxH₂O, where M = (NH₂)_x B₄Ca, Fe, Mg, Mn, Ni, Na_x, Sr, and x is 6, 8, or 10.

Tin, bromochlorides of. Rayman a. Preis

(A. 223, 823) obtained a compound to which they gave the formula SnBr,Cl by heating tin in Br that contained some Cl, and repeatedly distilling. The compound is a liquid boiling between 181° and 190°. It dissolves SnBr, which crystallises out unchanged. By adding Br to excess of SnCl, Ladenburg (A. Supplbd. 8, 60) obtained indications of the formation of bromochlorides, probably SnBr, Cl and SnBrCl,

Tin, chlorides of. Tin and Cl combine to form two compounds, SnCl2 and SnCl4. Both

formulæ are molecular.

STANNOUS CHLORIDE SINCL. (Dichloride of tin. Tin-salt.) Mol. w. 189-54; perhaps 379-08 tin. Tin.sait.) Mol. w. 189:54; perhaps 379:08 (= Sn.Cl.) in the liquid state (v. infra). Melts at 249:3° (Carnelley a. Williams, C. J. 35, 63).
Boils between 617° and 628° (C. a. W., l.c.); at 606° (Biltz a. Meyer, V. P. C. 2, 184). V. D. v. infra. H.F. (Sn.Cl'] = 80,790; [Sn.Cl', Aq] = 81,140; [Sn.Cl', 2H²O] = 86,520 (Th. 3, 327). Preparation.—1. By heating a mixture of carel posts in filters and HeCl. 1 Me sublines.

equal parts tin filings and HgCl, Hg sublimes and leaves SnCl.—2. By heating tin in HCl gas.—3. By dissolving tin in warm, fairly conc. HClAq, evaporating to the crystallising point, drying the crystals of SnCl, 2H,O that separate, heating them in a capacious crucible so long as gases are given off, pouring the liquid into a small crucible, pounding when cold, and distilling from a retort; the first portions of the distillate are said to be pure SnCl₂ (Capitaine, J. 1th. 25, 552).

Properties.—A semi-transparent, white solid; melts at c. 250° and boils at incipient redness (v. supra). Heated to bright redness, out of air, some SnCl, is given off, then SnCl. Heated in air gives SnCl, and SnO2. SnCl, dissolves in a little water; the solution is decomposed by much dilution, with separation of a hydrated oxychloride SnCl. SnO.2H.O. According to Michael a. Kraft (A. Ch. [3] 41, 471), 1,000 c.c. saturated SnCl_Aq contains, at 15°, 1,333 g. SnCl_ and 494g, water, and the S.G. is 1*27. Gerlach (D. P. J. 186, 131) gives the following data for solution of the hydrate SnCl_2H_O:—

P.c.	S.G.	P.c.	8.G.

Vol. IV	'.		

An aqueous solution of SnCl, generally becomes turbid from ppn. of Sn,OCl₂; digestion with tin and a little HClAq dissolves the pp.; addition of tartaric acid, or NH,Cl, stops the solution from becoming turbid the from the solution from becoming turbid the first basis. from becoming turbid, the former by dissolving the oxychlorise, the latter by forming a double salt SnCl. 2NH Cl, which is very soluble in water. Mallet (G. J. 35, 524) obtained a semi-trans-

parent, jelly-like solid from an aqueous solution of SnCl, which had stood in a loosely closed bottle for a year of two; the solid dried to a substance like gum arabic; it reddened litmus; the composition of the substance was SnO, HCl. Mallet writes the formula as SnO.OH.Cl, and suggests the name chlor-stannic acid.

Molecular weight of stannous chloride. V.D. of the gas obtained by heating SnCl, has been determined repeatedly. The following table presents the results :--

Calculated for SnCl. 94.7	Calculated for Sn _z Cl _z		Temp., and Observers	
96·5 90·1	103·7 104·5 101·5 123·7 123·7 122·9 119·5 111·4 102·7	?temp. 185-9 189-2	Rieth, B. 3, 668 [1870], at 619° V. a. C. Moyer, 1980° B. 12, 1195 [1879], 800° Meyer a. Züb-1980° Meyer a. Züb-1980° Meyer a. Züb-1980° Meyer a. Züb-1980° Meyer, Z. 760° P.C.2, 184 [1888], 1113° Meyer a. Z. 790° Meyer a. Z.	

From their determinations, Biltz a. Meyer concluded that molecules of the composition SngCl4 do not exist in the gaseous state, and that the mol. w. of the gas comes to a constant value. corresponding with the formula SnCl, only at a temperature very much above the b.p. of the liquid (SnCl, boils at 606°). In some of the earlier determinations at c. 800° partial decomposition occurred, with production of Cl. The results, taken as a whole, seem to be explained by assuming that the molecules of the liquid, near to the b.p., have the composition Sn₂Cl₄, that some of these are dissociated to 2SnCl₂ at c. 30° above the b.p., and that this process of dissociatica continues slowly, and is not completed at even 500° above the b.p.

Reactions.—1. Heated strongly in air, SnCl. is given off, and SnO2 remains. Heated to its b.p. in a retort, SnCl2 and SnCl4 distil, and the oxychloride Sn2OCl2 remains (Capitaine, J. Ph. 25, 552).-2. When sulphur is added to molten Solution the products are SnCl, and SnS; with selenion the products are SnCl, and SnSe (Schneider, P. 127, 624).—3. Many salts are reduced by SnCl2Aq, either to lower salts or to metals. Au, Hg, and Ag are ppd. from solutions of their salts; ferric and manganic safts are reduced to ferrous and manganous salts; CuCl.Aq to Cu2Cl2-4. The higher oxides of Bi, Cr. Ph. Mo, W, &c., are reduced to the lower oxides of these metals .- 5. Arsenious oxide is reduced to As by a considerable excess of SnCl_Aq. -6. Ac. cording to Böttger (Polytech. Noticol. 35, 96), a mixture of 2 pts. SnCl, rubbed with 1 pt. potassium chlorate gets hot, and produces an oxychloride of tin, KClO₄, oxide of chlorine, and H_O. For reactions with water v. supra, Properties; also infra, Combinations, No. 1.

-1. With water to form the hy-Combinations.—1. With water to form the hydrate SnCl₂.2H₂O. This compound is prepared by dissolving tin in warm cone. HClAq and evaporating to the crystallising point, in contact with tin to prevent formation of SnCl₂. SnCl₂.2H₂O, commonly known by the name of tin-salt, forms large white, monoclinic crystals (Marignac, J. 1856, 394); melts at c. 37.7°; S.G. 2.71 at 15.5° (solid), 2.588 at 37.7° (liquid) (Penny, C. J. 4, 239). H.F. [Sn,Cl;2H°0] = 86,520 (Th. 3, 327). When gradually heated to 100°, most of the water is removed; when rapidly heated, H.O and HCl are given off and Sn₂OCl₂ remains, which gives off SnCl₂ when more strongly heated. SnCl₂·2H₂O decomposes slowly on exposure to the air, forming Sn₀OCl₂ and SnCl₃.—2. With ammonia, forming SnCl₂NH₃.—3. According to Engel (C. R. 106, 1398), a compound of SnCl₂ with hydrogen chloride is formed by passing HCl gas over SnCl_2H_O at 0°; the liquid thus formed solidifies at 27°, forming crystals of SnCl_HCl_3H_O, which melt at 40°.—4. With chlorides of the alkali and alkaline earth metals, to form MCl, ShCl, XH.20, where M = (NH), 2, K₂, Ba, or Sr (v. Marignac, C. R. 55, 650; Rammelsberg, Krystall. Chemie, 211; Richardson, Am. 14, 89). Poggiale (C. R. 20, 1180) described a salt SnCl, 4NH, Cl.3H, O. Richardson (l.c.) obtained to the control of t táined SnCl₃.KCl.H₂O as well as SnCl₃.2KCl.2H₂O. These double salts are perhaps best regarded as stannochlorides, derived from the acid HSnCl. (v. Combinations, No. 3) and the hypothetical acid H2SnCl.

STANIO CHLORIDE SnCl., (Tetrachloride of tin.) Mol. w. 260-28. Boils at 113-9° at 760 mm. (Thorpe, C. J. 37, 372); at 114-1° at 760 mm. (Young, C. J. 59, 912). Solidifies at -33° (Besson, C. R. 109, 940). S.G. 6° 2·27875; 1·97813 at b.p. (Thorpe, l.c.). V.D. 133·1 at 124° (Dumas, A. Ch. [2] 33, 385). S.H. 1402 (10°-16°) (Regnault, A. Ch. [3] 9, 332). Heat of vaporisation = 30,530 (gram-units for 1 kilo.) (Andrews, C. J. 1, 27). H.F. [Sn,Cl·] = 127,250; [Sn,Cl·,Aq] = 157,170; [SnCl·,Cl·] = 46,460; [SnCl·,Aq,Cl·] = 76,030 (Th. 3, 327). C.E. (cubical, 0°-100°) 00130244 (Thorpe, l.c.). S.V. 131·07 (Thorpe, l.c.); for S.V. from 0° to 280° v. Young, C. J. 59, 933, 935). For vapour pressures from = 10° to 319° v. Young (l.c., p. 927). Critical temperature = 818-7°; critical pressure = 28080 mm. (Y., l.c., p. 928).

Formation.—1. By heating tin in excess, of Cl.—2. By heating 1 pt. tin filings intimately mixed with 4 or 5 pts. HgCl.1—3. By heating a mixture of Sn(SO₄), and NaCl.—4. By passing vapour of CCl. over heated SnO₂ (Watts a. Bell, C. J. 33, 442).—5. By adding fuming sulphurio acid to tin, and then passing in HCl gas and distilling (Heumann a. Köchlin, B. 15, 416).

Preparation.—Dry Cl is led over tin filings heated in a retort connected with a dry flask, which is kept cold; the distillate is distilled from tin filings, and then repeatedly redistilled in a current of dry CO. A solution of SnCl, is obtained by passing Cl into SnCl, Aq until no pp. is produced with HgCl, Aq, or by dis-

solving tin in dilute HClAq containing a little HNO.

Properties.—A thin, mobile, colourless, fuming, very corrosive liquid. Solidifies at -33° to small white crystals (Besson, C. R. 109, 940). SnCl, dissolves crystalline S, also P, I, Br, CS, &c. (Girardin, C. R. 51, 1057). SnCl, does not conduct electricity, even at its b.p.; addition of absolute alcohol forms crystals, probably (SnCl, 5EtOH), which conduct when dissolved; ether behaves similarly to alcohol (Coldridge, P. M. [5] 29, 383, 480). SnCl, withdraws moisture from the air, probably forming SnCl, 3H,O (v. infra, Hydrates of stannic chloride). SnCl, dissolves in water, with production of heat [SnCl, 4g] = 29,920 (Th. 3, 327), and considerable contraction of volume (v. also Reactions, No. 1). Gerlach (D. P. J. 178, 49) gives the following table:—

Pentge. SnCl.	S.G. SnCl ₄ Aq	Vol. of 100 pts. by wt. of solu- tion; vol. of 100 pts. water=100	Vol. of mixture of SnOl, and water; vol of sum of consti- tuents=100

	1	,	,

Hydrates of stannic chloride.—Various hydrates have been isolated: (1) SnCl.,3H.O. by exposing SnCl., to air (Casselmann, A. 83, 272); also by adding 18 pts. water to 260 pts. SnCl., when \$\frac{2}{2}\$ of the SnCl., remains unchanged, and \$\frac{1}{2}\$ forms the hydrate, which sinks in the excess of SnCl., (Gerlach, D. P. J. 178, 49); also by dissolving 260 pts. SnCl., in 54 pts. water, and letting the solution cool to 60° (C., l.c.); (2) SnCl.,2H.O. by keeping the trihydrate in vacuo (Scheurer-Kestner, C. R. 50, 50); also by drying the pentahydrate over H.SO. (Lewy, A. Ch. [3] 16, 303); (3) SnCl.,5H.O. by dissolving SnCl., conpletely in water and evaporating (G., l.c.; L., l.C.); (4) SnCl.,8H.O. by strongly cooling dilute SnCl.,4d (G., l.c.); (6) SnCl.,9H.O., obtained by Nöllner (Z. [2] 1, 445) by treating SnCl.,4d with aqua regia, and exposing the solution to a winter temperature. Gerlach (l.c.) gives a table (v. next page), showing the S.G. and percentage composition of solutions of the pentahydrate.

tion of solutions of the pentahydrate. Reactions.—1. With vater: SnOl, dissolves in water (v. supra) with production of much heat. Vignon (C. R. 108, 1049; 109, 372) found that H.SnO., ppd. from freshly prepared SnCl.Aq, from SnCl.Aq after keeping, and from SnCl.Aq after heating, showed markedly different heats of neutralisation by potash. He concluded that SnCl.Aq contains HClAq and H.SnO.Aq, and that the F.SnO, in solution gradually polymerises. Dilute SnCl.Aq gradually decomposes, giving HClAq and SnO.xH.O. Casselmann, A. 83, 272). Heating in a scaled tube with a little water is gaid to give SnO.x—2. With conc. neitric acid SnCl.4 forms SnO.xH.Q.—2. With conc. neitric acid SnCl.4 forms SnO.xH.Q.—3. Dry hydrogen sulphide forms white crystals of SnCl.5H.S., which gives off H.S and HCl when heated, and

leaves SnS₂ (Coldridge, P. M. [5] 29, 383, 480).--4. SnCl, dissolves stannous oxide, forming SnCl,

2. Short, dissolves statements of the control of Short, and a solution of ShO, HO in excess of ShOl, (Scheurer-Kestner, C. R. 50, 50).

Combinations.—1. With hydrogen chloride.

By passing dry HCl over ShOl, 5H,O, then saturation of the control o rating the liquid so formed with dry HCl at 28°, and cooling to 0°, Engel (C. R. 103, 213) obtained white crystalline leaflets of the compound SnCl. 2HCl.6H2O, melting at c. 20°, and giving off HCl when more strongly heated. The same compound was prepared by Seubert (B. 20, 793) by adding to SnCl, such a quantity of conc. HClAq that the ratio of water in the acid was to the SnCl, as 6H2O:SnCl, (100 pts. SnCl, require 62·15 pts. of 33 p.c. HClAq), and after a little passing in c. 8 pts. dry HCl; the whole then solidified to a crystalline mass, melting at 19.2°. This

compound is best called stannichlorhydric acid; it has also been called chlorostannic acid (Mallet gave the name chlor-stannic acid to SnO.OH.Cl, v. Stannous chloride, Properties, p. 721), and hydrochlorostannic acid. Chassevant (A. Ch. [6] 39, 5) has described a compound SnCl, HCl.3H.O.—2. With several metallic chlorides. The double salts of SnCl, and alkali and alkaline earth chlorides have the composition MSnCl₀.xH₂O, where M = (NH₄)₂, K₂, Na₂, Ba, Ca, Mg, or Sr; these selts are best named stannichlorides (for details, v. Bolley, A. 39, 101; Lewy, J. pr. 37, 479; Rammelsberg, Krystall. chemis; J. pr. 37, 479; Rammetsverg, Arystatt. Greens; Wittstein, R. P. 64, 74, Topsov, W. A. B. 69 [2] 261; Morel, G. G. 1891 [1] 492; Chassevant, A. Ch. [6] 30, 5). Cleve (Bt. [2] 31, 195) obtained double salts of the form rSnCl, 2MCl, 2H₂O, where M = Ce, Di, La, or Y, x = 2 and 5, and s had large values (from 18 to 45) . -- 3. With certain nonmetallic chlorides; the compound SnCl, 2SCl, is said to be obtained by the interaction of Cl and SnS (H. Rose, P. 44, 320; Casselmann, P. 42, 517); the compound SnCl, PCl, was obtained by Casselmann (l.c.) by heating a mixture of SnCl, 2SCl, and PCl, in a stream of HCl.— 4. With certain nonmetallic oxychlorides: (1) SnCl, POCl, formed by the reaction of POCl, and SnCl., POCl., formed by the reaction of POCl., and SnCl. (Casselmann, A. 91, 248; 98, 213); (2) SnCl., 2SeOCl., by combining the constituent compounds (Weber, B. B. 1865, 2154); (3) SnCl., 2NOCl., by passing the dry vapour from aqua regia over SnCl. (Hampe, A. 126, 43), also by, subliming SnCl., N.O., formed by the action of N.O. and NO. on SnCl. (Weber a. Hampe, P. 118, 471).—5. With hydrogen sulphide to form SnCl., 5H.S.; decomposed by heating to SnS₂, H.S., and HCl (Coldridge, P. M. [5] 29, 383).—6. With hydrogen canada. to form crystals that 6. With hydrogen cyanide, to form crystals that are decomposed in moist air (Rlein, A. 74, 85).
7. With ammonia, to form SnCl, 2NH, according to H. Rose (P. 24, 163), to form SnCl₄4NH₂ according to Grouvelle a. Persoz (A. Ch. [2] 44, 322) .- 8. With phosphorus trihydride, to form 3SnCl, 2PH, (H. Rose, P. 24, 159); heated to 100° in CO, there are formed HCl and Sn.P.Cl., according to Mahn (J. Z. 5, 160).—9. With certain nonnetallic oxides: (1) with SO₃ to form a solid [? composition] (H. Rose, P. 44, 320); (2) with NO a compound is formed, according to Kuhlmann (A. 39, 319), but no action occurs according to Hampe (A. 126, 43); (3) with N2Os to form STALLING (2.1.20), 20], (c) with 1303 to 10 ml SIG, 10.0, produced by passing NO₂ and N₂O over SnCl, (Hampe, l.c.).—10. With ethylic alcohol, to form SnCl, 5£tOH (Coldridge, P. M. [5] 29, 383, 480).—11. With amylic alcohol, to form SnCl, 2C,H₁₁(OH) (Bauer a. Klein, Z. [2] 4, 370) 19. With other to form SnCl, 24th C[Coldridge 12. With ether, to form SnCl, 2Et,O (Coldridge, l.c.) .- 13. With various nitriles, forming crystallisable compounds (Lewy, C. R. 21, 371).

Tin, chlorobromides of, v. TIN BROMOCHLOR-IDES, p. 721.

Tin, chloro-iodide of; v. TIN IODOCHLORIDE. y. 724.

Tin, chlorosulphide of; v. Tin THIOCHLORIDE, p. 733).

Tin, ferricyanides of; v. vol. ii. p. 840.

Tin, ferrocyanides of; v. vol. ii. p. 337.

Tin, fluorides of. Only one fluoride, SnF., has been isolated; double salts of stannic fluoride (SnF.) are known.

STANDOUS FLUORIDE SnF. (Diffuoride of tin.) Formed, in small opaque, lustrous, prisms, by dissolving SnO.xH.O in HFAq, and evaporating; heated in air it forms the oxythoroide SnOF₅(= SnF₄,SnO₂) (Marignac, Ann. M. [5],15, 221; Fremy, A. Ch. [3] 47, 37). By dissolving treshly ppd. SnO.zH₂O in solutions of alkali fluorides acidified by HFAq, Wagner (B. 19, 896) obtained stannofluorides of the form xSnF, 2MF, yH₂O, where x = 1 and 3, y = 1 and 2, and M was NH₄, K, and Na.

STANNIC FLUORIDE. This compound has not been isolated; a solution of SnO₂.xH₂O in HFAq coagulates when heated, but does not yield any definite compound; when evaporated in air HF is given off, and an oxyfluoride, SnOF, is depo-

sited (Marignac, l.c.).

Stannifluorides. A series of these salts, MSnF_e.xH₂O, where M = one atom of a divalent metal or two atoms of a monovalent metal, has been obtained by Marignac (Ann. M. [5] 15, The salts are isomorphous with the corresponding silicofluorides and titanifluorides; they are generally obtained by saturating the stannates with HFAq and evaporating, some are formed by double decomposition from the Pb or Ag salt. The following salts have been obtained: $MSnF_{\bullet}.xH_{\nu}O$; $M = NH_{\bullet}$, Ba, Cdx = 6, Cax = 2, Cu x = 4, Pb x = 3, Li x = 2, Mg x = 6, Mn x = 6, Ni x = 6, Ka x = 1, Ag x = 4, Na, Sr x = 2, Zn x = 6.

Tin, haloid compounds of. Tin and the halogens combine to form two series of compounds, SnX₂ and SnX₄ (SnF₄ has not been isolated). The V.D.s of SnCl₂, SnCl₄, and SnBr₄ have been determined; it is probable that the simplest formula in every case is molecular. One or two compounds of the forms SnXX' and SnXX, are known, where X and X' are different halogens. A few oxyhaloid compounds are known, and probably also one or two thiohaloid compounds. The compounds. SnBr, and SnCl, combine with HBr and HCl respectively, forming acids H₂SnBr_e and H₂SnCl_e, from which series of salts, stannibromides and stannichlorides, are derived; stannifluorides are also known. An acid HSnCl, has also been isolated, and a few stannochlorides-MISnCl, and M'snCl,-are known, as also some stanno-

Tin, hydrosulphide of. The compound SnS₂H₂, which has probably been isolated, may be called hydrosulphide of tin (v. Tin, Juno-

ACIDS AND SALTS OF, p. 733).

Tin, hydroxides of, v. Tin oxides and hy-DRATED OXIDES, p. 725; also TIN OXYACIDS AND

SALTS, p. 727.

Tin, hydroxyl chloride of, SnO.OH.Cl, v. Chlor-stannic acid, under STANNOUS CHLORIDE.

Properties, p. 721.
Tin, iodides of. Two compounds are formed by combining tin and I; they correspond in composition with the two bromides and the two chlorides. The V.D.s of the iodides have not been determined, but the simplest formulæ afe probably molecular.

STANNOUS IODIDE SnI₂. (Di-iodide of tin.) Formula probably molecular.

Preparation.—1. Tin and I are heated to-gether in the ratio Sn:2I (1 pt. tin to 2:14 pts. I); the brown crystalline solid so formed (a mixture of SnI, and SnI,) is mixed with tin

filings and heated, when orange-red-SnI, sub. limes, and SnI, remains as a red crystalline solid mixed with particles of tin which are easily separated (Henry, T. 1845. 363).—2. Conc. KIAq is added to warm conc. SnCl.Aq; the yellow crystalline pp. is dried and melted, out of contact with air, and a red crystalline mass of SnI, is formed on cooling (Boullay, A. Ch. [2] 34, 372).-3. Tin foil is heated for some hours with fairly conc. HIAq in a sealed tube at 1200-150° (Wöhler a. Dünhaupt, A. 86, 374); SnI, separates, on cooling, in shining yellow-red prisms

Properties and Reactions.—A red, crystalline solid. Melts at 316° (Carnellan a William) Melts at 316° (Carnelley a. Williams, C. J. 35, 564). Slightly soluble in cold, more soluble in hot, water, without decomposition (Boullay, l.c.). According to Personne (C. R. 54, 216), SnL is decomposed by a large quantity of water, forming HIAq and several oxyiodides (q. v.). SnI₂ is soluble in SnCl₂Aq. When heated out of contact with air, SnI₂ melts without decomposition, but when heated in the air it is decomposed to an oxylodide, which remains

in the vessel, and SnI, which sublimes.

Combinations.—1. With stannous chloride to form SnI, SnCl, (v. Iodochloride, infra).—2. With stannous ozide to form several oxyiodides (q. v.).— 3. With annonia, probably forming SnI₂2NH₄ (Rammelsberg, P. 48, 169).—4. With alkali iodides and with iodides of the alkaline earth metals to form stanno-iodides: these salts have the composition M.SnI4.xH2O and MSnI, xH,O, corresponding with the stanno-chlorides (v. Stannous chloride, Combinations, p. 722); $M = NH_4$, K, Na, also $\frac{1}{3}Ba$ and $\frac{1}{2}Sr$. The stanno-iodides are formed by mixing solutions of the constitutent salts, or by adding SnCl.Aq to excess of the alkaline fodide in solution; the salts must be crystallised from alcohol, as they are decomposed by water, forming stannous oxyiodides (v. Boullay, l.c.; Personne, l.c.).

STANNIC IODIDE SnI, (Tetra-iodide of tin.) Formula probably molecular. This compound is probably formed by heating tin with 4.2 pts. I, and subliming from the product (Henry, T. 1845. 363). Schneider (P. 127, 624) recommends to add 6 pts. CS₂ to 1 pt. tin filings, and then to add gradually, cooling frequently, 4 pts. I.

and to allow the yellow liquid to evaporate.

Sul crystallises in orange-red octahedra;
melts at 146°, sublimes at 180°, and boils at 295°
(Personne, C. R. 54, 216). S.G. 4.696 at 11° (Bödeker, Die Beziehungen zwischen Dichten Locater, Diction of Secretary of the Secretary Liquiden Stoffen [Leipzig, 1860]). Solubility in CS₂ at 15°=145 (Schneider, Lc.); it is also soluble in CHCl₄, EtOH, Et₂O, and C₆H₆. Decomposed by water to SnO₂xH₆O and HIAq. Combines with ammonia to form SnI₄xNH₂, where x = 3, 4, and Chemical Stoffens and Chemical Stoffens SnI₄xNH₂, where x = 3, 4, and Chemical Stoffens SnI₄xNH₂. 6 (Personne, *l.c.*), also = 8 (Rammelsberg, *P.* 48, 169). SnI₄ is said not to combine with alkali

iodides.

Tin, iodochloride of, SnICl (= SnI, SnCl). According to Henry (T. 1845, 363) the addition of I to conc. SnCl,Aq causes ppn. of SnI, and on evaporating the mother-liquor (which contains SnCl₃, SnCl₄, and Snl₂) straw-yellow orgatals are deposited that have the composition Snl₂SnCl₃. The crystals are decomposed by water, with separation of Snl₂. Tin, iodosulphide of, v. TIN THIO-IODIDE, p.

Tin, oxides and hydrated oxides of. . oxides have been isolated, SnO and SnO2; various compounds of these oxides with H.O seem to exist, but their composition readily undergoes change with variation of temperature. Both oxides interact with acids to form corresponding salts, SnX_2 and SnX_4 , where $X = NO_3$, \$SO4, \$PO4, &c. Some of the hydrates of SnO. also react as weak acids, especially SnO...H.O (=H₂SnO₃), from which is derived a series of stannates $MSnO_3$, $M = Na_2$, Ca, Pb, &c.; and $xSnO_2$. xH_2O (= xH_2SnO_3), x probably = 5, from which a series of metastannates, xMSnO_s is derived. Stannic and metastannic acids and salts derived from them are described under the heading Tin oxyacids and salts and derivatives тневеог (р. 727). The oxides SnO and SnO, are described in this section of the article Tin, and a brief account is also given of the experiments on the hydrates of these oxides other than stannic and metastannic acids.

When tin is strongly heated in air or oxygen a film forms on the surface consisting of SnO and SnO2; at a full red heat, or incipient white heat, tin burns to SnO... According to Vignon (C. R. 107, 734), tin ppd. by zinc from neutral SnCl,Aq or SnCl,Aq oxidises easily in air; after being exposed to the air for some days it contains from 20 to 33 p.c. SnO. Emich (M. 14, 345) found that the surface of tin that was kept molten in the air became covered with crystal-

line nodules of SnO₂.

STANNOUS OXIDE SnO. (Protoxide of tin.) Mol. w. not known.

Formation.—1. By heating finely-divided tin in the air; the metal becomes covered with a film of SnO (Vignon, C. R. 108, 96). Also by exposing tin ppd. by zinc from SnCl2Aq or SnCl4Aq to the air at ordinary temperatures (V., C. R. 107, 734).—2. By dehydrating SnO.xH₂O, ppd. from SnCl2Aq by alkali carbonates, either by heating in a stream of CO2, or by boiling with water containing a little KOH .- 3. By dissolving SnO.xH₂O in cold KOHAq, and allowing the solution to stand in the air (Ditte, A. Ch. [5] 27, 145).—4. By heating SnC₂O₄ in a tube of hard glass without free access of air (Liebig, A 495, 116) .- 5. By ppg. a stannous salt by KCNAq, and boiling the pp. for some days with KCNAq (Varenne, C. R. 89, 360).

Preparation. - SnCl_Aq is ppd. by Na_CO_Aq, the white pp. of SnO.H.O is thoroughly washed with cold water, and is then boiled with water containing a little KOHAq or NaOHAq (less than sufficient to dissolve the pp.), when the SnO.xH₂O is gradually dehydrated, and small black, lustrous crystals of SnO are obtained (Fremy, A. Ch. [3] 12, 460).-2. Tin is dissolved in warm HClAq, the solution is evaporated, in contact with tin, until it solidifies to SnCl2 on cooling; 7 parts, or rather more, Na₂CO₂.10H₂O are then added for each part of SnCl, in the . basin, and the liquid thus formed is heated with constant stirring until # becomes black, and is then allowed to cool; the brownish-black powder, SnO, thus obtained is thoroughly washed with cold water, and dried at 100° (Sandall, J. pr. 14, 254).—3. A solution of SnCl, is ppd. by a slight excess of KOHAq in the cold, the pp. is thoroughly washed and dissolved in cold KOHAa (c. 1 part KOH in 10 parts HO); the solution, which should be saturated with SnO.xH.O, is allowed to stand in the air, when SnO is gradually ppd. as small, blue-black, shining crystals (Ditte, A. Ch/[5] 27, 145).

Properties and Reactions.—Prepared by any of the methods described above, SnO forms small, black, lustrous, regular crystals (for crystalline form v. Nordenskjöld, P. 114, 612). S.G. 6:1 (N., l.c.); 6 6 at 0° (Botzelius; Ditte, A. Ch. [5] 27,

According to Fremy (A. Ch. [3] 12, 460), another modification of SnO is obtained by heating the black crystals (prepared by the first process given above) to 258°; the crystals are said to swell up and change into soft, olive-green laminæ, without any change in weight.

By evaporating very dilute NH ClAq, holding SnO.xH₂O in suspension, until NH₄Cl began to crystallise, Fremy (A. Ch. [3] 12, 460) obtained a cinnabar-red powder, which he took to be a third form of SnO. Retli (A. 60, 214) obtained red, crystalline SnO by digesting SnO.xH2O, at 56°, with a solution of SnO.xH2O in acetic acid; the solution containing a little free acetic acid, and having S.G. 1.06.

For the S.G. and appearance of SnO prepared

in various ways v. also Ditte (l.c.).

SnO is unchanged in air at ordinary temperatures. According to Ditte (A. Ch. [5] 27, 145), SnO that separates from an alkaline solution is unchanged at 300°-310°; when heated to redness it is partly decomposed to Sn, and SnO2 which combines with unchanged SnO to give 2SnO.SnO₂. SnO is readily converted into SnO₂ by heating with oxidising agents; the change is effected by heating to 500° in NO (Sabatier a. Senderens, C. R. 114, 1429). SnO dissolves in acids to form stannous salts, SnX2, X = NO3, ½SO4, ½PO4, &c.; it is not acted on by NHAq; boiled with fairly conc. KOHAq or NaOHAq it. gives a solution of an alkali stannate (M2SnO2) and tin; heated in Cl forms SnCl, and SnO2; mixed with S and strongly heated, SnS2 and SO2 are produced; SnO is reduced to tin by heating to redness in H or with C.

HYDRATED STANNOUS OXIDE. The white pp. formed by adding an alkali carbonate to solution of a stannous salt, washing with air-free cold water, and drying at a temperature not above 80°, is said to have the composition 2SnO.H.O = Sn.O(OH)... According to Ditte (A. Ch. [5] 27, 145) the pp. formed by adding KOHAq or NaOHAq to SnCl.Aq, washing thoroughly, and drying in vacuo at 14° is $S_{11}O.2H_2Q(=S_{11}O_2H_2H_2O)$. Stannous hydroxide is a yellowish white amorphous powder. It is dehydrated, to SnO, by heating in CO₂; also by the action of boiling water containing a little KOH, or a trace of HCl, or acetic acid—HNO.Aq and H.SO.Aq form stannous salts; also by boiling with NH.ClAq (Ditte, l.c.). The hydroxide is gradually oxidised by exposure to air to SnO₂.xH₂O. Boiled with conc. KOHAq it gives K2SnO3Aq and tin. Many metallic salts are reduced, to lower salts or to the metals, by the action of SnO.xH2O (for details of the interaction with CuO in presence of alkali v. Lenssen. J. pr. 89, 90).

STANNIC OXIDE SnO2. (Dioxide of tin.) Mol.

w. unknown: probably at least Sn, 0, 0, (v. Carnelley a. Walker, C. J. 53, 92). Occurrence.—Tinstone is more or less pure

Occurrence.—Tinstone is more or less pure SnO₂; the percentage of the oxide varies from c. 85 to c. 99, the other constituents are generally SiO₂, and oxides of Al, Fe, and Mn. Tinstone crystallises in quadratic forms. Crystalline SnO₂ has been found in the fused slag from a turnace used for casting gun-metal (Abel, C. J. 10, 119).

Fornation.—1. By expo.ing molten tin to the action of the air (Emich, M. 14, 345).—2. By heating to c. 600° SnO_xxH₂O formed by the interaction of tin and HNO_xAq, or of alkalis and stannic salts, or of alkali stannates and dilute acids.—3. By strongly heating SnO or SnO_xxH₂O.—4. By passing a mixture of vapour of SnO_xA, and steam through a rod-hot tube.—5. By heating SnC_xO_x, in small quantities, in contact with the air (Vogel, C. C. 1855. 413).—

6. By passing a little CO, into a dilute solution

of an alkali stannate (Ditte, A. Ch. [6] 30, 282). Preparation.—A. Crystallin—stannic oxide.—I. Molten tin is kept in contact with the air until the surface becomes covered with crystalline nodules of SnO₂ (Emich, M. 14, 345). 2. A stream of CO₂ is passed through SnCl, and then through a red-hot porcelain tube through which a current of steam is passed at the same time (Daubrée, C. R. 29, 227).—3. Amorphous SnO₂ is strongly heated in a rapid current of dry HCl (Deville, C. R. 53, 161).—4. SnC₂O₄ is strongly heated, in small quantities at a time, in an open

porcelain or silver dish (Vogel, C. C. 1855, 418).

B. Amorphous stannic oxide.—5. The hydrated stannic oxide obtained by ppg. a stannic salt by an alkali, decomposing an alkali stannate solution by dilute acid, or by treating tin with HNO₂Aq, is thoroughly washed and dried, and then heated to c. 630°, at which temperature dehydration is complete (Carnelley a. Walker, C. J. 53, 83).

Properties.—Crystalline stannic oxide is a hard, lustrous, white solid. It is dimorphous. Prepared by heating the amorphous oxide in HCl gas, SnO₂ crystallises in quadratic forms isomorphous with tinstone and anatase (TiO₂) (Daubrée, C. R. 29, 227); prepared by decomposing vapour of SnCl₄ by steam, it crystallises in trimetric prisms isomorphous with brookite (TiO₂). S.G. of crystalline SnO₂=6.7 to 6.85 (Playfair a. Joule, C. J. 1, 137; Mallet, J. 3, 705; Bergemann, J. 10, 661; Daubrée, C. R. 29, 227). The crystalls obtained by long continued heating molten tin in air had S.G. 7.0096 at 4° (Emick, M. 14, 345). Crystalline SnO₂ is hard enough to scratch glass. The amorphous oxide has S.G. 6.6 to 6.9 (P. a. J., Lc.; Herapath, P. M. 64, 321; Boullay, M. Ch. [2] 43, 266). It is a bard, yellowish-white powder. SnO₂ has not been fused. It is not acted on by acids (but v. Reactions, No. 6). Fusion with KOH or NaOH forms, SnO₂ which dissolves in water. The product of fusion with KHSO₄ dissolves in water, but addition of more water ppts. all the tin as SnO₋₋ MLO.

all the tin as SnO_xxH_zO.

Mailet (O. J. 85, 524) obtained a compound SnO_xHO₁, to which he gave the formula SnO.OH.Cl, and the name chlor-stannic acid, by keeping SnO₁ for a year or two in a loosely slosed bottle.

Reactions.—1. Fusion with sulphur produces SnS₂ and SO₂.—2. When strongly heated it chlorine SnCl₂ is formed.—3. SnO₂ is reduced to tin by heating to a high temperature in hydrogen, or with polassium, sodium, or carbon, or in carbonic oxide.—4. Fusion with caustic polash or caustic soda forms alkali stannate (M₂SnO₂), which dissolves in water.—5. Heating with phosphorus trichloridate 160° forms SnCl₂, SnO₁, and P₂O₂ (Michaelis, J. Z. 6, 239; 7, 110).—6. According to Ditte (C. R. 104, 172), SnO₂ dissolves very slowly in hot sulphuric acid (1 acid to 8 water), and on concentrating till not more than 3 or 4 vols. water are present to 1 vol. H₂SO₄ crystals of SnO₂.2H₂SO₄ separate.

Hydrated stannic oxide. Carnelley a. Walker (C. J. 53, 60, 68, 83) examined the dehydrating action of heat on SnO2.xH2O, obtained by decomposing Na SnO Aq by cold dilute HClAq and drying the pp. in the air for five months. The pp. lost less and less weight for each increase of c. 10° from 50° to c. 110°, at which temperature rather less water was present than corresponded with the formula SnO2.H2O, the loss of weight for each rise of 10° was then approximately constant up to c. 360°, at which temperature the composition was nearly that required by the formula 3SnO...H.O; at a little above 360° the solid changed colour from brown to pale yellow, and at the same time lost weight at a rate nearly three times as great as during the previous rise of 100°; after changing colour the solid had the composition 7SnO2.2H2O; the loss of weight, per 10° increase, then decreased very much for the next 30° or 40°, and after that dehydration continued irregularly until at 630°-635° the oxide SnO₂ remained. From these results, considered with results obtained by the same method for other hydrated oxides, C. a. W. concluded that probably a large number of hydrates of SnO, exists, but that none of these is stable through more than a very small range of temperature. The results of J. van Bemmelen (B. 13, 1466) on the dehydration by heat of stannic hydrates, obtained by oxidising tin by HNO, Aq, and by decomposing SnCl, Aq by CaCO,, and on the rehydration of the products obtained by heat, by placing them in air more or less saturated with mçisture, at different temperatures, show that the quantity of water of hydration varies with variations in température, in the molecular states of the solids, and in the moistness of the surrounding air. Not only does the quantity of water of hydration vary with variations in the molecular state of the hydrates, but the firmness or looseness wherewith the water is held also varies much as the molecular condition varies. According to J. van B. the loosely held water is given up in dry air; and when the product is placed in moist air water is taken up until a state of equilibrium is attained wherein as many molecules of water are taken up as are lost in the unit of time.

The following compositions have been given to different hydrates of SnO₂.

I. Hydrates obtaines by decomposing soluble stannates by dilute acids: (1) 3\$nO₂.7H₂O, by drying in a stream of dry air (Fremy, A. Ch. [3] 12, 462); (2) \$nO₂.2H₂O, by drying in the air at the ordinary temperature (Weber, P. 122, 358); (3) \$nO₂.H₂O, by drying in vacuo (Fremy,

l.c.); (4) 8SnO₂2H₂O, by drying at 140° (Fremy, l.c.); to these should probably be added (5) 7SnO₂2H₂O, by drying at c. 365° (Carnelley a.

7SnO_x2H_xO, by drying at 0.365° (Carnelley a. Walker, l.c.).

II. Hydrates obtained by oxidising tin by HNO_xAq: (6) 5SnO_x10H_xO, by drying at the ordinary temperature (Fremy, l.c.); (7) 5SnO_x6H_xO, by drying at the ordinary temperature (Thomson, Ann. Phil. 1817. 149), by drying over H_xSO_x (Weber, l.c.), by drying in vacuo, or at 100° (Fremy, l.c.); (8) 5SnO_x4H_xO, by drying at 130° (Fremy, l.c.); (9) 5SnO_x3H_xO, by drying at 150° (Fremy, l.c.); (10) 2SnO_xH_xO, by drying at 55° (Thomson, l.c.). by drying at 55° (Thomson, l.c.).

The hydrates obtained by decomposing stannates by dilute acids, or by ppg. stannic salts by CaCO, or BaCO, differ in properties from the hydrates obtained by oxidising tin by HNO, Aq; the former are generally distinguished as stannic hydrates, and the latter as metastannic hydrates. The stannic hydrates, dried in air, form hard, semi-transparent lumps, like gum arabic; soluble in the stronger acids, forming stannic salts SnX₄, where X=NO₃, ½SO₄, &c.; soluble in alkali solutions, forming stannates M¹₂SnO₃ (v. Stannates, under TIN ONYACIDS, AND SALTS AND DERIVATIVES THEREOF, infra). Metastannic hydrates are white solids (? crystalline) that do not dissolve in HNO₃Aq, or H.SO₄Aq (v. infra). These hydrates interact with HClAq, and the product is soluble in water but insoluble in conc. HClAq; according to Weber (P. 122, 358), the solution gives SnCl, 3SnO, 5H,O, when evaporated over H₂SO,; by prolonged boiling, with fresh additions of water, all the tin in the solution is ppd. as metastannic hydrate (Fremy, A. Ch. [3] 12, 463; 23, 393). Metastannic hydrates dissolve in KOHAq and NaOHAq, forming metastannates M₂H₂Sn₃O₁₅ (v. Metastannates, under Tin oxyacids, and SALTS AND DERIVATIVES THEREOF, p. 730).
According to Ditte (C. R. 104, 172), both stan-

nic and metastannic hydrates dissolve in warm H2SO,Aq (1 part acid and 8 parts water), and on concentrating till not more than 3 to 4 vols. water are present to 1 vol. H.SO, the solution deposits white crystals of SnO 2H SO: these crystals are very deliquescent; they are decomposed by water; if so much water is added that not more than 43 g. H₂SO₄ are present in 1,000 c.c. of the liquid, a pp. of SnO₂xH₂O is formed. By dissolving stannic or metastannic hydrate in

warm H₂SeO₂Aq, and concentrating, D. (l.c.) obtained crystals of SnO₂2H₂SeO₄.

For further details of reactions of stannic and metastannic hydrates v. TIN OXYACIDS, AND SALTS AND DERIVATIVES THEREOF (infra).

Oxides OF TIN OTHER THAN STANNOUS AND STANNIC OXIDES. Oxides which are most simply

regarded as xSnO.ySnO, seem to exist.

According to Fuchs (J. pr. 5, 318), a greyishwhite, slimy solid, having the composition SnO.SnO₂(=Sn₂O₃), is obtained by diffusing freshly ppd. Fe₂O₂xH₂O in SnCl₂Aq free from acid, and boiling

(2SnCl_Aq + Fe₂O₃ = SnO.SnO₂ + 2FeCl₂Aq).

This oxide is said to dissolve completely in

This oxide is said to dissolve completely in NH₂Aq, and also in HClAq.
By digesting SnO₂xH₂O, ppd. by alkali from SnO₄Aq, with SnCl₂Aq, Schiff (A. 120, 53) obtained an orange-yellow solid, to which he gave

the composition SnO.6SnO.5H.O; by digesting SnO₂xH₂O, formed by oxidising tin with HNO₂Aq, with SnOl₂Aq Schiff (*l.c.*) obtained a yellow powder, said by him to be SnO.68nO.9H.O. or when dried at 85° to be SnO.6SnO.4H.O (v.

also Tschermak, C. C. 1862, 305).
PURPLE OF CASSIUS. A purple-coloured solid is obtained by adding solution of a stannous salt to dilute AuCl, Aq; this solid has been examined by many chemists, who have generally assigned to it formulæ which represent it as a compound of SuO, sometimes of SnO.SnO, and AuO. According to the most recent investigations the composition varies according to the conditions of preparation, and all that can be said with certainty is that the purple solid is a compound of tin, gold, and oxygen (v. Buisson, J. Ph. 16, 629; Bohlen, Ar. Ph. 57, 277;
 Capaun, J. pr. 22, 153; Fuchs, J. pr. 5, 318; Wächter, A. 68, 116; Figuier, Ph. C. 1844, 724; Debray, C. R. 100, 1035; Müller, J. pr. [2] 30, 252; and, for a bibliography (to 1866), Fischer, D. P. J. 182, 39).

Tin oxyacids, and salts and derivatives thereof. Some of the hydrates of SnO2 interact with alkalis to produce salts wherein tin forms part of the acidic radicle; compounds are also known the acidic radicles whereof contain tin in combination with other negative elements besides oxygen, or tin in combination with both

metallic and nonmetallic elements.

The reactions of the hydrates of SnO2 ppd. from solutions of stannates by dilute cold acids, or ppd from stannic salts by alkalis, are distinctly different from the reactions of the hydrates of SnO2 obtained by oxidising tin by HNO3Aq, or by ppn. by dilute acids from solutions of another class of salts which have the same composition as stannates, except that they always contain H and O in the ratio 2H;O in addition to the constituents of stannates. is therefore usual to distinguish the acidic hydrates of SnO2 as stannic and metastannie acids; to the former is given the composition H_SnO₃(=SnO_H_O), and to the latter the composition $H_{10}Sn_{s}O_{1s} (=5SnO_{s}5H_{s}O)$. Neither of these formulæ is to be regarded as more than an attempt to connect the differences in the chemical behaviour of two compounds having identical percentage compositions (if the H₂O in one class is omitted) with differences in the complexities of their interacting atomic aggregates; the molecular weight of neither compound is known. It is, indeed, doubtful whether a compound with the composition xH2SnU, can exist apart from other hydrates of the composition ySnO_zH₂O; it is certain that the composi-tion of the hydrates of SnO₂ varies with very small variations of temperature, by whatever methods these hydrates are prepared (v. p. 726, HYDRATED STANNIC OXIDE)...

That the hydrates of SnO, obtained respectively by ppg. solution of stannates by dilute acids and by oxidising tin by HNO, Aq, differed in their reactions, was noticed by Berzelius in 1811 (v. Lehrbuch [5th ed.] 2, 596). Berzelius regarded these compounds as hydrates of two different modifications of stannic oxide; he called the oxide supposed to be a constituent of the hydrates obtained by ppg. solutions of stannates stannic oxide, and designated it as aSnO₂; the other oxide he called metastannic oxide, and designated it as bSnO₂. Gmelin called the hydrate from stannates ordinary stannic acid, and the other hydrate abnormal stannic acid.

STANNIO ACID H. SRO.

Preparation.—By adding cold dilute HCIAq to an aqueous solution of K.SnO. prepared by fusing SnO. with KOH, or by heating tin with KOH and KNO. (v. Potassum Stainler, p. 730), a gelatinous pp. is obtained which, when washed and dried in vacuo, has the composition SnO. H.O. H.SnO. (Fremy, A. Ch. [3] 12, 463). The same hydrate is formed, according to F. (i.c.), by adding CaCO. or BaCO. to excess of SnCI.Aq, washing, and drying in vacuo. (For details regarding the results obtained by different chemists who have examined the compositions of the stannic hydrates, v. Hydrated Stannic acid (no analyses are given) by dissolving SnO. xH.O ppd. from a stannic salt (? by alkali from SnCI.Aq) in SnCI.Aq, and dialysing until all the Cl had passed into the dialysate. Colloidal forms of stannic acid are also obtained (1) by dialysing a solution of the ppd. acid (J. van Bemthelm, R. T. G. 7, 87; abstract in C. J. 54, 1160 [1888]; the results of experiments on the dehydration of the colloidal acid are given).

Properties and Reactions.—A gelatinous, amorphous solid, drying (in air or in vacuo) to hard, semi-transparent lumps, like gum arabic, Reddens litmus paper. Vignon (C. R. 108, 1049) found that the heat of neutralisation, by KOHAq, of stannic acid formed by ppg. SnCl, Aq by KOHAq, decreased when the ppd. acid was kept in contact with water for some days, and decreased more rapidly when the acid was heated with water in a sealed tube for some hours. J. van Bemmelen (J. pr. [2] 23, 324) found that when stannic acid is shaken with solutions of HCl, or H.SO,, or with solutions of certain salts, such as KCl or K.SO, a definite number of molecules of the acid or salt is taken up by the stannic acid so as to form a loose combination therewith; and that the number of molecules thus absorbed varies with the proportion between the quantities of stannic acid and the soid or salt in the solution used, and also with the concentration of the solution used. The loose compounds thus formed are called absorptioncompounds by J. van B. Dissolves in the stronger neids (HNO₃, H₂SO₄, HCl, &c.). According to Ditte (C. R. 104, 172), when a solution of stannic acid in warm H₂SO₄Aq (1 part acid to 8 parts water) is evaporated until not more than 3 to 4 water) is evaporated until not more than 5 to 4 vols. water are present to 1 vol. H₂SO₄, and allowed to cool, it yields white deliquescent crystals of SnO₂.2H₂SO₄; and a solution of stannic acid in warm H₂SeO₄Aq yields a similar crystalline compound SnO₂.2H₂SO₄. Dissolves in excess of caustic alkali solutions, forming stannates of caustic alkali solutions, forming stannates of caustic alkali solutions. (g. v. p. 780) M. SnO. According to J. van. B. (i.e.) colloidal stannic acid does not form any compound when shaken with dilute cold KOHAq, but only complex molecular aggregates, the composition of which varies considerably with temperature and concentration. Stannic acid, dried at the ordinary temperature by pressure, is

gradually changed to metastannic acid by heat; the change begins at c. 55° (J. van B., L.c.; v. also infra, Change of stannic to metastannic acid, and vice versa). For other reactions of stannic acid v. infra, Distinctions between stannic and metastannic acids.

METASTANNIC ACID H₁₀Sn₅O₁₈. Preparation.—Tin, in thin pieces or granu-lated, is heated with HNO₃Aq, S.G. c. 135, until the metal is converted into a greyish-white powder, which is washed with dilute HNO, Aq, and then with water, and dried. The solid is said to have the composition H₁₀Sn₂O₁₅ (= 5SnO₂.5H₂O) when dried in vacuo (Fremy A. Ch. [3] 12, 463), when dried over H₂SO₄ (Weber, P. 122, 358), or when dried at the ordinary temperature (Thomson, Ann. Phil. 1817, 149). For details of the results obtained by different chemists who have examined the compositions of the metastannic bydrates v. Hydrated Stannic oxide (p. 726); v. also J. van Bemmelen, R. T. C. 7, 87 (abstract in C. J. 54, 1160 [1888]). It should be noted that the empirical formula assigned to metastannic the empirical formula assigned to metastannic acid dried in vacuo (Fremy), or dried over H₂SO₂ (Weber), is the same as that assigned to stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); this formula is a constant of the stannic acid dried in vacuo (Fremy); the st mula is SnO₂.H₂O. The different reactions of the two compounds show that if both have the same empirical formula one must be an isomeride or a polymeride of the other. Metastannic acid is also obtained by decomposing an aqueous solution of the sodium salt (v. p. 730, Metastannates) by boiling. Graham (T. 1861. 213) obtained colloidal metastannic acid by addand obtained constitute Helaq to the acid obtained by the action of HNO₂Aq on tin, dissolving the solid so formed in water, and dialysing. Vignon (C. R. 108, 1049) found that the heat of neutralisation of metastannic acid by KOHAq decreased when the acid was dried at 110°, and decreased very considerably when the acid was heated with water, for some hours, at 250° in a sealed tube.

Properties and Reactions.—A white powder, Insol. in nitric acid. Contact with conc. HClAq for a short time produces a compound (according to J. van Bemmelen, R. T. C. 7, 87; abstract in C. J. 54, 1160 [1888], no definite compound is formed, but only complex molecular aggregates of metastannic acid and HCl) which dissolves in water, but is insol. in HClAq. According to Barfoed (J. pr. 101, 258), the compound with HCl is quite insol. in HClAq S. G. 1·1, and may be purified by washing with acid of that concentration. The solution of this substance in water gives off HCl and H_O, with a very little SnCl, when distilled; and metastannic acid separates out (Freny, A. Ch. [3] 12, 463; 23, 893; H. Rose, A. 68, 272). Evaporation of the aqueous solution over H_SO, is said to give an oxyohloride \$3\text{NO}_S, \text{SnCl}_S, \text{ShL}_O (Weber, P. 123, 358). Metastannic hydrate dissolves in conc. HClAq after prolonged boiling, forming SnCl, solution (Löwenthal, J. pr. 77, 321). Barfoed (L.C.) says that conc. HClAq gradually converts recently ppd. and moist metastannic acid into stannic acid, and that the quantity of metastannic acid thus changed increases with the quantity of conc. HClAq, the time of contact, and the temperature. J. van Remmelen (J. pr. [2] 23, 324) found that metastannic acid forms absorption compounds with HCl, H_SO, KCl, KSO, &c.

(cf. STANNIO ACID, Properties, p. 728). For other reactions of the solution in water of the product of the action of HClAq on metastannic acid v. infra, Distinctions between stannic and metastannic acids. According to Ditte (C. R. 104, 172), metastannic acid dissolves in warm H₂SO₄Aq (1 pt. acid to 8 pts. water), forming a solution which gives crystals of SnO₂2H₂SO₄ when evaporated until not more than 3 to 4 • vols. water are present for one vol. H2SO4; the crystals are decomposed by water, with ppn. of SnO,xH2O (? metastannic hydrate), when sullicient water is added to insure that not more than 43 g. H2SO, are present in 1,000 c.c. of the liquid. A similar compound was obtained with selenic acid, viz. SnO₂2H₂SeO₄ (D., l.c.). Allen (C. J. 25, 274) found that metastannic acid dissolved in boiling conc. H2SO4, forming Sn(SO4)2 solution; by pouring this solution into water some of the tin was ppd., after a time, as stannic acid, but on boiling the whole of the tin came down as metastannic acid. Metastannic acid is said to dissolve slowly in fairly dilute cold KOHAq or NaOHAq; addition of conc. KOHAq or NaOHAq is said to ppt. K or Na metastannate; when the solution in KOHAq or NaOHAq stands in the air metastannic acid gradually deposits. According to J. van Bemmelen (l.c.), colloidal meta-stannic acid does not form any definite compound with KOH when shaken with KOHAq of different concentrations. By fusing metastannie acid with KHSO₄ or NaIISO₄, Allen (C. J. 25, 274) obtained a product which dissolved partially in water; the aqueous solution gave a pp. of metastannic acid on boiling.

rry weget

Distinctions between stannic and metastannie acids (v. Frenny, A. Ch. [3] 12, 462; 23, 398; H. Rose, P. 75, 1; 105, 561; Löwenthal, J. pr. 77, 321; Bartoed, J. pr. 101, 368; J. van Bemmelen, R. T. C. 7, 87; abstract in C. J. 54, 1160 [1888]).—Stannie acid is soluble in dilute HNO, Aq, H, SO, Aq, or HClAq; metastannic acid is insol. in these acids. Cold conc. HClAq dissolves stannic acid, and the solution gives the reactions of SnCl.; cold cone. HClAq forms a compound (? molecular aggregates) with metastannic acid, which is insol. HClAq of S.G. 1·1, or greater S.G., but dissolves in cold water.

The following reactions apply to solutions of stannic acid in HClAq on the one hand, and to solutions in water of the substance formed by the action of HClAq on metastannic acid on the other hand. Stannic acid solution, if conc., does not become turbid on boiling; long continued boiling, with additions of water, ppts. all the acid. Metastannic acid solution, even when conc., goes turbid on boiling; long-continued boiling, accompanied by dilution, ppts. all the acid. Stannic acid solution, when distilled, gives off H.O. with a little HCl and SnCl.; and a little stannic acid separates. According to Barfoed (J. pr. 101, 368), when a solution of stannic acid in HClAq S.G. 1 1 is distilled, the whole of the tin passes over as SnCl. Metastannic acid solution, when distilled, gives off H₂O, with some HCl and a very little SnCl, and the meta-acid separates in the retort. Addition of tartaric acid to the stannic solution, followed by gradual addition of NH,Aq, excess of NH,Aq being avoided, produces no pp. Treatment of the metastannic solution with tartaric acid and NH,Aq (not in excess) ppts. the meta-acid. SnCl,Aq gives no pp. with the stannic solution; SnCl,Aq gives a yellowish pp. (? SnO.6SnO,9H,O) with the metastannic solution. Addition of dilute H,SO,Aq to the stannic solution produces no pp., unless the stannic solution is very much diluted. Dilute he stands solution is very much diluted. Dilute H₂SO₄Aq profluces a pp. even in very dilute metastannic solution; by washing this pp. with hot water, metastannic acid remains (cf. Ditte's experiments are described under both STANNIC ACID and METASTANNIC ACID, pp. 728, 729). The stannic solution is not ppd. by conc. HClAq. The metastannic solution, if nearly neutral, is ppd. by conc. HClAq. Addition of K,FeCy,Aq to the stannic solution, in the ratio K,FeCy,Sn present, ppts. all the tin as SnFeCy. To ppt. all the tin from the metastannic solution, the K, FeCy, Aq must be added in c. the ratio 19K, FeCy,:Sn present; the pp. is not SnFeCy, it is said by some observers to be metastannic acid; J. van B. (l.c.) calls it an absorption conpound of metastannic acid and K,FeCy. stannic solution gives no pe. with excess of fairly conc. NaOhAq. The metastannic solution is completely ppd., as sodium metastannate, by excess of fairly conc. NaOHAq.

vice versa. A solution of stannic acid in HClAq gradually changes to metastannic acid; the change is the more rapid and complete the more dilute the solution (H. Rose, l.c.; Barfoed, l.c.); by boiling for some time with repeated additions of water the whole of the stannic acid may be converted into metastannic acid. A very conc. solution of stannic acid in HClAq remains unchanged (cf. reaction of meta- acid with conc. HClAq, infra). According to Löwenthal (l.c.), the change from stannic to metastannic acid is stopped by addition of tartaric acid, even when the solution of stannic acid in HClAq is dilute; the amount of change to the meta- acid may be determined (according to L., l.c.) by finding the quantity of K,FeCy, Aq required to completely

Change of stannic to metastangic acid and

add excess of fairly conc. NaOHAq, which ppts. all the meta-acid (as a sodium salt) but none of the stannic acid.

Stannic acid is converted into the meta- acid by heat (H. Rose, Lc.). J. van Bemmelen (Lc.) found that stannic acid dried by pressure at the ordinary temperature is completely soluble in cone. HClAq, but that by heating to c. 55°, or by heating with water to below 100°, some metastannic acid is formed which is insoluble in conc. HClAq.

ppt. the tin in solution. Barfoed (l.c.) says the best way to measure the amount of change is to

A solution of stannic acid in excess of KOHAq gradually deposits metastannate of K on exposure to air, with formation of K₂CO₂Aq.

Metastannic acid is gradually changed to stannic acid, according to Barfoed (l.c.), by constanne sent, according to Dartoea (s.c.), by con-tact with cone. HClAq; the quantity of stannic acid produced increases with the quantity of HClAq used, the time of contact, and the temperature.

Stannic acid is said to be obtained from the meta- acid by fusing the latter with a large excess of KOH, dissolving in water, and ppg. by cold dilute HClAq (H. Rose, i.e.; Fremy, i.e.).

Onyacids of Tin other than Starnic and Metastannic. (1) H.Sn.O., Spring. (Bl. [5] 1.

180) obtained a colloidal solid, drying at 100° to a white mass with the composition H.Sn.O., by adding excess of BaO, xH,O to a solution of SnCl, in HClAq, and dialysing the turbid liquid until BaOl, ceased to pass into the dialysate. S, regarded the new compound as an acid of the hypothetical perstannic oxide SnO, analogous to CeO, TiO, and (?) ZnO, (2) PLSnO, and H.Sn.O. The empirical formula of both these hydrates of stannic oxide is SnO, H,O. According to Musculus (C. R. 65, 961), the hydrates differ somewhat in properties both from stannic and metastannic acids; they are said to be

formed by keeping stannia acid under water, and to form K salts, KH,Sn,O, and KH,Sn,O,. Stannates, M,SnO, and M,SnO,. The alkali stannates are obtained by dissolving stannic acid in MOHAq (M=NH₄₀ K, or Na), and evaporating over H₂SO₄; the stannates of the alkaline earth metals may be obtained by the interactions of solutions of the alkali stannates with MO2H2 or MCO3 (M = Ba, Ca, Sr).

Ammonium stangate. A salt, said to have the composition (NH₄)₂SnO₃.SnO₂.IH₂O, is obthe composition (NH₁)₂snO₂,SnO₂,Xn₂O, is outained, as a yellowish jelly, by evaporating a solution of stannic acid in NH₂Aq over H₂NO₄ (Moberg, J. vr. 28, 230). When K₂SnO₂Aq is added to NH₂ClAq, stannic acid is ppd. according to Ditte (C. R. 96, 701).

Barium stannate. The normal salt

Barium stannate. The normal salt BaSnO₂.6H₂O is said to be obtained by adding BaCl, Aq to K, SnO₃Aq; it is described as a heavy, white powder (Moberg, Lc.). By adding K, SnO₃Aq to excess of BaCl, Aq, Ditte (Lc.) obtained a basic salt R: SnO₃BaO.10H,O as lustrous leaflets.

Calcium stannate. Ditte (l.c.) obtained the normal salt CaSnO3.5H2O, in white crystals, by normal sate Usero, or 1,0,1,1,1, white capenage adding K₂SnO₂Aq to excess of CaCl_Aq, washing, and drying at 100°. By heating for some hours a mixture of stannic acid and CaCl₂Aq, with a little CaO, D. obtained CaSnO, in regular crys-

Potassium stannate K₂SnO₈.xH₂O. pared by dissolving stannic acid in KOHAq, or by fusing SnO2 or metastannic acid with excess of KOH for some time and dissolving in water, and evaporating over H2SO,; transparent, rhombic prisms; crystallising with 4H_O (Fremy, A. Ch. [3] 23, 393), with 3H₂O (Moberg, l.c.). Marignac (Ann. M. [3] 15, 277) obtained the salt, in rhombohedral crystals, by gradually heating 8 pts. metastannic acid with 8 pts. KOH till the mixture boiled, allowing to cool, dissolving in water, filtering, and evaporating. Ordway (Am. S. [2] 40, 173) prepared the pure salt by adding an equal volume of absolute alcohol to a solution of the commercial salt (v. infra), repeatedly treating the syrupy layer that separated with alcohol, drying the pasty mass so obtained by pressure, dissolving in water, evaporating in vacuo, and washing the crystals with alcohol. K stannate dissolves easily in water; O. (l.c.) gives S. at $10^{\circ} - 106 \cdot 6$, and at $20^{\circ} - 110 \cdot 5$; solution reacts alkaline. Insoluble in alcohol. By adding u dilute soin solution sufficient to neutralise ? of the alkali, a white freculent pp. of K meta-stannate is said to be produced (O. L.c.); excess of cold dilute seid ppts. stannic acid. K_SnO_wH_0 is dehydrated at a red heat.

mercial stannate of potash solution is prepared (1) by fusing tinstone with KaS, KOH or

KNO, and dissolving in water; (2) by boiling tinstone with KOHAq; (8) by fusing tin with KNO4, and K₂CO₂, or boiling the metal with KOHAq containing KNO₂ and KCl (ν . Haeffeld, D. P. J. 144, 66; Vaughan, B. 5, 396; and DIOTIONARY OF APPLIED CHEMISTRY, vol. iii. pp. 843-4).

Sodium stannate Na2SnO2.xH2O. Prepared similarly to the K satt. Crystallises in hexagonal plates with 3H₂O (M., l.c.; O., l.c.). Marignac (l.c.) obtained rhombohedral crystals. Jonas (C. C. 1865, 607) obtained rhombic crystals. tals of Na, SnO, 9H,O by recrystallising the commercial salt. Haeffely (D. P. J. 144, 66) obtained crystals of Na SnO 3.3H2O by heating an aqueous solution of S.G. 1.3; on allowing to cool again the crystals dissolved, the S.G. became 1.35, and after a time crystals of Na, SnO, 8H, O were deposited. Scheurer-Kestner (Bl. [2] 8, 839) obtained crystals of the composition Na, SnO, 10H, O by evaporating a dilute solution of the ordinary salt, free from excess of NaOH, at a low tem perature. Na2SnO3.3H2O is more soluble in cold than in hot water; O. (l.c.) gives S. at 0°=67.4, and at 20°=61.3. Insoluble in alcohol. According to H. (l.c.), an aqueous solution of the octohydrate gives a crystalline pp. of Na metastannate when heated, or when left at the ordinary temperature for some weeks. Commercial stannate of soda solution is prepared similarly to the solution of the potash salt (v.

Strontium stanuate. A basic salt 2SrSnO₃.SrO.10H₂O was obtained by Ditte (C. R. 96, 701), in lustrous octahedra, by adding

K.SnO,Aq to excess of SrCl.Aq.

METASTANNATES. Only alkali metastannates have been prepared. The empirical formula of these salts is M₂O.5SnO₂.4H₂O; as they are dethese salts is M₂U.55NO₂-\$H₂U; as oney are uccomposed by removing water, the formula is generally written as M₂H₂Sn₂O_{1s} (cf. Metastannic acid dissolves slowly in KOHAq or NaOHAq; on adding cone. MOHAq the salts are ppd. The salts are better obtained by adding cone. MOHAq to a solution in water of the substance obtained by the interaction of metastannic acid and conc. HClAq (Barfoed, J. pr. 101, 368). Dilute acid solutions ppt. metastannic acid from solutions of metastannates. Metastannates heated with excess stannates. Metastannatos neated with excess of MOH give stannates. For more details regarding M.H.,Sn.O., (M = K or Nn) v. Fremy (A. Ch. [3] 23, 393); Weber (P. 122, 358); Haeffely (D. P. J. 144, 66).

ARSENIO-STANNATES. A compound

Na₂O.2As₂O₃.6SnO₂.5H₂O was obtained by Haeffely (D. P. J. 140, 290) by adding excess of HNO, Aq to a boiling solution of Na, SnO, and Na, AsO,, and treating the gelatinous pp. with

excess of NaOHAq.
OXALO-STANNATES. 2KHC₂O₂SnO₂SH₂O was obtained, in lustrous leaflets, by Péchard (C. R. 116, 1513) by dissolving stannic acid in hot KHC₂O₂Aq and allowing to cool.

PLATINO-STANNATES. Compounds of SnO and SnO₂ with PtO₂, derived from the acids H₂Sn₂Pt₂O₄ and H₂Sn₂Pt₂O₄ (v. Platino-stan-

NATES, this vol. p. 285).
PLATINO-SELENO-STANNATES v. this vol. p. 285.

BILLIOU-SLANNATES. Bourgeois (Bl. [2] 47, 197) obtained the salt CaO.SiO₂.SnO₂ in monolinic, lustrous crystals, by fusing SiO₂ and snO₂ with excess of CaCl₂, and extracting with water.

In connection with stannic and metastannic soids and their derivatives, v. Chlor-stannic acid, under Stannous chloride (p. 721); Tin, oxides and hydrated oxides of (p. 725); and Tin, thio-acids and salts of (p. 735).

ONDES AND HIRATED VALUES OF (p. 1207), and TR, THIO-ACIDS AND SALTS OF (p. 735).

Tin, oxybromides of. By adding pieces of tin to the mother-liquor from BaSnBr. (v. Stannibromides, under Stannib romales, p. 720).

Rayman a. Preis (A. 223, 323) obtained colour-less, prismatic crystals to which they gave the formula Sn,OBr.,12H.O; and from the mother-liquor from this compound fine, colourless needles of Sn,O.,Br.,10H.O separated after a time.

Tin, oxychlorides of. According to Ditte (A. Ch. [5] 27, 145), when SnO.xH₂O, obtained by ppg. a stannous salt by NH₂Aq, is boiled with water containing a trace of SnCl₂, a gelatinous oxychloride is obtained having the compositior. Sn₂OCl₂:6H₂O (= SnO.SnCl₂:6H₂O); and when this compound is boiled with a little more dilute SnCl₂Aq another oxychloride, Sn₂O₃Cl₄:6H₂O (= 3SnO.2SnCl₂:6H₂O) is formed in small, white, pearly tablets.

The oxychloride SnOCl, is obtained, according to Scheurer-Kestner (A. Ch. [3] 47, 1), by evaporating SnCl,Aq at 50° to 60°; also by heating 100 pts. SnCl,2H,O, dissolved in 50 pts. water, with HNO,Aq containing 16 pts N.O.

An oxyohloride is also formed by treating metastannic acid with conc. HClAq, pouring off the excess of acid, dissolving in water, and evaporating over H.SO, and CaO; to this oxychloride, which is an amorphous, white solid, Weber (P. 122, 358) gave the formula Sn,Oc01,5H,O(=3SnO_.SnCl,5H,O). Tschermak (W. A. B. 44, 2) obtained a crystalline oxychloride Sn,Oc01,4 (=4SnO_.3SnCl,SnCl,2) by dissolving moist metastannic acid in hot conc. SnCl_Aq containing HCl.

Mallet (C. J. 35, 524) obtained a semi-transparent, jelly-like solid from SnCl_Aq which had been kept in a loosely-stoppered bottle for a year or two; to this solid he gave the farmula SnC MCL_SNCOMED

SnO..HCl (= SnO.OH.Cl).

Tin, oxyfluoride of When SnF, is heated in air it is said to form the oxyfluoride SnOF, (= SnO.SnF,) (Fremy, A. Ch. [3] 47, 37; Marignae, Ann. M. [5] 15, 221).

Tin, oxyiodides of. According to Personne (C. R. 54, 216), various oxyiodides are formed by decomposing SnI, by much water; P. analysed four compounds, to which he assigned the compositions Sn.O.I. (= 25nO.SnI.), Sn.OI. (= SnO.SnI.), Sn.OI., (= SnO.SnI.), and Sn.OI.

Tin, phosphides of. By heating finely divided tin in vapour of P, Schrötter (W. A. B. 1849, 301) obtained a silver-white, brittle solid to which he gave the formula SnP; S.G. 6:56; easily acted on by MClAq, but not by HNO,Aq. Other crystalline solids have been obtained by heating iin and P together, but their compositions are not determined with certainty (v. Pelletier, S. 55, 106; Berthier, A. Ch. [2] 33, 180; H. Rose, P. 24, 326; Lüpke, C. C. 1890

[ii.] 643). Natanson a. Vortmann (B. 9, 1459) obtained a phosphide of tin by heating glacial phosphoric acid with C and tin; HClAq gave of PH, and left SnP.
Tin, saits of. Tin forms two classes of

Tin, selenides of. Tin and Se form two compounds, SuSe and SuSe. The former can be prepared by the direct union of the elements; the latter does not seem to be obtained by this method. Both selenides dissolve in alkali solutions, and in solutions of alkali sulphides.

STANNOUS SELENIDA SnSc. (Tin mono-sclenide or protosclenide.) Mol. w. unknown. Obtained by melting together So and tin (Berzelius; Welsmann, A. 116, 122). With excess of Se the disulphide SnSe, was said to be formed (Little, A. 112, 213), but this was probably a mistake (Schneider, P. 127, 624). Also formed by adding powdered Se to molten SnCl., heating till SnCl, is volatilised, and allowing to cool, when SnSe crystallises; excess of SnCl, is removed by washing with dilute HClAq (Schneider, i.e.). Steel-grey, lustrous prisms; probably isomorphous with SnS; S.G. 5-21 at 152 (S., i.e.). Also obtained, as a black powder, by passing H.Se into SuCl.Aq, washing, and drying at 100° SnSe prepared by ppn. is soluble in alkali solution; the crystals prepared by heating Se with SuCl, are insoluble, even in boiling alkali solu-Both crystalline and amorphous SnSe are soluble in solutions of alkali sulphides or sclenides. SnSe is insoluble in HClAq; oxidised by HNO,Aq to SnO,xHO, HSeO, and HSeO, Heated with I forms SnI, and SnSe,; or, with an excess of I, SnI, and Se; reacts similarly with Br. SnSe is not reduced by heating in H. Heated in air it is gradually oxidised to SnO, and SeO, (S., l.c.). According to Ditte (C. R. 96 1790), SaSe can be sublimed in a stream of H at a red heat; D. says S.G. is 6.179 at 0°.

STANNIC SELENINE SINSe. (Tin disclenide.) Mol. w. unknown. Not formed by heating together tin and Se, as excess of Se over that required to form SinSe sublimes; Little's statement that SinSe, is formed by directly combining tin and Se by heat (4. 114, 213) is probably wrong (Schneider, P. 127, 624). Prepared by rubbing 5 pts. I and 8 to 10 pts. crystallised Sul₂ (the Sul₃ is used to enable the 1 to be thoroughly powdered), adding 4 pts. powdered vinSe, then sufficient CS, to form a pasty mass (stirring constantly), and then adding more CS, to dissolve Sul₃, and washing with CS, when SinSe, remains as a dark, red-brown, indistinctly crystalline powder, which becomes darker when dried at 100° (Schneider, l.c.). S.G. 4-85. According to Welsmann (4. 116, 122), SinSe, is obtained, as a dark reddish-brown powder, by passing H.Se into SinCi,Aq; heated in H. this powder gives off Se and leaves SinSe.

SnSe, is not acted on by water, or by dilute soids; it is slowly attacked by cone. boiling HClAq; aqua regia, or cone. HNO,Aq, oxidises it to SnO₂, H₂SeO₃ and H₂SeO₄; it dissolves in hot conor H₂SO₄, and when the olive-green solution is poured into water Se separates and Sn(SO₂), remains dissolved. SnSeA is easily soluble in caustic alkali solutions, including NHAO, forming blood-red liquids. Heated NH,Aq, forming blood-red liquids. Heated with I, in the ratio SnSe,:4I, SnI, and Se are formed; Br reacts similarly to I (Schneider, l.c.).

Tin, silicides of. No definite compound has been isolated. Substances which seem to be of the nature of alloys are for med by heating together tin and Si; treatment with HClAq dissolves tin from these bodies, and separates Si along with SiO₂ (v. Winkler, J. pr. 91, 193).

Tin, silicofluoride. According to Berzelius (Lehrbucn [5th ed.] 3, 767), the salt SnSiF. separates (? from solution of SnO.xH.O in H.SiF.Aq) in prismatic crystals, which are

readily crystallised from water.

Tin. sulphides of. . Two sulphides of tin are known, SnS and SnS,: the former is readily obtained by heating tin and S; the latter by heating tin with an excess of S and some sub-stance (e.g. NH₄Cl) which readily volatilises, and so removes heat, which would else drive off the S above that required to form SnS. Both sulphides are also formed by ppn. by H2S from corresponding salts in solution. Both sulphides dissolve in solutions of alkali polysulphides. torming thiostannates, M.SnS₃.

Stannous sulphide SnS. (Tin monosulphide

or protosulphide.) Mol. w. unknown.

Preparation.—1. Finely divided tin is heated

with c. equal parts of S; the product is powdered, and repeatedly heated with S in a closed vessel. Ditte (C. R. 96, 1790) recommends to sublime the SnS thus prepared, by heating to redness in a porcelain tube in a stream of H .-2. H₂S is passed into a solution of a stannous salt until the liquid smells strongly of H₂S; the brownish black pp. of amorphous SnS is washed and dried, and is then added, little by little, to molten SnCl, as long as it is dissolved thereby; after cooling, SnCl₂ is dissolved out by dilute HClAq, and any dark-brown powder that is present is washed away from the heavier, greyish, lustrous, crystalline particles of SnS (Schneider,

P. 95, 167).

Properties.—A dark, lead-grey, crystalline solid; S.G. 4'85° (Karsten, S. 65, 394), 5'27 (Boullay, A. Ch. [2] 43, 266). Ditte (l.c.) describes SnS, after sublimation in H, as crystallising in thin, lustrous squares with an angle of c. 90°; with a groy-blue, metal-like lustre; soft and friable; S.G. 5.0802 at 0°. Crystalline SnS melts at a red heat; it expands considerably on cooling (Ditte, l.c.). Prepared by ppn. SnS is a brownish-black, amorphous solid

Reactions.—1. SnS, prepared by heating together tin and S, may be sublimed in hydrogen at a red heat (Ditte, C. R. 96, 1790); but continued heating in H is said to reduce it to tin, H.S being given off .- 2. Heated in air SnS is gradually converted into SnO, and SO, -3. Reacts with chlorine, even at the ordinary tempera-ture, to form SnCl, and SnCl, 28Cl, = (SnS,Cl,) (H. Rose, P. 47,517).—4. Fusion with potassium syssids produces tin and KONS.—5. SnS dis-

solves gradually in boiling hydrochloric acid, forming SnCl, solution and giving off H,S (for details of interaction with HClAq of different concentration, and with HCl gas, v. Ditte, C. R. 97,42).—6. Gradually oxidised to SnO, by heating with nitric acid.—7. Dissolves in solutions of alkali polysulphides, forming alkali thiostannates M2SnS3.-8. SnS is generally said to be nearly insoluble in solutions of alkali monosulphides (M2S). According to Ditte (C. R. 94, 1419, 1470), SnS is not acted on by K.SAq at the ordinary temperature if the concentration of the solution does not exceed 20K,S:100H,O; but a more conc. solution of K2SAq, out of contact with air, gradually converts the SnS into a grey, spongy mass of tin; and still more conc. K,SAq dissolves this, forming K,SnS,Aq and giving off H: if air is admitted the reactions are more complex.

STANNIC SULPHIDE SnS . (Tin disulphide.) Mol. w. not known.

Preparation .- 1. By saturating SnCl Ag containing a little HClAq with H.S, warming, again saturating with H.S, warming gently for some hours, collecting the pp., washing with dilute H2SAq, drying, and heating to above 100° out of contact with air. Pure SnS2 can scarcely be prepared in this way; there seems to be always prepared in this way; there seems to be always some Sno_x2H₂O present in the pp. (Kühn, A. 84, 110; Barfoed, J. pr. 101, 368).—2. By passing the mixed vapous of SnCl, and H₂S through a red-hot porcelain tube, or by passing H₃S into SnCl, and heating the white crystals of SnCl₄.5H₂S so obtained (Coldridge, P. M. [5] 29, 383).—3. A mixture of finely-divided tin and S, or of SnS and S with some substance that or of SnS and S, with some substance that gradually volatilises and so removes heat, is slowly heated to redness in a glass retort, or a loosely covered flask, imbedded in sand; the volatile substance gradually passes off, then the excess of S is volatilised and the SnS, remains, partly on the sides and partly on the bottom of the vessel. If tin is heated with S only, the heat produced in the reaction is so great that the SnS, formed is resolved into SnS and S. Various mixtures have been employed by different chemists; the following give good results: (1) equal parts sifted tin-filings, S, and NH,Cl (Pelletier); (2) 4 parts tin-filings, 3 parts S, 2 parts NH₄Cl (Woulfe); (3) a pulverised amalgam of 12 parts tin and 6 parts Hg, with 7 parts S, and 6 parts NH,Cl (W.); (4) 5 parts SnS and 8 parts HgCl2 (W.).

Patts Ligul₂ (W.).

References.—Pelletier (Crell's Chem. Ann.
1797 [1] 46); Woulffe (ibid. 1, 149); Bullion (ibid.
1793 [1] 89); Proust (Gehlen's Journ. f. Chem.
und Phys. 1, 250).

According to Gmelin (Handbuch [5th ed.] 3,75) if NH Cl is heated with tin and S there is formed a compound of NH₁Cl and SnCl₂, which then interacts with the S, forming SnS₂ (?2Sn + 8NH₂Cl = $2(2NH_1Cl.SnCl_2) + 2H_2 + 4NH_3$;

2(2NH,Cl.SnCl.) + 2S = SnS₂ + 2NH,Cl.SnCl₄ + 2NH,Cl)

Properties .- Prepared by sublimation, SnS. is a soft golden-yellow, lustrous, crystalline solid; S.G. 4.6 (Karsten, S. 65, 294), 4.42 (Boullay, A. Ch. [2] 43, 266). Crystalline SnS₂ is known chemistry, vol. iii. p. 845).

Reactions and Combinations.—1. Heated in

a closed vessel gives SnS and S, and a sublimate

of SnS,—2. Heated in air SnO, and SO, are formed.—8. Chlorine liquefies SnS, on cooling formed.—S. Chlorine liquefies SnS₂, on cooling yellow crystals of SnCl₄.2SCl₄ are formed (H. Rose, P. 42, 517). — 4. The compound SnS₄I₄(=SnSI₂.SI₂) is said to be formed by heating SnS₂ with iodine in a stream of CO₂ (Sohneider, J. pr. 79, 419; v. also Tin, Thiotodom, infra). According to Schneider (l.c.) a boiling alcoholic solution of I does not act on SnS₂ arcoard by sublimation between the configuration. SnS, prepared by sublimation, but with amor phous SnS, prepared by ppn. it gives SnS, I, -5. Amorphous, but not crystalline, SnS, is slowly decomposed by boiling cone. hudrochloric acid, H2S being given off and SilCl, solution formed. -6. The amorphous sulphide is slowly oxidised by hot nitric acid; aqua regia oxidises both amorphous and crystalline SnS₂ to SnO₂ and H2SO4Aq. -7. Fusion with lead monoxide produces a mixture of sulphides and oxides of tin and lead; with excess of PbO, SO₂ is given off and lead remains.—8. SnS₂ was said by Dumas (S. 66, 409) to combine with stannic chloride, forming SnS₂,2SnCl₄; the compound being produced by the interaction of SnCl, and H.S. According to Coldridge (P. M. [5] 29, 383) this compound to Coldridge (P. M. [5] 29, 383) this compound does not exist, the product of the reaction being SnCl₄5H,S.—9. SnS₂ dissolves in alkali sulphide solutions, forming thiostannates (q. v., infra), M.SnS₃.—10. In alkali solutions SnS₃ dissolves, probably forming stannates and thiostannates (?3SnS₂+6KOHAq

= K_SnO₂Aq + 2K₂SnS₂Aq + 3H₂O).
Tin Sesquisurphide. Berzelius (*Lehrbuch* [5th ed.] 2, 600) gave the formula Sn₂S₃ to a greyish-yellow, lustrous solid obtained by heating a mixture of 3 parts SnS and 1 part S in a retort; the substance was almost certainly a

mixture of SnS and SnS...

Tin, sulphochlorides of: v. Tin This-CHLORIDES, infra. Tin, sulpho-iodide of; v. TIN THIO-IODIDE,

Tin, sulphocyanide of; v. vol. ii. p. 352.

Tin, telluride of, SnTe. A grey, lustrous, metal-like, crystalline solid; S.G. 6:478 at 0°: obtained by heating together tin and Te, and alowly subliming in a stream of H (Ditte, C. P. 96, 1790).

Tin, thio-acids and salts of. It is doubtful whether a thio-acid of tin has been isolated with certainty; a few salts derived from the acid

H_SnS, have been obtained.

THIOSTANNIC ACID. (Sulphostannic acid.) Kühn (A. 84, 110) obtained an olive-brown pp. by adding HClAq or H.C.H.O.Aq to a conc. solution of Na.SnS. Na.S.12H.O (v. infra); after washing, and drying at 100°, the pp. was a leadengrey, lustrous solid having the composition H.SnS.. Storch (M. 10, 255), repeating Kühn's experiments, always obtained brown pps., which did not contain more S than required by the ratio Sn:S=1:2'19. S. concluded that the pps. were mixtures of H_SnS_s and SnS_s. By adding dilute oxalio soid sojution to solution of Na_SnS_s (prepared by saturating Na_SnO_sAq with H_SS) in quantity just sufficient to combine with the Na present, S. (l.c.) obtained a deepyellow liquid which remained clear for hours; after removing the H.S by a current of air S. found that the liquid contained tin and S in the ratio Sn:3S; he concluded that H.SnS, was present in the liquid. The liquid was decolourised by NH,Aq, KOHAq, Na,CO,Aq, (NH,),CO,Aq, and NH,ClAq; strong soids gave brownish pps. containing rather more S than required by the formula SnS..

THIOSTANMATES (Kühn, I.c.; Höring, Hirsel's Zeit. für Ihiarm. 1851. No. 8). The alkali salts are obtainal by dissolving SnS, in alkali sulphide solutions, M.SAq; the alkaline earth salts are formed by double decomposition from the alkali

Potassium thiostannate K,SnS,.10H,O. Obtained by dissolving SnS, in K,SAq, and adding alcohol, when the salt separates as a dark

brown heavy oil; all H_oO is given off at 100°.

Sodium thiostanuates. The normal salt Na, SnS, 2H,O is obtained, in yellow, glassy, regular crystals, by adding tin, little by little, to molten Na.S., treating the fused mass with water, and evaporating at a low temperature. A solution of SnS and S in Na SAq deposits colourless, monoclinic crystals of the basic salt, which, when dried over H.SO, has the composition Na.SnS.,Na.S.12H.O. The stronger acids (HCl, H.SO, CliCl.,CO,H) ppt. SnS., at once from Na.SnS.,Aq; but weak acids yellow solutions from which red-brown pps, separate more or less slowly (Storch, M.10, 255). Kühn (l.c.) gives the reactions of the two Na thiostannates with solutions of several metallic . salts; many of the pps. were doubtless thiostannates of the metals employed.

PLATINO THIOSTANNATES. (Z. [2] 5, 629; 6, 270, 613) obtained scalts to which he gave the composition M.Pt.SnS. (= M.S.3PtS.SnS₂), where M=K or Na, by fusing SnS₂, Pt, M₂CO₃, and S, and lixiviating

with water.

Tin, thiochlorides of. A compound SnS₂Cl₁₈ (= SnCl₁, 2SCl₁) is said to be formed, along with SnCl., by the interaction of Cl and SnS or SnS. (H.Rose, P. 42,517). Dumas (S. 66, 409) described a compound Sn₂S₂Cl₄(= SnS₂SnCl₄) as obtained by passing H₂S into SnCl₄; but according to Coldridge (P. M. [5] 29, 383) this compound is not formed. C. (l.c.) says that the passage of H.S. into SnCl, produces white crystals of SnCl, 5H, which are decomposed by heat, giving off HCl

and H₂S, and leaving SnS₂.

Tin, thic-iodide of. By melting together crystalline SnS₂ and I, in the ratio SnS₂4I, allowing the liquid to cool, and either heating in a stream of CO2, or dissolving in CS2 and crystallising, Schneider (J. pr. 79, 419) obtained brown, lustrous crystals of SnS.1, (=SnSI,SI). This thio-iodide is disselved unchanged by CS. or CHCl2; alcohol separates S; water, or a soluor CHCl₂; alcoholseparates S; water, or a solu-tion of a caustic alkali, produces SnS₂, S, and HIAq (or MIAq); HClAq or HNO₂Aq decom-poses it, with separation of S. The compound SnS₁I, is also produced by the interaction of a solution of I in CS₂ and ppd., dried SnS₂. (S., l.c.).
TIN ORGANIC COMPOUNDS. м. м. Р. м.

1.313. V.D. 6.00 (calc. 6.15). Got 1 an alloy of tin and 1. 1 313. V.D. 6 00 (calc. 6 15). Got by heating an alloy of tin and sodium (14 p.c.) with Med (3 pt.) at 100°-120° (Ladenburg, A. Suppl. 8, 74; cf. Cahours, A. 111, 236; 114, 879). Oil, with attended to the control of with ethereal odour. Reduces alcoholic AgNO. Staunic tri-methylo-iodide SnMe₃L. (170°). S.G. ² 2·148. Formed by the action of I on SnMe. Oil. Yields crystalline SnMe,OH and the salts (SnMe₃)₂SO₄, SnMe₃O.CO.H, and SnMe₃OAc. Forms the compounds SnMe₃OEt (Ladenburg, B. 3, 358) and SnMe, I2NH, (Ca-

hours. A. 122, 56).

Stannie di-methylo-di-lodide SnM 3.L. [30°]. (228°). S.G. 22 2.872. Formed by heating tinfoil with MeI at 150° (C.). Monoclinic crystal standard of the standard Converted by ammon tals (from ether-alcohol). Converted by ammonia into amorphous SnMe₂O, which is insol. water, but dissolves in acids forming the following crystalline salts: SnMe₂Cl₂ [90°] (189°), forming trimetric crystals; a:b:c = 834:1: 941.— SnMe₂PtCl₆7aq, forming trimetric crystals; a:b:c = 888:1:977. — SnMe₂Br₂. (209°). —

2093. — ShMe,BO, forming monoclinic crystals (Hjort-dahl, C. X. 88, 584).

Stannic ethide SnEt., Mol. w. 234. (181°).
SG. 32 1-187. Formed from SnEt,L, and Etl (Buckton, A. 109, 218; 112, 223; Frankland, A. 111, 44). Formed also, together with tin and ZnEtCl, by adding fused SnCl₂ to cooled ZnEt₂ and then distilling (Frankland a. Lawrance, C. J. 35, 134). Propared by heating powdered tin with Etl and the zino-copper couple; and also by heating ZnEtl with powdered tin at 160° (Letts a. Collie, C. J. Proc. 2, 166)., Oil. Has no action at 180° on Al, Na, or Mg. Slowly absorbs sulphur dioxide, forming crystalline SO₂(OSnEt₃)₂, insol. ether and an oil SnEt₄.SO₂Et, sol. ether. Hot conc. HClAq forms ethane and SnEt Cl. Iodine forms SnEt I and IEt.

Stannous ethide SnEt. S.G. 15 1.558.
Formed by adding zine to a warm solution of SnEt. Cl. (Frankland). Oil. Decomposed at 150° into SnEt. and tin. Br forms SnEt. Br...

Distannic hexa-ethide Sn_Et,. (265°-270°).

6.G. ² 1.412. V.D. 14.8 (calc. 14.7). Got by distilling SnEt,I with sodium (Ladenburg, A. Suppl. 8, 66; B. 3, 647). Pungent oil. I forms SnEt, I. Conc. HClAq forms SnEt, Cl, ethane,

and hydrogen.

Stannic tri-ethylo-iodide SnEt, (231°) S.G. 22 1.833. Formed by the action of EtI on an alloy of tin and sodium (Ladenburg, A. Suppl. 8, 60; B. 3, 353, 647; cf. Löwig, A. 84, 308). Liquid. Combines with NH, (2 mols.). On distilling with KOHAq it yields SnEt,OH crystallising from ether in prisms [43°] (271°) converted by heat into oily (SnEt₂)₂0, which recombines with water forming the hydroxide. NaOEt converts the iodide into SnEt,OEt (191°) S.G. 2 1.263, which is at once changed by water into the hydroxide. The hydroxide water into the hydroxide. The hydroxide SnEt₀NH is sol, water, strongly alkaline, absorbs CO₂ from the air, and is converted by acids into the salts:—SnEt₂Cl. [c. 0°]. (209°). SnEt_(SCy)_2—SnEt_S.—SnEt_SO_*.—Crystals.
SnEt_ClOAc)_2.—SnEt_Co_*.—Formate SnEt₂(CHO₂)

Stannic ethylo-trimethide SnEtMe. (125%, 128°). Formed from SnMe, I and ZnEt, (Cahours, A. 122, 59). Oil; converted by I into EtI and

SnMe,I.

Stannic di-ethylo-di-methide (145°). S.G. 9 1.260. V.D. 6.84 (calc. 7.14). formed from ShEt L and ZnMe, (Frankland, A. 111, 50; Morgunoff, A. 144, 157). Oil.
Stannic methylo-tri-ethide SnMeEt. (163°).

V.D. 6.72 (calc. 6.65). Formed from SnEt I and ZnMe, in the cold (C.). Heavy oil.

Stannic tetrapropylide SnPr. (224°). S.G. 14 1.179. Formed from SnPr.I and ZnPr.

(Cahours, C. R. 76, 133). Pungent oil. Stannic tripropylo-iodide SnPr,I. S.G. 10 1 692. Formed from PrI and an alloy of Na and tin (Cahours a. Demarçay, C. R. 88, 725, 1112). Oil, converted by moist Ag.O into crystalline SnEt.OH.

Stannic di propylo-di-iodide SnPr2I2. (272°). Formed from tin and PrI. Oil. Converted by alkalis into amorphous SnPr₂O, insol. water, which yields SnPr₂Cl₂ [81°].

Stannic tri-isopropylo-iodide SnPr.I. (257°).

Got in like manner.

Stannic di-isopropylo-di-iodide SnPr.I.. (267°). Yields SnPr2Cl2 [57°

Stannic tri-isobutylo-iodide Sn(C,H₀),I. (285°). S.G. ¹⁵ 1.540. Formed from CH_PrI and a 9 p.c. alloy of Na in tin (Cahours a. Demarcay, C. R. 89, 68). Pungent oil, converted by KOH into $Sn(C_4H_{\nu})_3OH$ (313°).

by KOH into $Sn(C_4H_9)_3OH$ (313°). Stannic di-isobutylo-di-iodide $Sn(C_4H_9)_2I_{\bullet}$. (290°-295°). Formed by heating tinfoil with isobutyl iodide at 125°. Liquid, converted by alkalis into amorphous $Sn(C_4H_9)_2O$, and by HCl into $^4Sn(C_4H_9)_2O_2$ [261°). Stannic tetra-isoamylide $Sn(C_3H_1)_4$. Formed from isoamyl iodide and an alloy of Na (1 pt.) and tin (6 pts.) (Grimm, A. 92, 383). Liquid. Stannic tri-isoamylo-iodide $Sn(C_4H_1)_4I$.

(304°). Accompanies the preceding compound (C. a. D.). Converted by potash into oily Sn(C,H,,),OH (337°).

Stannic tetraphenylide SnPh. (over 420°). Formed by heating bromo-benzene with a tin-sodium alloy and acetic ether (Polis. B. 22, 2915). Colourless prisms, insol. ligroin, v. sl. sol. alcohol, v. sol. boiling benzene. Stannic tri-phenylo-chloride SnPh.Cl. [105].

11, 2285; A. 194, 145). Triclinic prisms; a:b:c=-588:1:1067; a=62° 47'; B=76° 48'; a:b:c='588:1:1067; $a=62^{\circ}$ 47'; $\beta=76^{\circ}$ 48'; $\gamma=94^{\circ}$ 8'. Sol. alcohol and ligroIn, missible with ether. Converted by means of water into SnPh₂(I.OH, an amorphous insoluble powder [187°]. Potash forms SnPh₂(O. Ether, alcohol, and sodium-amalgam form SnPh₂(OEt)₂ [124°]. Stannie di-phenylo-di-bromide SnPh₂Br. [c. 38°]. (230° at 42 mm.). Formed from SnPh₂ and Br (Polis), and from the oxide and HR (A.).

HBr (A.).

Stannic di-phenylo-chloro-bromide

SnPh.BrCl [39°]. Crystalline. Formed from SnPh₂Cl(OH) and HBr.

Stannic di-phenylo-chloro-iodide SnPh₂ClI.

[69°]. Yellow monoclinic crystals (from ether), decomposed by water.

TIN GROUP OF ELEMENTS. Group IV. in the periodic classification of the elements contains the following members :-

6 Even series 2 Тi Zr Ce С 11 Odd series 3 5 7 9 Si Ge Sn Ρh

Subdividing this group in accordance with the chemical similarities of the elements we get the following families :-

Carbon family: C and Si.

Titanium family: Ti, Zr, Ce, —, Th.

Tin family: Ge, Sn, -, Pb.
The carbon family is considered in the article CARBON GROUP OF ELEMENTS (vol. i. p. 682); and that article also gives a sketch of the chemical relations of all the members of the group. The elements of the titanium family are considered under the heading TITANIUM GROUP OF ELEMENTS (this vol., p. 749). The tin family is considered in the present article.

Ge occurs in small quantities, as sulphide, in a very few rare minerals. Tin and lead are found native in not very large quantities. chief ore of tin is tinstone, which contains SnO2; SnS, is also found in tin pyrites; and various micas contain more or less SnO₂. Galena, containing PbS, is the chief ore of lead; sulphate, carbonate, phosphate, &c., are also found in considerable quantities. Ge is obtained by heating siderable quantities. Ge is obtained by heating its ore with Na₂CO₂ and S, dissolving in water, decomposing Na₂S by H₂SO₄Aq, ppg. Ag (Ag.S is a constituent of the ore) by HClAq, then ppg. GeS₂ by H₂S, oxidising the GeO₂ to GeO₂ by HNO₂, and reducing the GeO₂ by heating in H or with C. Tin is obtained by calcining tinstone, washing, and reducing the SnO₂ by heating with C. To obtain lead, galena is roasted in which appearing of in the strength of the state of in such a quantity of air that it is partially oxidised, both PbO and PbSO, being formed; by then heating out of contact with much air the PbS, PbO, and PbSO, interact to form SO, and lead. Tin and lead have been known from very early times. Ge was isolated in 1885.

The table on page 736 presents some of the principal physical and chemical properties of the

tin elements.

General formulæ and characters of compounds. Oxides:—MO, MO; also Pb₂O, and Pb₂O; various hydrates of most of these oxides rp, v, various nyuraes of most of sless chards are known. Sulphides:—MS, MS, (?PbS,). Haloid compounds:—MX, and MX, Acids:—H,MX, where M=Ge or Sn, and X=either Br, Cl, F, or I; also H,PbI,; H,SnO,

and $H_xH_sSn_sO_{1s}$; $?H_2SnS_s$. Salts:—MX, and MX, where M = Sn or Pb and X = NO_s, $\frac{1}{2}SO_{ss}$ PO, &c. Salts containing M in the gPO, &c. Salts containing M in the acidic radicle: — R'₂MX_s, where M = Ge, Sn, (?Pb), and X is a halogen; R'₂MO_s, where M = Sn, or Pb; also R'₂PbO₃; also R'₂HS₀O₁& also R'₂SnS₃.

The oxides MO are basic; they react with acids to form solts MX₂, X = NO₃, §SO₄, §PO₄, &c. (no salts of GeO have yet been isolated). PhO also dissolves in matter KOM forming K PbO

also dissolves in molten KOH, forming K.PbO. The oxides MO, where M = 8n or Pb, are both basic and acidic; they react with some acids to form salts MX,; several of these salts have been isolated when M = Sn, very few when M = Pb: they also react with molten KOH or NaOH (SnO.,xH,O also with MOHAq) to form salts K2(orNa2)MOs; when M = Sn two classes of salts are known, stannates MaSnO, and metastannates, probably M. H. Sn. O13. GeO, dissolves in acids, also in molten KOH or K. CO, but the products of these reactions have not yet been products of these teactors have not yet examined. Pb₂O₂ reacts with dilute strong acids to form Pl₂O₃, and PbN₂ which dissolves; with glacial acetic acid Pb₂O₄ forms Pb(C₂H₁O₂)₂ and Pb(C₂H₂O₂)₄. Pb₂O₃ probably reacts with dilute strong acids to give PbO₂ and a sult of PbO. The hydrates of MO and MO, react similarly to the oxides. Some of the hydrates SnO, xH,O are acidic; one class of these is probably polymeric with the other. There are indications of the existence of an oxide MO, in the case of tin; this oxide seems to be acidic.

The sulphides of Ge have not been much investigated; GeS, dissolves in alkali sulphide solutions, and is probably acidic. GeS has been gasified and V.D. determined. The sulphides of tin are both basic and acidic; with hot conc. HClAq they give SnCl, and SnCl, respectively; both dissolve in alkali sulphide solutions to form thiostannates M.SnS₂. PbS is basic; with acidsit gives salts PbX₂, and H₂S; there are indications of the existence of a higher sulphide, perhaps PbS2, which will probably form thioplumbates

with the sulphides of strongly positive metals.

The haloid compounds MX₂ (none isolated yet when M = Ge) may be formed by the direct union of the elements, and by the other usual methods. SnCl₂ and PbCl₂ have been gasified, and the formulæ are molecular; molecules of the composition Sn₂Cl₄ probably exist, but are decomposed at c. the boiling-point of the compound. Several salts are known of the form M.SnX, where X = Br, Cl, F, or I; and an acid to exist. H.PbI, and salts M.PbI, have been isolated; and also several salts coming under the general formula $x \operatorname{PbX}_x y \operatorname{NH}_i \operatorname{Cl}_i$, where $X = \operatorname{Br}$ or Cl. The haloid compounds MX, have been gasified, and V.D.s determined, when M - Ge and X = Cl or I, and when M = Sn and X = Br or Cl. PbCl, has not been isolated with certainty, but Poul has not been isolated with certainty, our salts of the form M₂PbCl₂ are known, and also seems salts xPbCl₂yNH,Cl. The acids H.GeF., H.SnBr., and H.SnCl., have been cotained, and also salts derived from these acids; salts M.SnF. and M.PbCl, are also known. GeHCl, has been isolated. Many oxyhaloid compounds x.MO.yMX.

and xMO_xyMX₄ are known.

The oxyactis of tin, H₂SnO₂, and (probably)
H_xH_zSn₂O₁, are to be classed with the weak

Occurrence and preparation.	Double sulphide of Ge and Ag occurs as a rare mineral. GeO ₂ also found in some specimens of euxenite, with oxides of Nb, Ta, and Y.	Metal found in small quantities. SnO ₂ occurs in tolerable quantities widely distributed.	Small quantities of lead found. Chief ore con- tains PbS; widely dis- tributed in considerable quantities.
61	Prepared by reducing GeO ₂ by H or C.	Prepared by reducing SnO ₂ by C.	PbS, PbO, and PbSO,; also by reducing PbO by
Physical ' properties.	Greyish white, lustrous, very brittle. Crystallises in regular octahedra. Molts at c. 900°; slightly volatilised at 1,350° in N or H.	Silver-white, lustrous, malleable, but malleability varies with temperature; tenacity very small. Crystallises very easily in rhombio and quadratio forms. Melts easily (at 232°), and boils between 1,450° and 1,600°.	C, White, with tinge of blue; lustrous; very malleable and ductile; tenacity very small; very soft. Crystallises easily in regular octahedra. Melts easily (at 330°), but at higher temperature than tin, and boils be- tween 1,450° and 1,600°.
Chemical properties.	Unchanged in air at ordinary temperature; oxidised to GeO ₂ when heated in fine division. Combines readily with Br, Cl, and I when heated, forming GeX ₄ . Heated in HCl gas forms GeHCl ₂ . Dissolves in H ₂ SO ₄ Aq. No salts have yot been isolated by replacing H of oxyacids by Ge. GeO ₂ dissolves in fused KOH or K ₂ CO ₂ . H ₂ GeF ₂ Aq and salts of this acid are known.	Unchanged in pure air at ordinary temperature. Heated in air gives SnO and SnO ₂ . Heated in Br, Cl, or I forms SnX ₂ and SnX ₄ . Heated with S forms SnS and SnSe ₂ . Reacts with acids forming two series of salts, SnX ₂ and SnX ₄ , X = NO ₂ , \$\$\frac{1}{2}\$\text{PO}_1\$, \$\frac{1}{2}\$\text{Conc.}\$ HNO ₃ produces SnO ₂ xH ₂ O, SnO is basic; SnO ₂ xH ₂ O, SnO is basic; SnO ₂ xH ₂ O, SnO is basic; SnO ₂ xH ₂ O, SnO ₃ show and acidic, with strong acids forms salts SnX ₄ , and with caustic alkalis forms stannates M ₂ SnO ₂ , SnS ₂ forms thio-stannates M ₂ SnS ₃ with alkali sulphides. Stanni fluorides M ₂ SnF ₂ are known; the cids H ₂ SnCl ₂ and H ₂ SnE ₃ have been isolated. Mol. w. perhaps same as at w. in solution in Hg. Valency of atom varies from 2 in SnCl ₂ gas to 4 in SnCl ₄ gas.	Tarnishes in air, film of oxide (? Pb ₂ O) forming on surface. Melted in air forms PbO and Pb ₂ O ₂ . Combines with halogens to form PbX ₂ ; PbCl ₄ also probably isolated. Combines with S and Se, forming PbS and PbSe; PbS.xS also probably exists. Reacts with aoids forming salts PbX ₂ , X = NO ₃ , \$SO ₄ , \$PO ₃ , &c. PbO is basic; PbO ₄ feebly basic and feebly acidic; PbC(2,H ₂ O ₂), has been isolated, and probably PbCl ₄ ; with molten KOH, PbO ₄ forms K ₂ PbO ₅ . No thioplumbates isolated. No acid H ₂ PbF ₂ , or salts thereof, isolated; but 3KF.HF.PbF ₄ probably exists. Mol., w. perhaps same as at. w. in solution in Hg. Atom is divalent in gaseous molecule PbMo ₂ , as a second of the pbF ₂ .

acids; the one is probably a polymeride of the other. The salts of these acids show very distinct differences: the acids themselves interact with strong acids to form salts containing tin in the positive radicles. Of acids containing tin and halogens the following have (probably) been isolated: HSnCl_s, H_SnBr_s, and H_SnCl_s. H_GeF_s is known, and H_PbI_s is said to exist. It is doubtful whether thiostannic acid H_SnS_s, has been obtained pure, but salts of this acid have been isolated.

The salts of oryacids containing these metals in the negative radicles are MaSnO, and M.H.SnO₁, M.PbO₂ and M.PbO₃. These salts are generally easily decomposed. Oxyacids and salts of oxyacids of Ge have yet to be searched for.

Salts derived from oxyacids by replacing II by M are known when M=Sn or Ph; no Go salts of oxyacids have yet been isolated. The tin salts belong to two classes, SnX, and SnX, where X=NO₃, \(\frac{1}{2}SO_4\), \(\frac{1}{2}CO_4\), \(\frac{

The elements of the tin family are distinctly metallic in their physical properties, and in most of their chemical properties also; they exhibit, however, non-metallic characters in their highest salt-forming oxides, MO₂, which are acidic towards strong bases, while they also react as basic oxides towards several acids. The tin elements are less chemically metallic, on the whole, than the members of the even-series, or titanium family, of Group IV.; the two distinctly non-metallic elements of the group are the first member of the even series—carbon, and the first member

of the odd series -silicon.

In considering the chemical analogies of the tin elements, the position of the members of the family in their respective series should be looked to (v. table in vol. iii. p. 811). Ge comes in series 5; it is preceded by Ga, Zn, and Cu, and succeeded by As, Se, and Br: tin comes in series 7; it is preceded by In, Cd, and Ag, and succeeded by Sb, Te, and I: lead comes in series 11; it is preceded by II, Hg, and Au, and succeeded by Bi and two unknown elements. The highest salt-forming oxides of the elements preceding and succeeding the tin elements in the series are: series 5, CuO, ZnO, Ga,O,; GeO₂; As,O₃, SeO₃, —; series 5, Ag,O, CdO, III,O₃; ShO₂; Sb,O₃, TeO₃, ?I₃O, ——. The preceding oxides GeO₂ are, on the whole, more basic than the oxides preceding SnO₂ or PbO₂; and the oxides succeeding GeO₂ are on the whole more acidic than the oxides succeeding SnO₂ or PbO₃. Hence we should expect the three oxides, GeO₃ SnO₅ and PbO₂ to be about equally acidic and equally basic; SnO₂ perhaps, being the most acidic of the three. Looking at the position of the tin elements in the general periodic system, we may express the relationship of these Vol. IV.

odd-series elements to the first member of the odd-series elements to the first member of the odd series of their group (Si) by the following statements: (1) Pb:Si = Ti:Ai = Hg:Mg = Au:Na = Bi:P. — (2) Sn:Si = In:Al = Cd:Mg \(\frac{1}{2}\) Ag:Na = Sb:P. — (3) Ge:Si = Ga:Al = Zn:Mg = Cu:Na = As:P. O) the whole, Bi is more unlike P than Tl is palike Al, Hg is unlike Mg, or Au is unlike Al, Cd is unlike Mg, or Ag is unlike Na; and As is more unlike P than In is unlike Al, is more unlike P than In is unlike Al, Cd is unlike Mg, or Ag is unlike Na; and As is more unlike P than Ga is nulike Al and As is more unlike P than Ga is unlike Al, Zn is unlike Mg, or Cu is unlike Na. Hence the differences between Pb and Si, tin and Si, and Ge and Si, respectively, will be very decided. If the relations expressed in the preceding statements are worked out in detail, they show that the differences between Pb and Si will be more marked than those between tin and Si, and still more marked than those between Se and Si; but at the same time there will not be anv very great differences between these three pairs of differences. Lead, then, will on the whole be the most metallic, and the the least metallic, of the tin elements. But the three elements will resemble each other closely in so far as their general positive or negative character is concerned. Then, considering the resemblances and differences between consecutive pairs of elements in (1) series 3 and 5 (i.e. Si and Ge series), and (2) series 5 and 7 (i.e. Ge and tin series) and (3) series 7 and 11 (i.e. tin and lead series), it is evident that Ge and Si will be more alike than Ge and tin, and that Ge and tin will more closely resemble one another than tin and lead. Hence, on the whole, we may expect that Ge will form several compounds wherein the element acts distinctly as a non-metal; it is possible that GeH4 may be isolated (GeHCl, exists). Ge will form volatilisable organic compounds; GeO, will probably be found to be di- or trimorphous.

"ITANIUM. At. w. 47.9. Mol. w. not known. Has not been fused. S.G. \$\frac{\pi}{2}\$ 3.5888 (K. Hofmann, B. 26, 1025); some older determinations ga'e S.G. c. 53 (c. Fritz, M. 1892. 772; Wilson, Pr. 32, 457 [1881]). S.H. 0° to 190° -1135, 0° to 211° -1288, 0° to 301° -1485, 0° to 440° 162 (Nilson a. Pettersson, Z. P. C. 1, 34); Fritz (M. 1892. 772) gives 13. S.V.S. 13.4.

Historical.—In 1791 Gragor found indications of a now element in a Cornish ironsand called menaccanite, from the village near which is was found (Crell's Ann. 1791 [1] 40, 103). The element was called menachin by Kirwan. In 1795 Klaproth found a compound of a new element in a mineral known as rother Schoerl zu Boinik in Hungarn, and called the element titanium (derived from Titan). In 1797 K. geognised that the chief constituent of the Hungarian mineral was the same as the characteristic constituent of menaccanite examined by

8 B

Gregor (K., Beiträge sur Kentniss der Mineralsurper). The element was isolated for the first

time by Berzelius in 1824 (P. 4, 3).

Occurrence.-Ti never occurs native. chief ore of Ti is more or less pure TiO2, which occurs in different crystalline forms as rulile and anatase (tetragonal) and brookin (rhombic). Various minerals contain TiO, con bined with SiO, and alkaline earths, e.g. titanite or sphene and ferrotitanite; compounds of titanates and nichates are found in some ware minerals, e.g. polycrase, euxenite, and pyrochlore. Varying quantities of TiO, occur in many titaniferous Varving iron ores. The ores of Ti are found in small quantities. Some of them, especially the titaniferous iron ores, are widely distributed (for analyses of Ti ores v. H. Rose, P. 3, 163; 14, 501; 15, 276; Mosander, P. 19, 211; Hermann, J. 25, 368; Berzelius, J. pr. 43, 50; Rammelsberg, P. 1858. 507; Scheerer, P. 64, 489; Groth, Tabellarische Uebersicht der Mineralien [2nd ed.] 35; O. v. d. Pfordten B. 22, 1485). Mazade (C. R. 34, 952) found traces of Ti compounds in the mineral spring of Negrac in France. For analyses and descriptions of anatase, brookite, Rath (ibid. 1878. 652). Cornu (C. R. 86, 101, 102). 983) obtained spectroscopic indications of the occurrence of Ti in the sun's atmosphere. bright-reddish crystals that are often found in blast furnaces wherein titaniferous iron ore has been smelted were supposed for many years to be Ti; but Wöhler (A. 73, 34) showed that they contain C and N besides Ti (v. TITANIUM CARBONI-TRIDE, p. 739).

Formation .- 1. By heating K, TiF, with K or Na, out of contact with air (v. Preparation) .-2. Ry heating TiCl, with Na in a closed iron crucible heated in a wind furnace (Nilson a. Pettersson, W. 4, 554; cf. Kern, C. N. 33, 57). According to Robinson a. Hutchings (Am. 6, 74), Ti is formed by heating TiCl, with Na to 130° in as sealed tube; but O. v. d. Pfordten (A. 237, 201) says that very little, if any, Ti is obtained, and that the main product is TiCl₂.—3. By fusing K₂TiF₂, with an equal weight of iron filings, and dissolving away the iron by HClAq (Wehrlin Climat C. 200, 200). a. Giraud, C. R. 85, 288).-4. By heating TiCl, to 180° with Ag obtained by reducing a salt of Ag; Ti₂Cl₆ is also formed (Friedel a. Guérin, A. Ch. [5] 7, 24).

Preparation.—Finely-powdered rutile is mixed with double its weight of K₂CO₃, and the mixture is fused in a Pt orucible placed inside an earthenware crucible. The fused mass is powdered and dissolved in the necessary quantity of HFAq in a Pt dish; water is added to dissolve which begins to separate, the liquid is boiled and filtered while boiling; the K_TiF, which separates from the filtrate in lustrous crystalline crusts, is pressed between filter-paper, washed repeatedly with cold water, again pressed. and recrystallised several times from boiling water (Wöhler, A. 74, 212). The dry K,TiF_e is and recrystalised several times from boiling water (Wöhler, A. 74, 212). The dry K,TiF_e is placed in a porcelain boat in a porcelain (or hard glass) tube connected with a supply of pure dry H; another boat, containing Na, is also placed in the tube; H is passed through the apparatus, and the Na is gradually vaporised and driven over the K,TiF_e, which is heated.

When the action is completed and the tube has cooled (the H stream being maintained), the solid is treated with water, which dissolves out KF, NaF, and Na (W. a. Deville, A. 103, 230). The Ti is finally washed with ether and dried over H.SO. (v. Kern, C. N. 33, 57). Merz (P. 73, 48) prepared Ti by heating a mixture of six pts. K₂TiF_s and three pts. NaCl with two pts. Na in a glass bulb placed in a sand-bath, while a stream of H was passed through the bulb, then adding zinc-powder and fusing, and dissolving

out the zinc by cold dilute HClAq.

Properties.—A dark-grey or black lustrous powder; has not been obtained crystallised. resembles iron reduced from Fe₂O₂ by H at a

low temperature.

According to Junot (J. 1853. 336), Ti was obtained by him as a silver-white lustrous deposit by electrolysing a solution prepared by dissolving titanate of K in boiling H₂SO₄Aq, evaporating to a syrup, and extracting with Na, SO, Aq. J.'s experiments do not seem to have been repeated. Lévy (C. R. 110, 1368) obtained hard, steel-white, cubicle crystals, which he took to be nearly pure Ti, by passing TiCl, vapour over Si, B, or several metals heated to bright redness. L. found only 80 p.c. Ti in the crystals. Ti burns brilliantly in a flame. When heated to redness in O, it is oxidised with production of an intensely Brilliant white light. also burns in Cl. It decomposes water at 100°. Warm HClAq dissolves Ti easily; it is also at once dissolved by HFAq. Heated by electric sparks, Ti gives an emission-spectrum very rich in lines (v. Thalen, A. Chr. [4] 18, 239; Troost a. Hautefeuille, C. R. 73, 620; Cornu, C. R. 86,

101, 983; Liveing a. Dewar, Pr. 32, 402).

The atomic weight of Ti has been determined The atomic weight of Ti has been determined (1) by analyses of TiCl₄ (H. Rose, P. 15, 145 [1829]; Pierre, A. Ch. [3] 20, 257 [1847]; Thorpe, C. J. 47, 108 [1885]); (2) by determining the weight of TiCl₂ (H. Rose, l.c.; Thorpe, l.c.); (3) by analyses of TiBr₄ (Thorpe, l.c.); (4) by determining the weight of TiO₂ got from a determinate weight of TiBr₄ (Thorpe, l.c.); (5) by measuring S.H. of Ti (Nilson a. Pettersson, Z. P. C. 1, 34); (6) by determining V.D. of TiCl₄ and TiI₄ (v. these confpounds). Rose's determinations gave values for the at. w. of Ti varying from 47-92 to 48-32; Pierre's values varied from 50-2 to 50-29. 48.32; Picrre's values varied from 50.2 to 50.29. The very accurate series of determinations made by Thorpe has settled the at. w. to be almost exactly 48 (48.01 if 0=16; 47.9 if 0 = 15.96).

The atom of Ti is tetravalent in the gaseous molecules TiCl, and TiI, Ti s metallic in many of its chemical properties; it decomposes water, giving off H; the oxides Ti₂O₂ and TiO₂ form corresponding salts; the chloride and iodide (and ? also bromide) can be gasified without decomposition; the sulphide TiS₂ does not show any acidic characters so far as it has been examined. The chlorides give pps. of corresponding hydrated oxides by reacting with alkalis, &c. On the other hand, Ti exhibits distinctly non-metallic or chlorous properties; hydrates of TiO, act as feeble acids, producing salts wherein Ti forms part of the negative radicle. The acids H.TiF. and H₂TiO₂F, are known, and also salts derived therefrom. TiCl₄ is very easily decomposed by

water, giving HClAq and TiO, xH,O, &c. As might be expected from the two-sided character of the reactions of Ti, most of the salts obtained by replacing the H of oxyacids by Ti are basic salts. The oxide TiO, has been isolated; it is probably a superoxide. Ti is closely related to Zr, Ce, and Th; these elements, with Ti, form the even-series family of Group IV. (v. TITANIUM GROUP OF ELEMENTS, p. 749). Ti is also closely related to Ge, Sn, and Pb, which form the oddseries elements of Group IV. (v. TIN GROUP OF ELEMENTS, p. 735). Ti also shows distinct relationships to C and Si, which are the first and second members of Group IV. (v. CARBON GROUP OF ELEMENTS, vol. i. p. 682). The similarity between Ti and Si is shown very distinctly in the titanic and silicic acids, the relations between which may be expressed by such a general equation as $nMH_1O_4 - mH_2O = M_nH_{4n-2m}O_{4n-m}$ (M = Ti or Si). Ti is the only element of Group IV. which is known to form compounds of the type $M_2TiO_2F_4 = Ti(OM)_2F_4 = TiX_6$.

Reactions and Combinations .- 1. Heated in air or in oxygen, burns brilliantly to TiO ... 2. Burns when heated in chlorine, forming Ti₁Cl.—3. TiI₄ is formed by passing vapour of iodine over hot Ti.—4. Combines with nitrogen when heated therewith (v. Nitrides, p. 743). -5. Ti is violently oxidised to TiO, by heating with cupric oxide or red lead .- 6. Interacts with water at 100°, forming TiO₂ and H.—7. Dissolves in warm hydrochloric acid, forming TiO₆ (Glatzel, B. 9, 1831; Rammelsberg, B. B. 1874. 490).—8. Ti dissolves easily in hydrofluoric acid (? forming Ti_F_s); also in warm dilute nitric or sulphuric acid, according to Glatzel (I.c.), the solution in H.SO, Aq deposits crystals of Ti_(SO₄), on cooling. Cone hot H.SO, reacts with Ti, giving off SO₂ (? forming Ti(SO₄).); cone. hot HNO₄ oxidises Ti to metatitanic acid

(q. v., p. 747) according to Weber (P. 120, 287).

Detection and Estimation.—Compounds of Ti are not reduced to metal by heating on char-coal in the blowpipe flame. Ti compounds, if not containing elements which give a colour to microcosmic salt, form a colourless glass when melted in the microcosmic salt bead in the outer blowpipe flame; in the inner flame they give a glass which is colourless when hot, but becomes violet on cewling; the delicacy of the reaction is much increased by adding a little zinc to the bead (Riley, C. J. 12, 13). Solutions of TiO₂xH₂O in HClAq or H₂SO₄Aq give white pps. of TiO2.xH2O on boiling; addition of a piece of tin to a solution of TiO_xH_O in HClAq causes evolution of H and produces a violet-blue solution which becomes rose-coloured on dilution with water (von Kobell, P. 62, 599). A solution of TiO,xH,O in HClAq gives a violet-red liquid. (Ti,Cl, solution) by digestion for some time with Cu (Fuchs, A. 56, 319). Ti is estimated as TiO₂, ppd. from solutions by a slight excess of NH,Aq. Insoluble compounds of Ti are generally fused with KHSO,, the fused mass is dissolved in water, and TiO₂-xH₂O is ppd. by long continued boiling.

Titanium, alloys of. The alloys of Ti have not been much examined. Wöhler a. Michel (A. 113, 248; 115, 102) obtained an alloy with aluminium approaching in composition to TiAl,

cryolite, and treating with HClAq. By heating a mixture of Ti and Al with KCl or NaCl in an earthenware crucible in a stream of H, Lévy (C. R. 106, 66) obtained brittle steel-grey crystals which he took to be an isomorphous mixture of TiAl, and JiAl. Ti alloys with iron; it is often present in pig-iron, but rarely in bar-iron or steel (v. Raley, C. J. 16, 387).
Titanium, bromides of. Only one bromide

has been isolated, TiBr,

TITANIC BEOMEDE TiBr. (Titanium tetrabromide.) Mol. w. has not been determined, but the formula is almost certainly molecular from

analogy of TiCl, and TiI.

Prepared by passing Br vapour over a mixture of TiO, and chargoal heated to full redness, collecting the liquid that distils over and solidifies in the receiver, and redistilling it from Hg (to remove free Br) (Duppa, Pr. 8, 42). Also prepared by passing HBr gas over TiCl, kept a few degrees below its boiling-point in a distilling flask connected with an appright condenser; the whole of the Cl of the TiCl, is expelled (Thorne, C. J. 47, 126). Therpe used 350 g. TiCl, and continued the passage of HBr for three days. The HBr is conveniently obtained by the interaction of Br and amorphous P in a little water; it is freed from Br by passing through a U tube containing broken glass and amorphous 12 and is dried by passing through another U tube containing CaCL.

TiBr, forms dark-yellow or orange crystals. S.G. 2 f. melting at c. 40°, and boiling at c. 229° (D., l.c.; T., l.c.). It is very hygroscopics easily decomposed by water, forming a perfectly clear

solution containing HBr and TiO₂ or Li₂O.

Titanium, bromochlorides of. By adding Br to TiCl, (q. v., p. 741) Friedel a. Guérin (A. Ch. [5] 8, 21) obtained a colourless liquid, furning in the air, boiling at 176°, which they said was probably TiBr Cl.; and by the reaction of Br with Ti Cl. they obtained a liquid boiling at 154°. probably TiBrCla

Titanium, carbonitride of, Ti CN. (Titanium nitrocyanide, or cyanonitride Ti, (CN)2N6.) This compound is often found in blast furnaces wherein titaniferous ironstone has been smelted. It was supposed by Wollaston to be Ti (G. A. 75, 220), and was for many years generally mistaken for the metal. In 1850 Wöhler (A. 73, 34) proved it to contain C and N besides Ti.

The compound is found in blast furnaces as luttons, around a contain C.

lustrous, opaque, copper-coloured, prismatic crystals. By treating these crystals with conc. HClAq, then with conc. H.SO, washing, treating with HFAq, and again washing, the compound is freed from admixed Fe, &c.; small leaflets of graphite generally remain mixed with the car-bonitride. Ti.CN, can be prepared by heating a mixture of dry K,FeCy, and TiO, in a closed crucible for an hour or two at c. the melting-point of Ni (1400° to 1450°), dissolving out Fe, &c., by cone. HClAq, washing, and drying. By exami-ning the brown powder thus obtained with a magnifying power of 300 diameters coppercoloured crystals of Ti₅CN₄ can be detected (Wöhler, A. 73, 34). It is also obtained by heating a mixture 1 part C and 5² parts TiO₂, in a closed carbon crucible for some hours at 1400° to 1450°; also by passing N over a mixture of by heating a mixture of TiO2, KCl, NaCl, and C and TiO2 in the ratio 1:53 heated in a carbon boat placed in a carbon tube to the melting-point

oost placed in a carbon tube to the melting-point of Pt (c. 1800°) (W. a. Deville, A. 103, 231).

When Ti, ON, is fused with KQH it gives off NH₂; heated to redness in a stream of water vapour TiO₂ is formed, and H, NH₃, and HCN are given off (W., l.c.); heated in Cl it gives TiCl, and TiCl, 2HCN (W., l.c.; also p. 219); the compound is burnt by heating with PbO, CuO, or HgO, giving off CO₂ and leaving TiO₄ and Pb. Cu, or Hg (much heat is produced in the and Pb, Cu, or Hg (much heat is produced in the reaction) (W., l.c.).

The simplest formula that expresses the composition of Ti carbonitride is Ti, CN, (W., l.c.; cf. Reinhardt, Zeit. für anorgan. Chemie, 1, 121). This formula is generally doubled and written Ti(CN)...BTi,N2, and the substance is regarded as a compound of cyanide and nitride of Ti; Joly (C. R. 82, 1195) regards it as a compound of carbide and nitride of Ti, and writes the formula

TiC.4TiN (or 2TiC.8TiN).

Titanium, chlorides of. Ti and Cl combine to form TiCl,; by the regulated action of H on TiCl, one-fourth of the Cl can be removed and TiCl, produced; and by the further action of H on TiCl, one-third of the Cl can be removed and TiCl, produced. The V.D. of the tetrachloride has been determined, and the formula TiCl, is molecular; from the analogy of C.Cl, and Si,Cl, it is probable that the molecular formula of the trichloride is Ti2Cla; from the analogy of PbCl, and SnCl, the formula TiCl, may be supposed to be molecular, but if the analogy of C2Cl, is to be followed, the molecular formula must be Ti.Cl.

Titakie chloride TiCl, (Titanium tetra-chloride.) Mol. w. 189:38. Melts at -25° (Haase, B. 26, 1052). Boils at 136.41° at 760 mm. (Thorpe, C.J. 37, 329). S.G. $_{45}^{92}$ 176041; S.G. at b.p. 152223 (Thorpe, t.c.). V.D. 98·8 at 143° (Dumas, A.Ch. [2] 33, 388). S.V. 121·47 (Thorpe,

l.c.).

Preparation. - 1. TiO₂ is intimately mixed previously with c. half its weight of lampblack previously heated to redness in a stream of Cl, and the mixture is heated to full redness in a tube of hard glass connected with a receiver, while a stream of dry Cl is passed over it. The TiCl, which collects in the receiver is freed from Cl by shaking with Cu, Hg, or Na amalgam (Merz, Bl. [2] 7, 401), or by boiling for some time (Thorpe, C. J. 47, 119), and is then distilled. Thorpe (l.c.) conducted the final distillation in dry N.— 2. Vapour of CCl,, or a mixture of equal volumes of Cl and CO, is passed over TiO2 in small lumps, heated to bright reduces in a tube of hard glass connected with a receiver. The TiCl, is purified as described above (Watts a. Bell, C. J. 33, 443).

Properties.—A colourless liquid, solidifying at -25° (Haase, B. 26, 1052). Does not conduct electricity (O. v. d. Pfordten, A. 237, 201). Fumes in the air, rapidly absorbing moisture and solidifying to the hydrate TiCl, 5H2O (Demoly, A. 72, 213). (For an apparatus for collecting TiCl, for analysis, v. Thorpe, l.c.) TiCl, is violently decomposed by water, forming HClAq, and TiO2xH2O some of which ppts. (v. Reactions, No. 8).

Reactions.—1. Hydrogen reduces TiCl, at a high temperature, to Ti_Cl, and then to TiCl, (v. trichloride and dichloride) .- 2. Mixed with oxygen and passed through a red hot porcelain tube, Ti,O,Cl, is formed (v. Oxychlorides, p. 748). 3. Heated to 130° in a sealed tube with sodium, the chief product is TiCl₂, according to 0. v. d. Pfordten (A. 237, 201); Robinson a. Hutchings (Am. 6, 74) say that Ti is produced in this reaction. Nilson a. Pettersson (W. 4, 554) obtained Ti by reducing TiCl, by Na at a very high temperature.—4. Sodium analgam produces Ti.Cl. and TiCl. (O. v. d. P., l.c.).—5. Reduced silver gives Ti.Cl. and Ti when heated with TiCl. to 180 (Friedel a. Guérin, A. Ch. [5] 7, 24).—6. By passing vapour of TiCl, over silicon, boron, or several neetals, heated to bright redness, Levy. (C. R. 110, 1368) obtained hard, steel-white, cubical crystals which he supposed to be nearly pure Ti .- 7. Pure, dry, hydrogen sulphide reacts at the ordinary temperature, forming Ti₂Cl₈; at a higher temperature a pp. is produced which is probably a thiochloride of Ti (O. v. d. P., A. 231, 257). -8. Cold water reacts violently with TiCl. with production of much heat and formation of a turbid liquid containing HCl and holding in suspension 2TiO₂H₂O (v. Metatitanic acid under TITANIUM OXYACIDS, AND SALTS AND DERIVATIVES THEREOF, p. 747); after 30 or 40 hours the liquid becomes clear, but ppn. occurs again on heating to c. 85° when about 7 pts. water are present to 1 pt. TiCl, used (v. Thorpe, C. J. 47, 120; and cf. Titanium oxyacius, p. 746). According to Merz (Bl. [2] 7, 401), an oxyadioride, approximately TiCl, 3TiO_16H_O, is obtained by evaporating TiCl₁Aq, or TiCl₁ that has deliquesced in air, over H₂SO₄ and CaO (v. Oxychlorides, p. 748). TiO₂, in the form of brookite, is obtained by passing vapour of TiCl₄ and water, mixed with CO2, through a red-hot porcelain tube (Daubrée, C. R. 29, 227; 39, 153). -9. With hydrochloric acid the compounds TiCl₂OH and TiCl₂(OH)₂ are formed (b. Trianium hydroxyl chiloribes, p. 743). -10. Chlorosulphonic acid (SO₂OH.Cl) reacts with TiCl, at the ordinary temperature to form a yellow, amorphous, deliquescent powder, having the composition TiCl₄·SO₄ (-TiCl₃·OSO₂·Cl) (Clausnizer, B. 11, 2011).—11. By passing vapour of TiCl, mixed with H. through a white-hot tube containing titanium dioxide the oxychloride Ti_O_Cl2 is obtained (v. Oxychlorides, p. 748).

Combinations .- 1. With water to form a pentahydrate and a dihydrate. Demoly (A. 72, 213) obtained TiCl, 5H,O, as deliquescent crystals, by allowing TiCl, to absorb moisture from the air, then adding a little more water, and evaporating under reduced pressure. By drying the pentahydrate over H₂SO₄ in vacuo, D. obtained TiCl₄,2H₂O.—2. With ammonia, to form TiCl. 4NH, according to H. Rose (P. 16, 57), TiCl. 6NH, according to Persoz (A. Ch. [2] 46, 315); easily decomposed in air; heated in a tube gives off NH₃, then NH₃ and HCl, and a yellowish sublimate of TiCl, 3NH, Cl, and leaves Ti; heated in NH, gives Ti, N, (v. TITANIUM NITRIDES, p. 743). 3. With hydrogen phosphide, to form a brown powder, which when heated gives a sublimate of TiCl. 2PH.Cl according to H. Rose (P. 42, 527).

4. With hydrogen cyanide to form TiCl. 2HCN (Wöhler, A. 73, 226); by vaporising this compound through a red-hot tube Ti,N, and C are formed (W. 1.a.). S. With cyanges a hilwide. formed (W., l.c.).—5. With cyanogen chlorids, to form yellow crystals of TiCl, ONCl; sublimable at 100° (W., A. 73, 219).—6. With phosphorus

mentachloride to form TiCl. PCl,; obtained by heating TiCl, and PCl, to 150° in a sealed tube (Bertrand, Bl. [2] 33, 565); also by heating TiO, and PCl_s in the ratio TiO₂:3PCl_s, or by saturating a mixture of TiCl₄ and PCl₅ with Cl (Tüttscheff, A. 141, 111), and removing excess of TiOl, by heating in a stream of Cl (Weber, P. 132, 452). A citron-yellow, loose, semi-crystalline solid; sublimes without melting; deliquescent in air. 7. With phosphorus trichloride to form vellow crystals of TiCl, PCl, melting at 85.5° (Bertrand, 1.c.).-8. With sulphur tetrachloride, to form 2TiCl, SCl,; obtained by saturating a mixture of TiCl, and S,Cl, with Cl, and warming in a stream of Cl (Weber, P. 132, 454).—9. By mixing TiCl. and sulphurous chloride H. Rose obtained large yellow crystals, probably a compound of the two yellow crystals, propaging a compound of the two chlorides (P. 42, 527),—10. With ammoniam chloride, to form TiCl, 3NH, Cl (v. supra, Combinations, No. 2).—11. With phosphoryt chloride to form TiCl, POCl,; obtained by gradually adding POCl, to TiCl, and gently warming (Weber, P. 132, 453); colourless, deliquescent sensitive matters and boilinest 1102. crystals, melting at 110? and boiling at 110 (Wehrlin a. Giraud, C. R. 85, 288).—12. With selenion oxychloride to form a yellow powder, decomposed by heat, having the composition TiCl, 2ScOCl₂; obtained by adding ScOCl₂ to TiCl, and drying the solid that separates on riol, and drying the solid may separates on cooling on a tile over H₂SO₄ (Weber, B. B. 1865, 154).—13. With nitrosyl chloride; obtained by saturating TiCl₁ with NO₂, and subliming (Hampe, A. 126, 47), also by passing the vapours from aqua regia into TiCl, (Weber, P. 118, 476). Hampe (l.c.) gives the composition 3TiCl. 4NOCl, Weber (l.c.) the composition TiCl. 2NOCl. A deep citron-yellow, crystalline mass; decomposes in air; sublimable out of air; with water gives off NO.—14. With sulphur trioxide to form TiCl₁.SO₂ (or TiCl₂.OSO₂.Cl), formed by the interaction of TiCl₄ and SO₂.OH.Cl at the ordinary temperature; a yellow, amorphous, deliquescent powder (Clausnizer, B. 11, 2011). --15. Demarçay (Bl. [2] 20, 127) obtained a great many compounds of TiCl, with esters, mercaptans,

and ethyl sulphide (cf. Bedson, C. J. 29, 309).

TITANIUM TRICHLORIDE Ti.Cl., (Titanium sesquichloride, Titanous chloride.) Mol. w. not determined; but from analogy of C.Cl., and

seguicinoriae. Titanous chloriae.) Mol. w. not determined; but from analogy of C.Cl.sand Si_zCl_s the formula Ti_zCl_s is probably molecular. Formation.—1. By reducing TiCl₁ by H (c. Preparation).—2. By reducing TiCl₁ by H (c. Preparation).—2. By reducing TiCl₁ by Sodium-amalgam (O. v. d. Pfordten, A. 237, 201); or by pure, dry H_zS (O. v. d. P., A. 234, 257).—3. By heating TiCl₁ with reduced Ag to 180°; Ti is also formed, and probably TiCl₂ also (Friedel a. Guérin, A. Ch. [5] 8, 24).—4. A solution of TiCl₂ also obtained by digesting a solution of TiC₂aH_zO in HClAq with Cu at 40°-50° (Fuchs, A. 56, 319); or with Ag ppd. by zinc from AgCl (von Kobell, P. 62, 599). Ti_zCl_s is also probably present in the greenish liquid obtained by adding Na amalgam to K_zTiF_s in HClAq (O. v. d. P., A. 237, 201).

Preparation.—TiCl, is placed in a retort connected with a tube of porcelain or hard glass (if a glass tube is used it should be wrapped in copper-foil) which is placed horizontally in a furnace; the other end of the tube projects considerably out of the furnace and is connected with a receiver to collect undecomposed TiCl.

The delivery tube from an apparatus evolving pure and dry H passes into the retort beneath the surface of the TiCl. H is passed through the apparatus until it is entirely filled with the gas; the tube is then heated to redness, and the retort is gently warmed. Ti_zCl_z is formed and condenses as dark-violet scales on the part of the tube that projects out of the furnace. When all the TiCl_z in the cooler part of the tube retort, the Ti_zCl_z in the cooler part of the tube is gently warmed, while the pusage of H is continued, to remove any adhering TiCl_z; the Ti_zCl_z is allowed to cool in the stream of H (Ebelmen, A. Ch. 13, 20, 385).

Properties.—A dark-violet, very lustrous solid, deliquescing in air, and dissolving in water to form a violet liquid, which gradually decolourises with ppn. of TiO₂xllO. *TiOl, is easily soluble in alcohol, forming a violet or green liquid; it is insoluble in ether, and sparingly soluble in HClAq (O. v. d. P., A. 237, 201).

Reactions.—1. Hented in hydrogen to c. 440°. TiCl, distils over and TiCl, remains (Friedel a. Guérin, A. Ch. [5] 8, 24).—2. Heated in air, TiCl, vaporises and TiCl, remains.—3. Dissolves in water, forming a violet, or green-violet, liquid which slowly becomes colourless with ppn. of TiCl, x40,—4. Alkalis, or alkali carbonates, in solution ppt. Ti₂O₃x41.O from Ti₂Cl₃Aq; ammoutum satphide forms the same pp.: hydrogensulphide gives no pp. (Ebelmen, l.c.).—5. Ti₂Cl₃Aq reduces solutions of gold, siteer, or platinum salts with ppn. of the metals; ferric and cupric salts are reduced to ferrous and cuprous salts; sulphurous acid volution is reduced by heating with Ti₂Cl₃Aq with ppn. of S (F., l.c.).—6. Ti₂Cl₃ reacts with bromine to form a liquid boiling at 154°, probably TiBrCl₁ (F. a. G., l.c.).

Combinations. — With water to form TL₂C_{0.8}H₁O; obtained by Glatzel (B. 9, 1829) by evaporating a solution of Ti in HClAq to the crystallising point, filtering off ppd. TiO_{2.2}H_{2.0} from time to time. The hydrate is a green solid; it dissolves in water, forming an opalescent violet solution containing a little suspended TiO_{2.2}H₂O; the solution becomes colourless on standing, and then gives the reactions of titanic acid.

Therefore TiCl_x (Sometimes called titanous chloride.) Mol. w. is not known. From analogy of SnCl_x and PbCl_x, the formula TiCl, would be molecular; but from the analogy of C_zCl₄ the molecular formula would be Ti_zCl₄.

of C.Cl., the molecular formula would be Ti.Cl.,
Formation.—1. By reducing Ti.Cl. by H
(v. Proparation..—2. TiCl. is probably formed,
along with Ti.Cl., by heating TiCl, with reduced
Ag (Friedel a. Guérin, A. Ch. [5] 8, 24).—3. Along
with Ti.Cl., by the action of Na annalgam on
TiCl.,; also by heating TiCl, with Na to 130° in
a scaled tube (O. v. d. Pfordien, A. 237, 201).

Irreparation.—Ti_Cl_n reacts with H at a red heat to give TiCl_n and TiCl_n. Friedel a. Guérin (l.c.) proceed as follows. The tube containing Ti_Cl_n, prepared from TiCl₁ (v. supra?, while still filled with H, is connected with an apparatus evolving pure, dry CO₂, and the whole of the H in the apparatus is driven out by CO₂. The Ti_Cl_n is then shaken into a small tubulated retort, placed on a sand-tray, and previously filled with CO₂; the CO₂ is displaced by pure, dry H; the retort is then heated to dull red

ness, while a stream of H is passed through it, until TiCl, ceases to distil off; the retort is allowed to cool in the stream of H, and CO, is then passed in until all the H is removed (if this is omitted the TiCl, takes fire in the air), and the black TiCl, in the retort, is quickly shaken into small dry tubes filled with CO, which are at once scaled off.

Properties.—A black, light powder; very rapidly absorbs water, forming a kind of mud; insoluble in CS, CHCl, or Et.O. Volatilised without melting by heating to full redness in II. Shaken with Et,O and KCNSAq, the Et,O becomes dark brown; this is a delicate test for TiCl₂ (O. v. d. Pfordten, A. 237, 201).

Reactions.—1. Takes fire when touched with a drop of water (? with formation of Ti₂O₂Cl₂; v. F. a. G., l.c.); thrown into water, it hisses like red-hot iron, decomposing the water with evolution of H and formation of a yellowish liquid.—2. Decomposes absolute alcohol, giving off H and forming a yellowish liquid.—3. Heated and leaving TiO₂—4. With bromine it forms a liquid boiling at 176°, probably TiCl₂Br₂ (F. a.

Titanium, chlorobromides of, v. TITANIUM

BROMOCHLORIDES, p. 739.

Titanium, cyanonitride of, v. TITANIUM

CARBONITRIBE, p. 739.

Titanium, ferrocyanides of, v. vol. ii. p. 337. Titanium, fluorides of. The only compound that has been isolated with certainty is TiE. There are indications of the existence of Ti₂F_s, and compounds of this fluorido with alkali fluorides are known.

TITANIC FLUORIDE TIF, (Titanium tetra-fluoride). Formula probably molecular, from analogy of TiCl, and TiI, By heating a mixture of TiO, and CaF, with H.SO, Unverdorben (P. 7. 200) extended a solvable distillation which he 7, 320) obtained a colourless distillate, which he supposed to contain a compound of Ti and F. Berzelius (P. 4, 1) obtained crystals (? TiF_i) by dissolving TiO_{2.} xH₂O in HFAq. The crystals were decomposed by water, giving an acid solution (? H₂TiF₆Aq), and an insoluble, 'so to say basic,' compound. TiO₂ is obtained by passing vapour of TiF, mixed with H₂O, through a tube heated to c. 800° or 1000° (Hautefeuille, A. Ch. [4] 4, 131; cf. TITANIUM DIOXIDE, p. 741). Heated to redness in H, perhaps gives Ti₂F₆ (H., l.c.).

Combinations .- 1. TiF, probably combines with hydrogen fluoride to form H. Tilfa. By diswhen hydrogen fatories to folial first of dis-solving TiO_xxH₂O in HFAq, evaporating, adding water to the crystals (? TiF₄) thus formed, and filtering from an insoluble solid (? oxyfluoride). Berzelius (P. 4, 1) obtained an acid solution from which, by neutralisation with KOHAq and exaporation, he obtained the salt K, TiF_s. The said solution probably contained H_sTiF_s. This compound (if it exists) is best called titanifuorhydric acid. It is analogous to H_sSiF_s. HASIF_n, and other acids of the type H₂MX_n, where M = an element of Group IV. (except C), and X = a halogen.—2. With various metallic fluorides to form TiF_n:2MF = M₂TiF_n. These salts were obtained from the K salt, which was got by neutralising the acid solution prepared as described under 1. Salts of NH4, Ca, Cu, Fe, Pb, Mg, and Ni are described (B., Lc.; Weber,

P. 120, 291). These salts are best called titanifluorides; they are similar to stannifluorides.—3. TiF, also combines with ammonium fluoride to form TiF,3NH,F (besides

TiF..2NH,F) (Baker, C. J. 35, 763).

By adding NH,Aq, drop by drop, to warm (NH,),TiF,Aq, Piccini (G. 17, 479) obtained a compound of the form TiO,F,xNH,F; from this he prepared TiO₂F₂Barr, and by carefully decomposing this salt by H₂SO₄Aq he obtained a solution of the acid TiO₂F₂PiF. P. regards this acid as a F derivative of the hypothetical pertitanic acid H.TiO, (the acid of TiO,); he calls the acid fluoroxypertitanic acid, and the cans the acid nuoroxypertianates. Following the plan adopted in this Dictionary, the acid will be called titanoxyftuorhydric acid H_TiO_F, and the salts, M'_TiO_F, will be called titanoxyftuorides. H_TiO_F, Aq is a yellow liquid, not ppd. by Ba salts, giving a pp. of TiO, with alkali carbonates.

TITANIUM TRIFLUORIDE Ti.F. This compound is said to be formed by strongly heating K.TiF. in a stream of H with a little HCl, according to Hautefeuille (C. R. 59, 189; cf. 57, 151). Acradicted (C. 17. 59, 189; cf. 61, 181). According to H., the compound is a purple-red solid, soluble in water. By treating Ti_Cl_Aq with KIHF_0 ro NH_F, Piccini (G. 16, 104) obtained violet pps. of Ti_F_2NF, where M = NH_0 or K; he also obtained Ti_F_3NH_F. The K salt is slightly soluble in water; soluble in dilute acids, forming green liquids, from which alkalis throw down azure-blue pps. that gradually oxidise to TiO_xxH_O on exposure to air. The

salt TiF, 3NH,F, when exposed to air, gradually oxidises to TiO.F..3NH,F.

Titanium, haloid compounds of. Ti combines with the halogens directly to form compounds TiX4; these tetrahalides are generally prepared by passing the halogen as gas over a red-hot mixture of TiO₂ and C. TiI₄ is best-prepared by heating TiCl₄ in HI gas, and TiBr₄ is very conveniently prepared by heating TiCl, in HBr gas; TiF, is prepared by dissolving TiO, xHO in HFAq and evaporating. The two tetrahalides TiCl, and Til, have been gasified. These formulæ are molecular, hence the formulæ TiF, and TiBr, probably also represent the compositions of the gaseous molecules of these compounds. By the action of H, or certain other reducing agents, on TiCl, two chlorides are obtained, Ti_xCl_x and Ti_xCl_x. The V.D. of neither has been determined, but from the analogy of C₂Cl₄ and Si₂Cl₅, the value of x in Ti₁Cl₂* is probably 2; from the analogy of C₂Cl₄, the molecular formula of the lowest chloride is probably Ti₂Cl₄, but from the analogy of SnCl₂ and PbCl₂ the formula TiCl₂ would be of SnCl, and PbCl, the formula TiCl, would be given to it. Ti.F. or TiF, probably exists. No bromide or iodide of either type Ti.X. or Ti.X. has been isolated. Two bromochlorides of the types TiX, and Ti.X. probably exist. TiCl, and TiBr, dissolve in cold water; the solutions contain HXAq and TiO...xH.O; dilution, and more quickly heating, ppts. insoluble TiO...xH.O from the solution of TiCl. FiF, is decomposed by water, giving H.TiF. aq (and? an oxyfluoride). TiI, is also decomposed by water; on heating insoluble TiO...xH.O separates. TiCl. combines insoluble TiO, xH₁O separates. TiOl combines with many non-metallic chlorides and oxychlorides. TiF₄ combines with metallic fluorides,

forming salts M.TiF., and also some more complex salts xTiF.yMF. A few oxylaloid compounds have been isolated, but a great number can doubtless be formed. The acid H.TiO.F. and salts of this acid have been isolated. dissolves in water, and after a time TiO..xH.O separates; the solution is an energetic reducing agent; alkalis ppt. Ti₂O₃.xH₃O. TiCl₂ reacts violently with water, giving off H, and probably

forming an oxychloride.

Titanium, hydroxyl chlorides of. By the reaction of the proper quantity of 36 p.c. HClAq with TiCl₄, the compound Ti(OH)Cl₃ was obmined by Koenig a. O. v. d. Pfordten (B. 21, 1708); using the calculated quantity of 36 p.c. HOIAq, the compound Ti(OH)₂Cl₂ was produced; and the prolonged action of ordinary air on either of the preceding compounds resulted in the formation of Ti(OH), Cl. These compounds are regarded by K. a. O. v. d. P. as derived from Ti(OH), by replacement of OH by Cl; the compounds may be called orthotitanic chlorhydrins. The compounds are yellow or white deliquescent rapidly with a hissing noise, Ti(OH)Cl₂ less violently, and Ti(OH)₃Cl with some difficulty. The aqueous solutions give pps. of TiO_{2...}"1.0 on boiling. When the compounds are heated they give (1) TiO_{1...} and TiO_{2...}"1.0, (2) "iO_{2...}"11.0 and HCl, and (3) TiO, TH,O, HCl, and H.O. By reducing Ti(OH)Cl, by Na analgam, in H, Ti,O, is produced (K. a. O. v. d. P., B. 22, 2070; cf. B.22, 1485).

Titanium, hydroxyl fluoride of. This name may be given to the compound Ti(OH), F4; it is described as titanoxyjluorhydric acid,

under TITANIC FLUORIDE (p. 742).

Titanium, iodides of. Only one compound

has been isolated, TiI,.
TITANIC TODIDE TII,. (Titanium tetraiodide.) Mol. w. 554 02. V.D. at 410° = 261.2

(Hautefeuille, Bl. [2] 7, 201).

Formation.—1. Vapour of I is passed over Ti heated to redness (Weber, P. 120, 287). -2. A mixture of TiCl, vapour, I vapour, and H is passed through a tube heated to dull redness; TiI, mixed with free I, condenses on the colder part of the tube (Hautefeuille, Bl. [2] 7, 201). -3. By decomposing TiCl, by HI.

Preparation. — Dry HI gas is passed into

TiCl, which is gradually heated to its b.p. and kept at that temperature until the reaction is completed; the TiI, is freed from traces of I, which give it a violet tinge, by a few distillations

in H (H., l.c.).

Properties and Reactions .- A reddish-brown, lustrous, brittle solid; when melted and cooled, crystallises in octahedra, changing after some days to tufts of silky, prismatic crystals. Melts at 150°, and boils a little above 360°; can be at 100°, and boils a little above 300°; can 130 distilled without decomposition; metted TiI, remains liquid till cooled below 100°. Furnes strongly in the air. Dissolves easily in water; solution turns brown on exposure to air and ppts. TiO,xH,O. When vapour of TiI, is heated in air it burns to TiO, and I,O, (H., l.c.).

Titanium, nitrides of. Four compounds of Ni and New hear described, but exceedings to

Ti and N have been described; but according to later experiments only two seem to exist.

TRITITANIUM TETRANITRIDE Ti, N4. Mol. w. unknown. This compound is obtained by heating

TiCl. 4NH. (v. TITANIC CHLORIDE, Combinations, No. 2, p. 740), loosely packed in a tube of hard glass, in a stream of dry NH, until the glass begins to melt, and allowing to cool in NH, (Wöhler, A. 73, 43; Friedel a. Guérin, A. Ch. [5] 8, 24). Indigo blue powder, or golden-yellow (? rhomboltedral) crystals; strongly heated in H gives Ti.N., (F. a. G., l.c.).

DITTARIUM INSTRUDE TI.N. Mol. w. unknown. Prepared by placing two porcelain boats, one containing Na and the other K.Tif. in a hard-glass sube previously filled with N, passing a stream of dry N through the tube. heating the K.TiF, to full redness while the Na is volatilised over it, and allowing to cool in N after all the Na has been volatilised; boiling with HClAq, washing, and drying (Wöhler a. Deville, A. 102, 234). Also obtained by heating K₂TiF₄ with K, KCl, NaCl, and Al in №; also by passing TiCl, vapour and II over heated Al, in N; also by passing vapour of TiCl, over heated NH₁Cl (W. a. D., l.c.). F. a. G. (l.c.) obtained the same compound by strongly heating TiO, in a stream of dry NH, for some hours; W. (A. 73, 43) said that TiN, was formed by this reaction. F. a. G. also obtained Ti.N. by strongly heating Ti.N. in II; W. said that Ti.N. was formed by this reaction. An amorphous brown-yellow, very hard powder; S.G. 5.28 at 18° (F. a.

G., l.c.).

The nitrides of Ti are not decomposed by heating, out of air, to c. 950° 1,000°; fused with KOH, or strongly heated in steam (F. a. G., l.c.), they give off NH₃; heated in Cl. TiCl, is produced (F. a. G., Lc.); heated with CaO, Pho, or HgO, the nitrides burn, and Cu, Ph, or Hg is produced (W., A. 123, 34).

TITANIUM DINITRIDE TINg. This compound is formed, according to Wohler (A. 73, 43), by heating TiO, in NII₃ for some time. Friedel a. Guérin (A. Ch. [5] 8, 21) say that the substance obtained by W. contained TiO₃, and that if the heating is continued until a definite nitride is heating is continued until a usually formed the compound so produced is Ti_N_. Formed,

PENTATITANIUM HEXANITUDE Ti,N,. Formed, according to W. (l.c.), by heating Ti,N, to full redness in H; or, mixed with C, by heating TiO₂ in CN or HCN gas. F. a. G. (l.c.) say that the product of either reaction is Ti, N2, in the latter reaction mixed with C.

Titanium, nitrocyanide of, v. TITANIUM

CARBONITHEDE (p. 739).

Titanium, oxides and hydrated oxides of (cf. TITANIUM OXYACIDS AND SALTS AND DERIVATIVES THEREOF, p. 746). Ti burns when heated in O, forming Thy.; by the reaction of reducing agents on TiCl₄Aq, and addition of alkalis, Ti₂O₄ is obtained; when the reduction is carried H₂O₂ is obtained, that TiO.xH₂O is formed. By the feaction of H₂O₂Qq in presence of alkali on salts of TiO₂, a pp. of TiO₂ is obtained. Oxides intermediate between TiO2 and Ti2O2 probably exist. TiO, is a basic oxide, forming salts TiX, where X = NO,, \$SO, &c.; many of the salts are basic. A few salts corresponding with TiO. have been isolated; no salt corresponding with TiO and derived from an oxyacid has yet been obtained. Some of the hydrates of TiO, react as feeble acids.

TITANIUM DIOXIDE TIO, (Titanic oxide. Titanic anhydride.) Mol. w. unknown.

Occurrence.—As rutile, anatase, and brookite; rutile occurs in dimetric prisms, isomorphous with tinstone; anatase in dimetric octahedra; and brookite in trimetric octahedra.

Formation.—1. By burning Ti in air or 0.—
2. By ppg. TiCl, Aq by alkali, and washing, drying, and strongly heating the ppd. TlO₂xH₂O.—

8. By ppg. K₂TiF₄Aq by NH₂Aq, and strongly heating the pp. after washing and drying.—

4. Vapour of TiCl₄, or TiF₄, mixed with steam is paged through a way heat this. passed through a red-hot tube. -5. TiS2 is heated in dry CO_2 (TiS₂ + $2CO_2$ = TiO_2 + 2CO + 2S; O. v. d. Pfordten, B. 22, 2070).

Preparation.-A. Amorphous titanic oxide.—1. Pure TiCl, is added, little by little, to water; sufficient NH₃Aq to neutralise the HCl produced is added, the solution is evaporated to dryness, and the residue is heated to somewhat above 700° until it ceases to lose weight. TiCl, may be obtained from rutile by mixing the finely-powdered mineral with c. half its weight of dry charcoal-powder, making into little pellets with starch-paste, drying the pellets, heating them to full redness in a covered crucible, then heating in a tube of hard glass (to get quite dry), and then passing dry Cl over the pellets while they are heated to bright redness, and a dry receiver is connected with the end of the hard glass tube. The TiCl, may be purified from SiCl₄, FeCl₅. &c.) by repeatedly distilling, best in a stream of N (v. Merz, J. pr. 99, 161).—2. K_TIF₄ is dissolved in water, NH₂Aq is added, the pp. of TiO₂.xH₂O is thoroughly washed, dried, and heated to somewhat above 700 . . (For a and neated to somewhat above 700°. (For a methods of getting K₂TiF₆ from rutile v. Preparation of titanium, p. 738.) For other methods of preparing TiO₂ from Ti ores v. Lévy (A. Ch. [6] 25, 511), Austen a. Wilber (Am. 4, 211), Hempel (Zeit. f. anorg. Chemie, 3, 193), Jones (Fr. 9, 41, 380). B. Crystalline titanic oxide .- 3. By long-continued heating to whitepess TiO₂ is said to become crystalline (n. Rammelsberg, B. 5, 1006).—4. Amorphous TiO₂-xH₂O is heated to incipient redness in HCl gas, at a pressure of three atmospheres; the crystals have the form of anatase (Hautefeuille a. Perrey, C. R. 110, 1038).-5. Crystalline TiO, is also formed, according to Hautefeuille (A. Ch. [4] 4, 127), by passing the mixed vapours of TiF, HF, and HCl—obtained by decomposing molten K. TiF. by HCl gas—through a Pt tube into which a stream of moist H is also passed; at c. 860° (boiling-point of Cd) crystals of anatase are produced, and at temperatures between 860° and 1,000° brookite is formed. 6. Heating amorphous TiO2 in an atmosphere of HF causes crystallisation; at an incipient red heat anatuse forms, at a higher temperature brookite, and at a very high temperature rutile (H_c, l.c.).—7. Crystals of rutile are formed by heating amorphous TiO₂ with microcosmic salt (Ebelmen, A. Ch. [3] 33, 34), or with borax (G. Rose, B. B. 1887, 190; Knou. 4, 157, 355), in a proreclaim 1867. 129; Knop, A. 157, 365), in a porcelain oven. For other methods of producing crystals of TiO₂ v. Deville (C. R. 53, 161, 163), Senarmont (A. Ch. [3] 30, 129), Michel (C. R. 115, 1020), Wöhler (A. 73, 35), Daubrée (C. R. 29, 227; 39, 153), H. Rose (A. 56, 127; 68, 163).

Properties .- TiO, obtained by strongly heating TiO, xH,O forms reddish-brown lumps, more nearly resembling rutile in colour and lustre the

higher the temperature to which it is heated. The dehydration by heat of TiO2.xH2O is ac. companied by the appearance of shades of colour from white, though grey and greenish, to black, according to Wagner (B. 21, 960); these colours are similar to those shown by anatase, brookite, and rutile. Nilson a. Pettersson (Z. P. C. 1, 33 note) prepared TiO₂ as a white powder with faintest yellow tinge, by decomposing TiCl₁ by NH₂Aq, evaporating, and heating to whiteness. NH₄Aq, evaporating, and neating to wniteness. When melted by the O-H flame the colour is blue to black. S.G. TiO₂ increases as the oxide is heated; heated to c. 700° S.G. is c. 3.95 (Karsten, S. 65, 394), after being very strongly heated S.G. rises to 4.25 (Ebelmen, J. 4, 15; 12, 14). S.G. of anatase is 3.75 to 3.9 (Breithaupt, J. 2, 730; Damour, J. 10, 666); S.G. of brookite is 4 to 4.2 (Rammelsberg, J. 2, 730; Beck, J. 3, 704); S.G. of rutile is c. 43 (Scheerer, P. 65, 296; Müller, J. 5, 847). After fusion in the O-H flame and cooling S.G. is 41, according to Hautefeuille (A. Ch. [4] 40, 140). S.H. 0° to 100° = 1785, 0°-211° = 1791, 0°-301° =:1843, 0° -440° =:1919° (Nilson a. Pettersson, Z. P. C. 1, 27; TiO₂ prepared by decomposing TiCl₄ by NH₃Aq, evaporating to dryness, and heating to white heat). TiO₂ crystallises in dimetric prisms (rutile), dimetric octahedra (anatase), and trimetric octahedra (brookite); it is isotrimorphous with SpO₂ (Wunder, J. pr. [2] 2, 206). TiO₂ is somewhat hygroscopic, even after prolonged and intense heating (Thorpe, C. J. 47, 125). It is insoluble in water, and in TiO_x is heated with conc. H_xSO_x until the excess of acid is removed, the solid thus produced dissolves in water. TiO₂ melts in the O-H flame. According to Moissan (C. R. 115, 1034), when heated in an electric furnace to c. 2500° TiO₂ forms black crystals of TiO.

Reactions .- 1. According to Ebelmen (A. Ch. [3] 20, 394), TiO₂ is reduced to Ti₂O₃ by heating to redness in hydrogen; but O. v. d. Pfordten (A. 237, 201) says the product has the composition Ti,O₁₂.—2. A mixture of TiO₂ and magnesium powder heated to redness in H gives Mg/TiO₃, and a brown powder which is probably TiO (Winkler, B. 23, 2657).—3. A mixture of TiO₂ and carbon strongly heated in chlorine gives TiCl. 4. By long-continued heating in dry ammonia Ti2N2 is formed (Friedel a. Guérin, A. Ch. [5] 8, 24).-5. The compound TiCl, PCl, is obtained by heating an intimate mixture of TiO₂ and phosphorus pentachloride, in the ratio TiO₂:3PCl₃, in a retort until the POCl₃ formed is driven off (Weber, P. 132, 452).—6. Heated to redness in carbon tetrachloride vapour, TiCl, is formed (Watts a. Bell, C. J. 33, 443). Demarqay (C. R. 104, 111) says that the first product is TiOCl...—7. TiCl, is formed by heating TiO₂ to redness in a mixture of equal volumes of chlorine and carbon monoxide (W. a. B., l.c.) .-8. Ti2N2 mixed with C is formed by heating TiO2 in cyanogen or in hydrogen cyanide (Friedel a. Guérin, A. Ch. [5] 8, 24).—9. Heating in a nixture of hydrogen sulphide and carbon disulphide forms Ti₂S₂ or TiS₂, according to the temperature (Thorpe, C. J. 47, 491).—10. When TiO₂ is fused with sodium or potassium carbonate the weight of CO₂ expelled corresponds with the formation of M₂TiO₂; on treating the fused mass with water MOHAq is formed, and an acid Na or K titanate which is insoluble in water (v. Hermann, J. pr. 38, 92).—11. Fusion with potassium hydrogen sulphate forms a substance soluble in water; by evaporating the fused mass with conc. H.SO,, and then treating with water, the double salt Ti(SO₄)₂.K.₂SO₄.3H₂O is obtained (Warren, P. 102, 449; Glatzel, B. 9, 1833; Hermann, l.c.).—12. Heating powdered TiO₂ with conc. sulphuric, acid produces a substance that dissolves wholly in water (?forming Ti(SO₄)₂.xH.O or TiO.SO₄; v. Merz, J. pr. 99, 157). For reactions of TiO₂.xH₂O 1, infra, hydrated titunic oxide; and v. also titunic acid under Titanium oxyacids and Salts AND DERIVATIVES THEREOF, p. 746).

HYDRATED TITANIC OXIDE. Hydrates of TiO, are obtained by gradually adding TiCl, or TiBr, to cold NH3Aq; by fusing TiO, with KHSO, dissolving in water, diluting, and boiling for some time; by adding water to TiCl, and boiling; by fusing TiO, with K.CO, washing the fused mass with small quantities of water till all KOII is removed, adding a little conc. HClAq, filtering cold, and allowing the liquid to stand, when it gradually deposits gelatinous TiO_xH₂O_x (O.v. d. Pfordten, B. 17, 727); by decomposing Ti(OEt), by H₂O (Demarçay, C. R. 80, 51); and by other reactions. The isolation of a great many definite hydrates of TiO2 has been announced from time to time. By decomposing TiCl, PCl, (v. Titanic chloride, Combinations, No. 6, p. 740) by the action of moist air, and drying over H.SO., Tüttscheff (A. 141, 111) said that the dihydrate TiO, 2H₂O was formed, and by drying this at 110²-120⁹ he said that the monohydrate TiO, H₂O was obtained. According to Carnelley a. Walker (C. J. 53, 66, 81), dehydration of TiO, xH₂O (obtained by adding TiCl, to cold NEA at a lightly for 14 days prepared some NH₃Aq), air-dried for 14 days, proceeds continuously from 15° to 710° whereat the whole of the water is removed. A very large number of hydrates probably exists, and these pass one into the other as temperature rises without any of them remaining unchanged through more than a few degrees.

a rew degrees.

Two classes of hydrates of TiO₂ exist; one obtained by ppg. TiCl₄ by NH₄A4, or warming TiO₂ with conc. H₂SO₃ dissolving in water, diluting, and ppg. by alkali; the other obtained by dissolving hydrates of the former class in dilute acid, and boiling. Hydrates of the former class dissolve easily in dilute acids, while those of the latter class are insoluble in dilute acids (for more details v. Titanium oxyacids, p. 746).

Hydrated TiO₂, obtained by ppn. by alkali in the cold, dissolves in dilute acids, forming salts TiX₁, where X = NO₃, \(\frac{1}{2}\)SO₃, \(\frac{1}{2}\)Co.; not many salts of this form have been isolated, and most of those that are known are basic salts. TiO₂, xH₂O dissolves in molten H₂PO₄; on cooling crystals of TiO₂P₂O₄(-TiP₂O₂) are obtained (Hautefeuille a. Margottet, C. R. 102, 1017). By heat-TiO₂xH₂O with a little cold conc. HClAq, pouring off the solution after a few days, and evaporating it in vacuo, Koenig a. O. v. d. Pfordten obtained cfystals approximating to Ti(OH)₂Cl₂, but differing from Ti(OH)₂Cl₂ pyepared by the interaction of TiCl₄*and HClAq (B. 22, 1485; cf. TITAMIUM HYDROXYL CHLORIDES, 748)

TITANIUM SESQUINOXIDE Ti.O. (Titanous

oxide.) Mol. w. unknown. By digesting a solution of TiO, xH.O in HClAq with Cu at 40° to 50°. Fuchs (A. 56, 319) obtained a violet solution which gave a brownish black pp. with NH,Aq; the pp. quickly reacted with water, giving off H and forming WiO. xH.O. Von Kobell (P. 62, 599) obtained similar reactions by using reduced Ag in place of Cu. Ebelmen (J. pr. 42, 73) obtained a hearly black pp. by adding alkali to Ti.Cl.Aq. According to Ebelmen (J. pr. 42, 76) Ti_O, can be prepared by heating TiO, to redness in perfectly dry H. Ti.O₃ thus prepared is described as a black solid; unacted on by HNO₅ or HClAq; oxidise to TiO, only by heating to a very high temperature; soluble in H, SO, Aq, forming a violet solution. According to O. v. d. Pfordten (A. 237, 201), the product of reducing $T(O_2)$ in H is not $T(O_3)$ but has the composition $T(O_3)$. Friedel a. Guerin (A. Ch. [5] 8, 38) obtained $T(O_3)$, but not free from other compounds, by passing TiCl, vapour mixed with H over TiO, at a red heat. They describe TiO, as a copper-red, metal-like, microscopically crystalline powder; not acted on by boiling HNO₃Aq, but oxidised to TiO₂xH₂O by boiling H₂SO₄Aq; soluble in HFAq or warm aqua regia; giving off NH, and H with hot alkali solutions; oxidised to TiO, by heating to redness in air.

O. v. d. Pfordten (B. 22, 2070) failed to obtain Ti,O, by the method of F. a. G.

Ti_O, by the method of P. a. O. When Ti is dissolved in hot HClAq, in an atmosphere of H, the solution contains Ti_ZCl_Z Rammelsberg, J. pr. 99, 176); a solution of Ti_{O,x}, H_ZO in HClAq reduced by zine also contains Ti_ZCl_Z (K. a. O. v. d. P., Lc.); in these solutions alkalis give black pps., probably Ti_{O,x}, H_ZO; the pps. soon change in contact w.th H_ZO to Ti_{O,x}, H_ZO, H being given off. According to O. v. d. P. (A. 237, 201), a solution of K, TiF, in a little HClAq gives a pp. of Ti_ZO,xH_ZO on treatment with Na-amalgam.

Sabatier a. Senderens (C. R. 114, 1429; 115, • 236) say that Ti O_z is oxidised to TiO_z by heating to c. 500° in NO_z or to c. 300° in NO_z.

TITANICH MONOXIDE TIO. This oxide has not been isolated with certainty. According to Moissan (C. R. 115, 1034) black prisms, which he took to be TiO, are formed by heating TiO, to c. 2500° in an electric furnace, and at a higher temperature the (?) TiO melts and then volatilises. By heating a mixture of TiO, and Ma powder to reduess, in H. Winkler (B. 28, 2657) obtained a brown powder which probably contained some TiO, mixed with MgTiO. According to Berthier (A. Ch. [2] 54, 374) TiO, lost 6 p.c. O when heated strongly in a carbon grueible, 13 to 16 p.c. O when heated with 12 p.c. C, and 20 p.c. O when heated with 12 p.c. C, and 20 p.c. O when heated with 24 p.c. C (TiO, 405cc 20 p.c. O in becoming TiO); the product may have been a mixture of TiO, Ti₂O₃, and Ti.

HYDRATED TITANIUM MONOXIDE

TiO.H., O. TiO.H., O. v. d. Pfordten (A. 237, 201)
obtained a black pp., said by him to be TiO.H.,
by the continued action of Na-amalgam on a
solution of K.TiF, in a fair amount of HULAq
(if there is little HClAq.Ti_O, is ppd.); the solution became green, then colourless, and then the
black pp. was formed. The black pp. formed by
NH,Aq, alkali carbonates, or (NH,),SAq, in solutions of TiOl, (q. v., p. 741) is TiO,H, according

to O. v. d. P. (l.c.). With Na₂HPO₄Aq, and NaC₂H₄O₂Aq, TiCl₂ is said to give bluish-black and greenish-black pps., which may be salts of TiO (O. v. d. P., l.c.).

TITANIUM PEROXIDE. TiO3. (Titanium trioxide or superoxide.) In 1882 (Atti dei Lincei, 1882. 1) Piccini dropped H₂O₂Aq into solution of TiO₂xH₂O; from the quantity of H₂O₂ that reacted he concluded that an oxide TiO₃ was produced. In the same year (B. 15, 2599) Weller obtained a yellow pp., which reacted with HClAq, giving off Cl, by the interaction of H₁O₂Aq and freshly ppd. TiO₂xH₂O or a solution of TiO₂xH₄O. In 1808, Classen (B. 21, 370) added TiCl₃, drop by drop, to dilutealcohol, the related to this calculation. then added to this solution a very large excess of H₂O₂Aq, and then KOΠΛq, NH₄Aq, or (NH₄)₂CQ₃Aq; in each case he obtained a yellow liquid from which a yellow pp. separated after some time; after syphoning oif the liquid, washing the pp. by decantation, and drying it on a tile, he obtained a yellow solid approximating to the composition TiO, 3H.O. In 1889, Lévy (C. R. 108, 294) approximately determined the composition of the pp. obtained by adding H₂O₂Aq to TiO₂.xH₂O in H₂SO₄Aq, by dropping in H₂O₂Aq of known concentration, and determining the quantity of H2O2 used in the reaction ; L. concluded that the results could be accounted for by supposing the yellow pp. to be TiO₃, TiO₂H₁O₃, or Ti₂O₃H₂O₅ but that probably the pp. was TiO₄. In 1893 Bailey a. Dawson (Studies from the Phys. and Ohem. Laboratoria of the Owens College, vol. i. p. 216) obtained yellow to orange solids, agreeing fairly in composition with the formula TiO,. B. a. D. added (1) H₂O₂Aq, (2) freshly ppd. BaO₂, to TiO₁.xH₂O in dilute H₂SO₄Aq, diluted the deep-red liquids thus obtained with twice their volumes of alcohol, added conc. alcoholic solution of KOH. washed the pps. with alcohol (to remove H₂O and H₂O₂), and then with ether, and, in some cases, dried in the air. According to B. a. D., TiO₃ dissolves in water, forming a deep-red liquid; this solution decolourises KMnO Aq; TiO, dissolves in HClAq, giving off Cl. By allowing ppd. TiO, to stand for some time, B. a. D. say that a modification is formed insoluble in water.

OXIDES OF TITANIUM INTERMEDIATE BETWEEN

TiO₂ AND Ti₂O₃.

I. By heating TiO₂ with HCl gas in a reducing atmosphere, Deville (C. R. 53, 163) obtained a blue, crystalline solid, to which he gave the formula TiO₂ Assimilated (1) and the solid to the solid time of the solid time o mula Ti,O. A similar solid (? same composition) was obtained by Friedel a. Guérin (A. Ch. [5] 8, 44) by passing H and HCl over TiO2 strongly heated in a porcelain tube. This blue solid is said to decompose water, in presence ef strong bases, giving off H and forming TiO.

II. By very strongly heating TiO, in H, O. v. d. Pfordten (A. 237, 228) obtained a dark indigo-blue solid, to which he gave the formula. Ti,O12; according to Ebelmen (J. pr. 42, 76), Ti.O. is formed by this reaction. Heated in air

the compound burns to TiO2.

III. By adding alcoholic solution of KOH to a solution of TiO₂xH₂O in dilute H₂SO₂Aq, after treating the solution with BaO₂, Piccini (Atti dei Lincei, 1882. 1) obtained yellow pps. with com-positions varying from Ti₂O₁₁ to Ti₂O₂.

Titanium oxyacids and salts and derivatives thereof. The hydrates of TiO2 react as feeble acids, besides reacting with the stronger acids as feeble bases. The salts wherein Ti forms part of the acidic radicles are generally obtained by fusing TiO2 with salts of the metals which are to be converted into titanates. Only a very few titanates are soluble in water; several dissolve in HClAq, but on diluting and boiling most, if not all, of the TiO2.xH2O is ppd.

TITANIC ACIDS. Hydrates of TiO, are obtained by various reactions (v. Hydrated titanic oxide. p. 745). By drying under different conditions solids are obtained approximately corresponding with the formula $x\text{TiO}_x y\text{H}_2\text{O}$, where x=1,2, or 3, and y=1,2,3,4, or 5. (For a list of the hydrates obtained by different experimenters v. Tüttscheff. A. 141, 111.) There seems to be a series of hydrates of TiO2, all of which may be classed together under the name titanic acids, none of them being stable through more than a few degrees of temperature (v. Carnelley a. Walker, C. J. 53, 66, 81); the relations of composition of these acids may be expressed by such a general equation as $n \operatorname{TiH}_1 O_1 - m \operatorname{H}_2 O = \operatorname{Ti}_n \operatorname{H}_{4n-2m} O_{4n-m}$

The titanic acids belong to two classes: those which are formed by decomposing TiCl, or TiBr, by dilute cold alkali solutions, or by warming TiO2 with conc. II2SO, dissolving the product in water, and ppge by dilute cold alkali solutions; and those which are formed by decomposing TiCl, or TiBr, by water and boiling, or by dissolving titanic acids of the former classin dilute acid and boiling, or by fusing TiO2 with KHSO, dissolving in much water and boiling. The acids of the former class are generally called titanic acids or ortho-titanic acids, and those of the latter class meta-titanic acids. Orthotitanic acids dissolve easily in dilute acids: metatitanic acids are insol. dilute acids; by prolonged heating with conc. H2SO4 compounds are produced which dissolve on adding water. Metaacids are also formed by heating ortho- acids to c. 100°. Experiments made by Merz (J. pr. 99, 166) show that the meta-acids lose water, on heating, more easily than the ortho- acids.

ORTHOTITANIC ACIDS. According to Wagner (B. 21, 960), a clear solution of an orthetitanic acid is obtained by adding water, a drop at a time, to TiCl,, with constant shaking; HCl and TiCl, are given off (by the heat of the reaction), a solid is produced, then a greenishyellow liquid, and finally a clear solution. By adding 1 pt. TiCl, to c. 6 to 7 pts. water, Thorpe (C. J. 47, 120) obtained an opalescent liquid which became clear after standing for 40 hours. and then contained orthotitanic acid; when this solution was heated ppn. of metatitanic acids began at c. 87°, and at c. 90° most of the Ti was ppd. A solution of TiBr, in water forms a perfectly clear liquid containing orthoacid (T., l.c., p. 126). The white flocoulent solid obtained by adding TiCl, to dilute HClAq, ppg. by NH, Aq when cold, washing with cold water, and drying in the air is TiO₂.2H₂O (=TiO₄H₄), according to Merz (*J. pr.* 499, 166); this composition is also assigned to the solid formed by keeping TiCl₄.PCl₄ under a bell-jar, with water and CaO, for some days, and then drying over H_2SO_4 (Tüttscheff, A. 141, 111). When TiO_4H_4 is dried in vacuo (Tüttscheff, Lc.), or over H.SO.

(Mers, i.e.), the product is said to be TiO2.H2O (Mers, i.e.), the product is said to be 1102.1120 (= H.TiO₂ = TiO.O₂H₂). The composition 2TiO₂H₂O (= H.Ti₂O₃ = Ti₂O₂.O₂H₂) is given to the product dried at .100° (Merz, i.e.; Demoly, O. R. 1849. 325), dried at 140° (Tüttscheff, i.e.), or dried in vacuo over H.SO₄ (H. Rose, A. 52, 268); after drying at 100° or upwards, meta-

acids are probably produced.

mermay kabilah

Orthotitanic acids are insoluble in water or alcohol; but dissolve easily in dilute acids; said also to dissolve in alkali carbonate solutions. The solutions in acids probably contain salts of the type TiX, X = Cl, NO_3 , SO_4 , &c.; but compounds of the form $Ti(OH)_2X_y$, where X is a monovalent acidic radicle, and x is not greater than 3, may be formed, similar to the compounds Ti(OII),Cl, Ti(OH)₂Cl₂, and Ti(OH)Cl₃, obtained by O. v. d. Pfordten by the interaction of HClAq and TiCl₄ (B. 21, 1708; v. TITANIUM HYDROXYL CHLOBIDES, p. 753). By adding a little cone. cold HClAq to orthotitanic acid, allowing to stand for some days, pouring off the clear liquid from undissolved acid, and evaporating in vacuo, Koenig a. O. v. d. P. (B. 22, 1485) obtained a white solid containing Ti and Cl in the ratio 1:147; they regarded this as consisting chiefly either of TiCl. (OH), but different in some properties from TiCl (OII)2 obtained from TiCl,—or chiefly of TiCl(OII), IICl.
White pps. are obtained by adding H₂PO₁Aq. H₂AsO₄Aq, or H₂C₂O₄Aq to solutions of ortho-titanic acids in dilute HClAq, HNO₃Aq, or H₂SO₄Aq, after making nearly neutral by NH₃Aq. When acid solutions of orthotitanic acids are diluted considerably and boiled for some time the whole of the Ti is ppd. as meta-acids. Ortho- acids are also partly changed to metaacids by keeping under water for a long time (Wagner, B. 21, 960), or by washing with hot water. When an orthotianic acid is heated strongly TiO₂ is produced, with vivid incandescence; the change from a meta-acid to TiO. is not accompanied by incandescence. According to Wagner (l.c.), the dehydration of moist ortho- acids by gently warming is accompanied by changes of colour from white to grey, green, and black.

METATITANIC ACIDS. Formed, as white powders, by dissolving ortho-acids in dilute acid and boiling for some time; also by fusing TiO2 with KHSO4 and boiling with much water; also by adding water to TiCl, or TiBr, and boiling; also by adding water to Hol, of This, and dolling, as by oxidising Ti by HNO, S.G. 1.25 (Weber, P. 120, 287). According to Weber (l.c.), freshly prepared dilute TiCl, Aq is not rendered turbid by HClAq, HNO, Aq, or H, SO, Aq, but these acids by HClAq, the second of the second sec at once ppt. metatitanic acids when added to dilute TiCl,Aq that has been boiled even for a few seconds. The pp. obtained by boiling a diluted solution of an orthotitanic acid in dilute diluted solution of an orthotitanic acid in dilute H_SO_sis said to have the composition TiO_21I_2O (=TiO_iH_1) when dried over H_SO_t the composition 3TiO_14H_2O (=Ti_0O_iH_1 - Ti_0O_iO_iI_1) when dried at 120°, and the composition STiO_24H_2O (=Ti_0O_iH_1 - Ti_0O_iO_iH_2) when dried at 140° (Tüttscheff, A. 141, 111); Merz (J. pr. 99, 166) gives the composition TiO_iH_2O (=TiO_iH_2) to the air-dried 120. and the composition 2TiO_iH_2O (=Ti_1O_iH_2) to the pr. dried over H_SO_4, or at 60°. ക്ക Metatitanic acids are white powders, insoluble

in water or dilute acids; after heating with conc. H2SO, the products dissolve in water; when strongly heated TiO. is formed without incandescence

COLLOIDAL TITANIC ACIDS. Graham (T. 1861. 213) obtained a gelatinous, probably orthotitanic, acid, insoluble in water, by dialysing a solution of TiO_.rH_O in HClAq; by dissolving this gelatinous acid in such a quantity of cold dilute HClAq that not more than 1 p.c. titanic acid was present in the solution, and dialysing for several days, G. (C. J. 17, 325) obtained a dilute aqueous solution of colloidal titanic acid. Colleidal, insoluble, titanic acids have also been prepared by Knop (A. 123, 351), Rose (G. A. 73, 76 [1823]), and O. v. d. Pfordten (B. 17, 727).

TITANATES. These salts have not been thoroughly investigated. Those which have been best examined are either derivatives of H.TiO, or II TiO, or are basic salts of the type &MO.TiO, where &>1. Some acid salts MO.xTiO., where a>1, are also known. The older investigations were made chiefly by II. Rose (P. 61, 507) and by Hautefeuille (A. Ch. [2] 4, 129).

Barium titanates. An acid siglt 2BaO.3TiO₂ (=2BaTiO₂.TiO₂ or Ba₂TiO₂.2TiO₂) was obtained by Bourgeois (C. R. 103, 141) in lustrous microscopic crystals, by heating to full redness a mixture of equivalent parts of TiO, and BaCO, with excess of BaCl, and washing with very dilute HClAq.

Calsium titanates. The normal salt CaTiO. occurs native as perowskite. The same salt was formed by heating to bright redness a mixture of equivalent parts of TiO, and CaCO, .ith excess of CaCl., and washing with very dilute HClAq

(Bourgeois, l.c.).

Iron titanates. The mineral titaniferous iron or ilmenite is more or less pure xFe2Ox.yTiO2. By fusing a mixture of 2 pts. TiO, and 5 pts. Felia with a large excess of NaCl, washing with water, and then with very dilute acid, Hautefouille (C. R. 59, 733) obtained dark purple-violet, (G. R. 59, 755) obtained that proposed lustrous crystals of ferrous titanate Fe,TiO, (=2FeO.TiO.); but according to Koenig a. O. v. d. Pfordten (B. 22, 1485) the salt produced of the control of the con is ferric titanate Fe4(TiO4), (2Fe,O4.3TiO2). K. a. O. v. d. P. say that the salt dissolves in water after warming with conc. H2SO, forming a green solution containing Fe2(SO4)2 and titanic acid.

Magnesium titanates. The normal salt MgTiO (= MgO TiO) was obtained (by Haute-The normal salt feuille, i.c.) by heating to whiteness, for a short time in a closed crucible, a mixture of 1 pt. TiO, and 10 pts. MgCl2 with a little NH4Cl, washing with extremely dilute acetic acid, and then with water; lustrous, six-sided (probably trimetric) crystals, S.G. 3-91. The same salt is formed, according to Winkler (B. 23, 2657), by heating a mixture of TiO₂ and Mg powder. By heating a mixture of 2 pts. TiO₂, 1 pt. MgQ, and 40 pts. MgCl, and washing with very dilute acetic acid, the salt Mg.TiO, (= 2MgO.TiO₂) is said to be formed in hard, lustrous, regular octahedra, S.G.

3.42 (H.).

Potassium titanates. When TiO, is fused with excess of K₂CO, the quantity of CO₂ given off corresponds with the formation of the

normal salt K.TiOs; after fusion two layers are obtained, the lower of which is said to consist of K₂TiO₃, while the upper contains the undecomposed K₂CO₃. K₂TiO₃ is described as a yellowish, fibrous, easily fused solid (H. Rose, P. 61, 507). Water resolves it (according to Rose) into an insoluble acid salt, and a soluble basic salt; but according to Hermann (J. pr. 38, 92) no trace of titanic acid goes into Colution in water, but all remains in the insoluble acid salt.

Sodium titanates. The normal salt Na, TiO, was obtained by H. Rose (l.c.) similarly to the K salt; water resolves it into an insoluble acid salt and NaOHAq. By heating Na₂WO₄, and in some cases also WO₃, with mixtures of TiO₂ and Na₂CO₃ previously fused, Cormimbouf (C. R. 115, 823) obtained three acid salts:

(1) 2Na, O.3TiO₂ (= 2Na, TiO₃.TiO₂, or Na, TiO₄.2TiO₄), (2) Na, O.2TiO₂(Na, TiO₃.TiO₃, or $Na_2Ti_2O_3$), (3) $Na_2O.3TiO_2$ (= $Na_2TiO_3.2TiO_3$, or

Strontium titanates. An acid salt
2SrO.3TiO₂ (=2SrTiO₃:TiO₂ or Sr₂TiO₄:2TiO₂)
was obtained, in pale-greenishyellow cubes, S.G. 5.1, by Bourgeois (C. R. 103, 141), by heating equivalent parts of TiO₂ and SrCO₃ with excess of SrCl2, and washing with very dilute HClAq.

Zinc titanates. The normal salt ZnTiO, was obtained by Lévy (C. R. 107, 421), by heating to redness & mixture of 2 pts. TiO₂, 8 pts. ZnSO₄, and 3 pts. K.SO., and washing with dilute HClAq; pale-violet, silky needles, S.G. 3.17, scarcely acted on by boiling conc. acids or cone. KOHAq. By varying the proportion of TiO, ZnSO, and KSO used, L. (l.c.) obtained the normal salt Zn, TiO, which may also be regarded as a basic salt ZnTiO, znO; the basic salt BZnO.2TiO₂ (= 2ZnTiO₃.ZnO); and the acid salt 4ZnO.5TiO₂ (= 4ZnTiO₃.TiO₂).

FLUOTITANATES; v. Titanifluorides, under TITANIC FLUORIDE, Combinations, No. 2 (p. 742).

FLUOROXYTITANATES: v. Titanoxyfluorides, under Titanic fluoride (p. 742).

MOLYBDOTITANATES. A few compounds of the form TiO.12MoO.2M.O.xaq, where M = NH, and K, are described by Péchard (C. R. 117, 788). By shaking with ether a solution of the NH, salt, acidified by HClAq, and allowing the ethereal liquid to evaporate, P. (l.c.) obtained molybdotitanic acid TiO₂-12MoO₂-22aq, in golden yellow octahedra, melting at c. 60°, very soluble in water.

OXALOTITANATES. By dissolving

TiO_xxH_xO in hot KHC_xO₄Aq end cooling, Péchard (C. R. 116, 1513) obtained triclinio crystals of 2KHC₂O₄.TlO₂.H₂O. By treating a solution of this salt with BaCl₂Aq, crystals of Ba(HC,O4)2.TiO2.H2O were obtained; and by decomposing this by an equivalent quantity of dilute H,SO,Aq, filtering, and evaporating in vacuo, long needles of oxalotitanic acid 2H₂C₂O₂.TiO₂.2H₂O were obtained.

SILICOTITANATES; v. this heading,

7. 464.
Titanium, oxychlorides of. Several oxychlorides are known. (1) TiOCl_w. According to Demarçay (C. R. 104, 111), this is the first product of heating TiO₂ and CCl₄ in a sealed tube; it is described as a yellow crystalline solid.

Heated with CCl₄ it gives TiCl₄ and COCl₂.

(2) TiOCI. Obtained by passing a mixture of TiCI, vapour and dry H over TiO₂ in a tube heated white hot; Ti₂O₃ and Ti₂CI_a are also produced in the reaction (Friedel a. Guérin, Bi. [2] 22, 481). Brown, orthorhombic leaflets; heated in air burns to TiO₂ and TiCl₃. (3) Ti₄O₂Cl₃. Formed by passing TiCl₄ vapour through a reduct the containing fragments of provening hot tube containing fragments of porcelain (Troost a. Hautefeuille, C. R. 73, 563). (4) By allowing TiCl, to deliquesce in air, and then evaporating over H₂SO, and CaO, Merz (Bt. [2] 7, 401) obtained a solid approximating in composition to Ti₂O₂Cl₂16H₂O. In connection with expension of Tiranum hydroxyl chlorest IDES (p. 743).

Titanium, oxyfluoride of. By decomposing by water the crystals formed by dissolving TiO_xxH₂O in HFAq and evaporating, Berzelius (P. 4, 1) obtained a white solid, of which he said it was an insoluble, 'so to say, basic,' com-

The titanoxy/luorides TiO,F,.2MF may be regarded as compounds of the oxyfluoride TiO,F.

(v. TITANIC FLUORIDE, p. 742).

Titanium, oxythiochloride of. The compound TiCl, OSO, Cl formed by the reaction of TiCl, with SO, OH.Cl may be regarded as TiO, SCl.

(v. Trranic chiosides, Reactions, No. 10, p. 740).
Titanium, salts of. Not many salts have been prepared by replacing H of oxyacids by Ti; most of those that have been isolated are basic salts derived from the oxide TiO2. One salt, Ti₂(SO₄)₃, corresponding with the oxide Ti₂O₃ has been isolated. For the individual salts v. Nitrates, vol. iii. p. 517; Phosphates, this vol. p. 112, TiP₂O₃, prepared by dissolving TiO₂xH₂O in molten II₂PO₄ (Hautefouille a. Margottet, C. R. 102, 1017) should be added; and SULPHATES, this vol. p. 580.

Titanium, sulphides of. Three compounds of Ti and S have been isolated: TiS, Ti₂S, and TiS, corresponding with the three oxides TiO,

Ti₂O₃, and TiO.

TITANIUM DISULPHIDE TIS, (Titanic sulphide.)
Mol. w. unknown. H. Rose (P. 8, 177) said that
this compound was obtained by passing vapour di CS₂ over very strongly heated TiO₂; but O. v. d. Pfordten (B. 17, 727) and Thorpe (C. J. 47, 421) have found that it is not possible by this method to obtain TiS₂ free from Ti oxides. TiS₄ is prepared by passing perfectly dry H₂S into TiCl, kept somewhat below its b.p., and sending the mixed vapours through a glass tube heated to incipient redness; TiS, deposits in the tube, and HCl is given off (Ebelmen, A. Ch. [3] 20, 285; confirmed by O. v. d. Pfordten, B. 17, 727). According to O. v. d. P. (A. 234, 257), the H₂S should be passed through CrCl.Aq, to remove traces of O, and dried by means of P_2O_3 ; and the tube should be filled with H.S before the mixed vapours are passed into it.

TiS, forms large, brass-yellow, lustrous, metal-like scales.

TiS, is decomposed to Ti2S, and S by heating in hydrogen or nitrogen; it is not changed by heating in hydrogen in presence of excess of hydrogen sulphide; heated to redness in carbon dioxide it is completely oxidised to TiO_2 (O. v. d. P., A. 234, 257). Ebelmen (l.c.) gives the following reactions: with dry chlorine gives TiCl, and S₂Cl₂; heated in air, TiS₂ is burnt to TiO, and SO,; exposure to moist air decomposes TiS, gradually, with evolution of H,S; heated to redness with steam gives TiO, xH,O, H,S, and H; nitric acid produces TiO, xH,O, S, and NO: aqua regia oxidises it to TiO, xH,O and H,SO,Aq; not acted on by hydrochloric acid (H. Rose said that TiS, dissolved slowly in HClAq, giving off H,S); insoluble in potassium sulphide solution; digestion with potash solution produces K titanate and KHSAq (Rose).

TITANIUM SESQUISULPHIDE Ti.S.. Mol. w. unknown. Thorpe (C. J. 47, 401) obtained this compound by passing the vapours of moist H.S and CS2 over powdered TiO2 heated to very bright redness in a porcelain tube; dry H.S and CS2 had no action on TiO2. T. describes Ti.S3 as a greenish-black powder; he did not obtain it quite free from TiS3, as by heating at a lower temperature than full redness in H.S and CS2 it is slowly changed to TiS2. O. v. d. Pfordten (A. 234, 257) obtained Ti.S3 by heating TiS2 to full redness in dry H or N (S being set free); he describes it as a grey, metal-like solid; insoluble in NaOHAq; soluble in HNO3Aq or cone. H.SO4 forming green solutions.

TITANIUM MONOSULPHIDE TIS. Mol. w. unknown. Formed by very strongly heating TiS₂ in perfectly dry II quite free from O (T., lc.; O. v. d. P., lc.). A black powder (T., lc.); forms dark-red crystals (O. v. d. P., lc.). Slowly acted on by HNO₃Aq or aqua regia; insoluble in NaOilAq.

Titanium, sulphochloride of, v. Titanium Thiochloride, infra.

Titanium, thiochloride of. The pp. formed by passing pure dry H.S. into hot TiCl, is probably a thiochloride, according to O. v. d. Pfordten (4. 234, 257). M. M. P. M.

TITANIUM GROUP OF ELEMENTS. The four elements, titanium, zirconium, cerium, and thorium form, with carbon, the even-series family of Group IV. in the periodic classification of the elements. There is yet an element to be discovered between Co and Th; this unknown element will come in series 10 of Group IV. The titanium family of elements is closely allied to the tin family—Ge, Sn, Pb—which, with Si, form the odd-series members of Group IV. Carbon is the first even-series member, and silicon the first odd-series member, of the group; these two elements are more like one another than they are like the rest of the group.

For the properties and relations of C and Si v. Carbon group of elements, vol. i. p. 682; and for the tin family v. Tin group of elements,

this vol. p. 735.

The presence of an element, before unknown, in a Cornish mineral was recognised by Gregor in 1791, and by Klaproth a few years later; the element—called titanium by Klaproth, was isolated by Berzelius in 1824. Klaproth, in 1789, recognised the presence of a new earth in zirconite from Ceylon; the metalezirconium was isolated by Berzelius in 1824. In 1803 the presence of a new earth in a Swedish mineral was announced by Klaproth, who gave the name of cerium to the metal of the earth, he had discovered; Mosander isolated the element in 1826. Berzelius discovered a new earth, in a Norwegian mineral, in 1828, and isolated the metal of the

earth, which he called thorium, in the same year.

None of the four elements Ti, Zr, Ce, or Th occurs native; the compounds of these elements are comparatively rare, especially those of Ce and Th.

The most frequently found compounds are the oxides MO, generally in combination with SiQ, and with alkaline carths. The metals are obtained by reducing their double fluorides by Al, K, or Na; also in some cases by reducing the chlorides by H or Na; Co has also been isolated by electrolysing motten CcCl. The table on the following parapresents some of the physical and chemical properties of the elements.

cal and chemical properties of the elements.

General formulæ and characters of compounds.—Oxides.—MO₃, probably for all (? Th₂O₃); MO₂, for all; M₂O₃, when M = Ti or Ce; perhaps TiO. Hydrates of MO₂ effst.

Sulphides.—MS₃, when M = Ti or Ce; TiS.

Haloid compounds.—MN₃, when X = Br,
Cl. E. or I tonly Cet. Treated: MN₃, when

Haloid compounds.— MX, when X = Br, Cl, F or I (only CeF, prepared); MX, when M = Ti, and X = Cl, also when M = Ce and X = Br, Cl, F or I; Ticl. Salts.— MR, R = NO₃, SO₃, PO₄, &c.; most are basic when M = Ti or Zr, but when M = Ce many are normal, and when M = Th most are normal; several salts Ce₂R₃ are known, and a few TiR₄; the Ce₃R₄ salts are more stablethan the CeR₄ salts. Salts are more salts. Salts are more salts a

The oxides MO, are basic, and also feebly acidic when M is Ti or Zr; they interact with some acids to form corresponding salts, and, when M = Ti or Zr, with alkalis to form salts wherein M forms part of the acidic radicle; no salts of oxyacids with Ce or Th in the negative radicles have yet been isolated. Several hydrates of MO, exist, they easily pass one into the other with small changes of temperature; some of these hydrates react as feeble acids towards strong bases, forming salts of the types Xr₂MO₂, Xr₃MO₂, and, generally, xr₃O₂MO₂; these salts are not referable to such definite forms as the stannals or silicates are, but they resemble these classes of salts fairly closely.

The salts which are derived from the oxides MO, by the interactions of these oxides with acids, are of the form MN, where X=NO, \$500, \$100, &c.; when M=Ti most of the salts that are known are basic, when M=Zr, many are basic, bat a fair number of normal salts is also known; when M · Ce or Th, most of the salts that have been isolated are normal. Little is known of the oxides MO; as they are obtained by adding H₂O₂Aq and an alkali to solutions of salts MX, they are probably superoxides; the formula Th₂O, that is assigned to the oxide of Th formed in this way cannot be accepted as final. The oxides Ti₂O, and Ce₂O₂ are basic; the most definite and stable salts of

Ce are derived from this oxide. Several of the haloid compounds MX, have been gasified without decomposition, viz. TiCl., TiI., ZrCl., and ThCl. The haloid compounds MX, form many double compounds with other halides; some of these are certainly best regarded as salts of hypothetical acids containing M and X in their acidic radicles; the salts of this class R.MF. acidic radicles; the salts of this class B.MF_a are characteristic of the elements of Group IV.; all the elements of the group, except C and Cc, give these salts B.MF_a. Ce is said to form K_aCe_xF₁₁(= 2CeF_a.3KF), but further examination will most probably lead to the isolation of salts B.CeF_a. Ti and Ce form chlorides MX₁₀ or more probably M_aX_a from the analogy of C.Cl_a and Si_aCl_a; Ce also forms Ce_xF_a, Ce_xF_a, and Ce_xF_a, indeed the only haloid compound of Ce belonging to the form MY, that he yet heap isolated ing to the form MX, that has yet been isolated is CeF4. The sulphides have not been thoroughly examined; Ti is the only member of Group IV. which is known to form three sulphides corresponding with the oxides, TiS, TiS, and TiS,; one sulphide of Zr is known, probably ZrS; ThS₂ is the only sulphide of Th that has been isolated; and the only known sulphide of Co is Ce,S,. So far as investigation has gone, the

sulphides of Ti, Zr, Ce, and Th are basic.

A comparison of the titanium family with the tin family, which comprises the odd-series members of Group IV (C and Si being omitted), shows that Ti, Zr, Ce, and Th are more metallic, on the whole, than Ge, Sn, and Pb. Th is certainly the most markedly positive element of Group IV., and Ti is at least not more negative than Ge; Zr is more metallic than Ge, and Co more metallic than tin. The following formula show that, so far as composition goes, there is about an equal similarity between C and Si and the Ti elements, as between C and Si and the

tin elements:

there is between the two families of Group VI. Considering that the titanium and the tin elements belong to even and odd series, respectively, of Group IV., which group comes midway in the general periodic scheme of classification. we should expect the titanium (even-scries) family to be rather more metallic than the tin (odd-scries) family, but at the same time we should expect these two families to be very like one another; this is exactly what a study of the two families shows to be the case.

A comparison of the odd-series families of the different groups with the even-series families (omitting series 2 and 3) shows that, speaking broadly, the members of the even-series families are more metallic in their chemical properties than the members of the odd-series families, and that the general difference between even and odd families becomes more marked in the higher than in the lower groups (v. Table in vol. iii. p. 811). For instance, the even family of Group VI.—Cr. Mo, W, and U—is decidedly more metallic than the odd family of the same group—S, Se, and Te; but although the even family of Group II.—Ca, Sr and Ba—is more metallic than the odd family of the same group -Mg, Zn, Cd and Hg - there is not nearly so great a difference between these two families as

p-tolenyl-imido-ethyl-ether (Glock, B. 21, 2653). Pearly plates, sol. alcohol and ether.

Reactions .-- 1. CO.Ch, in toluene and NaOH

1422).
Salts.—B'HCl laq. [218°].— B'H.PtCl.
[225°].—B'HNO. [133°]. Needles, v. sol.
water (Kirschnick, A. 265, 167).—B'HNO. 2aq.
[95°].—B'2H.SO. 2aq. [240°], v. sol. water.
o-TOLENYLAMIDOXIM C.H.,N.O. i.e. 1422)

C,H,C(NOH).NH, [149.5°]. Formed by heat-

ing o-toluic nitrile with hydroxylamine hydrochloride, alcohol, and Na₂CO₃ (Schubart, B. 22, 2438). Needles (from hot water), v. sol. alcohol and ether.

Ethyl ether C,H,.C(NOEt).NH. [140°].

Prisms, v. sol. alcohol.

Benzoyl derivative C,H,.C(NOBz).NH2. [145°]. Needles, sol. alcohol. Conc. H.SO. forms С,H,.С<^{N.O}>СРЬ [80°].

o-Toluyl derivative
. C,H,C(NO.CO.C,H,).NH₂. [N.8°]. Converted at 180° into C_1H_1 , $C \leqslant_N^{N,\hat{O}} \geqslant_{\hat{C}} C_1H_1$, [59°] (Stieglitz, B. 22, 8156). Sodium diazobenzene sulphonate forms C_7H_7 . C_7H_7 . C_7H_7 . C_7H_7 . C_7H_7 . C_7H_7 . C_7H_7 .

Reactions.—1. Benzene sulphonic chloride forms C,H,.C NO SO.C,H, [89°] (Pinner, B. 24, 4173).—2. Aceto-acetic ether gives rise to C,H,C N CCH₂Ac [97°] (Schubart, B. 22, 2438) .- 3. Acetic aldehyde forms the compound C,H,.C NO CHMe [127.5°].-4. Hot, HOAC forms $C_{rH,.}C \stackrel{N.O}{\leqslant}_{N}^{N.O} > 0.C_{rH}$, [135°].—5. COCl. produces C,H,.C $\stackrel{N.O}{<}$ CO [220°].—6. ClCO₂Et yields C,H,.C(NH,):NO.CO,Et [130°] .- 7. Phenyl cyanate gives C,H,C(NOH).NH.CO.NHPh [155°].—8. Phenyl thio-carbimide reacts forming Q,H,C(NOH).NH.CS.NHPh.—9. Potassium cyanate acting on the hydrocloride gives rise to C₇H₇.C(NOH).NH.CO.NH₂ [170°]. 10. Ac₂O and NaOAc acting on the hydrochloride form NH(C(NH).C,H₂) [153°] (Glock, B. 21, 2657).—
11. Succinic anhydride forms the compound **C,H,.**O < N.O > C.CH₂.CH₂.CO₂H [138·5°].—12. Boiling Ac₂O forms $C_7H_7.C < N.O > CMe$ [80°].

13. CS. and alcohol form, on long boiling, C,H,,C(NSH)NH.CS.SHH,N.C(NSH).C,H, (Crayen, B. 24, 390).—14. US, and alcoholic potash yield C,H,C(NH,CS). [165*].

Methyl ether C.H. C(NOMe).NH. [85°].

Ethyl ether Eth'. [64°]. Needles. Converted by HBr and NaNO, into O.F. CBr:NOEt, an oil, decomposed at 155° (Schubart, Be 22, 2434), while hydrogen chloride and NaNO, form O,H,.CCl:NOEt (200°).

Bensoyl derivative C,H,.C(NOBz).NH, [178°]. Converted by heat into $C,H,C \stackrel{N.O}{<} CPh$.

References.—Nerso and Oxy-Toluamidoxim.
p.TOLENYL-IMIDO-ETHYL ETHER
C.H., C(NH).OEt. The hydrochloride B'HCl
[1817] formed by the action of dry HCl on p-toluic nitrile dissolved in ether-alcohol forms

prisms, yielding B'₂H₂PtCl₂2aq, converted at 200° into p-toluio amide, by NH₄ into p-tolenylamidine, by aniline into di-phenyl-tolenyl-amidine [168°], and by Ao₂O into the compound C₄H₄Me.C(NH).OAc [147°] (Glock, B. 21, 2650). The free base is liquid and changes on keeping into a polymeride [260°].

TOLENYL-PHENYLENE-DIAMINE

 $C_eH_4 < \stackrel{NH}{N} > C.C_rH_r$. [268°]. Formed by reduction of tolvl-o-nitro-aniline and also from ptoluyl chloride and o-phenylene-diamine in benzene (Hübner a. Hanemann, A. 210, 328). Prisms, sl. sol. water, sol. alcohol.

TOLENYL-PHTHALAMIDONE C, H, N, O i.e.

tolenyl-benzenyl-amidine o-carboxylic acid (Bistrzycki, B. 25, 1984).

TOLENYL-XYLYLENE-DIAMINE C'2H18N i.e. [1:4] $C_0H_4Mo < N_{NH} > C_0H_2Me_2$ $\begin{bmatrix} 5 \\ 6 \\ 1:3 \end{bmatrix}$ [217°]. Formed by reducing the p-toluyl derivative of nitro-xylidine (Brückner, A. 205, 125; Hübner, A. 210, 333). Long crystals (from dilute alcohol).—B'HCl.—B'HNO₃.—B'₂H₂SO₄.

TOLIDINÉ v. DI-AMIDO-DITOLYL. TOLIL v. DI-TOLYL-DIRETONE.

TOLIL-BENZOIN v. BENZOIN, Reaction 9. TOLINDOLE v. METHYL-INDOLE.

TOLISATIN v. Methyl-ISATIN.

TOLU-ACET-ALDEHYDINE C11H14N2 i.e. $C_7H_e(N;CHMe)_2$ or $C_7H_e < \stackrel{N}{N}_{Et} > CMe$ (?) [91° uncor.]. Formed together with a small quantity of ethenyl-tolylene-diamine, by mixing tolylene o-diamine (1 mol.) with aldehyde (2 mols.) in cold HOAc (Hinsberg, B. 20, 1588).

TOLU-AMIDOXIM v. TOLENYL-AMIDOXIM.

TOLU BALSAM. Obtained from incisions

in the stem of Myroxylum toluiferum growing in Columbia, South America. It contains a terpene, tolene $C_{10}H_{16}$ (154°-170°), benzoic and cinnamic acids, benzyl cinnamate and two resins: $C_{18}H_{18}O_4$ [60°] v. sol. alcohol and ether and $C_{18}H_{20}O_{3}$ [above 100°], insol. alcohol and ether (Deville, A. 44, 304; Scharling, A. 97, 71; E. Kopp, A. 64, 372; Busse, B. 9, 830; Baillon, Ph. [3] 4, 385).

TOLUBENZYLAMINE v. METHYL-BENZYL-

AMINE. TOLUENE C,H₈ i.e. C₆H₈,CH₉. Methylbenzene. Retinaphtha. Phenyl-methane. Mol. w. 92. V.D. 3·20 (calc. 3·29). (109°) (R. Schiff, A. 220, 91); (111°) (Wilbrand a. Beilstein, A. 128, 259; Tollens a. Fittig, A. 131, 304). S.G. 20 ·8656 (Brühl); 21 ·8566 (Gladstone, C, J. 59, 290); 13 ·8708 (S.). C.E. (13°-109°) ·001242. S.V. 118 (S.). μ_{B} = 1·4893, (C.). μ_{B} = 1·507 (B.). R_{∞} = 50·06. H.F.p. -3520. H.F.v. -5200 (Thomsen, Th.). H.C. 933,762 (Stohmann, J. pr. [2] 35, 41). Critical temperature 321° (Pawlewski, B.-16, 2634). Occurs in cold tar (Mansfield). Obtained by dry distillation from balsam of tolu (Deville, A. Ch. [3] 3, 168; Muspratta. Hofmann, A. 54, 9), from dragon's 168; Muspratta. Hofmann, A.54, 9), from dragon's blood (Glenard a. Boudault, C. R. 19, 505), from the resin of Pinus maritima (Pelletier a. Walter.

A. Ch. [2] 67, 278), and from wood (Völckel, A.) 86, 334).

Formation .- 1. By distilling vulpic acid with KOH (Möller a. Strecker, A. 113, 69). 2. By the action of sodium on a mixture of bromobenzene and MeI (Fittig a. Tollens, A. 131. 303).—8. By passing petroleum vapour over red hot charcoal (Letny, B. 11, 1210).—4. Beheating petroleum with AlCl, in presence of PbO and air (Friedel a. Crafts, Z. 1878, 1166).— 5. By passing MeCl or CH,Cl, into benzene containing AlCl₂ (Friedel a. Crafts, A. Ch. [6] 1, 460; 11, 264).—6. Together with CH₁ by heating benzene with MeI and I (Rayman a. Preis, A. 223, 317).-7. By distilling cresol with P2S3 (Geuther, A. 221, 58) .- 8. By distilling toluic acid with baryta (Noad, A. 63, 305).

Properties.—Oil, smelling like benzene.

Reactions.—1. When passed through a redhot tube it yields benzene, styrene, naphthalene, diphenyl, anthracene, phenanthrene, and other products (Ferko, B. 20, 661; cf. Berthelot, Bl. 7, 218; Graebe, B. 7, 48).—2. Distillation over red-hot PbO gives benzene, di-phenyl-ethylene, diphenyl, phenanthrene, and anthracene (Lorenz, B. 7, 1097; Vincent, C. R. 100, 908). -3. By electrolysis of toluene to which alcohol and H.SO, have been added benzoic aldehyde and phenose are formed (Rénard, C. R. 92, 965) .--4.—When electric sparks are passed through toluene, acetylene and hydrogen are given off (Destrem, Bl. [2] 42, 267).—5. AlCl, at 200 in sealed tubes forms benzene, and m- and p-xylene (Friedel a. Crafts, C. R. 100, 692; Anschütz, A. .235, 178).-6. Oxygen passed through toluene containing AlCl, forms cresol (Friedel a. Crafts, C. R. 86, 884). -7. A mixture of toluene and ethylene passed through a red-hot tube yields benzene, styrene, and antiracene (Ferko)...
8. CH₂Cl₂ and AlCl₃ yield di-tolyl-methane (280°-290°), di-methyl-anthracene [232°], and m., and p. xylenes (Pricedel a. Crafts, Bl. [2] 41, 322).—9. Bromine acts upon toluene in the dark as readily as in diffused daylight, with production of o- and p-bromo-toluene. The addition of iodine greatly hastens the reaction, but the same products are formed. In direct sum light the substitution takes place entirely in the side-chain, with production of benzyl bromide. But if iodine (even 2 p.c.) is present the effect of the sunshine is entirely counteracted, and the substitution takes place wholly in the nucleus (Schramm, B. 18, 606; cf. Zakrzewski, M. 8, 304).—10. Chlorine, in presence of I, acting even on boiling toluene, forms chloro-toluene and benzyl chlorido (Beilstein a. Geitner, A. 231, 170; cf. Aronheim, B. 8, 1401).—11. Crt) Cl. added slowly to a solution of toluene in CS. ppts.C.H.2CrO.Cl., which slowly absorbs moi; ture, being converted into benzoic add-hyde (Etard. A. Ch. [8] 22, 223).—12. H.SO, yields the o-and p-suphonic acids, converted by potash-fusion into o- and p-cresol (Wurtz. A. Ch. [4] 25, 108).—13. Bz.Q. forms Ci.H.; (c. 260°) isomeric with the di-phenyl-ethylenes, and yielding benzoic acid on oxidation (Lippmann, M. 7, 521).—14. HNO, forms o- and p-nitro-toluene.—15. Parallelyde and conc. H.SO, form ditolylethams and C₂₂H₂₈ (350°-860°) (O.* Fischer, B. 7, 1194). even on boiling toluene, forms chloro-toluene and 1194).

Compounds (C,Hs),AlCls. S.G. 2 1.08 (Gus-

tavson, B. 11, 2151). Oil.— (C.H.), AlBr. S.G. *

Dihydride C,H₁₀. (105° 108°). Formed by heating toluene with PH₄I at 350° (Baeyer, A.

155, 271; Z. [2] 4, 445).

Tetral plride C.H., (104°). S.G. U 797. Occurs in the product of distillation of colophony (Rénard, A. Ch. [6] 1, 231). Oil, sol. alcohol and ether. Rapidly absorbs oxygen. In contact with water it forms crystalline C, H100, H₂SO, forms two polymerides (230 -235°), one only being oxidisable by air.

Hexahydrids C.H., (97°), S.G. § 7741, C.E. (0° 20°) 901 Ø. S.V. 142 (Lossen, A. 225, 109). H.C. 1,092,800 (Longuinine, C. R. 93, 275). Formed by heating tohene with conc. 111Aq at 280 (Wreden, A. 187, 161; cf. Berthelot, Bl. [2] 7, 124; 26, 146). Occurs in oil of resin. Completely oxidised by a hot mixture of

HNO₃ and H₂SO₄, References, - Tri-amido-, Bromo-, Bromo-IODO., BROMO-TODO-NITRO., BROMO-NITRO., CHLORO., CHLORO-TODO., CHLORO-NITRO., LODO., IODO-NITRO., NITROSO., NITRO., and OXY- TOLUENE. TOLUENE ARSONIC ACID r. ARRENIO.

TOLUENE CARBOXYLIC ACID v. Toluic

Tolpene dicarboxylic acid C,H,O, C₆H₃Me(CO₂H)₂[4:2:1]. Methyl-phthalic acid. Mol. w. 180. [152°]. Formed from (a)-amido-ptoluic nitrile by Sandmeyer's reaction, the resulting nitrile being saponified (Niementowski, M. 12, 623). V. e. sol. water and alcohol. o-amido-phenol it forms C,H,Me(CO),N.C,H,OH [205°], whence boiling aqueous sodium carbonate gives rise to C_dH₃Me(CO₂H).CO.NH.O₄H₄.OH₄ • [200°].

Amide C,H,Me(CONH,), [188°]. Formed . from the imide and NH_3Aq .

102 | Needles

Anhydrida. [92]. Needles. Imida C_uH₃Me.C₂O₂NH. [196°]. Got by fusing the anhydride with urea. Needles.

Nitrite C_bH₃Mc(CN)₂, [120°] (N.); [117°] (Glock, B. 21, 2663). Needles. Converted by alcohol and HCl into C, H, Cy. C(NH, Cl). OEt

[199°]. Toluene dicarboxylic acid (3.11, (3.11, (3.11))C.H.Mc(CO,Hb. 4.33:1]. (B)-Xylidic acid. Methylicophthalic acid. [320°-330°]. Formed by oxidation of m-xylene carboxylic acid (Jacobsen, B. 14, 2112) and of C.H.Mc(CH.OH), (Hielt a. Gadd, B. 19, 868). Formed also by fusing potassium toluene m-disulphonate or the salt C_aH₁Ne(SO₂NH₂),CO₂K with sedium formate (Hakansson, B. 5, 1088; Remsen a. Hes, Am. 1, (Hakansson, B. 5, 1088; Rémsen a. 11es, Am. 1, 119). The same acid (?) is got by oxidation of C_nH₂Mc_nCO₂H [1:4:2] by HNO, (S.G. 1·12) at 150° (Claus a. Wollner, B. 18, 1858). Small crystals, sl. sol. hot water. May be sublimed.—Ag.A": crystals, v. sol. hot water.

Toluene dicarboxylic acid.

C_nH₂Mc(CO₂H₂ [2:4:1]. Methyl-terephthallo acid. (a) Xylidic acid. [c. 282°]. Formed by boiling pseudocumene with dilute HNO₂ (Fittig a. Laubinger, A. 151, 276). Got also by traing

a. Laubinger, A. 151, 276). Got also by fusing

C.H.Me(SO.NH.)CO.K with sodium formate (Remsen a. Iles, Am. 1,114). Needles (by sublimation). Sl. sol. Aq. Oxidised by KMnO, to trimellitic and isophthalic acids (Krinos, B. 10, 1494).—~ZnA". S. 36 at 0°; '735 at 100°, '5 at

130° (Jacobsen, B. 10, 859).

Toluene dicarboxylic acid C,H,Me(CO,H)2 [310°-315°]. Formed by fusing potassium toluone (y)-disulphonate with socium formate (Senhofer, A. 164, 134). Minute needles, v. sl. sol. cold water, v. sol. alcohol and ether. May be sublimed. -BaA" 2aq. -Ag. A": amorphous

Toluene w o-dicarboxyliceacid

CO.H.CH., C.H., CO.H. [2:1]. Homophthalicacid v. o-Carboxy-phenyl-acctic acid.

Nitrile v. o-Cyano-Benzyl Cyanide.

Toluene w m-dicarboxylic acid

CO₂H.CH₂.C₂H₁.CO₂H [3:1]. Formed by oxidation of m-di-ethyl-benzene (Allen a. Underwood, Bl. [2] 40, 100). Needles (from alcohol). Sublimes without melting at 200° 210 .- Ag A".

Toluene ω p-dicarboxylic acid
CO₂H.CH₂,C₃H₂,CO₃H. [285²-288²]. S. 1 at 50°.
S. (alcohol) 14 3 at 30°. Formed by the action 5. (atcono) 14°3 at 30°. Formed by the action of dilute (25 p.c.) HCl on the amide (Mellinghoff, B. 22, 3215). V. sl. sol. ether and benzene.—
Ag_aA": crystalline pp. The same (?) acid formed by oxidation of C₆H, PrPr [1:4] yields

BaA'-14aq /Paterno a. Spica, B. 10, 1740).

Amide CO(NH₂),CH₂,C₆H₁,CO.NH₂. [235°].

Formed from CH₂Cy.C₆H₁,Cy and H₂SO₄. Small

hard nodules.

CO(NH₂).CH₂.C₆H₄.CO₂H₄. acid[261°]. Formed from CH_Cy.C,H,CO_H and H₂SO. Sl. sol. ether, hot water and alcohol.—AgA': crystalline.

Iso amic acid CO2H.CH2.C8H1.CO.NH2. [229°]. Formed from p-cyano-phenyl-acetic acid. Crystalline, v. sol. alcohol and hot water.

-AgA'. Crystalline.

-ARA. Crystamine.
Nitrile CH.Cy.C_aH₄.Cy. p-Cyano-benzyl
cyanide. [100°]. (above 360°). Formed from
CH_Cl.C_aH₄.Cy and KCy (Mellinghoff, B. 22,
3209). Needles, v. sl. sol. hot water, sol. alcohol and ether.

Semi-nitrile CH2Cy.CaH4.CO2H. [201°]. Formed from ω -chloro-p-toluic acid by treatment with KOHAq and alcoholic KCy (Mellinghoff, B. 22, 3213). Crystalline, v. sol. alcohol and ether. -AgA'.

Semi-nitrile CO.H.CH..C.H..Cy. [152] Formed from the nitrile and HCl at 105°.

Prisms, v. sol. alcohol.—AgA'. Crystalline.

Nitrile-amide CH_Cy_C₆H_, CO.NH.

[182°]. Formed from ω-chloro-p-toluic amide

and KCy. Plates. Amide nitrile CO(NH.).CH.,C.H.,Cy. [196.5]. Formed from the nitrile and HCl at 70°. Crystalline, v. sol. alcohol.

Toluene tri-carbaxylic acid C.H.(CO.H).CH,.CO.H. Formed in small quantity by oxidation of s-tri-ethyl-benzene (Friedel a. Balsohn, Bl. [2] 34, 635). Needles. Sublimes before metting.—Ag₃A". Tables (from hot

TOLUENE O-PHOSPHINIC ACID

C.H.Me.P(OH). Obtained by decomposing its chloride with water (Michaelis a. Paneck, A. 212, 223). Oil. Monobasic acid.—CaA' aq. Chloride C.H.Me.PCl2. (244°). Formed

by the action of PCl₃ on mercury ditolyl [107°] and by warming toluene with AlCl. and PCl. Liquid.

Toluene p-phosphinic acid CaH, Me.P(OH)2. [105°]. Formed in like manner. Plates, v. sl. sol. water. Oxidised by HNO₃ to the phosphonic acid. Decomposed on heating into tolyl-

phonic acid. Decomposed on heating into tolylphosphine and toluene phosphonic acid. -KA'.
-NH,A'.-BaA',aq.-FbA',--CuA',4aq.
Ether C₀H,Me.P(OEt)₂. [280°].
Formed from the chloride and dry NaOEt.
Chloride C₀H,Me.PCl₂. [25°]. (245°).
Formed, together with the o-isomeride, from
toluene, PCl₃, and AlCl₃ (Michaelis a. Paneck,
A. 212, 203). Formed also from Hg(C,H,)₂
[235°] and PCl... Needles. v. sol. ether and [235°] and PCl3. Needles, v. sol. ether and benzene.

References .- NITRO- and OXY-TOLUENE PHOS-PHINIC ACID.

TOLUENE PHOSPHINIC ANHYDRIDE v. PHOSPHING-TOLDENE

TOLUENE O-PHOSPHONIC ACID

C_aH₄Me.PO(OH)₂. [141°]. Formed by the action of water on its chloride (Michaelis a. Paneck, A.

212, 231). Crystals, v. sol. water. $-Ag_2A''$.

Chloride C,H.,PCl,
This is formed from
C,H.,PCl₂ and chlorine. Yellow solid.

Toluene p-phosphonic acid CoH, Mc.PO(OH)2. [189°]. Formed from C.H. PCl, and cold water. Woolly needles. Oxidised by alkaline KMnO₄ to CO₂H.C₄H₄.PO(011)₂. Bromine forms bromotoluene. – KH₄A"₂: needles. – BaH₄A"₂—AgHA". – Ag₂A".

Chloride C.H. PCl. [42°]. Formed from H.PCl., and chlorine. Yellow mass, converted C₇H, PCl₂ and chlorine. Yellow mass, comby dry SO₂ into liquid C₇H₇. POCl₂ (285°).

Toluene ω-phosphonic acid

C_aH_aCH_aPO(OH)₂. [166°]. Formed, together with (C_aH_a)₂PO(OH) [191°], from benzoic aldehyde and PH_aI (Litthauer, B. 22, 2145). Stellate groups of prisms (from HOAc).

Reference. - OXY-TOLUENE PHOSPHONIC ACID. TOLUENE & SELINIC ACID C, H, SeO, i.e. C_sH_s,CH_s,SeO.OH. [85°]. Formed by oxidising benzyl disclenide with HNO₃ (Jackson, A. 179, 8). Needles, sl. sol. cold water, v. sol. alcohol, hearly insol. ether. -- AgA': slender crystals (from hot water).

TOLUENE SULPHAMINE v. AMIDO-TOLUENE SULPHINIC ACID.

TOLUENE o-SULPHINIC ACID C, H, SO, i.e. C_zH₁Mc_zSO.OH. [80°]. Formed by boiling C_zH₁N₂H₂SO.C_zH₂ with baryts water (Limpricht, B. 20, 1241). Long needles, v. sol. ether.—BaA'₂ 3aq. Nodules, v. sol. water.

Toluene p-sulphinic acid C_zH₁Mc.SO_zH.

[85°]. Formed in like manner (Limpricht), and also from toluene p-sulphonic chloride and sodium-amalgam, zinc-dust, or Na SO, (Otto, A. 142, 92; 145, 19; B. 9, 1586; Blomstand, 142, 92; 145, 19; B. 9, 1586; Blomskand, B. 3, 965). Plates, v. sol. ether. Fuming HNO₂, Groms crystals [190°]. The Na salt heated with CH_{*}.CHCl_{*} and alcohol at 150° gives a small quantity of 'CH_{*}.CHCl.SO_{*}.C, H. [48°] (Otto, J. pr. [2] 40, 519). The Na salt with ClCO_{*}Et gives the ether (Otto, B. 26, 308).—BaA'₂: 1 lates.—CaA'₂ 4aq.—ZnA'₂ 2aq.—AgA'.

Methyl ether. Formed from the Na salt and ClCO_{*}Et in MeOH. Oil (Otto, J. pr. [2] 47, 1666).

Ethyl ether EtA'. Oil. KMnO, in HOAc to toluene p-sulphonic ether

(Otto a. Rossing, B. 19, 1226)

Toluene exo-sulphinic acid C.H. CH. SO.H. Prepared by reducing C_eH₃.CH₂.SO₂Cl with sodium-amalgam (Otto a. Lüders, B. 13, 1288). Very unstable.-NaA': leaflets, sol. hot alcohol.

Reference .- AMIDO TOLUENE SULPHINIC ACID. TOLUENE o-SULPHONIC ACID C.H.SO, i.c.

C.H.Me.SO3H [1:2].

Formation.—1. In small quantity together with the p-isomeride, by dissolving toluene in hot fuming H.SO. (Engelhardt a. Latschinoff, Z. [2] 5, 617; Anna Wolkoff, Z. [2] 6, 321).-2. Together with the m- and p- isomerides by the action of Cl.SO...OH on toluene (Claesson a. Wallin, B. 12, 1848; Noyes, Am. 8, 176).— 3. From o-toluidine by diazotisation followed by treatment with H.SO, (Müller a. Wiesinger, B. 12, 1348).-4. By reducing p-bromo-toluene sulphonic acid with sodium-amalgam (Terry, .1. 169, 27) .- 5. From (4,1,2) - nitro-toluene sulphonic acid by elimination of NO2 (Jenssen, A.

Preparation.—By adding toluene (60 g.) to CISO₃H (150 g.) in the cold, and pouring the product into water (Noyes).

Properties. -- Thin leaflets (containing 2aq), v.

sol. water. Deliquescent.

Amide C.H., SO., NH... [154°]. S. 1 at 9°; S. (alcohol) 3°5 at 5°. Octahedra, sl. sol. water. Yields a benzoyl derivative [112], which forms C.H., SO, NKBz 1 aq and (C.H., SO, NBz), Ba aq. (Wolkoff, Z. [2] 6, 57). Oxidised by KMuO, in acid solution to o-sulpho-benzoic acid and in

neutral solution to C₆H₄<SO₂>NH (Fahlberg a. List, B. 21, 242).

Anilide C,H., SO,NHPh. [136°].
Toluide C,H., SO,NHC,H., [131°].
Toluene m-sulphonic acid C, H., Mc. SO, H

[1:3]. Formation. 1. By the action of H SO, on m-diazo-toluene salts (Müller a. Wiesinger, B. 12, 1349).—2. A product of the action of CISO H on toluene (Claesson a. Wallin, B. 12, 1848). -3. From o-bromo-toluene m-sulphonic acid and sodium-amalgam (Müller, A. 169, 47). 4. By the diazo-reaction from p-toluidine sulphonic acid and from o-toluidine sulphonic acid (Pechmann, A. 173, 202; Pagel, A. 176, 297; Nevile a. Winther, C. J. 37, 628; Klason, B. 19, 2887).

Properties .- Thin deliquescent scales (con-

Oxidised by 5° (C. a. W.); 17.4 at 14° (V.). Monoclinic tables and octahedra (from alcohol). Melts at 91° according to Noyes. Oxidised by alkaline K₃FeCy₆ to CQ₂H.C₆H₄.SO₂NH₅ (Noyes a. Walker, Am. 8, 187).

Anilida C.H., SO, NHPh. [72°].

m-Toluide C.H.SO., NHC.H., [103°].

Toluene p-sulphonic acid Call, Mo.SO, H [1:4.] The chief product of sulphonation of boiling Tollens, A. 131, 310; Marclor, A. 136, 85; Engelhardt a. Latschiueff, Z. [2] 5, 617; Jaworsky, Z. 1865, 221; Otto a. Grüber, A. 142, 92; 145, 10; Chru tshoff, B. 7, 1167; Fahlberg, B. 12, 1048). -2. From toluene and CISO₂H (Claesson a. Wallin, B. 12, 1848). -3. By the action of H2SO, on p-diazo-toluene salts (M. a. W.).

Properties. -Thick leadlets or flat prisms (containing aq). Deliquescent. Melts at 92° (Norton a. Otten, Am. 10, 140). Fusion with sodium formate yields p toluic acid (Remsen, B. 8, 1412). Potash-fusion gives p-cresol. Hydro-

8,1112). Potash-fusion gives p-eresol. Hydrolysis by steam begins at 150° (Armstrong a. Miller, C. J. 45,148).

Salts. KA' aq. Trimetric crystals; a:b:o=864113:237.—NaA' 3aq. NaA' 2aq.—NHA'.—CaA'_4aq.—BaA'_a, BaA'_aq. S. 21 at 12°.—BaA'_3aq. (Kelbo, B. 16, 621). PbA'_2. —MgA',6aq. ZnA'_26aq. CdA'_26aq.—MhA'_26aq.

Chloride C,H,SO,Cl. Oil. Chloride C,H,SO,NH, [108°]. S. 4 at 9° (C. a. W.); 265 at 14° (V.). S. (alcohol) 7·4 at 5°. Leaflets. Yields C,H,SO,NHK aq. BzCl forms C,H,SO,NHB2 [147°-150°], which gives KA', Caz'A', aq, BaA', AgA', and AgA'NH, and is converted by PCl, whence ammonium carbonate solution forms C,H,NO, CCl.C,H, (100°), whence ammonium carbonate solution forms C,H,NO, NC,HC,H, (10°), whence ammonium carbonate solution forms C,H,NO, NC,HC,H,O, converted by NH,Aq into C,H,SO,N,H,(C,H,O), (180°) and

(C,H,SO₂)₂N₂H₂(C,H₁O₂), which crystallises from alcohol (Wolkoff, Z. 1870, 580).

Methylamide C,H,SO₂.NHMe. [75°]. Rectangular plates, sl. sol. hot water. Yields

C,H.,SO,NBzMe [58°].

Ethylamide C,H.,SO,NHEt. [58°].

Antide C,H.,SO,NHPh. [103°].

forms C,H.,SO,NBzPh [149° cor.] (Remsen a. Palmer, Am. 8, 242).

C,H,.SO, NMePh [95°]. Methylanilide

Methylantide C,H,,SO,,MMePh [95°].
Moncelinic crystals (Otto, J, pr. [2] 47, 371).

Ethyl-anilide [88°]. Prigns, insol. water.
p-Toluide C,H,,SO,NHC,H, [118°].

Toluene exo.sulphonic acid C,H,,CH,,SO,H.
Formed by boiling benzyl chloride with aqueous K₂SO₂ (Böhler, A. 154, 50; 221, 215; Mohr, A. 221, 216; Otto a. Lüders, B. 13, 1286). Formed also by oxidising benzyl disulphide with HNO_s (Barbaglia, B. 5, 270, 688), and also, together with acetic acid, by heating benzyl methyl ketone with H₂SO₄ (Krekeler, B. 19, 2625). Very hygroscopic crystals. The K salt heated with KCy yields C₆H₄.CH₂.CN.
Salts.—NH₄A'.—KA'aq. Trimetre prisms.

—BaA', 2aq. Plates, sl. sol. water.—CaA', 2aq.—PbA'(OH): crystals.—PbA',.—AgA'; crystalline.

Chloride C_aH_a, CH_a, SO_aCl. [93°]. De-

omposed by heat into SO₂ and benzyl chloride. A mide C_aH₂.CH₂.SO₂NH₂. [102°] (O. a. L.) [105°] (Pechmann, B. 6, 534). Needles, sol. water and alcohol.*

Toluene (α)-disulphonic acid C₆H₃Me(SO₃H)₂ [1:2:4]. Formed by sulphonation of toluene and

of toluene o- or p-sulphonic acid (Hakansson, B. 5, 1084; Senhofer, A. 164, 129; Gnehm a. Forrer, L. 10, 542; Claesson a. Berg, B. 13, 1170; Klason, B. 20, 354). Formed also by heating toluene p-sulphonic chloride with H.SO. (Fahlberg, B. 12, 1652; Am. 1, 170; 1,280; (Fahlberg, B. 12, 1652; Am. 1, 170; 2, 182).

TOLUENE p-THIOSULPHONIC ACID

C₁H₁Me.SO₂.SH. Formed by heating a solution of a salt of toluene p-sulphinic acid with sulphur (Otto, B. 15, 129; 20, 2087) or by adding a mixture of Na₂S and C,H,SO₂Na to an alcoholic solution of iodine (Otto a. Tröger, B. 24, 1132). A solution of Na salt gives a white pp. of cuprous salt on adding CuSO,

Reactions.—1. Indine added to an alcoholic solution of the K salt forms the three compounds (C,H,SO₂), S [134°], (C,H,SO₂), S₂ [199°], and (C,H,SO₂), S₃ [182°]. The compound (C,H,SO₂), S is also formed by the action of I on a mixture of C,H,.SO,SNa and C,H,SO,Na, and crystallises from benzene in monoclinic forms a:b:c=2.829:1:3.221; $\beta=60^{\circ}7'$. The compound (C,H,SO₂)₂S₂ is split up by boiling HOAc into (C,H,SO₂)₂S₃ is split up by boiling HOAc into (C,H,SO₂)₂S and (C,H,SO₂)₂S₃ (Otto a. Tröger, B. 21, 1126).—2. Cl.CO₂Et acting on the Na salt forms the cthyl and tolyl ethers and the compound (C,H,SO,)2S, [182°] (Otto a. Rossing,

B. 24, 1148).

Salts.—NaA' 2aq. Trimetric tables.—

KA' 2aq.—AgA' aq: small tables, sl. sol. water.

Ethyl ether C.H., SO., SEt. Tolyl ethyl

disulphoxide. Got from NaA' and Etl. Oil. Ethylene ether C₂H₁A'₂. [77°]. Needles. Decomposed by zinc-dust into the zinc salts of toluene sulphinic acid and ethylene mercaptan

(Otto a. Heydecke, B. 25, 1478).

Tolyl ether C.H., SO, SC, H., Tolyl dissulphoxide. [78°]. Formed by oxidation of p-tolyl mcreaptan (Märcker, A. 136, 83). Formed also from toluene p-sulphonic acid and water at 100° (Otto a. Tröger, B. 24, 480). Mono-clinic prisms (from alcohol). Decomposed on acid and di-tolyl disulphide [41°] (Otto a. Nössing, B. 19, 1240). Reduced by zinc and dilute H.SO. Br. (Otto 2. The C. H.SO.) (C₁₄H₁₄S₂O₂)₂Br₂ (Otto a. Grüber, A. 149, 105). Alcoholic H₂S forms, on wayming, toluene p-sulphinic acid, di-tolyl disulphide, and tolyl tetrasulphide.

Reference. - AMIDO-TOLUENE THIOSULPHONIC

TOLUBNYL- v. TOLENYL-.

o-TOLUIC ACID C.H.Mc.CO.H.[1:2]. Mol. w. 136. [104°]. H.C.v. 928,800. H.C.p. 929,400. H.F. 98,600 (Stohmann, J. pr. [2] 40, 133).

Fornation.—1. By oxidation of oxylene with dilute HNO₃ (Bieber a. Fittig, Z. [2] 6, 496; A. 156, 242).—2. From toluene o sulphonic acid vid C.H.,CN (Ranysay a. Fittig, Z. [2] 7, 584; A. 168, 246).—3. By the action of sodiunt amalgam on a mixture of ClCO.Et and o-iodotoluene and saponification of the resulting C,H,.CO,Et (Kekulé, B, 7, 1007). 4. By boiling phthalide (3 mols.) with HIAq (127°) and yellow P (2 at.), the yield being 97 p.c. (Hessert, B. 11, 238; Racine, A. 239, 72). -5. From o-toluidine via the nitrile (Cahn, A. 240, 280).

Properties.—Plates (containing 2ng), volatile with steam, sl. sol. cold water. Oxidised by alkaline KMnO, to phthalic acid (Weith, B. 7, Bromine-vapour above 100° forms phthalide; in the cold Br forms bromo-toluic

platande; hand could be form acid C₆H₃MeBr.CO₂H [167°]. Salts.—NaA' 2aq. [228°]. plates.—CaA'₂ 2aq. BaA'₂ 2aq. Ethyl ether EtA'. (220°). Efflorescent

Amido-ethyl ether Amido-ethyl ether
C,H,CO.O.CH,Edh.,NH,... Formed from o-tolyloxazoline and HClAq. Oil. Yields B'HBr
[156°], B'C₈H₈N₃O, [188°].
Amido-propyl &ther
C,H,CO.O.CHMe,CH,NH,... Formed by evapo-

rating tolyl-methyl-oxazoline with HClAq. Yields B'HBr [140°], B'C, H, N, O, [192°], and a platinochloride [211°].

Benzyl ether C.H.A'. (315°). S.G. 17 112. Oil (Hodgkinson, C. J. Proc. No. 103, p. 167). Chloride C.H.OCl. (211° at 733 mm.).

Anhydride (C,H,.CO) O. [c. 38°]. (Ebove 325°). Formed from the Na salt (6 mols.) and POCI. (1 mol.). Insol. water, sol. ether and

Amide C,H,.CONH... [140°] (Hutchinson, B. 24, 174; G. J. 57, 957; cf. Weith, B. 6, 420). On reduction in acid solution it yields o-tolyl alcohol and a small quantity of the dihydride C,H_s.CO.NH₂ [156°], which on boiling with water yields an acid [68°]. The dihydride is also formed by reducing the amide in alkaline solution.

Anilide C,H, CO.NRPh. [125]. Formed from anti-phenyl-o-tolyl ketoxim and PCl_a followed by water (Smith, B. 24, 4047).

Xylide C.H., CO.NHC, H.Me₂ [1:2:3]. [165°].

Formed by heating o-tolyl xylyl ketone with hydroxylamine at 120° (Smith).

Bromo-ethylamide C.H., CO.NH.CH., CH.Br. [71°] (Salomon, B. Landolt, B. 8, 720), and in other ways (Buchka 26, 1322).

Chloro-ethylamide C,H,.CO.NH.CH, CH,Cl. [73°]. White needles.

Bromo-propyl-amide Needles . C,H,,CO.NH.CH,,CHBr.CH3. $(86^{\circ}).$ (from benzene-ligroïn) (Salomon B. 26, 1323).

Chloro-propyl-amide C,H,.CO.NH.CH,.CHMeCl. [84°]. Formed by evaporating o-tolyl-methyl-oxazoline with excess of HClAq. Needles (from ligroin). .

o-Nitro-benzyl-amide C.H.,CO.NH.CH.,CH.,NO, [195]. Needles (from alcohol). May be reduced to the o-amido-

benzyl-amide [116°], which yields B'HCl [214°] (Wolff, B. 25, 3034).

(Woin, B. 20, 3034).

Imide (Q,H,CO)₂NH. [148°].

Nitrile C,H,CN. (204° cor.). V.D. 4·03 (obs.). H.F. -34,800 (Berthelot a. Petit, A. Ch. [6] 17, 12:3). Formed by heating KCy with potassium toluene o-sulphonate or with tri-otolyl phosphate (Heim, B. 16, 1776), by heating o-tolyl thiocarbimide with finely-divided copper (Weith, B. 6, 419), by boiling o-tolyl carbamine (Weith, B. 7, 722), by heating o-iodo-toluene with AgCy at 350° (Merz a. Weith, B. 10, 751), by boiling the formyl derivative of o-toluidine with zinc-dust (the yield being 18 p.c.) (Gasiorowski a. Merz, E. 17, 74; 18, 1004), and by Sandmeyer's reaction from a-toluidine (Cahn, B. 19, 756). Liquid. H.SO, at 60° to 70° forms C.H. C(NH).NH.CO.C H. [103°], which is converted, by warming its acid solution, into the imide (C.H., CO), NH (Krafft a. Kerstens, B. 25, 455). Cone. HIAq forms C.H., CI_, NH_ [98°] (Biltz, B. 25, 2510).

Hexahydride v. Methyl-nexamethylens CARBOXYLIC ACID.

M-Toluic acid C_cH₁Me,CO_cH [1:3]. [110^o] (Jacobsen, B. 14, 2347; Bornemann, B. 20, 1382). (263°). H.C.v. 928,500. [1.C.p. 929,100] H.F. 98,900 (Stohmann, J. pr. [2] 40, 134). S. 09 at 15°; 1·66 at 100°.

Formation. 1. By oxidising bromo-xylene. and reducing the resulting bromo toluic acid with sodium-amalgam (Ahrens, Z. [2] 5, 106; Richter, B. 5, 421; Böttinger a. Ramsay, A. 168, 255). 2. By distilling uvitic acid with lime (Fittig, B. 5, 268). 3. By oxidation of m-xylene with dilute HNO₄ (Taxildaroff, B. 4, 410; Bruckner, B. 9, 406; Reuter, B. 17, 2028).—

4. By saponifying the nitrile. Preparation. 1. By boiling \(\omega\)-chloro-xylene with HNO, (4 vol. of S.G. 14) and water (3 vols.) (Senff, A. 220, 247).—2. By suphonating crude xylene, then preparing C₃H_Me₂SO₂NH₂, oxidising by KMnO₃, heating the resulting C₃H_Me(SO₂NH₂).GO₂H with HCl at 230°, and

distilling with steam (Jacobsen, B. 14, 2347). Properties. - Long needles, volatile with steam, v. sol. alcohol and other. Oxidised by chromic acid mixture to isophthalic acid.

Salts.—CaA' 3aq. S. 3.17 at 15°; 8.2 at 100°.—BaA', 2aq: trimetric plates or tables.—

AgA'.

Ethyl ether EtA'. (226°).

Chloride (218' at 724 mm.) (Ador a.

Rilliet, B. 12, 2300).

Nitrité C.H.CN. (200°). Formed by heating m-tolyl thiocarlimide with Cu (Weith a

a. Schachtebeck, B. 22, 841).

—Tofnic acid C.H.Mc.CO₂H [1:4]. [179].

(275° cor.) (Fischli, B. 12, 415). H.C.v. 926,800.

H.C.p. 927,400. H.F. 100,600 (Stohmann, J. pr.

[2] 40, 134). Formation.—1. By the action of dilute NHO₃ on cymene (Noad, P. M. [3] 32, 19; A. 63, 289) on p-xylene (Beilstein, A. 137, 302; Bruckner, A. 205, 113), and on terpenes (Hirzel, Z. 1866, 205).—2. By saponification of the nitrile.—3. By heating p-bromo-toluene with ClCO₂Et and sodium-amalgam and saponifying the product (Wurtz, C. R. 68, 1238).—4. From p-bromo-toluene, CO, and sodium (Kekulé, 4,

187, 184). - 5. By the action of POCl₂ (40 g.) on 1 a mixture of toluene (40 g.), HOAc (80 g.) and ZnCl, (80 g.) at 110° (Frey, J. pr. [2] 43, 116). 6. By reducing bromo p-toluic acid with sodiumamalgain (Reinsen a. Morse, Am. 1, 138) .-7. From the chloride which is formed by the action of COCl2 on toluene in presence of AlCl3 (Ador a. Crafts, B. 10, 2176) .- 8. From the amide which is formed by the action of AlCl, on a mixture of toluene, CS₂, and NH₂,CO.Cl (Gattermann a. Schmidt, B. 20, 859).—9. By fusing C,H,.CO.Cl,II,.CO,II with potash (Friedel a. Costte, Bl. (19) 35, 50(8), and she have the continuous and the cost of the Crafts, Bt. [2] 35, 508), and also by passing gaseous evanic acid and HCl into Sluene at 100° containing AlCl, (Gattermann a. Rossolymo, B. 23, 1195).

Properties.—Needles, v. sol. hot water, v. e. sol. alcohol and ether. Volatile with steam. Oxidised by CrO, or KMnO, to terephthalic acid. Yields a di-nitro-derivative [158].

Salts.—KA'.—BaA', 2aq: needles (Buchka a. Irish, B. 20, 1764).—CaA', 2aq.—MgA', 2aq.—

Cul', - AgA'.

Methyl ether McA'. [322]. (217°).

Ethyl ether Eth'. (228"). Oil.

Amido-ethyl ether C, H, COO.C, H, NH.,

Yields B'HBr (167°) and B'C, H, NO, I(80°).

p-Amido-propyl ether C,H,,CO.O.C,II,,NH2. Th The hydrobromide B'HBr is formed by evaporating a solution of the bromo-propyl-amide. It yields B'C, H, N, O, [186°] and B',H,PtCl,

[186°] and B'Haltuch.
Phenyl other PhA'. [72°].
Chloride (225° at 720 mm.).
Amile C.H., CO.NH... [159°]. Formed by heating the NH, salt in scaled today at 230° (Hallemann, R. T. C. 6, 79).
Methylamide C.H., CO.NHMe. [143°].

Formed by the action of NHMe.COCl on toluene in presence of AlCl₃ (Gattermann a. Schmidt, B. 20, 120; A. 244, 51). Tables.

Ethylamide C,H,CO.NHEt. [96°].

Bromo-ethyl-amide

C,H, CO.NH.CH, CH, Br. [129°] (Salomon, B. 26, 1325). Formed from p-toluic chloride and bromo-ethylamine. Plates. Converted by boiling water into the amido-ethyl ether.

Chloro-ethyl-amide C,H,.CO.NH.CH,.CH,Cl. [122°]. Needles (from ligroin).

Bromo-propyl-amide C,H,CO.NH.CH,CHBr.CH₃. Melts at 74°. becomes solid, and melts again at 158° (B. 26, 1326)

Chloro-propyl-amide C,H,CO.NH.CH.,CHMeCl. [78°]. Anilide C,H,CO.NHPh. [145°]. Formed, from toluene, phenyl cyanate, and AlCl, (Leuckart, J. pr. [2] 41, 306).

o · Nitro · anilide. [110°]. Yellow prisms.

p - Toluide C,H,.CO.NHC,H,. [160°]. Formed by the action of sodium-amalgam and HOAc at 60? on an alcoholic solution of di-p-tolyl ketoxim (Goldschmidt a. Stöcker, B. 23, 2747; 24, 2799). Needles. Nitro-toluideC,H,CO.NHC,H,Me(NO2)

[4:1:8]. [166°].

Diphenylamide C.H., CO.NPh., [1559]. Prisms (from alcohol) (Lellmann a. Bonhöffer, B. 20, 2118).

Xylide C.H., CO.NHC, H.Me., [1396]. Yields C.H., CO.NH.C, H.Me. (NO.) [1876].

Phenyl-methyl-amide C.H., CO.NPhMe. [70°] (Lellmann a. Benz, B. 24, 2114).

o-Nitro-benzyl-amide C.H.,CO.NH.CH.,C.,H.,NO2. [142°] (Wolff, B.

25, 3036).

Nitrile C.H.Me.CN. ſ28·5°1. Formed by distilling potassium toluene p-sulphonate with KCy (Merz, Z. [2] 4, 33), by heating C.H. N.CS with Cu (Weith, B. 6, 421), by heating tri-p-tolyl phosphate with KCy (Heim, B. 16, 1775), and by passing C.H..NH.CHO over heated zinc-dust (C. a. M.). Obtained also from p-toluidine by Sandmeyer's reaction (Glock, B. 21, 2650). Sodium added to its boiling alcoholic solution forms a small quantity of ω -amido-p-xylene, the greater part being saponified (Bamberger a. Lodter, B. 20, 1710). ILSO, gives C.H.,C(NII).NH.CO.C.H. [145°]. Easily converted into the imide (C.H.,CO).NII [155°] (Kruff a. Karstens, B. 25, 454). Conc. HIAq forms C.H. Cl. NH. [115°-120], decomposed by

forms C.H.,CL,NH₂ [115 - 120], account fusion (Biltz, B. 25, 2539).

Tetrahydride C₃U_{1,0}O₂, (252°). Formed by reduction of CH₂:CCCH₂CH₂CH₂CO₂H with sodium-amalgam (Einhorn a. Willstälter, B. 26, 2009). Needles, melting below 0°. Yields CaA'₂4aq, CuA'₂2aq, McA'. (210°-220°), and an amide [158°]. Boiling NaOHAq converts the acid into a solid isomeride [47°] (254'-260°) which yields CaA', 4aq and an amide [135°]. Hexahydride (Screbojakoff, B. 25, 3355).

References .- Amido-, Bromo-, Bromo-nitro-, CHLORO-, NITRO-, NITRO-AMIDO-, OXY-, OXY-AMIDO-, and SULPHO- TOLUIC ACID.

a-Toluic acid is PHENYL-ACETIC ACID

o-TOLUIC ALDEHYDE C.H.Mc.CHO[1:2]. o-Toluylic aldchyde. (200°). Prepared by boiling ω-chloro-o-xylene with lead nitrate solution (Lauth a. Grimaux, Bl. [2] 7, 233; Rayman. Bl. [2] 27, 498). Prepared also from o-xylene by the successive action of CrO,Cl, and water Bornemann, B. 17, 1467), and by oxidising C_nH,Mc.Cll,OH with chromic acid mixture (Kröber, B. 23, 1029). Oil, smelling like bitter almonds. Yields a crystalline compound with NaH&O3. Reduced by sodium-amalgam to o-tolyl-carbinol.

oxim. White crystals (from ether), v. solalcohol. Yields a crystalling had Oxim C.JI, Me.CH: NOH. [49°]. Is an anti-Yields a crystalline hydrochloride. Ac₂O yields an acetyl derivative [56°]. AcCl acts in like manner. The acetyl derivative is decomposed by alkalis with regeneration of the oxim, no nitrile being formed (Dollfus, B. 25, 1921). The oxim is converted in ethereal solution by PCl, into the nitrile (204°).

"m-Toluic aldehyde C_cH₁Mc.CHO[1:3]. (199°). S.G. 2 1·037. Formed by boiling ω-chloro-m-xylene or ω-bromo-m-xylene with lead nitrate solution (Gundelach, Bl. [2] 26, 44; Müller, B. 20, 1913) and select by the action content. 20, 1213), and also by the action of water on C,H,CrO,Cl, obtained from m-xylene (Etard, B. 14, 848; Bornemann, B. 47, 1464). Oil, smelling like almonds. Combines with NaHSO. Aniline forms C.H., CH:NPh. (314°).

Phenyl-hydraside C.H., Me.CH:N2HPh. [91°]. (B.); [88°] (Rudolph, A. 248, 100).

Prisms (from ligroin), v. sol. ether.

n-Toluic aldehyde CaH.Me.CHO[1:4]. (205°). Formed by distilling calcium p-toluate with calcium formate (Cannizzaro, A. 124, 254). Formed also by the action of water on the product of com-bination of p-xylene with CrO.Cl. (Bornemann). Oil, with peppery smell. Oxidised by air to toluic acid. Alcoholic potasts forms potassium toluate and tolyl-carbinol.

Reference .- NITRO- and OXY- TOLUIC ALDE-

TOLUIC CHLORIDE v. Chloride of Toluic

TOLUIDES. Compounds derived from toluidine by displacement of H in NH, by an acid radicle

o-TOLUIDINE $C_8H_4Me.NH_2[1:2]$. Mol. w. 107. (198°). S.G. ²⁰ 9986 (Brühl, A. 200,189). H.C.p. 964,700. H.C.v. 963,750. H.F. 3,800 (Petit, C. R. 107, 266). μ_B 1-5895. R_{∞} 57:56. S.V. 126:6. Formed from o-cresol, ZnBr., NH₀, and NH₀Cl at 335° (Merz a. Müller, B, 20, 547). Prepared by reduction of o-nitro-toluene. May be senarated from p-toluidine by means of the acidoxalates (Bindschedler, B. 6, 448; Ihle, J. pr. [2] 14, 449; Miniati, Booth a. Cohen, S. G. I. 6; 418), by freezing (Rosenstiehl, Bl. (2) 17, 7), by means of the nitrates (Schad, B. 6, 1361), hydrochlorides, sulphates, or phosphates (Lewy, Fr. 23, 269; B. 19, 1717, 2728; cf. Wülfing, B. 19, 2132). o-Toluidipe can be prepared from C.MeHBr(NH.)(NO) H. vid. C.MeHBrI(NO)H, C.MeHBrl(NH.)H, C.MeHBrlBrH, followed by C.Me(NO.)BrIBrH, and C.Me(NH.)BrIBrH. It can also be got from C.Me(NH.)BrIBrH vià can also be got from Cate(N1)167116711 that CaMelBriBrH, followed by C_MelBriBr(NO) and C_aMelBriBr(NH_2) thus proving that the toluidine C_H_Me(NH_2) [1:2] is identical with C_aH_Me(NH_2) [1:6] (Wroblewsky, A. 192, 213).

Properties.—Oil. A solution in H_SO_H_O is coloured orange by HNO₄ and blue by CrO₃, the

solution in the latter case becoming reddishviolet on dilution. Forms a crystalline com-pound with liquid CO₂ at 8° (Bitte, C. R. 105, 614). With PbO, and aqueous acetic acid gives a green colour, while PbO, and alcoholic acetic acid gives a reddish-violet colour (Lauth, C. II. 111, 975). Unlike p-toluidine, it forms a crystalline compound with alloxan (Pellizzari, C. C. 1887, 1288, 1396). If an ethereal solution of o-toluidine is shaken with very dilute blacking. powder solution the aqueous layer becomes yellow or brown, and the ethercal layer, if decanted and shaken with dilute H SO, colours A solution of p-tolylene this reddish-violet. diamine hydrochloride mixed with a little otoluidine gives a green colour on addition of

rougaine gives a green colour on addition of FeCl, or K_Or₂O, (Nietzki, B. 10, 1157).

Reactions.—1. POCl, forms PO(NHC,H.) e [225°] (Michaelis a. Rudert, B. 26, 505), v. sol. water, whence Br forms PO(NHC,H.,BrM), [253°]. Another product of the action of POCl. no-toluidine is POCI(NHC, H, Me)₂, whence water forms HO.PO(NHC, H₂)₂ [95⁻²]. PSCI, forms PS(NHC, H₃)₂ [95⁻²]. PSCI, forms PS(NHC, H₃)₃ a whitegranular powder (Harden C. J. 51 40)₁ = 8 Deating with mathematical states. C. J. 51, 40).—3. On heating with matter acid it yields the mono-toluide [178°], di-toluide [181°], and a tolyl-imide [116°] of malic acid (Bisa) off, B. 23, 2043).—4. Chloro-citryl chloride forms C,H,N CO.C.H (214°) (Skinner

a. Ruhemann, C. J. 55, 289) .- 5. SO, alcohol, and nitrous acid give rise to the 'sulphazide C₁₁H₁₂N₂SO₂ [142°] (Limpricht, B. 20, 1241).— 6. On nitration of o-toluidine or its acetyl derivative NO₂ enters the p- and o- positions, but in presence of H.SO₄ (10 pts.) the compound C.H.Mc(NO₂)(NH₂) [1:4:6] [107°] is formed (Nölting a. Collin, B. 17, 265), together with the (1,2,6)-isomeride (Green a. Lawson, C. J. 59, 1018). -7. Benzoic aldehyde forms C_sH₂CH:NC₇H₇, an oil (316°) (Etard, Bl. [2] 39, 530; Pictet, B. 19,1063). 8. Hydrobenzamide or warming forms the same body (310°) (Lachovitch, M. 9, 695). 9. Toluidine heated with toluidine hydrochloride and benzoic aldehyde in scaled tubes at 120 forms $C_nH_nCH(C_nH_nMe,NH_n)_n$, a crystalline powder turning blue in the air (Ullmann, J. pr. [2] 36, 251). - 10. The methyl derivative of p-oxy-benzoic aldehyde at 120 produces the compound CaH (OMe).CH;N.C H [32°] (Steinhart, A. 241, 310). Il. Bromo-propiolic acid reacts, forming C_{1.}H₁₈N₂O₂ [185°] (Mabery a. Krause, B. 22, 3308). –12. aB-Di-brory-acrylic acid produce pale-yell-w needles [15°] (M. a. K.). –13. The hydrochloride heated with MeOH at 250°–300° xvlidine gives rise to di-methyl-toluidine, xylidine $C_0H_3Me_2(NH_2)$ [4:3:1] and mesidine (Limpach, B. 21, 640).—14. Cyanagan passed into an alcoholic solution forms crystalline C_nH_nN_n which yields B"H_Cl_n and B"2HNO₁ (Bladin, I^H, [2] 41, 128).—15. On heating with S it yields C_nH_nN_nS [120] crystallising from alcoholic realization and the control of the con in yellow plates and yielding a dibromide *C₁,H₁,Br₂N₂S₁[190] (Gattermann, B. 22, 425).— 16. CISO₂H in CHCl₂ forms C₂H₂NH₂SO₂H₃, which yields BaA', 2aq. Both the acid and as salts reproduce o-toluidine when treated with hot water (Traube, B. 23, 1656).

Salts (Beilstein a. Kuhlberg, A. 156, 66; Rosenstieht). B'HClaq. S. 374 at 15.5°. S. (alcohol) 100. - B', H PtCl_o. Decomposed by boiling water (difference from p-toluidine) (De Coninck, Bl. alcohol) 2.68 at 21°. S. (ether) .65 at 21°.— Chloroacetate B'C.H.ClO. [95°] (Bischoff, R. 21, 1257).—(\$?)-naphtholate [81°] (Dyson, C. J. 48, 470).

Formyl derivative C,H, NH.CHO. [58°]. (288°). 'Plates (Ladenburg, B. 10, 1129; Tobias, B. 15, 2446). The crystalline polymeride [211° is v. sol. hot HOAc, nearly insol. ether and cold alcohol.

Thioformyl derivative C.H.NH.CSH: [96°]; yellow needles; bitter taste; sol. alcohol and ether, insol. water. Formed by heating the formyl derivative with P.S. It dissolves unformyl derivative with P₂S₃. It dissolves unaltered in cold aqueous NaOH, and is reprecipitated by an acid. By distination in vacuo it

forms di-tolyl-formamidine $\overset{\leftarrow}{C_2H_1,NH} \gg CH$ with

evolution of H₂S and CS₂. By heating for 7 hours at 190° under pressure a crystalline compound

at 190° under pressure a crystaline compound $C_{14}H_{18}N_{2}$ S [160°] is formed with evolution of H_{2} S (Senier, B. 18, 2292; C. J. 47, 762).

Acetyl derivative C.H., NIIAc. [109°] (Bedson a. King, C. J. 37, 753). (296°). S. 85 at 19°. Formed from the base and HOAc (Bedl-19°). stein a. Kuhlberg, A. 156, 77; Alt, A. 252, 318), or by shaking it with water and Ac.O (Hinsberg, B. 28, 2962). Converted by PCl, into the compound C,H,N:CClMe, which when carefully heated gives a base C,H,N:CMe.CH₂.CCl:NC,H, [53°], and when treated with excess of o-toluidine gives · di-tolyl-acetamidine [69°]. Br in HOAc forms $C_{a}H_{3}MeBr(NHAc)$ [1:6:2] [157°].

Chloro-acetyl derivative C,H,NH.CO.CH_Cl. [112]. Formed by the action of chloro-acetyl chloride on o-tolulline dissolved in benzone (Widman, J. pr. [2] 38, 299). Needles (from dilute al-conol). Converted by alcoholic potash into a pyrazine derivative

[160°].
Di-ntoro-acetyl derivative C, H, NH.CO.CHCl2. Needles, volatile with steam • (Bügheimer a. Hoffmann, B. 18, 2987).

Tri-chloro-acetyl derivative
C,H,NH.CO.CCl₃. [67°]. Formed from hexachloro-acetone and o-toluidine (Cloez, A. Ch. [6] 9, 215). Needles, sl. sol. cold alcohol. Bromo-acetyl derivative

C,H,.NH.CO.CH,Br. [113°]. Formed from o-toluidine and bromo-acetyl bromide (Widman, J. pr. [2] 38, 298). Needles. Converted by alcoholic potash into C₁₀H₁₈N₂O₂ [160°].

Thio-acetyl derivative

C,H,NH.CS.CH,. [68°] (Wallach, B. 13, 529; 16, 147). Converted by NaOEt and EtBr into oily C,H,N:CMe.SEt (262°).

Propionyl derivative C.H..NH.COEt. [87°]. (299° at 730 mm.)! Formed from o-toluidine and propionic acid (Pictet a. Duparc, B. 20, 3421). Needles, sl. sol. hot water. (Avidised by KMnO, to propionyl-o-amido-benzoic acid €117°].

a-Bromo-propionyl derivative C,H,NH.CO.CHBr.CH₃. [131°]. Needles, insol. ligroin (Tigerstedt, B. 25, 2920). Bensoyl derivative C,H,NHBz. [131°]

(Gudeman, B. 21, 2553); [143°] (Brückner, A. 205, 130). Long braad needles. Vields benzoylo-amido-toluic acid on oxidation by KMnO.
PCl. forms C,H.,N:CCl.C.,H. (Just, B. 19, 982).

Oxaly! derivative C,O./(NH.C.H.).

Plates (from alcohol) (Bladin, Bl. [2] [181°]. 41, 130).

Phthalyl derivative C,H,N:C,O,:C,H, [182°]. (near 360°). Needles, sol. hot HOAc (Frehlich, B. 17, 2679).

Phenacyl derivative C,H,NH.CH,.CO.C,H₃. [89°]. Formed from the base in alcohol and ω-bromo-acetophenone (Bischler, B. 25, 2865). Needles. Yields B'HCl and an acetyl derivative [92°].

m-Toluidine C_oH₁Me.NH₂ [1:3]. (197°) (Beilstein a. Kühlberg, A. 156, 83); (201°) (Buchka a. Schachtebeck, B. 22, 840); (202°) (Lorenz, A. 172, 180; Morz a. Müller, B. 20, 548). S.G. 25; 998. S.N. 128:1. H.C.v. 964,600. H.C.p. 965,600. H.F. 2,900 (Petit, A. Ch. [6] 17, 155). Formed by reduction of m-nitro-toluene. Obtained also from p-toluidine by successive acetylation, nitration, saponification, diazotisation, boiling with alcohol, and reduction (Lorenz, B. 7, 448). Formed also by heating m-cresol with ZnBr, ammonia, and NH, Br at 300° (M. a. M.). Prepared from benzoic aldehyde by nitration, conversion into m-nitro-benzylidene chloride and reduction of this body by zinc and HClAq in the cold (Vienne a. Steiner, Bl. [2] 35, 428; Widman, B. 13, 676; Bl. [2] 36, 216; Ehrlich, B. 15, 2011; Harz, B. 18, 3398). m-Toluidine can be shown to exist in commercial toluidine by means of the nitroso- derivative of di-methylm-toluidine, since o- and p- di-methyl-toluidines do not give nitroso- derivatives (Wurster a. Riedel, B. 12, 1796).

Properties. -Oil. Its solution in H2SO4H2O is coloured yellowish-brown by CrO, and blood-red by HNO3. Its ethereal solution, shaken with water and a little bleaching-powder, is coloured reddish, the aqueous layer being brownish yellow. HNO, added to its solution in a mixture of H₂SO, and HOAc below 0° forms nitro-toluidine [134°] and some of its isomerides. Cyanogen passed into its alcoholic solution gives the compound (C,II, NH₂), C₂N₂ [200°] which forms B'₂HCl, B'₂ZlNO₃, and B'₂Zl₂SO₄ (Clève a. Bladin, Bl. [2] 41, 129). Yields (4,2,1)-xylidine when its hydrochloride is heated with MeOH at

200°-300° (Limpach, B. 21, 616). Salts.—B'HCl. S. 96·3 at 12°. alcoho) 61-9 at 9 - B'_1H_PtCl_-B'HNO_ 18 20-1 at 23-5°. S. S. 35 at 11:5°. H.C.p. 958,800. H.C.v.
957,800. H.F. 9,700 (Petit, C. R. 107, 266).
S.V. 128,700. Formed by reduction of p-nitrotoluene (Muspratt a. Hofmann, A. 54, 1; 66, 144; Noad, A. 63, 305: Hugo Müller, Z. 1864, 161; Sell, C. J. 16, 186; v. also o-TOLUTDINE). Formed also by heating p-cresol with ammoniacal ZnOl₂ (Buch, B. 17, 2637; Merz a. Müller, B. 20, 545) and by treating methylaniline hydrochloride at 350° (Hofmann, B. 5, 720). On sulphonating a mixture of o- and ptoluidine the o-toluidine is first attacked and

the p-toluidine can then be distilled off.

Properties.—Plates (from ligroin or dilute alcohol). Its solution in H₂SO₄H₂O is turned yellow by CrO, and blue by HNO, in the latter case changing to red and finally brown (Rosenstichl, Bl. 10, 200). Bleaching-powder does not colour its solution in water or ether. PbO, and HOAc diluted with water or alcohol give a bright red colour (Lauth, C. R. 111, 975). When boiled with water, crystals of an efflorescent hydrate

separate on cooling (Lewy, B. 19, 2728).

Reactions.—1. Oxidised by KMnO₀ alkaline R₃FeCy₉, or chromic acid to C_uH₂₁N₃ or C₆H₂Me(NC₁H₁)₄(NH₂) [1:2:5:4], which may be readily reduced to C_uH₂Me(NHC₁H₁)₄(NH₂) readily reduced to C₁(1.34(NIC,11.34(NI₂) crystallising from alcohol in colourless plates [166°], readily re-oxidised to C₂(11.3N, (Barsilovsky, A. 207, 102, 118; J. R. 1887, 132; Perkin, C. J. 35, 728; 37, 546; Klinger a. Pitschke, B. 17, 2439; Green, C. J. 63, 1395). The compound $C_{cl}H_{21}N_3$ crystallises from xylene in dark-red plates [227°], dissolving in acids, forming maroon-red liquids, quickly decomposing with separation of p-toluidine. Conc. composing with separation of p-tolindine. Cone. H₂SO₄ dissolves C₂₁H₂N₃, forming a greenish-blue liquid which on warning becomes winered with production of p-toluidine. – 2. Oxidised by CrO₃ and HOAc to toluene-azo-toluene C,H₂,N₂,C,H₃. — 3. Nitrons acid forms C,H₂,N₂,NHC,H₃. When NaNO₂ is added to a solution of the hydrochlorides of o and p-toluidine, the activation is first attacked. toluidine, the o-toluidine is first attacked, yielding C₂H₂N₂,C₂H₆NH₄ and can thus be removed when mixed with p-toluidine (Wülfing, D. P. J. 263, 260).—4. Substituents usually enter positions 3 and 5 [Me 1] but when p-toluidine or its acetyl derivative is dissolved The Hard of the compound C₄H₄Me(NO₂)(NH₂) [1:2:4] is formed instead of the (1,3,4)- isomeride (Nölting a. Collin, B. 17, 263).—5. Bromine in conc. HClAq at 0° forms C₄H₂Br₂Me(NH₂) [5:3:1:4]; but C₄H₃BrMe(NH₂) C₂H₂Br₂Me(NH₂) [5:3:1:4]; but U₄II₃DrMe(NH₂) [2:1:4] is formed in presence of conc. H₂SO₄, (Hafner, B. 22, 2538, 2902).—6. ICl forms C₂H₂H₂Me(NH₂) [5:3:1:4] (Michael a. Norton, B. 11, 107).—7. Chlorine passed into p-toluidine dissolved in H₂SO₄ at 0° forms C₂H₂MeCl(NH₂) [1:3:4] and larger quantities of its [1,2,4] · isomeride. In HClAq (40 p.c.) the chief product is C₂H₂MeCl₂(NH₂) [1:3:5²A] (Hafner).—8. Cyanogen respective an electric solution forms C₂H₂MeCl₂(NH₂) [1:3:5²A] (Hafner).—8. Cyanogen passed into an alcoholic solution forms CieHisN. or (C,H,N),C,N, crystallising in planty scales [322°-280°] and yielding the crystalline salts B',2HCl, B',2HNO, B',H,SO, 6aq, and B',H,C,O,

(Hofmann, C. J. 1, 170; A. 66, 144; Clève a. Bladin, Bl. [2] 41, 125). The mother-liquor contains C_{.1}H_{.2}N_{.3} [182°] which yields the salts B'HCl 3aq (a_sred powder) and B'_{.2}H_{.3}PtCl_. The compound C₁₆H₁₈N_{.4} is also formed when p-toluidine is heated with oxalimido-ether at 100° (Vorländer, B. 24, 805).—9. Cyanurio chloride forms C₈N_{.3}(NHC.H.), [288°] (Klason, J. pr. [2] 33, 294).—10. Chloro-acetic acid (½ mol.) forms C,H,NH.CH.,CO,H, while chloro-acetamide forms C,H,NH.CH.,CO,H, (P. F. Meyer, B. 8, 1158). An alcoholic solution of Meyer, B. 8, 1458). An alcoholic solution of chloro-acetic acid and HCyS yields C₁₀H₁₂N₁SO₂ [176 · 182 ·] (Nenchi, J. pr. [2] · 16, 1).—11. Dichtoro-acetic acid forms tolylamido-methyloxindole.—12. Chlorat reacts, with formation of CCl₃CH(NHC,H₁), [115 ·] (Wallach, A. 173, 278). When chloral is warmed with an alcoholic architect for the Line of the color. alcoholic solution of p-toluidine there is also formed CCl_xCII(OEt).NIIC, II, [77°]. = 18. Aldehyde forms crystalline CH_xCH(NIIC, II,) [c. 60°] .-- 14. Furfuraldchyde added to a hot alcoholic solution of / coluidine and its hydrochloride forms brown amorphous $C_{19}H_{22}N_2O_{29}$ which yields B'HCl and B'HNO₃ both crystallising in purple needles (Stenhouse, A. 156, 203). 15. Nascent formic alaichyte produces a base $C_{17}H_1,N_2$ [134] which is converted by nitrous acid with evolution of CO_2 into $C_{18}H_{18}N_2O_3$ acid with evolution of CO, into Charling Vg. [260° 264°] (Tollens, J. pr. [2] 36, 225).— 16. Bensoic all hlyde at 100° reacts, forming C_hH₂CH(NHC,H₁)₂ [100°] (326° i.V. at 723 mm.), which changes at 160° into an isomeride [120°-125] and is converted by Br in CS₂ into C₁₁H₁₁B₂N [160 -165°] (Schiff, Z. 1865, 400; Mazzara, J. 1880, 566; Pictet, B. 19, 7063). In the action of p-toluidine and its hydrochloride on benzoic aldehyde at 120 there is produced on benzoic aldehyde at 120° there is produced $C_2\Pi_{\rm BN}$, [178] and $C_2\Pi_2$, $C_2\Pi_2$ ($C_2\Pi_2$ [Me,NH₂)₂ [186°] (c. 430°), which yield a di-acetyl derivative [218°] and a di-benzoyl derivative [198°] (Ullmann, J. pr. [2] 36, 267). 17. p-Methoxylebrasic aldehyde forms $C_2\Pi_2$ (OMe), CHI(NC,H.) (1992) (Steinheyst 4, 111, 2001). [92°] (Steinhart, A. 241, 332). 18. p-Methoxy [92] (Steinmart, A. 241, 533).—18, p-Methoxybenzophenone chloride yields the compound C₆H₁(OMe).CPh:NC,H, [96] Hantzsch a. Kraft, B. 21, 3520).—19. An ethereal solution of C₆H₂.CCl:NSO₂Ph, obtained from benzene sulphonic antilde and PCl₈, forms the compound C₆H₂.C(NHC,H.):N.SO.Ph, which separates in second-line and the compound C₆H₂.C(NHC,H.):N.SO.Ph, which separates in second-line and the compound compound the c monoelinic crystals; a:b:c = 650:1:533; $\beta =$ mononinic crystais; a:00 = 000(1:055; B=69° 16′, insol. water (Wallach a. Gossmann, A. 214, 216).—20. Alcohol, SO, and nitrous acid form the sulphazide C₁₄H₁₆N₂SO₂ [140°] (Limpricht, B. 20, 1241).—21. Heated with persulphocytnic acid it gives p-tolyl-thiobiuret (B. 17, 584).—22. On heating with sulphur it. (B. II, 584).—22. On seating with surprise 1, yields dehydrothiotoluidine and primuline; v. Pransulane.—23. Diazobenzan chloride yields C₃II., N_x. AHC, H₁. (85°) which is identical with the product of the action of p-diazotoluene chloride on aniline (Nölting a. Binder, B. 20, chloride on annihe (Mothing L. Brider, B. 20, 3005),—24. Brono-propiolic acid forms di-tolyl-acetamidine C₁₆H₁,N. [120°] (Mabery a. Krause, B. 22, 3307), which is also formed by the action of HOAc and PCl, on p-toluidine (Mot-mann, Pr. 15, 55).—25. Hacquic acid in boiling aqueous solution forms C,H,N<CH,CH,CO,H
[185°] (Scharfenberg, A. 254, 150).—26. Acetyl-

citric anhydride dissolved in chloroform forms

C₃H₅O(CO₂H)(CO.NHC,H₇)₂ [189°] Klingemann, C₄H₁O(CO₂H)(CO.NHC,H.)₂ [189°] Ringemann, B. 22, 987).—27. Malic acid at 160° yields C.H₂O(CO.NHC,H.)₂ [208°] (Bischoff, B. 23, 2045).—28. The hydrochloride heated with MeOH yields C₄H₂Mc₄(NH₂) [1:3:4] (Limpach, B. 21, 640).—29. Elihylene oxids forms oxyethyl-p-toluidine (Demole, B. 7, 635).—30. SOCl₂ forms thionyl-toluidine (q. v.).—31. 30. SOCI, forms PO(NHC,H.), [192°]; which yields PO(NHC,H.,Br.), [180°] and PO(NH.C.H.,NO.), [247°] (Rudert, B. 26, 569). Another product of the action of POUI, is POCI(NHC,H.)., whence water forms HO.PO(NHC,H.), [124°]. — 32. PSCI forms PS(NHC,H.). [185°]

PO(NHC,H_BP)₈ [180"] and FO(NHO,H_A)₂ [247°] (Rudert, B. 26, 569). Another product of the action of POUl₃ is POCl(NHC,H₁)₂, whence water forms HO.PO(NHC,H₁)₂ [121°].—32. PSCl₃ forms PS(NHC,H₁)₃ [N85°].

Salts.—B'HGI. S. 22°9 at 11°; S. (89 p.c. (alcohol) 25 at 17°. B'HAuCl₁.—B',H,PtCl₂. Not decomposed by boiling water (De Coninck, Bl. [2] 31, 499).—B',H,PtCy, (Scholz, M. 1, 905).—B',PtCl, Et,PO₃ (Saillard, Bl. (2] 18, M. 1, 905).—B',PtCl, Et,PO₃ (Saillard, Bl. (2] 18, M. 1, 905).—B',PtCl, Et,PO₃ (Saillard, Bl. (2] 18, M. 1, 905).—B',PtCl, Et,PO₃ (Cochin, Bl. 1878, 315).—B,ZnCl, 3aq (Lachovitch, M. 9, 513).—B,H,ZnCl, (Gräfinghoff, Z. 1865, 599).—B',HgCl, [125°]. Thick needles, sol. alcohol and ether (Klein, B. 11, 743).—B',NiCl,2E(OH. Green pp. (Lippmann a. Vortmann, B. 12, 81).—P',CoCl₂. Blue needles.—B',Hl,SnCl₄. Monoclinic crystals (Hjortdahl, J. 1882, 535).—B',H,CuCl, (Pomey, C. R. 104, 800).—B',MnCl, (Leeds, J. 1882, 503).—B',UrO,Cl₂.—B',HB. Plates (Städel, B. 16, 28).—B',HgBr. [121°]. Plates (Klein, B. 13, 835).—B',ZnBr,.—B',CdBr,.—B'HH.—B',HgI, [81°].—B',HgH, (Jörgensen, J. pr. (2] 14, 386).—B',MI,Sol,HH, (Jörgensen, J. pr. (2] 14, 386).—B',MI,Sol,HH, (Jörgensen, J. Pr. (2] 14, 386).—B',MI,Sol,HH, (Jörgensen, J. Pr. (2] 14, 386).—B',MI,Sol,D,B',HB, O, S. 5°6 at 22°; S. (84 p.c. alcohol) 1°3 at 23°.—B',HSO, Crystals, converted into B',H,Sol, by water (Tollens, B. 18, 3312).—B',Ag,Sol, 2aq (Mixter).—B',HP,O, J. Thick needles, v. sl. sol. oold water (Lewy, B. 19, 1717).—B',(NH,Ph)H,CoCy, 14aq (Weselsky, J. 1869, 314).—B',H,ChO, [102°] (Baralis, J. 1884, 699).—B',CH,Clo, [141°]. (B.) [136°] (Disiberg, B. 18, 194).—B',CH,Clo, [137°].—Mu cate B',C,H,Glo, Ycllowish crystals, sol. hot water.—Piorate B'C,H,Clo, [141°]. (B.) [136°] (Disiberg, B. 18, 194).—B',C,HClo, [137°].—Mu cate B',C,H,Glo, Ycllowish crystals, sol. hot water.—Piorate B'C,H,N,G, [141°]. (B.) [136°] (Disiberg Brown laters.—B',HgH,N,H,CHO, [45°] (Hühner a. Ru,lolph, A. 200, 371); [52°] (Tobias, B. 15, 244(9)).

heating with P.S. into C.H., NH.CHS [174°]

(Senier, B. 18, 2294; C. J. 47, 766). Yields C,H,.NNa.CHO aq.

Acetyl derivative C.H.,NHAc. [1470] (Hübner a. Wallach, A. 154, 302; Kelbe, C., L. 44, 915). (307°) (Beilstein a. Kuhlberg, A. 156, 74). S. 089 at 22°. Dimorphous, crystallising in monoclinic forms; a:b:c=1.216:1:.788; $\beta = 106^{\circ}$ 7', and also in trimetric crystals; a:b:c = .651:1: 329 (Panebianco, G. 9, 362). Oxidised by KMnO, to acetyl-p-amido-benzoic acid (Hofmann, B. 9, 1299). Oxidised in like manner in the animal body (Jaffe a. Hilbert, H. 12, 295). PCl, forms a liquid product which solidifies when strongly cooled, the crystals doubtless being C,H,NH.CCl,,CH,. This readily splits up into HCl and C,H,N:CCl.CH,. This is a colour-less solid which is converted by Aq into acetyl-toluidine; by toluidine into di-tolyl-acetanidine. The chloro-innide C,H,N:CCl.CH, at 100° forms a base $C_{11}H_{10}N.C[1(72^3]]$, which may be crystallised from alcohol. It is probably C.H.N.C.Mc.C.H...C.C.I.N.C.H.. It is decomposed by moist air or water with production of McC(N.C.H.)N.C.H.H., H.O.C.M.C.H.. M.C.H.. M.C.MeC(NC,H,)NC,H,H, HOAC and MeCONHC,H,
and by heat with production of an amorphous
base C_bH₁₈N₂ (Wallach a. Fassbender, A. 214,
202). Nitrous acid converts acetyl-p-toluidin
into C,H,NAC.NO [80°] (O. Fischer, B. 10, 959).
Chloro-acetyl derivative
C,H,NH.CO.CH,Cl. [162°]. Needles (Tommasi,
Bl. [2] 19, 400; Meyer, B. 8, 1154).
Di-chloro-acetyl derivative
CH NH.CO.CHC. [163°] (Bigheimer a. Hoff.

C,H,NH.CO.CHCl. [153°] (Rügheimer a. Hoffmann, B. 18, 2980).

Tri-chloro-acetyl derivative C,H,NH,CO.CCl₂. [80°] (C.); [102°] (J.). S. (alcohol) 12·5 at 14°. Formed from p-toluidine and (CCl₃), CO (Cloez, A. Ch. [6] 9, 145), and also from p-toluidine and CCl3.COCl (Judson, B. 3, 784).

Bromo-acetyl derivative C, Π , NH.CO.CH, Br. [164°]. Needles (Abenius, J, pr. [2] 40, 433) converted by alcoholic potash into an azine and C.H.NH.CO.CH.OEt [32°] which is v. e. sol. alcohol.

Thio-acetyl derivative Theo-acetyl derivative C.H., NILCS.CH₂, [131°]. Formed from the acetyl derivative and P₂S₅ (Jacobsen a. Ney, B. 22, 206). Got also by heating tolyl-acetamidine with CS₅ at 100° or di-tolyl-acetamidine with ILS (Bernthsen a. Trompetter, B. 11, 1759; Wallach a. Pannes, B. 13, 529). Converted by NaOEt and EtBr into oily C.H.,N:CMc.SEt (272°) (Wallach a. Wüsten, B. 16; 147).

a-Bromo-propionyl derivative C.H.NH.CO.CHBr.CH₂. [125°] (Tigerstedt, B. 25, 2921). Plates, v. sol. CHCl₃.

Benzoyl derivative C,H,NHBz. (322). Formed from p-toludine and BzCl (Jaillard, Z. 1865, 440; Kelbe, B. 8, 875; Hübner, A. 208, 310; Wallach, A. 214, 217; Gudeman, B. 21, 2553; Müller, B. 22, 2404). Needles, vo. 8. alcohol. Converted by PCl, into C.H.N.CCl.C.H., [522] [Just, B. 19, 980) crystallising from ligroin in prisms.

using from ligroin in prisms.

p.Nitro-benzoyl derivative
C₅H₄(NO₂).CO.NHC.H., [197°]. Formed from
p-toluidine and p-nitro-benzoyl obloride. Yellow
needles (Gattermann, B. 25, 1082). Converted
by PCl₅ into C₅H₄(NO₂).CCl₄NHC.H., [119°]
crystallising in golden prisms.

Phenacyl derivative O,H,NH.CH,.CO.C,H,. [127°]. Formed from w-bromo-acetophenone and p-toluidine in alcohol (Bischler, B. 25, 2866). Yellow prisms, yielding B'HCl and an acetyl derivative [89°] crystallising in white needles (from alcohol).

Phthalyl derivative C,H,N:C2O2:C4H. [205°] (Fröhlich, B. 17, 2679).

Formed by oxidation of a mixture of tolylene-odiamine (1 mol.) and (β)-naphthol (1 mol.) with K_sFeCy_s. Formed also, together with the isomeride [169°], by the action of (β)-naphthoquinone on tolylene-o-diamine (Witt, B. 20, 577). Dissolves in conc. H.SO, with violet-red colour. Forms with its isomeride a molecular compound

[142°]. Tolu- $(\alpha\beta)$ -naphthazine $C_1, H_{12}N_2$ i.e.

$$C_eH_1$$
 $CH:CH.CN$
 C_vH_2Me
 $\begin{bmatrix} 41\\ 3 \end{bmatrix}$. [169°].

Formed as above, and also, together with amidobenzene p-sulphonic acid, by boiling sulpho-benzene azo-(β)-naphthyl-p-tolyl-amine with dilute H.SO, and by boiling wood black' C₈H₄(SO₃H).N. C₆H₃(SO₄H).N. C₆H₄(SO₄H).N. C₁₀H₁.NHC.H. with dilute H.SO₄ (Witt. B. 20, 577). Yellow erystals, v. sl. sol. alcohol. Conc. H SO₄ forms a brownish-red solution.

C.H.,MeO. [24:1]. [69°]. Formation.—1. By exidation of tolylenep-diamine or of o-toluidine (Nietzki, B. 10, 832, 1934; A. 215, 158; Ladenburg, B. 10, 1128).—
2. By boiling crude crossol with MnO₂ and dilute H₂SO₄ (Carstanjen, J. pr. [2] 23, 425). Separated from accompanying xyloquinone by related with SO₂ caustallicing the hydrother. reduction with SO2, crystallising the hydrotoluquinone from benzene, and re-oxidising by fuming HNO₂.—3. By oxidation of m-xylidine (Nölting a. Baumann, B. 18, 1151).

Preparation.—20 g. of o-toluidine are dis-

solved in 600 c.c. of water containing 160 g. of H.SO.; 20 g. of finely powdered potassium bichromate are added by degrees, with continual agitation, keeping the temperature at 10°-15°. After standing over night, 33 g. more K, Cr, O, are added; the quinone is then extracted with ether, dried over CaCl. and the ether removed by dis-

tillation. The yield is about 86 p.c. of the theoretical quantity (Schniter, B. 20, 2283).

Properties—Golden-yellow plates smelling like quinone. Very volatile. M. sol. hot water, v. sol. alcohol and ether. Its aqueous solution is turned brown by alkalis. SO₂ reduces it to hydrotoluquinone. Dilute (50 p.c.) H₂SO₄ changes it to isotoluquinone (C,H,O₂), a powder not melted at 300° (Spica, G, 12, 225). An aqueous solution of toluquinone mixed with one of hydrotoluquinone deposits steel-blae needles of the quinhydrone [52°], v. e. sol. water. o-Nitro-aniline forms [2,2:4:6] C_sH_sMcO_sNH_sO_gH_sNO_g erystallising from alcohol in red crystals decomposing at 200° (Leicester, B. 23, 2796). Nitrop-toluidine CallaMe(NO2).NH2[1:3:4] forms a homologous body.

Chlorimide $C_0 \Pi_3 \mathrm{Me} < \frac{O}{\mathrm{NGI}} \left[1\frac{\mathbf{y}}{2}\right]$. [88°] (Hirsch, B. 18, 1514). Formed by the action of a solution of bleaching-powder on the hydrochloride of amido-o-erciol. Yellow prisms (from alcohol) volatile with steam. Decomposes violently at 100 '-115°. By digestion with NaIISO, for several hours it is converted into amidocresol sulphonic acid.

Chlorimide $C_0H_3Me < \stackrel{NCI}{O} \begin{bmatrix} 1\frac{5}{2} \end{bmatrix}$. [75°]. Made in like manner from anyido-m-cresol

(Staedel, A. 259, 218). Yellow prisms (from. alcohol), volatile with steam.

Oxim C.H.McO(NOII)]2:1:4). Nitroso-ocresol. [135]. Formed by the action of nitrous acid on oscresol (Nölting a. Kohn, B. 17, 370). Formed also by the action of hydroxylamine hydrochloride on toluquinono (Goldschmidt a. Schmid, B. 17, 2063). Needles (from water), decomposed by fusion. V. sol, alcohol and ether. Yields nitro-cresol [95"] on oxidation. NaA'3aq.

KA': brown needles, v. sol. water. $Ox im = C_8H_4MeO(NOH)$ [2:4:1]. Nitroso-mcresol. Formed by boiling nitroso-di-methyl-ni-toluidine with dilute (10 p.c.) NaOHAq (Wurster a. Riedel, B. 12, 1799). Formed also by the action of NO.SO, II on m-cresol and water at 0° (Bertoni, G. 12, 303). Small needles (from water). Decomposes at 145°-150°. Sl. sol. hot water. Gives Liebermann's reaction. Forms an acetyl derivative C.H.MeO(NOAc) [92] crystallising in large prisms.

Di-oxim C₆H₄Me(NOH)₄[2:1:4]. Formed by the action of hydroxylamine on either monooxim (Nietzki a. Guitermann, B. 21, 430) or by oxim (Nictzki a. Guitermann, B. 21, 439) or by boiling nitroso-o- or m-toluidine with hydroxyl amine hydrochloride (Mehne, B. 21, 729). Yellow needles, exploding at 220° 234°, v. sl. sol. benzene, sol. hot water, alcohol, and other. Reduced by tin and HClAq to tolylene-p-diamine. Alkalino K. FeCy, forms di-nitroso-toluene. According of Mc(NOA) [1102] exceptibilizing from C. H. Mc(NOA) [1102] exceptibilizing from forms CaH, Me(NOAc), [120°], crystallising from alcohol in colourless needles.

Ditolylimide C, H, Me(NC, H,)2. Formed by oxidation of tolylene-di-tolyl-diamine in alkaline solution (Green, C. J. 63, 1409). Red prisms, v. sol. alcohol, v. e. sol. benzene.

References .- DI-BROMO-, CHLORO-, IODO-, and OXY TOLUQUINONE.

. TOLUQUINOXALINE v. METHYL - QUIN-

o-TOLURIC ACID C., H., NO., i.e. C., H., CO.NH.CH., CO.H. Toluyl Toluul - alucocoll the second of th

[162.5°]. Formed from toluyl chloride, amido-acetic and, and NaOH (Gleditsch a. Möller, A. 250, 376). Found in the urine of dogs that have

zou, 5/0). round in the urine of dogs that have taken o-toluic acid. Thick plates, sol. water.

m. Tôluric acid. [139°]. Formed as above, and also when m-xylene or m-toluic acid is administered to a dog (G. a. M.; of. Schultzen a. Naunyn, Z. 1868, 29). M. sol. water.—ZnA', 4aq.—CuA', 6aq.

p. Toluric acid. [161°]. Formed from actions hallowide acid. [161°].

p-toluyl chloride, and glycocoll (G. a. M.) and also by passage of p-xylene or p-toluic acid through the animal body (Kraut, A. 98, 360). Plates (from water), sl. sol cold water, v. sol.

alcohol.—CaA', 3aq.—BaA', 5aq.—AgA'.

TOLUYL. The radicle CH_x,C_yl₁,CO. The same name has been given to the radicle CH₂.C₄H₄.CH₂, which is isomeric with xylyl, and has also been called tolyl, but may be more conveniently named methyl-benzyl. Tolyl

is CH₂.C₄H₄.
o-TOLUYL-ACETIC ACID
Ethyl ether C₄H₄Me.CO.CH₂.CG₂Et₄ got by boiling the nitrile with alcohol and HCl.

Gives a violet colour with FeCl,.

Nitrile C, H, CO. CH, CN. [74.4°]. Formed

by boiling o-toluyl-cyano-acetic ether with water (Haller, C. R. 108, 1117). Prisms, sol. alcohol and alkalis. Diazobenzene chloride and NaOH form C,H,CO,CHCy,N,C,H, [125°]. Cold alcoholic HCl forms the hydrochloride of C,H,CO,CH,C(NH).OEt [116°].

TOLUYL-ACRYLIC ACID C,H,O, i.e. C

CaH,(CH₂).CO.CH:CH.CO₂H. [138°]. Formed by the action of AlCl₃ on a mixture of maleic anhydride and toluone (Pechmann, B. 15, 888). TOLUYL ALCOHOL v. TOLYL-CARBINOL.

TOLUYLAMIDE v. Amide of TOLUIC ACID. p-TOLUYII-o-BENZOIC ACID C₁₃H₁₂O₃ i.e.

[1:4] C₄H₄Me.CO.C₄H₁CO₂H [1:2]. Principle tolyl ketone carboxylic acid. Mol. w. 240. [146°].

Hormed by the action of phthalic anhydride on toluene in presence of AlCl₃ (Friedel a. Crafts, A. Ch. [6] 14, 447; C. R. 92, 833). Prisms (containing aq) (from alcohol-toluene), v. sl. sol. hot water. Its dilute aqueous solution tastes sweet. Potash-fusion yields benzoic and p-toluic acids. Warm cone. H_2SO_4 forms (β) -methylanthraquinone. — BaA', 4aq. — CdA', 1aq. -

CuA', 4aq.

Methyl ether MeA'. [53°].

Ethyl ether Eth'. [69°].

Toluyl-benzoic acid C,H,.CO.C,H,.CO.L. [222°]. Formed by oxidation of di-tolyl-methane Ador a. Crafts, C. R. 85, 1163; O. Pischer, B. 7, 1184; Ador a. Crafts, C. R. 85, 1163; O. Pischer, B. 7, 1195; Anschütz, A. 235, 316). Slender needles (from MeOH), sl. sol. hot water.—KA':

tufts of long needles.—AgA.

Reference.—DI-CHLORO-TOLYI-BENZOIC ACID.

TOLUYLENE: v. Tolylens...
p.TOLUYL-PROPIONIC ACID C₁₁H₁₂O₃ i.e.
C.H.,CO.CH.,CH.,CO.H. [127°] (C.); [120°] (B.). Formed by the action of succinyl chloride or succinic anhydride on toluene and AlCl, (Claus, B. 20, 1878: Burcker, Bl. [2] 49, 448). Plates B. 20, 1878; Burcker, Bl. [2] 49, 448). Plates or needles (from water), v. sol. ether.—BaA', 4aq: sol. hot water.—AgA': small needles, insol. Aq. .-TOLUYL-TOLUIC ACID. Lactons

C.H. CO,H, [93°]. Got from nitro-tolyl-

methylene-phthalide, HIAq, and P (Heilmann, B. 23, 3166). Thin prisms. Converted by alcoholic NH₂ into C₀H₄. CH:C.C.7H₇ [196°].

oo-DITOLYL C₁H₁₁ i.e. [1:2] C₁H₁Me.C₂H₁Me [1:2]. Mol. w. 182. (272°). S.G. 102 9945. Formed from o-bromo-toluene and Na (Fittig, A. 139, 178). Liquid.

mm-ditolyl [1:3] C₂H₁Me.C₃H₁Me[1:3]. (280°)

(Schultz, B. 17, 468); (288°) (Perrier, C. R. 114, 481); (280°) (Stolle, B. 21, 1096). S.C. 49 9993. Formed by diazotising diamide diditolyl and boiling the product with alcohol. Formed also by the action of Na on m-bromotoluene (P.), and by reduction of di-oxy-m-ditolyl and di-chloro-m-ditolyl. Oil; yields diphenyl di-m-carboxylic acid and isophthalic acid on exidation.

pp-ditolyl [1:4] C₆H₄Me.C₆H₄Me [1:4]. [121°]. S.V. 198 0. Formed by adding Na to a solution of p-bromo-toluene in toluene (Zincke, B. 4, 396; Louguinine, B. 4, 514). Monoclinic prisms (from ether). Yields on oxidation p-tolyl-benzoic acid [244°] and diphenyl di-p-carboxylic acid (Carnelley, C. J. 32, 653). SbCl, at 360° forms CCl, and per-chloro-diphenyl.

om-Ditolyl [1:2] C_0H_1Me, C_0H_1Me [1:3]. (270°). Formed from [2:4:1] $C_0H_1Me(NH_2), C_0H_2Me(NH_2)$ [1:3:4] by elimination of amidogen by the diazoreaction (Schultz, B. 17, 471). Yields isophthalic

acid on oxidation by CrO.

op-Ditolyl [1:2] C₆H₄Me.C₆H₄Me [1:4]. (272° 280°). Formed from crude brome-toluene and Na. It is also one of the products of the passage of a mixture of behzene and toluene through a red-hot tube (Carnelley, C. J. 37, 707; 47, 587). Oxidised by CrO, and HOAc to o-tolylp-benzoic acid [180°] and terephthalic acid.

Ditolyls have also been obtained by Barbier (C. R. 78, 1769) and Varet a. Vienne, Bl. [2] 47,

919).

References .- DI-AMIDO-, DI-BROMO-, DI-IODO-, NITRO-AMIDO-, OXY-AMIDO-, and OXY-DITOLYL.

p-TOLYL-ACETAMIDINE C₉H₁₂N₂

 $C_9H_{12}N_2$ i.e. [96°]. Formed CH₃.C(NII).NHC₆II₄Me [1:4]. from p-toluidine hydrochloride and acetonitrile (Bernthsen a. Trompetter, B. 11, 1757). Prisms. Alkaline in reaction.—B"₂H₂PtCl₆.—B"H₂C₂O₄. Prisms, v. sol. water and alcohol.

Di-o-tolyl-acetamidine [1·2] C.H.Me.NH.CMe:NC₆H.Me [1:2]. [136°] (W.); [140°] (L.). Formed by the action of PCl₃ on o-toluidine and HOAc (Ladenburg, B. 10, 1262), and also by the action of o-toluidine on CMc(SEt):NC,II, or on CMcCl:NC,H, (Wallach a. Wüsten, B. 16, 148; A. 214, 208). Needles.

Di-p-tolyl-acetamidine [1:4] C.H.Me.NH.CMe:N.C.H.Me [1:4]. tolyl-imid-tolyl-amide. [120°]. Formed from p-toluidine and CMeCl:NC,H,, which is the proproduction and Catelline, H, which is the product of the action of PCl, on acetyl.—toluidine (Wallach a. Fassbender, A. 214, 203; B. 9, 1214; 16, 148). Formed also from p-toluidine and bromopropiolic acid (Mabery a. Krause, B. 22, 3307). Prisms (from benzene). Formed also from the production of the from p-toluidine, HOAc, and PCl, -B'H.PtCl, -B'HCl. [200°].

op-Di-tolyl-acetamidine C₆H,Me.NH.CMe:NC₆H,Me. [142°]. Formed from o-toluidine and the product of the action of PCl, on acetyl-p-toluidine, and also from

p-toluidine and the product of the action of PCI on acetyl-o-toluidine (Wallach a. Pannes, 4.214, 209). Formed also from p-toluidine and [1:2] C.H.MEN:CMC.SEt, and from o-toluidine and [1:4] C₆H₄MeN:CMeSEt; the compounds obtained, [148°] and [140°] respectively, being perhaps isomeric and not identical (Wallach, B. 16, 148)

o-TOLYL-ACETIC ACID C₀H₁₀O₂ i.e. [1:2] C₂H₁Me.CH...CO₂H. |89° f. Formed by c. TOLYL-ACETIC ACID C.11., 102, i.e. [1:2] C. H., Me.C.H... CO.H... [80°]. Formed by saponification of its nitrile (Radziszewski a. Wispeck, B. 15, 1747; 18, 1281). Needles, sl. sol. cold water. Yields phthalic acid on oxidation.—CaA'₂ 4aq.—AgA'. Plates, sol. bot water A mide [161°]. Plates, sl. sol. ether. Nitrile C., H., N. (244°). S.G. 2² 10156.

Formed from w-bromo-o-xylene and KCy. Oil. m-Tolyl-acetic acid [1:3] C6H4Me.CH2.CO.H. [61°]. Formed by saponifying its nitrile, which is obtained from ω-bromo-m-xylene (R. a. W.).

Needles, sol. hot water.—CaA', 3aq.—AgA'.

Amide [141°]. Sl. sol. cold water.

Nitrile (241°). S.G. 2° 1.0022. Oil.

Methyl other MeA'. (228°). S.G. 2° 1.041.

Liquid (Senkowski, M. 9, 854).

Ethyl ether Eth'. (238°). S.G. 175 1.018.
p-Tolyl-acetic acid [1:4] C₂H₁Me.CH₂CO₂H.
[94°]. Formed in like manner from ω-bromo-pxylene (R. a. W.; Strassmann, B. 22, 1230). Got also by reducing p-tolyl-klyoxylic acid with Hr (Claus a. Kroseberg, B. 20, 2051). Needles, sl. sol. cold water. Phthalic anhydride and

NaOAc yield $C_6H_4 < CO_{C(CH,C_6H,Me)} > O$ [151°], whence HNO2 at 0° forms the compound $C_6H_4 < CO \xrightarrow{\bullet} C(NO_2).CH(NO_2)C_7H_7 > O$ [140°], which

is converted by treatment with boiling alcohol into C₈H₄<CO (CNO₂)C,H,>O [207°], and is reduced

by HI and P to C₆H₄ CO.O (Ruhemann, B. 24, 3965).—NaA': needles, sol. water.—

CaA', 3aq.—AgA': needles, sol. hot water. Ethyl ether EtA'. (240°). Amide C,H₁₁NO. [185°]. Plates. Formed from the acid, and also by the action of yellow ammonium sulphide on p-tolyl methyl ketono (Willgerodt, B. 21, 534).

Nitrile C,H,.CN. [18°]. (243°). S.G. 82 ·9922.

Reference. - Nitro- and Oxy-Tolyl-Acutic

ACID. m-TOLYL-ACETYLENE [1:3] C.H.Me.C:CH. Methyl-styrene. (164°). Formed by distilling barium m-tolyl-propiolate with lime (Müller, B. 20, 1215). Formed also by saturating a solu-20, 1210). Formed also by saturating a solution of m-tolyl-acrylic acid with HBr at 0° and treating the product with NaOHAq. Oil, becoming solid on standing. Gives an explosive red pp. with animoniacal Cu₂Cl₂. Br forms C,H,CHBr.CH₂Br [45°].

Di-tolyl-acetylene C,H,C:C.C,H, [136°]. Formed by heating C,H,CHBr.CHBr.CHBr.CH, with alcoholic potach at 140° (Goldschmiedt a Hern

alcoholic potash at 140° (Goldschmiedt a. Hepp, B. 6, 1505). Needles (from alcohol).

DI-TOLYL-ACIPIPERAZINE OXY-DI: TOLYL-PYRAZINE

Di-tolyl-di-aci-piperasine DI-OXY-DI-TOLYL-PYRAZINE.

m-TOLYL-ACRYLIC ACID C, H, O, i.e. [1:3] C.H.Me.CH:CH.CO.H. Methyl-cinnamic acid. [111°]. Formed by heating m-toluic aldebyde with Ac.O and NaOAc (Bornemann, B. 17, 1474; 20,1382; Von Miller, B. 20,1213; 23,1899). Silky needles v. sol. alcohol, al. sol. ligroin. FeCl, gives a bright-yellow pp. in neutral solutions. Reduced by sodium-amalgam to m-tolyl-propionic acid [43°]. KMnO, oxidises it to m-toluic acid. Br forms C,H.C,H,Br,CO,H [167°].—

BaA'_AA'. Crystalline powder.
p-Tolyl-acrylig acid
[1:4] C_hH_Me,CH:CH,CO_H. [197°]. Formed from p-toluic aldehyde, NaOAe, and Ac.O (Von Miller, B. 23, 1897; cf. K. bber, B. 23, 1033). Needles (from benzene), sl. sol. hot water. Reduced by HI and P to p-tolyl-propionic acid. Br forms C.H.Me.CHBr.CHBr.CO.H.

TOLYL ALCOHOL v. TOLYL-CARBINGL.

p-TOLYL-ALLYL-HYDRAZINE C10H11N2 i.e. C,II,N(C,H₂),NH₂. (160°-170° at 90° mm). Got from tolyl-hydrazine and allyl bromide (Michaelis, B. 26, 2175°). Oil. Yields B'HCl, [129°] Bonzoic aldchyde forms the compound C,H,.N(C,H,).N:CHPh -[61°], while cinnamic aldehyde forms the corresponding hydrazide [118°]. Ferric chloride gives the tetrazone (C,H,(C,H,)N),N, [104°],

o - TOLYL-ALLYL-THIO-SEMI-CARBAZIDE C,H,NH.NH.CS.NHC,H,. [105°]. Formed by warming o-tolyl-hydrazine with allyl thiocarbimide (Avenarius, B. 24, 268). Needles, insol. water, v. sol. alcohol and CS.

p - Tolyl - allyl - thio - semi - carbazide [128°]. •Formed in like manner (A.). Needles

o-TOLYL-ALLYL-THIO-UREA C, H, N, S i.e. C, H, NH.CS.NHC, H, J. Tolyl-thiosinamine. [98]. Formed from o-toluidine and oil of mustard (Jaillard, Z. 1865, 441; Maly, Z. [2] 5, 258; Weith, B. 8, 1259. Decar B. 29, 2002). Englyparytals med 1528; Prager, B. 22, 2998). Pearly crystals, m.sol. ether, v. sol. HOAc. According to Dixon (C. J. 55, 622), it melts at 76°. Converted by heatings with HClAq into tolyl-propylene-ψ-thio-urea [126°]. Cyanogen passed into its alcoholic solution forms C₁₃H₁₄N₄S, which on warming with dilute H2SO, and alcohol gives a pp. of oxalyl-tolyl-allyl-thio-urea CS<NC,H,>C,O, [157°].

Reference. -- OXY-TOLYL-ALLYL-THIO-URFA.

o-TOLYL-AMIDO-ACETIC ACID C.H.1NO. i.e. C.H.1Me NH.CH.2CO.H. Tolyl - glycocoll. [150]. Prepared by the action of chloro-acetic acid and aqueous NaOAc on o-toluidine (Staats, B. 13, 137; Cosack, B. 13, 1091; Ehrlich, B. 16, 201; Bischoff a. Nagtvogel, B. 22, 1787).— GuA', 2aq. Small needles .- CaA', 3aq: needles,

m. sol. water (Mauthner, M. 11, 377).

Ethyl ether Eth.'. (281'). S.G. 30 1058.

Oil (Bischoff, B. 25, 2270).

Acetyl derivative C,N,NAc.CH,CO,H. [212]. Tables (from dilute alcohol).

• Chloro-acetyl derivative C,H,N(CO.CH,Cl).CH,.CO,H. [117] from the acid and chloro-acetyl chloride, in ether (Widman, J. pr. [2] 38, 304). Rectangular plates, v. sol. hot alcohol, sl. sol. water.

Bromo-acetyl derivative C.H.N(CO.CH.Br).CH.,CO.H. [124]. Bectangular plates.

Glycolyl derivative C,H,N(CO,CH,OH),CH,CO,H. [144°]. Formed. by boiling the chloro-acetyl derivative with conc. Na_CO_Aq (Abenius, J. pr. [2] 40, 503). V. e. sol. water. Yields KA' aq, BaA'2'/aq, and AgA', and is converted by heating at 160° into C,H,N CO.CH, O [109°], whence alcoholic NH, produces C,H,N(CO.CH₂.OH),CH₂.CO.NH₂ [152°], crystallising in plates (from attohol).

o Toluide C,H,NH.CH₂.CO.NHC,H,

o. Toluide C,H,NH.CH,CO.NHC,H,. [92°]. Formed by boiling chloro-acetic ether with o-toluidine (Ehrlich, B. 16, 205). Needles,

insol. water and HClAq.

m-Tolyl-amido-acetic acit [1:3]C,H,Me,NH.CH,CO,H. Formed from chloro-acetic acid and m-toluidine in ether (Ehrlich, B. 15, 2011). Solid mass.—CuA'₂2a₄. Ethyl. ether Eth'. [68]. Formed from

chloro-acetic ether and m-toluidine. Six-sided plates, v. sol. alcohol and ether, sl. sol. Aq.

p-Tolyl-amido-acetic acid [1:4]C₈H, Me.NH.CH, CQ H. [119°]. Formed, together with a compound [168°], from p togener with a compound [1687], Iron ptoluidine chloro-acetic acid and NaOAc (dissolved in a little water) at 100° (P. J. Meyer, B. 8, 1158; 14, 1323; Staats, B. 13, 137; Schwebel, B. 10, 2047; Bischoff, B. 23, 1997; 25, 2281). Got also by saponifying its ether. Needles (from water). When fused with potasit it yields a product which, when dissolved in water is oxidized by air to an dissolved in water, is oxidised by air to an indigo-derivative (Heumann, B. 24, 1346). When fused with p-chloro-acet-toluide it yields methyl-indigo (Eckenroth, B. 24, 693). methyliming (Eckenton, B. 24, 503). In compound [1689], formerly supposed to be p-tolyl-amido-acetic acid, ought, according to Bischoff a. Hausdörfer (B. 25, 2281) to be represented as CO_H.CH_N(C, H)_CH_CO.ONH_C, H_E thyl ether Eth'. [49]. Formed from

chloro-acetic ether and p-toluidine. Monoclinic

plates, v. sl. sol. hot water.

• Amide C_pH₁₀N₂O. [163°]. Formed by heating p toluidine with chloro - acetamide. Plates, v. sl. sol. cold water.

Anilide C,H,NH.CH,.CO.NHPh. [83°].
Formed by heating chloro-acetic acid with

aniline. Needles (from hot water).
p-Toluide C.H., NH.CH., CO.NC, H.,. [136°]. Formed in like manner, and also by heating toluidine with the compound of glyoxal with NaHSO₃ (Hinsberg, B. 21, 112). Plates, v. sl. sol. hot water. Yields a chloro-acetyl derivative

Nitrile C,H,NH.CH,CN. [126°]. A product of the action of heat on the amide.

Acetyl derivative C.H., NAc.CH., CO.H. [175°]. Formed from chloro-acetic ether and C.H., NAcNa, the product being saponited with O.A., NACKA, the Product being saportime with potash (Paal a. Otten, B. 23, 2006). Plates (from water).—NaA'3aq: plates, v. sol. water.

Imids (C.H.,NH.CH₂.CO),NH. [210°].

Imide (C.H., NH.CH., CO), NH. [210°]. Got by heating the acid at 200° and adding NH,Aq to the product. Needles, sl. sol. waters and NH,Aq (Bischoff).

Dio-tolyl-di-amido-acetic acid (C,H,NH),CH.CO,H. [240°]. Formed by heating di-chloro-acetic acid with o-toluidine (P. Meyer, B. 16, 925). Needles, insol. water, sl. sol. alcohol, v. sol. aqueous acids and alkalis. Reference.—NITRO-TOLYL-AMIDO-AGETIC ACID.

[1:4]C,H,Me.NH.CH,.CO.C,H,. Phenacyl-ptoluidine. [134°]. Formed from p-toluidine and

p-TOLYL-AMIDO-ACETOPHENONE

bromo-acetophenone in alcohol (Lellmann a. Donner, B. 23, 167). Tables, v. sol. benz. ene, m. sol. alcohol. Yields, on nitration, [1:3:4]C₀H₃Me(NO₂).NH.CH₂Bz [165°] and a dinitro- derivative [156°]. Forms B'HNO, and

B'HCl.

, p-TOLYL-AMIDO-ACRYLIC ETHER [1:4]C_aH₁Me.NH.CH:CH.CO₂Et. [116°]. Formed from p-toluidine and formyl-acetic ether (Von Pechmann, B. 25, 1053). Yellow plates, insol. water and ligroïn. Alcoholic potash yields plates [144°]. Ac.O forms acetyl-toluidine. TRI-p-TOLYL-TRI-AMIDO-BENZENE

C₂,H₂,N₃ i.e. C₀H₃(NHC,H₁)₂. [187°]. Formed by heating phloroglucin with p-toluidine at 210° (Minunni, B. 21, 1984). Needles, v. sl. sol. cold alcohol. Conc. H₂SO₄ forms a bluish-green solution, turning black on heating.—B"HCl: amorphous; decomposed by water.—B"2HCl: small needles.—B",H₂PtCl₃.

Tri-acetyl derivative [1989]. Plates.

Tri-benzoyl derivative [282°]. Minute

prisms.

p-TOLYL-AMIDO-BENZOYL-(a)-NAPHTHO-INONE C_6H_3 -CO. C_6H_3 -CO.Ch- H_6 -CO.Ch

[197°]. Formed by boiling p-toluiding with benzoyl-(α)-naphthoquinene in alcoholic solution for 15 minutes (Kegel, A. 247, 185). Red

needles (from HOAc), v. sl. sol. alcohol.

p-TOLYL-o-AMIDO-BENZYL-AMINE [4:1] C₆H₄Me.NH.CH₂·C₆H₄·NH₂ [1:2]. [80.5°]. (söderbaum a. Widman, B. 23, 2187). Thin leastets (from alcohol). Ac.O yields a di-acetyl derivative [186°]. The mono-acetyl derivative C,II,NAc.CH₂.C₆H₄NH₂ [99°] may be got by reducing C,H,NAc.CH₂.C₆H₄NO₂.

O-TOLYL-a-AMIDO-n-BUTYRIC ACID

C,H,,NH.CHEt.CO,H. [84°]. Long prisms. Forms an acetyl derivative [116°] and yields

propyl-o-toluidine on distillation.

Ethyl ether EtA'. (278°). S.G. 29 1.019. Got by heating o-toluidine with a-bromo-butyric

ether at 100° (Bischoff a. Mintz, B. 25, 2314). ο-Tolyl-α-amido-isobutyric acid C.H. C.H. C.M. C. H. [629]. Formed together with the 3 isomeride [110°] by the action of KOH and a current of steam on the ether [57°], which is got by heating o-toluidine with a-bromoisobutyric ether (Bischoff a. Mintz, B. 25, 2334). The acid [110°] yields an acetyl derivative [219°], sl. sol. ether. On distillation it forms a lactone [95°].

p-Tolyl-a-amido-n-butyric acid C.H.NH.CHEL.CO.H. [153°-156°]. Got from the ether Eth' (279°) S.G. 32 1-011, which is produced when p-toluidine is heated with a.bromo-n-butyric acid at 105°. Leaflets. Yields Got from propyl-p-toluidine on distillation.

Acetyl derivative C,H,NAc.CHEt.CO.H.

[149°]

p-Tolyl-a-amido-isobutyric acid [1:4] C_bH₄Me.NH.CMe₂.CO₂H. [150°]. Formed together with the \$- isomeride, by the action of hot potash in a current of steam on the ether EtA' [36°], which is got by heating p-toluidine with a-bromo-isobutyric acid. Yields an acetyl derivative [146°]. Forms isopropyl-p-toluidine on distillation.

p-Tolyl-8-amido-isobutyric acid C,H,NH.CH,CHMe.CO,H. [196°]. Formed as above. Gives an acctyl derivative [206°] and decomposes on distillation into p-toluidine and

a lactone C,H,N<CH,CHMe
CO .CMe,O
CO (?) [170°].
o-TOLYL-AMIDO-CROTONIC ACID

[1:2] C₆H₄Me.NH.CMe:CH.CO₂H.

Methyl ether MeA'. [31°]. Formed by the action of o-toluidine on methyl aceto-acetate (Conrad a. Limpach, B. 21, 523). Prisms (from alcohol).

Ethul ether EtA'. Yellowish oil.

p-Tolyl-amido-crotonic acid.

Methyl ether MeA'. [60°]. Prisms.

Ethyl ether EtA'. [29°]. Formed from acetoacetic ether and p-toluidine.

TOLYL-AMIDO-CYANURIC ACID Cyanuric acid, described under Cyanic acids. p-TOLYL-AMIDO-METHENYL-BENZAMID-

OXIM CPh \ll N.O \gg C.NH.C, H, Me [1:4.]. [135]. Formed by heating p-tolyl-thiocarbimide with benzamidoxim (Koch, B. 24, 398). Plates

(from alcohol), v. sol. ether.
DI-p-TOLYL-AMIDO-METHYLENE-0-PHE-

NYLENE DIAMINE C₁H₂N₄ i.e.

C₄H₄NH CNH1.C H, [186°]. (above 400°).

Formed by heating C(NC,11.), with e-phenylene-diamine at 135° (Moore, B. 22, 1639; 3188). Tables (from alcohol), v. sl. sol. boiling water.
—Salts: B'_3HCl. Needles,—B'_3H_PCl_8aq.
—B'H_SO, Needles, insol. ether, v. sol. hot Aq. Nitrosamine

 $C_{_{0}}H_{_{4}} < \stackrel{N(NO)}{\underset{N(NO)}{\langle NO, H_{7}, NO \rangle_{2^{*}}}} C(NC, H_{7}, NO)_{2^{*}} \quad [130^{\circ}]. \quad Yellow$ needles, v. sol. alcohol.

Di-acetyl derivative [143°]. Needles. Di-benzoyl derivative [185°]. Prisms. Tetra-benzoyl derivative [274°

Tetra-p-tolyl-tetra-amido - di - methylene - ophenylene-diamine $\mathbf{C}_{0}\mathbf{H}_{1}:\mathbf{N}_{2}(\mathbf{C}(\mathbf{NHC}_{1}\mathbf{H}_{7})_{2})_{2}$. [116°]. Formed by heating C(NCH₂), with ophenylene-diamine at 200° (Moore, B. 22, 3195). phenylene-diamine at 200° (atome, 17, 22, 31, 57). Needles, v. sol. alcohol. Decomposed by dilute HClAq at 150° into di-p-tolyl-urea and o-phenylene-diamine. B'2H,SO, Needles, sl. sol. cold water.—B'3HCl.—B'3H,PtG, 15aq.

Tetra-acetyl derivative [1152].

Tetra-benzoyl derivative [1460]. DI-p-TOLYL-AMIDO - METHYLENE-o-PHE-NYLENE-PHENYL-GUANIDINE

 $C:NPh > C(NHC, H_1)_x$ [187]. Formed

by boiling C(NC,H,), with o-phenylene-phenyl-guanidine (Keller, B. 24, 2508). Needles (from

pushing alcohol), sl. sol. ether.

DI - p - TOLYL - AMIDO - METHYLENE - o.

PHENYLENE -p-TOLYL-GUANIDINE
C₂H,:N₂(CNC,H,):C(NHC,H,)₂. [1,88°]. Formed
by heating o-phenylene-p-tolyl-guanidine with
C(NC,H,)₂ at 220° (Keller, B. 24, 2513). Prisms (from benzene).

DI - p - TOLYL - AMIDO - METHYLENE - 04 TOLYLENE-p-TOLYL-GUANIDINE C,H,:N₂(C:NC,H,):C(NHC,H,), [210°]. Formed by heating tolylene-tolyl-guanidine together with C(NC,H,), at 220° (Keller, B. 24, 2521). Needles, sl. sol. alcohol.
o-TOLYL-AMIDO-METHYL-MALONAMIC

ETHER CO.Et.CMe(NHC.H.,).CO.NH. Formed by dissolving a evano-tolyl-a-amido-propionic cher in cont. H.SO, (Gerson, B. 19, 2966). Long needles, sol. hot water. Converted by boiling NaOHAq into tolyl-amido-propionio

p-TOLYL-AMIDO p METHYL-OXINDOLE

 $C_{10}H_{10}N_{2}O$ i.e. $C_{0}H_{0}Me < \frac{NH}{CH(NDCH)} > CO.$

[167]. Formed by heating di-chloro- (or di-bromo-) acetic acid, with p-toluiding (Duisberg, B. 18, 190). Needles, y. sol. hot alcohol. Reduces ammoniacal AgNO, forming a mirror. Readily absorbs exygen from the air, forming C₆H₃Me < N11 CO. Alcoholic KOH forms a blood-red solution. BIICI: crystalline

powder. Di-acetyl derivative C16H11Ac2N2O. [117°].

Nitrosamine C, H, N,O... [c. 220°]. p-TOLYL-AMIDO METHYL-THIAZOLE

ĊН CMe. [125°]. Formed S C(NHC,H):N oxy-methyl-thiazole and p-toluidine (Hantzsch a. Weber, B. 20, 3130).

TRI-p-TOLYL-TRI-AMIDO NAPHTHASENE $C_{s}H_{i} < \stackrel{C(NHC,H):C(NHC,H_{i})}{C(NHC,H):CH}. \quad [160^{\circ}]. \ \, \textbf{Formed}$

by heating nitroso-ethyl-(a)-naphthylamine with 7-toluidine at 150 (Pischer a. Hepp, A. 256, 244). Needles (from alcohol). Readily axidised to di-methyl-phenyl-rosinduline.

O-TOLŸL-AMIDO-(a)-NAPHTHOQUINONE C₁₇H₁₃NO₂ i.e. C₁₀H₂O₂(NHC₃H₂). [142°]. Formed from o-toluidine and (a) naphthoquinone (Elsbach, B. 15, 689). Red needles, sol. NaOHAq.

p-Tolyl-amido (a)-naphthoquinone C., H.O. (NHC, H.). [2027]. Formed from (a) naphthoquinene and p-toluidine in hot alcoholic solution (Plimpton, C. J. 37, 638). Formed also by the action of p-toluidine on (β) -oxy- (α) naphthoquinone, and by heating p-tolyl-amido-(B) naphthogumone with HOAc at 150° (Elsbach, B. 15, 687). Red needles. Forms a crimson solution in conc. H2SO4. Insol. NaOHAq.

 $Ditoluide = C_0H_1 < \frac{C(NC, H_1):C.NHC_1H_2}{C(NC, H_1):CH}$ [1476]. Formed by oxidation of tri-p-tolyl-amidonaphtbalene (Fischer a. Hepp, A. 256, 246). Orange plates.

o.Tolyl.amido (β)-naphthoquinone C₁₀ H₂O₂(NHC H₂) or C₁₀ H₂(OH)O(NC,H₂). [240°]. Formed from (B) naphthoquinone and o-toluidine (Elsbach, B. 15, 689). Red needles, sol. dilute NaOHAq. Not affected by heating with HOAc at 150°. On heating with dilute HClAq it yields

(β) oxy-(α)-naphthoquinone and o-toluidine p - Tolyl - amido - (B) - naphthoquinone [246°]. Formed from (β) -naphthoquinone and p-toluidine (Elsbach, B. 15, 686). Red needles, sol. hot al-cohol and NaOHAq. On heating with HClAq at 130 it is split up into p-toluidine and (8)naphthoquinone.

Methyl ether MeA'. [150°]. Red crystals (Zincke a, Brauns, B. 15, 1969). Ethyl ether Eth'. [137'].

Isopropyl ether PrA'. [139].

p-Toluide C,0H, (NHC,H,)O(NC,H,). [188° cor.]. Formed by heating di-bromo-(a)-naphthol with p-toluidine (Meldola, C. J. 45, 159). Formed also from (B-naphthoquinone oxim, p-toluidine, and HOAc (Bromme, B. 21, 391). Orange crystals with green lustre.

DI-o-TOLYL-DI-AMIDO-OIAZTHIOLE

C₁₆H₁₆N₄S i.e. S<C(NHC,H₁):N. [135°]. Formed by boiling an alcoholic solution of o-tolyl-thiourea with dilute HClAq and H₂O₂ (Hector, B. 23, 368). V. sol. alcohol. Cya 10gen passed into its alcoholic solution forms C₁₆H₁₆N₄SCy₂(89°).—B'HClaq. [219°].—B'2H,PtCl_c. [192°].—B'AgNO₂. White pp.—B'2H,HgCl_c. [232°]. Needles.—Picrate: B'C₆H₃N₃O₇. [201°]. Acetyl derivative C₁₆H₄,RaN,S. [211°]. Bensoyl derivative C₁₆H₄,RaN,S. [214°]. Nitrosamine C₁₆H₁₆(N),S. [135°].

Nitrosamine C₁₆H₁₆(N),S. [135°].

Formed in like manner from n-tolyl-11. by boiling an alcoholic solution of o-tolyl-thio-

Formed in like manner from p-tolylhio-urea (Hector, B. 23, 364). Thick yellowish prisms, v. sol. alcohol. Cyanogen forms B'Cy₂ [190°].—B'HCl. [233°]. White needles, becoming reddish in air.—B'_2H_PtCl₈ 1\(\frac{1}{2}\)aq. [109°].—B'AgNO₄ 1\(\frac{1}{2}\)aq. [177°].—B'_2H_1\(\frac{1}{2}\)L(1\(\frac{1}{2}\)aq. [14°_2]. Pi or \(\frac{1}{2}\)steel [238°]. Yellow prisms, sl. sol. alcohol.

Acetyl derivative C₁₆H₁₅AcN₁S. [166°].

Bunzoul derivative C₁₆H₁₅BzN₄S. [186°].

Nitrosamine C₁₆H₁₅(NO)N₁S. [247°].

o-TOLYL-m-AMIDO-PHENOL C₁₆H₁₅NO i.e.

O,H,NH.C₆H₄OH. (c. 373° cor.). Formed from resorcin, o-toluidine, and CaCl₂ at 270°, (Philip, J. pr. [3], 34, 70). Oil. Reduced by hot zincodust to hydro-acridine and acridine.

Formul designation (LiGe). Tables

Formyl derivative. [169°]. Tables.
o-Tolyl-p-amido-phenol C,H,NH.C,H,OH.
[90°]. (86°° cor.). Formed from hydroquinone,
o-toluidine and CaCl, at 240° (Philip, J. pr. [2] 34, 57). White lamine (from light petroleum). Reduced by distilling with zine to hydro-acridine and acridine. Converted by heating with conc. HCl into hydroquinone and o-toluidine.

Salt .- B'HCl : crystalline powder. Mono-formyl derivative [136.5°]. Di-acetyl derivative [106°]: needles.

Di-benzoyl derivative [1019]: needles.

Di-benzoyl derivative. [1719].

p-tolyl-m-amido-phenol C₁₄H₁₄NO i.e.
C,H,NH.C,H,OH. [929]. (350° cor.). From
resorcin, p-toluidine and CaCl₂ at 260° for 8
hours (Hatschek a. Zega, J. pr. [2] 33, 20°).

Prisms or needles (from benzene mixed with petroleum ether). Distilled over zinc-dust, it gives C.H.NHPh.

Salts .- B'HCl; decomposed by water.

Formyl derivative.

C.H., N(CliO).C., H., OH. [14°]. V. sol. ether. Di-benzoyl derivative.—
C.H., NBzC., H., OBz. [c. 105°]. Gives with tuning HNO, a di-nitro-derivative, [110°].

Nitrosamine.—C.H., N(NO).C., H., OH. Onyphenyl-tolyl-nitrosamine. [105°]. Yellow readles (term ill electron) phenyl - tolyl - nitrosamine. needles (from dil. alcohol).

needles (from dil. alcohol).
p-Tolyl-p-amide-phenol C,H.,NH.C,H.,OH.
[122°]. (350°-360°). From hydroquinone, ptoluidine, and CaCl., 8 hours at 260° (Hatschek
a. Zega, J. pr. [2] 33, 224). Plates. Heated
with zinc-dust it gives phenyl-p-tolyl-amine.
Salt.—B'HCl. Powder, decomposed by Aq.
Di-acetyl derivative. [101°]. Tables.

Di-bensoyl derivative. [1697]. Nitroso-derivative O.H.,N(NO).O.H.,OH [130°]; needles. Very unstable.

o-TOLYL-a-AMIDO-PHENYL-ACETIC ACID NHC,H,CHPh.CO₂H. [143°]. Formed from abromo-phenyl-acetic acid and o-toluidine (Stöckenius, J. 1878, 781). Plates, almost insol. water

p-Tolyl-a-amido-phenyl-acetic acid. Formed in like manner, using p-toluidine. Insol. water. Ethyl ether EtA'. [90°]. Yellowish prisms.

o-TOLYL - AMIDO-TRI-PHENYL-METHANE CPh₃.NHC,H₇. [142°]. Formed from CPh₃Br and o-toluidine (Wittich, B. 17, 705). Prisms

(from ether). p-Tolyl-amido-tri-phonyl-methane Crystals (from ether).

CPh.,NC.H.,NO. Nitrosamine f145°-

p-TOLYL-AMIDO-DI-PHENYL-NAPHTHO-QUINOXALINE. Phenylo-chloride

Got by heating C₁₀H₃(OEt) < N=CPh with ptoluidine at 120° (Witt a. Schmidt, B. 25, 2005). Bronzed plates, v. sol. alcohol, forming a crim-son solution. Con. H.SO, forms a slate-blue solution, becoming first blue and then violet on dilution.

TRI-p. TOLYL - TRI - AMIDO - DI-PHENYL-TOLYL-CARBINOL C41H30N3O. Tri-tolyl-rosaniline. The salts are formed by heating rosaniline salts with p-toluidine (Hofmann, A. 132, 290) .-C41H38N3Ci. Small blue crystals (from alcohol), insol. water.

TOLYL-AMIDO-PIPITZAHOIC Toluido-PIPITZAHOIC ACID.

o-TOLYL-a-AMIDO-PROPIONIC ACID

CH₃.CH(NHC,H₇).CO₂H. [116°]. Formed by saponification of the nitrile (Tiemann a. Stephan, B. 15, 2038; C. C. 1886, 470). Got also by boiling o-tolyl-amido-methyl-malonic acid with NaOllAq (Gerson, B. 19, 2963). White crystals. Ethyl ether Eth' (2786). S.G. \$\frac{20}{26}\$ 1.047. Hormed from a-bromo-propionic ether and o-toluidine (Bischoff a. Hausdörfer, B. 25, 2298).

Actyl derivative C,H,NAc.CHMeCO,H.
[177°]. Leaflets.

Amide. [125°]. "Minute needles.

Nitrile CH,CH(NHC,H).CN. [78°]. Formed by digesting the cyanhydrin of acetic aldehyde (lactonitrile) with o-toluidine.

p - Tolyl - α -amido - propionic acid. Formed in like manner. Plates, sl. sol. water and ether. May be sublimed.

Ethyl ether EtA'. [35°]. Acetyl derivative [166°]. Tables.

Amids. [145°]. Needles, sol. hot Aq. Nitrile. [82°]. Plates, sl. sol. hot Aq.

p. Tolyl-8 amido-propionic acid C.H.Me.NH.CH.CH.CO.H. [86°]. Formed from \$-iodo propionic acid and p-toluidine (Bischoff a. Mintz, B. 25, 2352). Pearly scales, v. e. sol. ether.

Reference. — DI-BROMO-TOLYL-AMIDO-PROPIO-NITRILE.

o-TOLYL-AMIDO-PYROTARTRIMIDE CH, CO NH [181°]. Obtained by saponi-

fication of o-tolyl-amido-pyrotartramic ether, which is formed by the action of H.SO, upon the a-cyano-a-o-toluido-butyric ether (Schiller-Wechler, B. 18, 1050). White needles. alcohol and benzene, sl. sol. ether and hot water, insol. cold water and ligroin. Has both acid and basic properties.
DI-p-TOLYL-DI-AMIDO-SUCCINIC ACID

CO.H.CH(NHC.H.).CH(NHC.H.).CO₂H. [c. 200°]. Formed, together with 'di-toil succin' C₁₈H₁₆N.O₂ [228°], by boiling di-bromo-succinic acid with p-toluidine (Junghahn a. Reissert, B. 26, 1766). V. sol. alcohol, insol. water. Yields 25, 1700). V. Sol. alcolol), fiscol. water. Tields a di-nitroso-derivative [125°], and a di-netyl derivative $C_{22}H_{21}N_{2}O_{q}$ aq, which yields CaA'' aq, BaA'' aq, and anhydrides $C_{21}H_{21}N_{2}O_{5}$ [232°], and $C_{22}H_{30}N_{2}O_{7}$ [222°]. Na,A''.—CaA''.—CuA''.

Ethyl ether Et,A''. [169°]. Needles.

DI-p-TOLYL-TRI-AMIDO-TOLUENE

C₆H₂Me(NHC,H₁)₂(NH₂)[1:2:5:4], [166°], Formed by reducing amido-toluquinone ditoluido with zine-dust and HOAc (Green, C. J. 63, 1403; cf. Barsilowsky, B. 6, 1209). Plates (from dilute HOAc). A very feeble base.

DI - p - TOLYL - DI - AMIDO - TOLUQUINONE C_bHMeO₂(NHC,H₂)₂[1:2:5:4:6]. [178*]. Formed from azotoline, MeOH, and conc. H₂SO₄ (Fischer a. Hepp, A. 262, 251). Brownish-red needles. Di-p-tolyl-di-amido-toluquinone

C₆HMeO₂(NHC,H₇)₂ [122;5;3;6]. [241°]. Formed by boiling toluquinone with p-toluidine and alcohol (Fischer a. Hepp, A. 256, 259). Yellow

TOLYLAMINE is TOLUIDINE (q.v.)

(312)Di-o-tolyl-amine NH(C,H,Me[1:2]) i.V.) at 728 ram. (Graebe, A. 238, 363). Obtained, together with diphenylamine by heating o-toluidine with aniline hydrochloride at 280 (Girard a. Willin, Bl. [2] 25, 248). Formed also by heating o-cresol with ZnBr., ammonia, and NH.Cl at 335° (Merz a. Müller, B. 20, 547). Oil.

Di-m-tolyl-amine NH(C,H)₂. (322°). Formed in like manner (Cosack B. 13, 1091; Merz a. Müller, B. 20, 519). Oil, volatile with steam. Sl. sol. acids, v. sol. alcohol.

Nitrosamine (C,H,),NNO. [103°]. Dip-tolyl-amine NH(C,H),... [79]. i.V.) (Graebe, A. 238, 363). Formed by heating p-toluidine with its hydrochloride (Girard, A. 140, 346; Gerber, B. 6, 446). Formed also by heating p-cresol with ZnCl₂ ammonia, and NH₂Cl at 335° (Merz a. Müller, B. 20, 516). White needles. Its salts are decomposed by

Nitrosamine (C,II,),N.NO. [103] Yellow trimetric crystals (Lehne, B. 13, 1514 Cosack).

Acetyl derivative (C,H,),NAc. [85°]. $[125^{\circ}].$ Benzoyl derivative (C.H.), NBz. References. - TETRA-BROMO- and NITRO- DI-TOLYL-AMINE

DI.p-TOLYL-ISOAMYL-AMINE C, H,N i.e. (C,H,),NC,H₁₁, (290°-800° at 15 mm.). Formed by heating di-p-tolyl-amine with isoamyl alcohol and HCl in sealed tubes (Girard, Bl. [2] 24,

120). TOLYL-ANILINE v. PHENYL-TOLUIDINE. Vol. IV.

TOLYL-ARSINE v. ARSENIC.

TOLYL-AURAMINE C, H, N, i.e.

C,H,Me.N:C(C,H,NMe,), Formed from auramine
hydrochloride and p-toluidine (Fehrmann, B. 20, 2853). Decomposed by H₂S in alcoholic solution at 50° inte CS(C₆H,NMc₂), and p-toluidine.—
B'₂H,PtCl₈. Red flakes, v. sl. sol. water.

TOLYL-AZIMIDO-TOLUENE v. COMPOUNDS ...

DI - 2'- TOLYL - TETRAZINE Ciellien, i.c. $C_{c}H_{i}Me.N < \stackrel{N=CH}{CII:M} > N.C_{c}H_{i}Me.$ [185°]. Mole w. 269 (obs.). Formed by the action of chloroform and alcoholic potash on p-tolyl hydrazine (Ruhemann, C. J. 55, 218; 57, 51). Yellow plates (from hot alcohol). Yields a nitroderivative C18H15(NO2)N1 [144°].

TOLYL - DISAZO - compounds v. DISAZO-COMPOUNDS.

TOLYL BENZAMIDE v. Benzoyl derivative of TOLUMBINE.

p - TOLYL - BENZAMIDINE $C_{14}U_{14}N_{2}$ i.e. $C_{6}U_{5}$ (NC, U_{1}), NH, [99°]. Formed from benzonitrile and toluidine hydrochloride (Bernthsen, B. 8, 1319; 9, 429). Forms a crystalline nitrate

and oxalate. Di-p-tolyl-benzamidine

C.H., C(NC,H.).NHC,H., [131°]. Formed by the action of p-toluidine on benzonitrile, and on w-chloro-benzylidene-p-toluidine C,H,N:CCl.C,H, (Bernthsen; Just, \hat{B} , 19, 981). May be sublimed.

Reference. -- AMIDO-TOLYL-BENZAMIDINE. needles. Di.p-tolyl-di-amido-toluquinone p-toluide p-to Calla CS.NHC, H, and Na CO, at 100° (H. Müller, B, 22, 2406). White needles, sl. sol. hot water. B'HCl: white needles, sl. sol. water. ClCO,Et converts it into C_0H_3 . $C < N_{C_1H_2}^{N.O} > CO$. [163°].

TOLYL-BENZENE v. METHYL-DIPHENYL. Tri-p-tolyl-benzene C2,H2, i.e. C6H3(C,H7)

[171°]. Formed by passing dry HCl into p-tolyl methyl ketone for some days (Claus, J. pr. [2] Al, 402). Needles. Oxidised by Cr0, to C_pII,(CO.H). Yields C_pII,(Br. 212°). P-1014L-BENZIMIDO PHENYL ETHER C_pII,C(NC,H.).OPh. [120°). Formed from

C.H., C(NC, H.). OPh. [120°]. Formed from CaH, CCl: NC, H, and NaOPh (Hantzsch, B. Formed from 26, 927).

om-TOLYL-BENZOIC ACID [1:3] C. H., Mc.C. H., CO. H. [1:3]. [204°]. Formed by oxidation of [1:3] C. H., Mc.C. H., Me [1':3'] with dilute HNO. (Perrier, C. R. 114, 484). Silky needles, sol. alcohol, m. sol. Aq.

pp-Tolyl-benzoic acid [1:4] C₆H, Mc.C₆H, CO₂H [1':4']. [244']. Formed by oxidation of pp-ditolyl by CrO₂ and HOAc (Camelley, J. 1877, 384). Sl. sol. hot water.—

op-Tolyl-benzoic acid. [180°]. Formed by oxidation of [1:2] C₄H₄Me.C₄H₄Me [1':4'] (Carnelley, C. J. 37, 707). Insol. water, sol. hot alcohol.

TOLYL-BENZYL-AMINE v. BENZYL-ADLU-

p-TOLYL-BENZYL-ISOBUTYL-UREA O. H., N.O. [41°]. Got from p-tolyl-benzylcarbamic chloride and isobutylamine (Hammerich, B. 25, 1824). Crystals (from ligroin).

p-TOLYL-BENZYL-CARBAMIC CHLOBIDE (C.H.Me)N(CH.Ph).COCl. Formed from p-tolylbenzyl-amine and COCl, (Hammerich, B. 25,

1822). *Oil.

p-TOLYL-BENZYL-CARBINOL C, H, O i.e. C, H, Mc.CH(OH).CH,Ph. [66°]. (above 360°). Formed by reducing p-tolyl benzyl ketone in alcoholic solution by Na (Mann, B. 14, 1646). Small concentric needles, sol. alcohol and ether. p-TOLYL-BENZYLENE-ACETAMIDINE

C₁₀H₁₀N₂ i.e. C₀H₄ < CH₂.NC,H₇. [79°]. Formed by reduction of the acetyl derivative of o-nitrobenzyl-p-toluidine in acetic acid solution with tin and HCl (Lellmann a. Stickel, B. 19, 1610). Small glistening plates. V. sol. alcohol, ether, and chloroform.

and chloroform.

p.TOLYL BENZYL KETONE C₁₃H₁,O i.e.
C₄H₁Me.OD.CH₄Ph. [109°]. (above 360°). Formed
by the action of AlCl₃ on a mixture of phenylacetyl chloride and toluene (Mann, B. 14, 1646;
Strassmann, B. 22, 1229). Plates, sol. alcohol
and ether. Na added twiss alcoholic solution forms the carbinol and an acid C19H20C2 ["3"].

Oxim [131°]. Plates, insol. water. o-TOLYL BENZYL OXIDE C,H,O i.e. [1:2] C.H.Mc.Q.CH.Ph. (2859-290°). Oil (Standel, B. 14, 899). Converted by HNO, (S.G. 1.5) into a tri-nitro- derivative [145°]. mrTolyl benzyl oxide. [43°]. (300°-305°).

Tables (from alcohol), v. sol. ether.

p-Tolyl benzyl oxide [41°]. Formed from C,H,Me.OK and CH,PhCl (Frische, A. 224, 154). Crystals. Converted by HNO, (S.G. 45) into di-nitro, η -cresol [84°]. **TOLYL-BENZYL-ISOPHOSPHINE** $C_{11}H_{13}P$

or C₂₇H₂₈P₂. [187°]. An indifferent body formed by the action of zinc on a mixture of benzyl chloride and CoH, MePCl2 (Michaelis a. Gleichmann, B. 15, 1963)

p. TOLIVI BENZYL SULPHONE C.H.Me.SO., CH.Ph. (145°). Formed by the action of benzyl chloride on sodium tolucne p-sulphinate (Otto, B. 13, 1278). Needles, sol. hot alcohol.

p.TOLYL.BENZYL.THIO.SEMICARBAZIDE C,H,N,S. [121°]. Formed from benzyl thiocarbimide and p-tolyl-hydrazine (Dixon, C. J.

61, 1022). Prisms, sl. sol. cold alcohol. o-TOLYL-BENZYL-THIO-UREA C o-TOLYL-BENZYL-THIO-UREA C_{1.}H_{1.}N₂S i.e. C₂H₄MeNH.CS.NHCH₂Ph. [139°]. Formed by boiling o-tolyl-thiocarbimide with benzylamine in alcohol (Dixon, C. J. 59, 556). Tufts of prisms, m. sol. hot alcohol.

m-Tolyl-benzyl-thio-urea. [114°]. Formed from benzyl-thiocarbimide and m-toluidine.

Vitreous crystals, v. sl. apl. hot Aq. p-Tolyl-benzyl-thio-urea [121°]. p-TOLYL-BENZYL-UREA

[181°]. CH,Ph.NH.CO.NHC,H,Me. from p-tolyl cyanate and benzylamine (Kühn a. Henschel, B. 21, 505).

Problem 11, 2009.

p-Tolyl-di-bensyl-urea C₂₂H₄, N₂O i.e.

(CH_Ph)₂N.CO.NHC₄H, Me. [169°]. Got from (O,H.)₂N.CO.U and p-toluidine (Hammerich, B. 25, 1820). Needles (from alcohof), insol. ether.

p-Tolyl-di-bensyl-ures C₂₂H₂₂N₂O i.e.

CH_PhN(O,HTMe).CO.NH.CH₂Ph. [85°].

Formed from tolyl-bensyl-carbamic chloride and

Formed from tolyl-benzyl-carbamic chloride and benzylamine (H.). Prisms, v. sol. alcohol.

Di-p-tolyl-benzyl-urea C₁₂H₁₂N₂O. [115°].

Formed from p-tolyl-benzyl-carbamic chloride and p-toluidine. Needles, v. sol. hot alcohol.
Di-p-tolyl-di-benzyl-urea

CH.,PhN(C,H,Me)),CO. [93°]. Got from ptolyl-benzyl-carbanic chloride and p-tolyl-benzyl-amine. Crystalline, sol. alcohol.

DI.-p.TOLYL-BIURET (C,H,MeNH.CO),NH.

[c. 220°]. Formed from p-tolyl-urea and p-tolyl cyanate at 160° (Kühn a. Henschel, B. 21, 506). White needles (from alcohol).

Tri-p-tolyl-biuret (C₈H₄MeNH.CO)₂NC₈H₄Me. ſ156°7.

from di-p-tolyl-urea and p-tolyl cyanate.

p-TOLYL-BORIC ACID C₈H₄Me.B(OH). [240°]. Formed by the action of water on boronp-tolyl-dichloride (v. vol. i. p. 531). Needles, sol. hot water. HgCl₂ gives a white pp. of C,H,HgCl.

TOLYL-BROMO-ETHYLENE v. BROMO-TOLYL-

ETHYLENE.

TOLYL BROMO METHYL KETONE

C.H.Me.CO.CH.Br. [55°]. Formed by the action of hot water on di-exo-bromo-eso methylatrolactic acid (Böttinger, B. 14, 1598). Crystals, volatile with steam, sol. water and ether.

p-TOLYL BROMO-METHYL SULPHONE

C.H.Me.SO.CH.Br. [92°]. Formed by the action of bromine on an aqueous solution of Thin monoclinic needles, sol. hot alcohol.

p-Tolyl di-bromo-methyl sulphone CaH.Me.SOa.CHBr2. [117]. Form Formed tolyl-sulphono-acetic acid and Br (O.). Monoclinic prisms, v. sol. hot alcohol.
TOLYL-BUTANE v. BUTYL-TOLUENE.

m-TOLYL-BUTYLENE C.H., Me.CH., C.H., (195°). Formed from C.H., Me.CH., Cl., allyl iodide, and Na (Aronheim, B. 9, 1790). Oil. Yields a liquid dibromide.

p-TOLYL-p-BUTYL-PHENYL-THIO-UREA C₈H,Me.NH.CS.NH.C₈H,C₄H₂. [137°]. Formed from isobutyl-phenyl-amine and p-tolyl-thiocarbimide (Mainzer, B. 16, 2024). Plates, sol. alcohol and ether.

DI-p-TOLYL-ISOBUTYL-UREA 119°]. Formed from (C,H,)2N.COCl and isobutylamine (Hammerich, B. 25, 1822). Prisms, v. sol, alcohol and ether.
m-TOLYL-ISOBUTYRIC ACID

C₄H₄Me.CH₂.CHMe.CO₂H. [92°]. Formed by oxidation of m-isobutyl-toluene by dilute HNO₄ (Kelbe, B. 16, 620). Needles (from ligroin).-

AgA: pp.

Reference.—Nitro-tolyl-isobutyric acid. o-TOLYL-CARBAMIC ACID C.H.NO. i.e. C,H,Me.NH.CO,H.

Ethyl ether EtA'. [42°] (C.); [46°] (L.). Formed from o-toluidine and ClCO2Et (Cosack, Formed also from C.H., Mc.CCl:NCl and alcoholic potash (Lachmann, B. 12, 1349). Tables, sol. alcohol and benzene. Volatile with steam. alcohol and benzene. Volatile with steam. Yields o-tolyl cranate on distilling with Prop. Isobutyl ether C.H.A'. (275°-280°). Oil (Mylius, B. 5, 974). Parially decomposed on

distillation into tolyl cyanate and isobutyl alcohol.

Bensyl ether CH.PhA'. [84°]. Formed from o-tolyl cyanate and benzyl alcohol (Gattermann a. Cantzler, B. 25, 1097). Needles

Phonyl ether PhA'. [92°]. Formed by boiling di-o-tolyl-ures with di-phenyl carbonate for some hours (Eckenroth a. Rückel, B. 23, 699). Crystals (from ligroin).

m-Phenylene ether C₆H₄A'₂. [154°]. Formed by heating o-tolyl cyanate with resorcin at 120° (G. a. C.). Colourless plates.
p-Phenylene ether C₆H₄A'₂. [206·5°].

Formed by heating o-tolyl cyanate with hydroquinone at 150°.

o-Tolyl ether C,H,A'. [126]. Formed from o-tolyl cyanate and o-cresol (G. a. C.). Needles.

(β)-Naphthyl ether C₁₀H,A'. [149]. Formed by heating o-tolyl cyanate with (β)-naphthol at 160° (G. a. C.). Plates.

Di-phenyl-othylene ether C.H.Ph.A [234°]. Formed by heating o-tolyl cyanate with hydrobenzoïn at 100° (Auwers, B. 24, 1778). Needles. An isomeride [163°] is obtained from isohydrobenzoïn.

m-Tolyl-carbamic acid [1:3]C,H,Me.NH.CO.H.

Ethyl ether C₁₀H₁₃NO₂. Prepared from m-toluidine and chloro-formic ether (Cosack, B. 13, 1090). Oil, v. sol. alcohol and ether.

p-Tolyl-carbamic acid

[1:4]C.H.Me.NH.CO.H. Ethyl ether EtA'. [52]. Formed from p-toluidine and ClCO Et (Hofmann, Pr. 19, 108; B. 3, 656). Monoclinic prisms, v. sol. alcohol (Levin, J. 1882, 381).

Phenyl ether PhA'. [115°]. Formed by distilling di-p-tolyl-urea with di-phenyl carbonate (Eckenroth a. Rückel, B. 23, 698). Needles (from hot ligroin).

Di.p.tolyl-carbamic acid (C,H,),N.CO.H.

Ethyl ether Eth'. [62']. Formed from (C,H,),N.COCl and NaOEt (Hammerich, B. 25,

(C_t)_{1/2}, v. sol. alcohol and ether.

Chloride (C_tH₄Me)₂N.COCl. [103].

Formed from COCl₂, a solution of di-p-tolylamine in benzene, and conc. NaOHAq (Hammerich, B. 25, 1821). Needles (from alcohol), v. e. sol. ether. AgCy forms the compound (C,H,)₂N.CO.CN(AgCy)₂ crystallising in needles which begin to melt at 103°.

o-TOLYL-CARBAMINE [1:2]C,H,Mc.N.C.

(184°). S.G. 24 968. Formed by the action of alcoholic potash on o-toluidine and chloroform (Nef, A. 270, 309). Oil, volatile with steam. When heated at 245° for 3 hours it changes to the isomeric o-toluic nitrile. Heated with S in the isomeric bettile inner. Heater with S in CS, at 130° it yields o toly! thiocarbinide. H.S at 100° forms C. H.Mc.NH.CHS [101°].

Chloride C. H.Mc.N.CCl. (215°). Found

by passing chlorine into a chloroform solution of the carbamine.

p-Tolyl-carbamine CaH, Me.N:C. (99° at 36

p-rolyl-carbannie C₆H₁Mc.N:C. (199° at 36 nm.). Formed in like manner from p-toluiding (Nef). Oil.

Chloride C₆H₁Me.N:CCl₂. (226°). Converted by p-toluidine into tri-p-tolyl-guanidine.

o-TOLYL-SEMI-CARBAZIDE C₆H₁N₁O i.e.

NH₂CO.N₂H₂C,H₁. [160°]. Formed by heating o-tolyl-hydrazine with urea (Pinner, B. 21, 1210). Eight needless meal water.

1219). Flat needles, m. sol. water.

p.Tolyl-semi-carbanide C,H,,NO. [158].

Sl. sol. cold water. Reduces Fehling's solution.

Di-p-tolyl-carbanide CO(NH.NHC,H.), [201°]. Formed from p-tolyl-hydrazine and carbamic ether (Preund, B. 24, 4197). Tables, insol. water, v. sol. hot alcohol.

TOLYL-CARBINIDE Q. TOLYL ISOCYANATE, vol. ii. p. 316, o-TOLYL-CARBINOL C.H.O i.e.

[1:2]C₆H,Me.CH.OH. ω-Oxy-o-xylens. Mol. w. 122. [34°]. (223°i.V.). S.G. 12 1 02. S.1 in the cold; 1.5 at 100°. Formed by boiling w-bromo-oxylene with KOHAq (Colson, Bl. [2] 43, 8; A. Ch. [6] 6,116). Formed also by reducing the aldehyde C. H. Me.CHO (Raymann, Bl. [2] 27, 498), by the action of HNO, on the amine C. H. Me. CH., NH. (Kröber, B. 23, 1028), and by reducing o-toluic

(Hutchinson, B. 21, 174). Needles, v. sol. alcohol and ether, sol. hot water. Oxidised by alkaline KMnO, to o-toluic acid [103°].

m-Tolyl-carbinol [1:3]C.H.Me m-Tolyl-carbinol [1:3]C₀H,Me.CH₂·OH. (217°). S.G. 2 1·036 (C.); ¹² ·016•(R. a. W.). S. 5 in the cold. Formed by boiling the bromide

S. of the could refine a pointing the bronder C_0H Mc.CH.Br with alkalis (C.). Liquid, v. sol. alcohol and ether, sl. sol. cold water. Yields mallic acid [108°] on exidation.

12 hylyt ether C, H. CH. OEt. (202°) at 740 mm. S.G. 11 93. Oil.

Acetyl derivative C.H., CH, OAc. (226°). Formed from C,H,CH,Br and KOAc (Radziszewski a. Wispek, B. 15, 1747). Oil.

p-Tolyl-carbinol [1:4]C,II,Me.CII,OH. [59°] (217°). Formed from p-toluic algebyde and alcoholic potash (Cannizzaro, C. R. 54, 1225; A. 124, 255). Needles, sl. sol. cold water.

Ethyl ether C_nH_w.OEt. (203°) at 740 mm. S.G. 17 93. Formed from w-bromo-p-

Will-carbinol (C₀H₀Me₂OH.OH. (69°) (W.); [62°] (Ador a. Crafts, B. 10, 2175). amalgam (Weller, B. 7, 1184). Needles (from alcohol), insol. water.

Reference .--Oxy-tolyl-carbinol.

TOLYL-CARBINYL-AMINE METHYL BENZYL-AMINE

DI-p-TOLYL-CARBINYL AMINE

(C₇H₁₎₂CH.NH₂. [93°]. Formed by reducing the oxim of di-p-tolyl ketone in alcoholic solution with sodium-amalgam and HOAc at 60° (Goldschmidt a. Stöcker, B. 24, 2798). Tables.

-B'HCl. [235°]. White needles.
Acetyl derivative [159°]. Needles.
• TOLYL-CARBINYL-UREA v. Ms1 BENZYL-UREA.

Di.p. totyl-carbinyl-urea
NH., CU.NH.CH(C,H.),. [152°]. Formed from
the hydrochloride of the amine and KCyO
(Goldschmidt, B. 24, 2799). Needles.

DI-p-TOLYL-CARBONATE (C,H,O),CO. [115], Formed, together with diethyl carbonate, by heating p-tolyl ethyl carbonate at 300 (Bender, B. 19, 2268). V. sl. sol. cold alcohol. DI-TOLYL DICARBOXYLIC ACID

[3:4:1]C,H,Me(CO,H),C,H,Me(CO,H)[1:8:4] [over 300°]. Formed by heating its nitrile with dilute H₂SO₄ (Löwenherz, B. 25, 1036). Plates, insol. water, sl. sol. hot alcohol.

Nitrile C, H₁₂(CN), [190°]. Formed from di-amido-ditolyl by Sandmeyer's disco- reaction. Formed from Needles, m. sol. cold alcohol.

Reference.—OXY-DITOLYL DICARBOXYLIC ACID. TOLYL CHLORIDE v. w-CHLORO-XYLENE,

p-TOLYL CHLORO-BENZYL SULPHONE C.H.Mc.SO.cOHOI.C.H.M. [203°]. Formed by heating sodium toluene p-sulphinate with benzylidene chloride (Otto, J. pr. [2] 40, 519).

Needles (from HOAc). p-TOLYL CHLORO-ETHYL SULPHONE

[1:4]C_uH₄Me.SO₂.CHCl.CH₃. [48°]. Formed by boiling CH₃.CCl₂.CO₂Na (1 mol.) with C,H,.SO,Na (2 mols.) in aqueous, solution.

Formed also by heating ethylidene chloride (2.5 g.) with sodium toluene p-sulphinate (4.5 g.) and alcohol at 150° (Otto, J. pr. [2] 40, 515,534). Trimetric tables, v. sol. hot alcohol. Des not

act upon C,H.,SO,Na even at 200°.
p-Tolyl chloro-ethyl sulphone
C₆H,Me.SO,CH,CH,Cl. [79°]. Formed from
C₄H,Me.SO,CH,CH,CH,DH and PCl, (Otto, J. pr.
[2] 30, 357). Needles or plates, v. sol. hot alcohol.

p. TOLYL CHLORO METHYL SULPHONE C_aH_aMe.SO_x.CH₂Cl. [84°]. Formed by heating an aqueous solution of CHCl_x.CO_xNa (1 mol.) with C,H,SO2Na (2 me.s.) on the water-bath (Otto, J. pr. [2] 40, 528). Tables (front benzene), v. sol. hot alcohol.

p-Tolyl di-chloro methyl sulphone
Collime SO. CHCl. [114°]. Formed by passing chlorine into a warm aqueous solution of Collime So. CH. CO. H. (Otto, J. pr. [2] 40, 544). Crystals, ingol. water, v. sol. hot alcohol.

C₆H₄Me.CH₂.C₆H₄.OH. TOLYL-CRESOL (250°-255° at 10 mm.). Formed by heating wchloro-xylene with phenol and zinc filings (Mazzara, G. 9, 421). Oil, sol. alcohol, ether, and alkalis. Not coloured by FcCl₃.

Acety: derivative (250° at 9 mm.).

Decomposed in moist air into HOAc and tolyl-

p-TOLYL-CUMINYL-AMINE $C_{17}H_{21}N$ i.e. $C_{4}H_{4}Me$, NH, CH_{2} , $C_{4}H_{4}Pr$. [36°]. (above 200°). Formed by the reduction by sodium-amalgam of the product of the action of cuminol on p-toluidine (Uebel, A. 245, 293). Plates or prisms.—B'HCl. Plates or needles, sl. sol. hot

Nitrosamine C_{1.}H_{...}N.NO. [67°]. Prisms. p-TOLYL-CUMINYL-UREA C₁₈H_{...}N₂O i.e. C₁₆H₁₈.NH.CO.NHC₈H_.Me. [150°]. Formed from cuminylamine and p-tolyl cyanate (Goldschmidt a. Gessner, B. 22, 928). Needles, v. sol. alcohol.

p-TOLYL-CUMYLIDENE AMINE

O_sH,Me.N:CH.C_sH,Pr. [51°]. Formed from cuminic aldehyde (cuminol) and p-toluidine in alcoholic solution (Uebel, A. 245, 292). Yellowish plates (from alcohol). Decomposed into the parent substances by heating with acids and alkalis.

alkalis.
p-TOLYL-\$\psi\$-CUMYL-UBEA

C_tH_Me.NH.CO.NH.C_tH_tMe_3. [218°]. Formed from \$\psi\$-cumidine and \$p\$-tolyl cyanate (Goldschmidt a. Bardach, \$B. 25, 1361). Needles.
p-TOLYL-CYANAMIDE C_tH_Me.NH.CN.

[77°]. Formed by heating C,H,NH.CS.NH.OH.

or by the action of hydroxylamine on o-tolyl thiocarbimide (Tiemann, B. 22, 1940; Voltmer, B. 22, 881). Tables, v. sol. alcohol and KOHAq, m. sol. water.

DI-o-TOLYI-CYANAMIDE C₁₅H₁₄N₅ i.e. C(NC,H₁₅)₂. Carboditolylimide. (above 300°). Formed by heating the alkyl derivatives of dio-tolyl-thio-urea (Will a. Bielschowski, B. 15, 1317). Amorphous, v. sol. benzene. Converted by dilute HClAq into di-o-tolyl-urea.

Di.p-tolyl-oyanamide C₁₆H₁N₂SO or C(NC,H₁)₂, [60°]. (above 230°). Formed by the action of HgO on a benzene solution of ditolyl-thio-urea (Will, B. 14, 1488). Thick prisms, sol. benzene and ether. On heating with aniline it gives phenyl-di-tolyl-guanidine. Acids and alkalis convert it into di-p-tolyl-urea. On distillation it yields compounds melting at 49° to 60° and at 149° (Schall a. Paschkowetzky, 25 to 60° and at 143° (Schall a. Paschawezzy, B. 25, 2892). Phenyl-hydrazine at 190° forms C₃₆H₃₆N₆ [163°], which crystallises from alcohol in plates, and yields B'₄4HCl and B'₂2H₂PtCl, On heating with phenyl-hydrazine at 165° there is formed N₂PhH:C(NC, H₁)₂ [138°], crystallising in pale-red needles, yielding B'₂H₂PtCl₄ (Wessel, Ph. 21, 140°). $B.\ 21,\ 2274$). Tolylene-o-diamine at 140° forms $C_{zz}II_{zz}N$, [196°], which yields B'_z3HCl [143°]

(Dahm a. Gasiorowski, B. 19, 3057).
TOLYL CYANATE v. CYANIC ACID.

TOLYL CYANIDE v. Nitrile of TOLUIC ACID. TOLYL-CYANURIC ACID v. CYANIC ACIDS. TOLYLENE ALCOHOL v. DI-OXY-XYLENE TOLYLENE-DI-ALLYL-DI-THIO-DI-UREA

CaHaMe(NH.CS.NHCaHa)... [152°]. Formed from c-tolylene-o-diamine and oil of mustard (Lellmann, A. 228, 246). Needles (from alcohol), decomposed on fusing into tolylene-

thio-urea and di-allyl-thio-urea.
Tolylene-di-allyl-di-thio-di-urea [150°]. [1:3:4] $C_sH_3Mc(NH.CS.NHC_3H_s)_2$. [150°]. Formed from *i*-tolylene-o-diamine and oil of mustard (Lellmann, A. 221, 24). Decomposed by heat like the preceding isomeride; melting a second time at 210°-230°.

Tolylene-di-allyl-di-thio-di-urea [1:2:5] C, H, Me(NH.CS.NHC, H,)2. Formed from tolylene-p-diamine and allyl thiocarbimide (Lellmann a. Würthner, A. 228, 209). Plates or prisms, nearly insol. ether.

Telylene-di-allyl-di-thio-di-urea. Formed from tolylene m?-di-amine and allyl thiocarbimide. Prisms (from alcohol), insol. ether, v. sol. HOAc. Melts without decomposi-

TOLYLENE-DI-AMIDO-DI-ACETIC ETHER [1:2:4] C₀H₃M₆(NH.CH_{..}CO₂Et)₂. [70°]. Formed from tolylene-*m*-diamine and chloro-acetic ether (Zimmermann a. Knyrim, B. 16, 516). Needles

(from water).

c-TOLYLENE-o-DIAMINE C,H10N2 i.e.

Mol. w. 122. [62°]. $C_8H_4Me(NH_2)$, [1:2:3]. Mol. w. 122. [62°]. (255°). Formed from $C_8H_4Me(NH_2)(NO_2)$ [1:2:3] by reducing with Sn and HCl (Lellmann, A. 228, Reddish crystals, smelling of acetamide.

-B"2HCl. Sol. water, ppd. by HCl. c-Tolylene-m-diamine C₂H₃Me(NH₂)₂ [1:2:6]. [104°]. Formed by reduction of nitro-toluidine (0.2°) , or of liquid di-nitro-toluene (Ullmann, B. 17, 1960). Prisms, sol. hot water. Gives a brown colour with nitrous acid. CrO₃ and FeCl₄ give a brown colour .- B'HCl: crystals, v. e. sol.

i-Tolylene-m-diamine C.H.Me(NH2), [1:2:4]. 190°]. (c. 280°). Formed by reducing di-nitro-toluene (Hofmann, Pr. 11, 518) by reducing (44,2)-nitro-toludine (Nölting a. Collin, B. 17, 268), and by the action of SnCl, on amido-toluene-azo-amido-cresol (Graeff, A. 229, 348). Needles (from water), v. sol. alcohol, ether, and

hot water. Chloroformic ether, ClCO_Et, forms [1:2:4] C_H_Me(NH_)(NH_CO_Et) [91°], and chiefly C_dH_Me(NH_CO_Et). [137°] (Schiff, A. 268, 314). Phenyl-thio-carbimide yields CO_Et.NH_C_H_Me.NH_CS.NHPh [155°]. Hep-thio-carbimide with the control of tole aldehyde in the cold forms C, H, N, (C, H,), but when heated it yields an orange mass which forms a highly fluorescent solution (Schiff a. Vanni, A. 253,319). Benzoicaldehydeforms C.H. (N:CHPh). [122°-128°], while cinnamic aldehyde gives C,H,(NC,H,), [162°] (Schiff, A. 140, 98; 239, Cl.CO.CO.Et forms C.H.Me NH.CO [c. 260°] and [1:2:4] C.H.Me(NH.).NH.CO.CO.Et [170°], which yields an acctyl derivative (192° Phenyl-thiocarbimide forms the compound NHPh.CS.NH.C, H, Me.NH.CO.CO, Et [1555] and $C_{\rm e}H_{\rm s}Me < NH.CS > NPh [198°] (Schiff, A. 268,$ 307). Tolylene-m-diamine heated with citric acid at 125° forms C13H12N2O1, crystallising from acid at 125° forms C₁₁H₁₂N₂O₁, crystatusing from boiling alcohol in minute octahedra, decomposing at about 187° (Schneider, B. 21, 665). Acetyl-acetone at 100° forms a syrup, which when heated with H₂SO₄ yields C₁₂H₁₁N₂ [191°] (Combes, C. R. 108, 1252).—B"HCl.—B"2HCl.—B"2HBr.—B"H₂SO₄2aq; prisms. S. 5°6 at 19·5 (Bailstein a. Kuhlberg. A. 158, 351).— 19.5 (Beilstein a. Kuhlberg, A. 158, 351). -B"HPtCl_e.-B"2HCyS. Prisms (Lussy, B. 7, Prisms (Lussy, B. 7,

o.Acetyl derivative CoH₂Me(NHAc)NH₂[1:2:4]. [140]. Formed from CoH₂Me(NH₂)(NO₂) [107°] by acetylation and reduction (Wallach, A. 234, 350). Needles. -B'2H2PtCl6. • p-Acetyl derivative

C₀H₂Me(NH₂)(NHAc) [1:2:4]. [160°]. Formed white needles.

Di-acetyl derivative C.H., Mic(NIIAC),. [224°]. Got by boiling the base with Ac,O or HOAc (Roch, A. 153, 132; Tiemann, B. 3, 8; Ladenburg, B. 8, 1211). Needles.

Benzoyl derivative (24H,MC(NO),(NIIBz) [1224]. [142°]. Got by reducing C.H., Mc(NO),(NIIBz) (Bell, B. 7, 1505).

Di-benzoyl derivative [224°]. Tables, Di-acetyl derivative C, H3Me(NHAe)2.

Di-benzoyl derivative [224]. Tables, sl. sol. alcohol (Ruhemann, B. 14, 2056).

Thiobenzoyl derivative C₄H,Me(NH.)NH.CSPh. [1979] (Bernthsen a. Teophysics B. 14, 1760)

Trompetter, R. 11, 1760).

Phthalyl derivative

C.H.McONLO, C.H. [192°]. Formed from the base and phthalic anhydride (Bicdermann,

B. 10, 1161). Needles, split up by dilute HCl into phthalic acid and a base C₃, H₄, N₆O₄. Di-hthalyl derivative

C,H,Me(NC,H,O2)2. [233°]. Crystals, insol. water and alcohol.

s-Tolylene-m-diamine C.H.Me(NH2), [1:3:5].

33-10. Formed by reducing s-di-nitro toluene (Staedel, A. 217, 202). Syrup.—B"H₂SO₄.—B"H₂SO₄.—B"H₂SO₄.—Cydiamine C₂H₃Me(NH₂)₂ [1:2:5]. [64]. (274°). Formed by reducing (5,1,2). and (2,1,5)-nitro-toluidines (Beilstein a. Kuhlberg, A. 158, 352; Fileti a. Crosa, G. 18, 306), and C.H.Me.N.-C.H.Me.NH. [2:1:5] or [5:1:2]

(Nietzki, B. 10, 832, 1158). Plates (from benz-ene), v. sol. water, alcohol, and ether. Forms toluquinone on oxidation. FeCl, added to a solution of folylene-p-diamine hydrochloride mixed with o-toluidine gives an intense green colour.—B"2MCl. Plates.—B"H₂SO₄. S. 84 at 11.5°.

Di-acctyl derivative C.H.Me(NHAc), [220']. Prisms (from dilute alcohol) (Nietzki, B. 10, 1157; 12, 2237).

Tolylene-o-diamine C.H.Me(NH.), [1:3:4]. [88:5]. (2659). Formed by feducing (3 1,4)-mitro-y-toluidine (Beilstein a. Kuhlberg, A. 158, 351. Graeff, A. 224, 343). Plates, m. sol. cold water. Its aqueous solution quickly blackens when exposed to air. FeCl₃ forms by oxidation C11H15N2O, crystallising from wood spirit in brownish-red plates [247] (O. Fischer a. Sieder,

Reactions .- 1. Benzoic aldehyde at 140° forms $C_{.1}H_{18}N_{2}$ or $C_{.7}H_{6} \underset{N}{\overbrace{\hspace{1cm}N}} \overset{N(C,11,)}{N} \nearrow CPh$ [195-5°]

(Laderburg, B. 11, 591, 1656; Hinsberg, B. 19. 2026; 20, 1585), which yields B'MeI [209°], B'EtI [181°], and B'EtI, [125°], and is oxidised by KMnO, to an acid C21H16N2O2 [254°].-2. Furfuraldehyde, acting on the hydrochloride, forms C, H, N, O, [128:5], which yields B'McI [195:5], B'MeI, [128], and B'MeI, [109], 3. electic aldehyde (2 mols.) added to a cold solution of • the base (1 mol.) in glacial acetic acid forms

€,H_u < NEt >CMo (Hinsberg).-4. Anisic aldehyde, added to a dilute aqueous solution of tolylenc-o-diamine hydrochloride containing a little alcohol, forms C "H "N2O2 [1529-1569], which separates on addition of ammonia (L.). - 5. Salicylic aldehyde at 110° forms C2,11,2,N,O3 [106° 110°], and at 135° it forms azurine C, H, N,O, [250.5°], which exhibits blue fluorescence in alkaline solutions. -6. Glucose (2 mols.) added to an alcoholic solution of tolylene-o-diamine forms on account southern or only all sing in satiny needles, v. sol. water [c. 160], which gives a red colour with FcCl₃. Glucose converts tolylene-o-diwith reci₃. Chicose converts tolyiene-o-anamine accitate into amorphous 'glycodiamidotoluene' C₁₃H₁₈N₂O₃, m. sol. water (Hinsberg, B. 20, 495; Griess a. Harrow, B. 20, 2209). Glucoson C₆H₁₆O₆ acts in aqueous solution on phenylene-o-diamino, forming C₁₄H₁₆N₂O₄ [c. 186*] (E. Fischer, B. 22, 93). -7. Arabinose forms C₁₂H₁₆N₂O₄ [238*] (G. a. II.).—8. Acrolem in boiling agments solution forms tolylene-o-diaminosis of the control of the cont in boiling aqueous solution forms tolylene-o-di-amine acroson [185°] (Fischer a. Tafel, B. 22, 99)...9. Formic aldehyde forms C₁₈II₂₂N₄ [222°] (Fischer a. Wrezinski, B. 25, 2713)...10. Butyric

 C_1H_1 N N CPr [158°], and the compound $C_{15}H_{22}N_2$ or $C_7H_4 < N_2 < N_2 < N_3 > CFr$ (Hinsberg, B. 20, 1590).-11. Nitrous acid or, better, amyl 90, 1590).—11. Nitrous acid or, better, amyl nitrite acting on a salt of tolylese-c-diamine forms azimido-toluene C,H,N, [84°] (323°), which is v. sol. alcohol and hot toluene (Zincke a. Lawson, A. 240, 115; c/s Ladenburg, B. 9, 220; Bössneck, B. 19, 1759; Nölting a. Abt, B. 20, 3001). Azimido-toluene forms the salts B'₂H₂PtCl_s, NaC,H_sN_s, Hg(C,H_sN_s)₂ [235°], and AgC,H_sN_s. AcCl converts azimido-toluene into

aldchyde forms tolylene-butenyl-diamine

the (3)-acetyl derivative $C_rH_0 < N > NAc$ [94°], while the isomeric (a)-acetyl derivative C_rH_s $\stackrel{NA_0}{\sim}$ N [132°] is formed by the action of nitrous acid on the acetyl derivative of tolvlenep-diamine. -12. Boiling chloro-acetic ether forms exytoluquinoxaline dihydride and a compound Daytoluquinoxanne dinydride and a compound $C_{18}H_{18}N_{1}O_{2}$ (?) [147°], whence HNO forms a compound [248°] (Hinsberg, A. 237, 365).—13. Isalin yields $C_{18}H_{11}N_{8}$ [290°], sl. sol. alcohol (Hinsberg, A. 237, 344).—14. Equal mols, of tolylene-o-diamine and acetoacetic ether when gently warmed together eliminate H.O. and form a condonsation product $C_{18}H_{18}N_2O_2$ [82°]; if this is heated at 100°–120° acetic ether is evolved, and a tolyleneethenyl-o-diamine $C_6H_3Me < NH > C.CH_3$ is pro-

duced (Ladenburg a. Rügheimer, B. 12, 953; Witt, B. 19, 2977, 3299).—15. Chloro-aceto-acetic ether forms C,H_a(NH),CMc.CHCl.CO_sCt [110°], crystallising in needles (Autenrieth a. Hinsberg, B. 25, 606).—16. Oxydehydmaetic acid forms C₄H₄O₅(C₄H₃Me(NII₂)₂) [147°] (Feist, B. 25, 325).—17. o-Aldehydo-benzoic acid in hot

water forms C H₃Me \(\bigc \text{N}{NH} \) C.C₆H₄.CO₂H [258°]

(Bistrzycki, B. 23, 1043).—18. Di-oxy-quinons forms di-oxy-methyl-phenazine $C_{12}H_{10}N_{\nu}O_{2}$ [c. 265°], which yields a di-acetyl derivative [160°]. 19. Opianic acid gives, in alcoholic solution at 0°, the acid C₀H₂Me:(N₂H):C.C₀H₂(OMe)₂·CO₂H₃. orystallising in needles, decomposing at 234' (Bistrzycki, B. 24, 627).—20. Di-bromo-pyruvic acid (1 mol.) forms, on boiling, C, H, N:C.CHBr2

Salts.—B"2HCl. Needles (Hübner, A. 209, 364). - B"H₂SO₄1 aq. Scales. S. 9.29 at 19.5°.

-B"2H₂C₂O₄ aq (Hinsberg, B. 16, 1532). Compound with pyrocal pyrocatechin B"C.H.O. [78°]. Needles (from ligroin) (Merz, B. 19, 726).

Compound with cyanogen B"Cy2 aq. [c. 244°]. Formed by passing cyanogen into an alcoholic solution of the base (Bladin, B. 18, 666). Crystals, m. sol. alcohol and ether. Converted by heating with water into NII, and two isomeric compounds C,H,N,O, one melting at 290°, the other beginning to decompose at 230°-240°. B"Cy₂ yields the salts B"Cy₂HCl 1 luq, B"Cy₂2HCl, B"Cy₂H₂PtCl₂ 2aq, minute needles, (B"Cy₂)₂H₂PtCl₂2aq, and B"Cy₂H₂SO₄ aq : minute tables.

p-Acetyl derivative
C.H.Me(NH_{**})(NHAc) [1:3:4]. [131°]. Formed
by reducing C.H.Me(NO_{*})(NHAc) with iron plate dilute HOAc (Bossneck, B. 19, 1757), Plates (from water). Converted by nitrous acid-into acetyl-azimido-toluene. On distillation it yields tolylene-acetamidine $C_0H_3Me < N > CMe [203°]$

(Niementowski, B. 25, 861).

Di-acctyl derivative C_aH_aMe(NAcH), [216]. Formed by boiling the base with Ac₂O (Bistraycki, B. 23, 1878). This prisms (from water). Yields HOAc and tolylene-acctamidine

Yields tolylené-propenyl-amine manner (B.). [166°] on distillation.

Benzoyl derivative by reduction of C_aH₂Me(NO₂)(NHBz) with tin and HClAq (Hübner, A. 208, 314). Crystals, split up by distillation into water and tolylenebenzamidine [240°].

Di-benzoyl derivative C₄H₃Me(NHBz)₂. [264°]. Got by shaking tolylene-o-diamine with BzCl and NaOHAq (Hinsberg, A. 254, 255), by the action of Bz O on the diamine (Bistrzycki, B. 23, 1879; 24, 631), and by the action of Bz Ql on the benzoyl derivative (Hübner, A. 208, 314). Needles (from HOAc).

o-Chloro-benzoyl derivative C₄H₄Me(NH₂).NH.CO.C₅H₄Cl. [153°] (Schreib, B. 13, 467). Converted by benzoyl chloride into C6H3Me(NHBz).NH.CO.C4H4Cl [178°]. Di-cinnamyl derivative

C_eH₃Me(NH.CO.Č_xH₂)₂. [206°]. Formed from tolylene-o-diamine and cinnamic anhydride (B.). Groups of small needles (from dilute alcohol).

Groups of small needles (from dilute alconol).

Oxalyl derivative C.O.(NH.C.H.e.NH.).
[above 300°]. Obtained by the reduction of C.O.(NH.C.H.e.NO.). (Hinsberg, B. 15, 2691).

Small needles (from alcohol-ligroin). On fusion it splits up into Aq and C.H.A. [193°].—

Salts.—B"H.ZO.5aq. Colourlers needles.

Phthalyl derivatives.

The compounds C₈H_MeN₃H₂(C₈H₄O₂) [104°] and C₈H₄Me(NC₈H₄O₂)₂[272°] are known (Biedermann, B. 10, 1165; Ladenburg, B. 10, 1125).

Benzene-sulphonyl derivative C_aH₃Me(NH₂).NH.SO₂Ph. The hydrochloride, B'HCl, is formed by the action of benzene sulphonic chloride on tolylene-o-diamine in benz-ene (Bistrzycki a. Cybulski, B. 24, 633; cf. Lellmann, A. 221, 18).

Phenyl-acetyl derivative C.H.Me(NH.).NH.CO.CH.Ph. [195°]. Formed from tolylene-o-diamine and phenylacetyl chloride (B. a. C.). Needles, v. sol. hot alcohol.

Di-phenylacetyl derivative C₆H₄Me(NH.CO.CH₂Ph)₂. [176°]. Needles, insol. ether, v. sol. hot. alcohol.

References .- Bromo-, Chloro-, and Nitro-TOLY ENE-DIAMINE.

TOLYLENE-DIAMINE SULPHINIC ACID v. DI-AMIDO-TOLUENE SULPHINIC ACID.

TOLYLENE-O-DIAMINE SULPHONIC ACID C₆H₂Me(NH₂)₂.SO₃H [1:2:3:5]. Formed by reducing nitro-toluidine sulphonic acid (Nietzki a. Pollini, B. 23, 139). Needles. Forms azines with o-diketones.

c-Tolylene-m-diamine sulphonic acid C.H., N.SO. i.e. C.H.Mc(NH.), SO. H [1:2:6:4]. S. .07 at 14°. Formed from toluene p-sulphonic acid by nitration and reduction (Schwahert, A. 186, 360; Marckwald, A. 274, 349). Prisms, not melted at 280°.—BaA', 4aq.—HA'HCl 2aq.—HA'HBr 2aq.—HA'HNO, aq: needles, sl. sol. alcohol.—(HA'), H_SO, aq: plates.

Tolylene-m-diamine aulphonic acid (Bistraycki, B. 23, 1878). Thin prisms (from water). Vields HOAc and tolylene-acetamidine on distillation.

Di-propionyl derivative

CH,Me(NH,Jr,SO,H [1:2:4:5]. S. 1054 at 10°. GH,Me(NH,Jr,SO,H [1:2:4:5]. S. 1054 at 10°. GH,Me(NH,Jr,SO,H [1:2:4:5]. With SnCl, (Limpricht a. Foth, B. 18, 2185; A. 230, 309). Small prisms.—KA'aq.—CH,Me(NH,CO,Et). [133°]. Formed in like BA'. 5 aq.—HA'HCl aq.—HA'HBraq: prisms. Tolylene-m diamine sulphonic acid

C.H.Me(NH.),:SO₂H [1:2:4:x]. Formed from tolylene-m-diamine and fuming H₂SO₄ (Wiesinger, B. 7, 464). Small prisms.—NaA'4aq.—KA'aq.—MgA'₂5aq.—CaA'₂6\frac{1}{2}aq.—SrA'₂7aq.—BaA',6\frac{1}{2}aq.—MnA'₂3aq.

TOLYLENE - DIAMINE THIOSULPHONIC

ACID v. vol. i. p. 188.
TOLYLENE-BENZAMIDINE v. BENZENYL-TOLYLENE-DIAMINE

TOLYLENE-BENZENYL-DIAMINE v. BEN-EENYL-TOLYLENE-DIAMINE

• p-TOLYLENE-BENZYL-DI-AMINE
[1:2:5] C₆H₃Me(NH₂).NHCH₂Ph. Got by reducing p-nitroso-benzyl-o-toluidine by alcoholic ammonium sulphide (Boeddinghaus, A. 263, 809).—B"2HCl. Needles, sl. sol. alcohol. TOLYLENE BLUE $C_{\rm h}H_{\rm 18}N_{\rm i}$ HCl. Formed by

mixing solutions of nitroso-dimethyl-aniline hydrochloride and (1,2,4)-tolylene-m-diamine (Witt, C. J. 35, 358; B. 12, 931). Prisms (containing aq) with coppery lustre, forming blue solutions in water and alcohol. Acids turn the solutions reddish-brown. Alkalis pp. the base as a tarry mass. Tin and HClAq reduce it to the leuco-base, which forms a deliquescent hydrochloride and crystalline (C1, H2, N1) HSnCl3. On boiling tolylene-blue with water for some time part is reduced to leuce-tolylene blue and part oxidised to tolylene red C15H16N1. Tolylene blue heated in aqueous solution containing HOAc for 12 hours at 40° forms tolylene violet $C_{11}H_{14}N_4$, characterised by an insoluble sulphate. Hydrated tolylene-violet $C_{11}H_{14}N_4$ aq is a scarlet powder which dissolves in alcohol and in ether, forming solutions with orange fluorescence.

Tolylene red $\begin{bmatrix} \mathbf{1_4^3} \end{bmatrix} C_e H_3 (\mathrm{NMe_2}) < \stackrel{N}{N} > C_e H_2 Me (\mathrm{NH_2}) \begin{bmatrix} \mathbf{3} \\ \mathbf{4} \\ \end{bmatrix} G : \mathbf{1} \end{bmatrix}$

(Bernthsen a. Schweitzer, A. 236, 332; Andresen, B. 19, 2217). Orange-red reedles (containing 4aq). Forms a red fluorescent solution in al-cohol. Its neutral salts are red, its acid salts are blue. By elimination of NH₂ by the diazoreaction it is converted into di-methyl-amidomethyl-phenazine.

Isomeride of tolylene red

 $\begin{bmatrix} \mathbf{1_4^3} \end{bmatrix} \mathbf{C_0 H_3 (\mathrm{NMc_2})} < \overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}\overset{\mathrm{N}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}\overset{\mathrm{N}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}\overset{\mathrm{N}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{N}}}{\overset{\mathrm{N}}}{\overset{N}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}}{\overset{\mathrm{N}}}{\overset{$

Formed from chloro-di-nitro-tolucue and dimethyl-p-phenylene-diamine and reduction of the product (Witt, B. 25, 3008). Coppery needles, sol. warm water. TOLYLENE-BUTENYL-DIAMINE v. Bu-

TENYL-TOLYLENE-DIAMINE.

TOLYLENE-DICARBAMIC ETHER v. i-TOLYLENE-m-DIAMINE.

C.H.N.O. TOLYLENE DICYANATE [1:2:4] C₆H₂Me(N:CO)₂. [94°]. Formed from tolylene m-diamine and COCl₂ (Snape, C. J. 49, Formed from 258). Needles, sol. ether. When heated with phenol at 130° it yields C₄H₃Me(NH.CO₂Ph)₂ [147.5°] crystallising in needles.

TOLYLENE-ETHENYL-DIAMINE C.H., N. i.e. C.H.Me NH CMe. [203°] (Niementowski, B. 25, 861). (3502) (Nölting a. Witt, B. 17, 81). Formed by boiling (1,3,4)-tolylene-o-diamine with HOAc (Ladenburg, B. 8, 67) by reducing the acetyl derivative of nitro-p-toludine (Hobrecker, B. 5, 920), and by adding aldehyde to a solution of tolylene-o-diamine in very dilute HOAc (Hinsberg, B. 20, 1589). Tables (from water). Forms with acctone and SO, the comwater). Forms with acetone and SU, the compound (C,H,0,N,C,II,0)SO, (Boessneck, B. 21, 1909).—B',H,PiCl,.—B'HNO,.

TOLYLENE ETHENYL ETHYL DIAMINE

CMa-CH.C.N.—SCALA [1669].

C₁₁H₁₄N₂ i.e. CMe:CH.C.N CMe. CH:CH.C.NEt Formed from [1:3:4] C_aH₃Me(NH₂).NHEt and Ac₂O (O. Fischer, B. 26, 200).

Tolylene-ethenyl-ethyl diamine

CMe:CH.C.NEt CMe. [93°]. Got by ethylation of tolylene-ethenyl-diamine (Hübner, A. 210, 351). Formed also by the action of aldehyde (2 mols.) on tolyene-o-diamine (1 mol.) (Hinsberg, B. 20, 1585) and by heating C₆H₄Me(NO₂)NEtAc with zinc-dust and HOAc (Niementowski, B. 20, 1884). Needles (containhing Saq). Combines with ethyl iodide, forming B'EtI and B'EtI, [111], which yield B'EtOH and B'Et_PtOl. Salts.—K'HI aq [148].—B'HNO, ng. [99°]. Milts at 95° when anhydrous—B'C,II,N,O,—Crystals, sl. sol. alcohol.

TOLYLENE-ETHYL-DIAMINE

CMe:CH.C.NH., CH :CH.C.NHEt [55°]. Formed by reduction of nitro-ethyl-p-toluidine (Gattermann, B. 18, 1184; Fischer, B. 26, 199). White plates, quickly blackened by light and air. Rotates on

Reactions .- 1. Bisulphide of carbon yields C_sH_sMe N_{Et} C.SH [139].-2. Ac_sO forms tolylene-ethenyl-ethyl-diamine [166°]. •3. Benzoic aldehyde yields $C_0H_3Me < N_{NEt} > CPh$; while o- and p-nitro- and o-oxy- benzoic aldehydes from corresponding bodies [170°], [176°], and [78°].

Salts. B'HCl. [176']. B',H,C,O,. [151']. Tolylene-ethyl-diamine C. H. Me (NHEt). NH, [1:2:5]. (264° cor.). Formed by reducing nitroso-ethyl-o-toluidine (Koch, A. 243, 307). Oil, v. sol. ether. - B"2HCl. [124°]. Crystals, insol. ether.

Tolylene-ethyl-diamine $O_0H_3Me(NH_2)(NHEt)$ [1:2:4]. $(282^{\circ}$ uncor.). Formed by reduction of nitro ethyl p-toluidine (Nölting a. Stricker, B. 19, 549). Oil. Gives

the reactions characteristic of m-diamines. Tolylene-di-ethyl-diamine C_aH₃Me(NHEt)₂[1:3:4]. (265° uncor.). (Hinsberg, A. 265, 191). Turns black in air.

Tolylene di-ethyl-diamine Tolyiene sliethyl-diamine
C₃H₃Me(NEt₂)(NH₂) [1:2:5]. (240° i.V.). Formed
Dyreducing nitro-di-cth yl-o-toluidine (Bernthsen,
B. 25, 3138). Oil. FcCl₃ slowly gives a purple
colour in an aqueous solution of the sulphate.
Na, 92O, and K, Cr₂O, added to its solution in
HOAc slowly ppt. SO₃H.S.C₃H₂Me(NEt₂)(NH₂)
[210°-215°].—B'H₂SO, Large colourless tables.
DI-TOLYLENE-ETHYLENE-TETRA-AMINE

DI-TOLYLENE-ETH I LEGIL-AMENE.

v. ETHYLENE-DI-TOLYLENE-TETHAL-AMENE.

TOLYLENE-DI-ETHYL-DI-THIO-DI-UREA

OHIOGNHEEL. [140°]. Got TOLYLENE-DI-ETHYL-DI-THIO-DI-UREA [1:3:4] McC₃H,(NH.CS.NHEI)₂ [149°]. Got from ethyl mustard oil (5·5 s.) and tolylene-di-amine (3 g.) in alcohol (15 c.c.) (Lellmann, A. 221, 23). V. sol. alcohol, more sol. HOAc, sl. sol. water. Decomposes when melted into tolylene-thio-urea, Me.C₂H₂(NH)₂CS, and CS(NHEt)_p.

(1.2.4)-Isomeride [225°]. Formed from tolyl- | ene-di-thio-di-urea and EtI at 105° (Lussy, B.

8, 668). Crystals.
TOLYLENE-DI-ETHYL-DI-UREA

[1:2:4]C,H₃Me(NH.CO.NHEt)₂, [175°]. Formed by heating tolylene-urea with Etlat 110° (Lussy, B. 8, 292). Crystals, v. sol. alcohol and ether. TOLYLENE HYDRATE v. PHENYL-BENZYL-

DI-TOLYLENE KETONE OXIDE

 $\begin{bmatrix} \mathbf{1_4^3} \end{bmatrix} \mathbf{C_6H_3Me} \overset{\mathbf{O}}{\underset{\mathbf{CQ}}{\mathbf{O}}} \mathbf{C_6H_3Me} \begin{bmatrix} 3 \\ 4 \end{bmatrix}. \quad [166^\circ].$ Formed by heating oxytoluic acid with Ac.O (Weber, B. 25, 1745). White flakes, sol. alcohol

l ether.

TOLYLENE MERCAPTAN C₆H₃Me(SH)₂
Dithiocresorcin. [37°]. (263°) T1:2:4]. Dithiocresorcin. [37°]. (Klason, B. 20, 355).

Di-toly ene mercaptan

HS.C₆H₃Me.C₆H₃Me.SH. [113°]. Formed from the diazo- compound of di-amido-o-ditolyl by combination with potassium xanthate at 75° and saponification of the resulting oil with alcoholic potash (Leuckart, J. pr. [2] 41, 214). Yellowish plates, v. sol. alcohol and ether. Methyl ether [118°]. Needles

TOLYLENE METHENYL-AMIDINE C.H.N.

i.e. $C_0H_0Me < NH > CH$. [114°]. Formed by boiling from (1,3,4)-tolylene-diamine with formic acid (Ladenburg, B. 10, 1123; O. Fischer, B. 22, 644). -B',H,PtCl_e. Yellow prisms.

TOLYLENE-METHENYL-DIAMINE v. METHENYL-TOLYLENE-DIAMINE and the preceding

body.
TOLYR METHENYL - METHYL - DIAMINE

 $C_0H_{10}N_2$ i.e. CMe:CH.C.N CH. (91°). Formed by heating C,H.(NHL).NIIMe with formic acid (O. Fischer, B. 26, 195).

Isomeride CH.C.NMe CH. (279°).

Formed by heating tolylene-methenyl-amidine with McI (O. Fischer, B. 22, 614). Formed also from (1,3,4)-tolylene-diamine and formic aldehyde (Fischer a. Wreszinski, B. 25, 2711). Oil.

—B'HI aq.—B'HCl. Prisms (from HClAq).

TOLYLENE-METHYL-DIAMINE

[1:3:4] C_aH₃Me(NH₂).NHMe. [44°]. Formed by reducing nitro-methyl-p-toluidine (Gattermann, B. 18, 1487; O. Fischer, B. 26, 194). Formed also by heating methyl-p-amido-toluene-agobenzene sulphonic acid with SnCl, and HClAq (Bamberger a. Wulz, B. 21, 2082). Four-sided tables.

Reactions .- 1. Acetic anhydride yields C,H. CNH CMe [1420]:-2. CS, reacts, forming.

C,H, NH CS [194°].-3. Benzvic aldehyde

· forms C,H₆<N_{NMe} CPh [127°], while o-nitroand o-oxy-benzoic aldehyde form corresponding

bodies [153°] and [180°]. Salts. -B'HCl. [175°-180°]. Plates (from [124°].-B'C,H,N,O, alcohol).-B'H2C2O4.

[164°].
Tolylene-di-methyl-diamine C.H.Me(NMe.)(NH.) [1:5:2]. [28°]. (270°). Formed by reducing nitroso-di-methyl-m-toluidine (Wurster a. Riedel, B. 12, 1801; 13,

126). Needles or prisms, v. sol. water, alcohol, 120). Needles of prisms, v. sol. water, alcor and ether. Yields toluquinone on oxidation.

Acetyl derivative [158].—

B'_2H_PtCl_4aq.

Tolylene-di-methyl-diamine

C₀H₃Me(NMe₂)(NH₂) [1:2:5]. [47°]. (240° i.V.). Formed by reducing nitro-di-methyl-o-toluidine (Bernthsen, B. 25, 3134). FeCl, gives an intense bluish-red colour in neutral solutions. Na S.O. and K2Cr2O, added to the acetic acid solution ppt. C₆H₂Me(NMe₂)(NH₂)S.SO₃H [c. 240°]. Salt.--B'2H SO, Needles, v. e. sol. water.

Tolylene-tetra-methyl-diamine C_oH₁Me(NMe₂)₂ [1:2:5]. (c. 2:0°). Formed by heating the preceding body with MeOII and HCl at 180° (W. a. R.). Liquid. Coloured blue in aqueous solution by FeCl₃.

Methylo-iodide B'MeI. [160°]. Needles.

Tolylene-tetra-methyl-diamine C_aH₃Me(NMe)₂[1:3:4]. (226°) at 717 mm. Got by methylation (Niementowski, B. 20, 1888). Liquid, v. sl. sol. water. FcCl₃ at 40° to 50° gives a reddish-brown colour. HNO₃ added to its solution in H.SO, gives a red colouration.-B'.H₂PtCl_g.-B'HHgCl₃.-B'C_gH₃N₃O₇. Yello tables.

Reference .-- NITRO - TOLYLENE - TETRA-METHYL-

TOLYLENE-METHYL-ETHENYL-AMIDINE

CMe:CH.C.N CH :CH.C.NMe SCMe. [142°]. C₁₀H₁₂N₂ i.e. Formed, together with $C_{10}H_{12}N_2O$ [163°], which . crystallises with 2aq, by reducing the compound $C_6H_3Me(NO_2).NMeAc$ (Niementowski, B. 20, C₃H₃Me(NO₂).NMeac (Nicinenowski, B. 25, 1878), and by acting on tolylene-methyldiamine with Ac₂O (O. Fischer, B. 26, 196). Needles (from hot water). B'₂H₂PtCl₃ (dried at 1974). 100°), [234°-244°],—B'HCl \(\frac{1}{2}aq.\)—B'MeI. [221°].
—B'MeOH. [115°-135°].

TOLYLENE TETRA-METHYL DI-PYRROLE $\begin{array}{llll} \textbf{TETRACARBOXYLIC} & \textbf{ACID} & \textbf{C}_{zz}\textbf{H}_{zz}\textbf{N}_z\textbf{O}, & \textit{i.e.} \\ \textbf{[1:2:4]C}_{o}\textbf{H}_{z}\textbf{Me} \big(\textbf{N} < \begin{matrix} \textbf{CMe}: \textbf{C}, \textbf{CO}_{z}\textbf{H} \\ \textbf{CMe}: \textbf{C}, \textbf{CO}_{z}\textbf{H} \end{matrix} \big), & \textbf{[248°]}. & \textbf{SL}. \end{array}$ sol, hot alcohol and ether.

Ethyl other Et, A'v. Formed by heating di-acetyl-succinic ether with tolylene-m-diamine and HOAc at 150° (Knorr, A. 236, 314). Oil. TOLYLENE-METHYL-THIO-UREA

CMe:CH.C.NH >CS. [194°]. Formed from CH:CH.C.NMe C.H. (NH.) (NHMe) and CS₂ (Fischer, B. 26, 196). Needles (from alcohol).

TOLYLENE-DI-OXAMIC ACID C₁₁H₁₀N₂O₃i.c.

C, H, Me(NH.CO.CO, H), [1:2:4]. Formed, together with the amide, by the action of alcoholic NH3 on the ether. Crystalline. Very sweet. Decomposed by warm KOHAq into oxalic acid and tolylenediamine. - Ag A". - PbA". - BaA" 2aq.

Di. amide C, H, Me(NH.CO.CONH.), [1:2:4]. Cormed from the other and alcoholic ammonia (Schiff, A. 268, 3 3). White powder, m. sol. alcohol.

Ethyl ether [1:2:4] C.H.Me(NH.CO.CO.Et). [130°]. Formed by boiling C.H.Me(NH.).NH.CO.CO.Et with alcohol and oxalic ether (Schiff a. dvanni, A. 268, 340). Small needles (from ether).

C.H.Me.CO.CO.NH. [1:2] [210°]. Formed from C.H.Me(NH.).NH.CO.CO.NH. by boiling

with alcohol and oxalic ether (Schiff, A. 268, |

Amide ether

 ${}^{*}C_{\bullet}H_{\bullet}Me < NH.CO.CO.H_{2}[1_{4}^{2}]$ [c. 220°]. by fusing C,H,Me(NH,).NH.CO.CO.Et with ox. amic ether.

TOLYLENE-OXAMIDE C.H.3Mc NH>C.O.

[c. 260°]. Formed from (1,2,4)-tolylene-diamine and chloro-glyoxylic ether, and also by heating tolylone-diamine oxalate to 160° (Schiff a. Vanni, A. 268, 312).

TOLYLENE-PENTENYL-DIAMINE

 $\begin{bmatrix} 1_4^3 \end{bmatrix} C_6 H_3 M_9 < N_{\text{H}} > C.C_4 H_9. \quad [116^\circ]. \quad \text{Formed}$ by reducing the valeryl derivative of nitro-p-toluidine (Friederici, B.~11,~1974; Hübner, A.~209, Prisms (from ligroin), v. c. sol. alcohol.

TOLYLENE - DI - PHENYL - DI - AMIDO-METHYLENE-DIAMINE C2, H20N, i.c.

C_sH_sMe<NH>C(NHPh)₂. [161°]. Formed from C(NPh), and (1,3,4)-tolylene-diamine at 130°. 149° (Dahm a. Gasiorowski, B. 19, 3057). Needles (from benzene), v. sol. alcohol. -B' 3HCl. [171]. B'H.SO. Plates, v. sol. water and alcohol. TOLYLENE-PROPENYL-DIAMINE

 $C_aH_aMe < NH > CEt.$ [166*]. Formed by distilling the dipropionyl derivative of tolylene-odiamine (Bistrzycki, B. 23, 1879). Needles, m. sol. water, almost insol. ligroïn.

TOLYLENE RED v. TOLYLENE BLUE,

DI-TOLYLENE, DISULPHIDE

CMe:CH.C.S.C.CH:CH [116°]. Formed by the action of heat at 200°-250° on tolylene liazosulphide C_eH₃Me
N [43], obtained from cthenyl - amido - tolyl mercaptan and HNO, (Jacobsen a. Ney, B. 22, 911). Conc. H₂SO₄ gives an intense blue colour.

TOLYLENE - DI - THIO - DI - CARBAMIC ETHER [1:3:4] C, H, Me(N:C(SH).OEt), [120]. Formed by boiling toly!ene-di-thiocarbimide with alcohol (Billeter a. Steiner, B. 20, 230). Plates (from benzene). Yields a yellowish-white silver

TOLYLENE - DI - THIOCARBIMIDE [1:2:4] C.H.Mo(N.CS), [56°], (c. 300°). Formed from tolylene-m-diamine and CSCl., and also by heating tolylene-di-thio-di-urea with conc. HClAq (Billeter a. Steiner, B. 18, 3292; 20, 230). Needles. Converted by NH, Aq into tolylene-dithio-di-urea [206], by aniline into disphenyltolylene-di-thio-di-urea [168]. Copper at 250% produces CaH, MeCy2 [141°

Tolylene-di-thiocarbimide [1:3:4]

C_sH₂Me(N.CS)₂. [42°]. Formed from an aqueous solution of tolylene-o-diamine hydrochloride and CSCl, in CHCl, (B. a. S.). Plates. Converted by HCl at 200° into o-tolylene-thio-urea.

TOLYLENE-DI-THIO-DIGIN COLLIC ACID

C.H.Me(S.CH., CO.H.). [152°]. Formed from thio-orein C.H., Me(S.H.). [35°], chloro-acetic acid, and NaOHAq (Gabriel, B. 12, 1640). Needles, m. sol. hot Aq.

TOLYLENE THIO-URBA $C_aH_aMe < NH > CS$. Formed from C.H.Me(NH,HCl), [1:2:3] and excess of NH SCN by boiling with water, evaporating, and heating to 120° (Lellmann, A. 228, 245). Small red crystals (from alcohol). Does not melt below 326°; may be sublimed. Insol. water, sl. sol. alcohol, dissolved by warm NaOH; re-ppd. by HCl. When boiled with lead acetate and excess of NaOH, no PbS is formed.

O.H.Me</br>
NH>OS. Tolylene - thio - urea [281]. Formed by heating (1,3,4)-tolylene-o-diamine sulphocyanide at 130° (Lellmann, A. 221, 10]. Formed also by the action of alcoholic NH, on o-tolylene di-thiocarbin'de (Billeter a. Steiner, B. 20, 231). Silvery plates, sol. alcohol, HOAe, and cold NaOHAq, sl. sol. water and

m-Tolylene thio - urea C.H.Me NH CS.

[119°]. Formed from (1,2,1) tolyfone-diamine and alcoholic CS₂ (Lussy, B. 8, 293). Crystalline powder, v. c. sol. alcohol.

m-Tolylene-di-thio di urea [1:2:4] G.H.Mc(N.H.O.S.N.H.)... [218°] (L.); [200°] (B. a. S.). Formed by heating tolyleno-m-diamine sulphocyanide (Lussy, B. 7, 1265; Rednamine Saphovyamide (lassy, B. 1, 1205; Gebhardt, B. 17, 3016; Baleter a. Steiner, B. 18, 3293; 20, 228). Crystalling powder, insol. water and ether, nearly insol. alcohol, m. sol. hot

TOLYLENE-TOLENYL-AMIDINE C1.H1.N2 i.e. C₀H₃Me NH C.C₀H₄Me. Formed by reducing [1:4] C.H.Me.CO.NH.C.H.(NO.)Me [4:3:1] (Hübber, A. 210, 331). Needles, sl. sol. water. — B'HCl.—B'HNO., -B'HNO., Crystels, sl. sol.

Water.
TOLYLENE - DI - p - TOLYL - DI - AMIDO -METHYLENE DIAMINE Callan, i.e.

 $C_{\nu}H_{\nu}Me < \frac{NH}{NH} > C(NH_{\nu}C_{\nu}H_{\nu}Me)_{2}$

Formed by heating C(NC₈H,Me), with (1,3,4)-tolylene-diamine (Dahm a. Gasiorowski, B. 10, 3059). Needles (from alcohol).—B'₂3HCl. Deliquescent needles, v. sol. water.

TOLYLENE TOLYL-DIAMINE C, H, N, i.e. [1:3:4] C. H. Mc(NH.) NHC, H. Mc [1:4]. Amido-di-p-tolyl-amine. [109]. Formed by reducing nitro-di-p-tolylamine (O. Fischer, B. 23, 8798; 26, 187). Prisms (from ligroin), turning brownishred in air. H.SO, forms a blue solution changing to green. FeCl, forms C.H.,N,O [188°] crystal-sing in red plates, yielding B',H.PtCl, Boiling with acetic anhydride and sodium acetate with acctic anhydride and sodium acctate produces $C,H_c < N(\frac{C,H_s}{N}) > CMe$ [95°], which forms $H_s^2H_sPtCl_c$. Benzoic aldehyde $C,H_c < N(\frac{C,H_s}{NH}) > CHPh$ [156°], which yields $(C_{sH},N_{sH}$

o Satts. -B'H.C.O., Nearly insol. cold Aq.— B'C₆H,N₃O. Brownish-red crystals. Acetyl derivative [126]. Prisms.

Tolylene-p-tolyl-diamine [1:4:3] C_0H_2 Me(NH $_2$).NHO, H_4 Me [1:4]. Formed from toluene-azo-toluene or s-di-p-tolylhydrazine (hydrazo-toluene) in alcohola solution by the action of SnCl. and HCl (Täuber, B. 25, 1022; cf. Melms, B. 8, 554; Goldschmidt, B. 11, 1626). Plates, v. e. sol. alcohol. NaNO, colours its solution in H₂SO, deep blue (?). Benzoic aldehyde reacts, forming

 $C_{1}H_{\bullet} < \stackrel{N(C_{7}H_{7})}{N} \geqslant OPh \ [165^{\circ}] \ (\textit{cf. Lellmann}, \ \textit{B.}$ 15, 832). Benzil in alcohol and HCl forms C₂,H₂,N₂O [173°]. Ethyl nitrite and H₂SO₄ added to its alcoholic solution form the azimide $C_1H_1 < N(C_1H_1) > N$ [93°]. On oxidation together with p-toluidine it forms the ditoluide of amidotoluquinone (Green, C. J. 63, 1408).

toluquinone (Green, C. J. 63, 1408).

Tolylene-di-p-tolyl-diamine
[1:2:5] C₃H₂Mc(NHC,H₁).

[113°]. Formed by heating hydrotoluquinone (40 g.) with p-toluidine (160 g.) and ZnCl₂ (80 g) to 200°-280° for 5 hours (Green, C. J. 63, 1408). Plates, sol. HOAC, insol.

TOLYLENE-p-TOLYL-GUANIDINE

C.H.Me NH C:NC,H, [198°]. Formed from tolylene-o-diamine and C(NC,H,)2 (Keller, B. 24, 2518). Prisms (from alcohol), or tables (from benzene). Phenyl cyanate forms the compound C,H,N,CO,N,H,CO,NPh [233°], crystallising from hot alcohol in needles .- B'HC! .-B'2H2PtCl6 - B'2H2SO, 5aq. Needles, sl. sol. cold

Acetyl derivative C,H, < NAC > C:NC,H,.

[149°]. Needles, v. sol. alcohol.
Di-tenzeyl derivative [201°]. Needles. Nitrosamine C,H,:N,H(NO):C:NC,H, [c.

Nttrosamine C,H_a;N₂H(NO):C:NC,H₁, [c. 140°]. Decomposed on fusion.

TOLYLENE,p.TOLYL-THIO-UREA
CH:CH.C,N(C,H₁) CS. [270°]. Formed from CMe:CH.C,NH diamine and CS₂ in alcohol (Fischer a. Sieder, B. 23, 3799). Prisms, insol. water, sl. sol. ligroin. Conc. H₂SO₁ forms a green solution green solution.

TOLYLENE-UREA C,H,N,O i.e.

[1:\frac{3}{4}]C_0H_3Me<\frac{NH}{NH}>CO. [292°]. Formed by heating tolylene-o-diamine with urea and got also by the action of HClAq at 140° on $C_eH_sMo < NH > C.OEt [163°]$, which is formed by the action of HN:C(OEt)2 on tolylene-o-diamine hydrochloride (Sandmeyer, B. 19, 2051). Formed also by heating C,H, (NH,).NH.CO.NPh, (Lellmann a. Bonhöffer, B. 20, 2124) or the compound C₁H₆(NH₂).NH.CO.NHPh (Leuckart, J. pr. [2] 41, 324, who states that it melts above 300°); and by heating tolylene-o-diamine in benzene with COCl, in toluene in sealed tubes at 100° (Hartmann, B. 23, 1048). Needles, st. sol. hot water.—B'HCl: prisms.
TOLYLENE - DI - URE:

TOLYLENE - DI - UREL C. H. N.O. i.e. [1:8:4] C. H. Me(NH.CO.NH.). [282°]. Got from tolylene-diamine hydrochloride and potassium cyanate in aqueous solution (Lellmann, A. 221, 14). Needles, sl. sol. water and chloroform,

sol. alcohol and hot conc. HCl; v. sol. HOAc.
Tolylene-di-urea C,H,,N,O, i.e.
[1:2:4] C,H,Me(NH-CO,NH₂)₂. [220°]. Formed from tolylene-m-diamine sulphate and KCyO (Strauss, A. 148, 157). Formed also from tolylene cyanate and ammonia (Lussy, B. 8, 291). Scales, sl. sol. alcohol and hot water.—B"2HCl:

TOLYLENE-VIOLET v. Tolylene blue. s-DI-TOLYL-ETHANE

C.H.Me.CH.CH.O.H.Me. (296°). Formed from

O.H.Me.CH.Cl and sodium (Vollrath, Z. 1866, 489). Oil.

u-Di-p-tolyl-ethane CH₃.CH(C₆H₄Me)₂. (295°). S.G. ²⁰ '974. Formed by shaking paraldehyde with toluene and H₂SO₄ at 0° (O. Fischer, B. 7, 1191). Formed also by heating di-a-tolyl-propionic acid with lime (Haiss, B. 15, 1476) and by the action of ethylidene chloride and AlCl, on toluene (Anschütz, B. 18, 664; A. 235, 315). Oil. Yields toluyl-benzoic acid and di-tolyl ketone on oxidation.

s-mp-Di-tolyl-ethane C2H4(C,H,)2. 300°). Formed from ethylene bromide, toluene, and AlCl₃ (Friedel a. Balsonn, Bl. [2] 35, 52; A. Ch. [6] 1, 487). Yields isophthalic and Formed from ethylene bromide, toluene, . terephthalic acids on oxidation.

References .- AMIDO-, CHLORO-, TRI-CHLORO-

DI-NITRO-, and OXY-TOLYL-, ETHANES.

TOLYL ETHER v. DI-TOLYL OXIDE. o-TOLYL-ETHYL ALCOHOL. hydride CH₂ CH₂ CH₂ CH.CHMe.OH. (195°-200°). Formed, together with the tetrahydride CH₂ CH₂.CMe C.CHMe.OH (142° at 50 mm.) by reducing CaH, Me.CO.CH, in moist ethereal solution by sodium (Kipping a. Perkin, jun., C. J. 57, 22). Oil. Yields an acetyl derivative (201°-208°).

p - TOLYL - ETHYL - m : AMIDO - PHENOL. Ethyl derivative C,H,NEt.C₄H₄,OEt. Formed from C,H,NH.C₆H₄,OH, potash, and Etl (Hatschek a. Zegn, J. pr. [2] 33, 217). Oil.

p-Tolyl-ethyl-p-amido-phenol. Ethyl deri-vative C,,H₂,NO i.e. C,H₂,NEt.C,H₄,OEt. (c. 340°). From C,H₂,NH.C₆H₄,OH, potash, and EtI (H. a. Z.). Oil.

TOLYL-ETHYL-AMINE v. ETHYL-TOLUIDINE. Di-tolyl-ethyl-amine (C,H,Me),NEt. (255°-260° at 20 mm.). Formed by heating di-p-tolyl-amine with EtOH and HCl at 250°-280° (Girard, Bl. [2] 21, 120). Oil.

o-TOLYL ETHYL CARBONATE C10H12O3 i.e. [1:2] C_oH₄Me.O.CO.OEt. (236°). Formed from sodium o-cresol and ClCO₂Et (Bender, B.13,700).

m. Tolyl ethyl carbonate. (246°). Formed in like manner from m-crosol. Oil.

p. Tolyl ethyl carbonate. (245°). Oil. By

long heating at 300° it yields di-p-tolyl carbonate and di-ethyl carbonate (Bender, B. 19, 2268).

DI - p - TOLYL - ETHYLENE C₁₆H₁₀ i.e. C₄H_Me.CH:CH.C₆H_Me. Di.methyl-stilbene. [179°]. (above 300°). Formed by distilling (C₆H₄Me)₂CH.CCl₃ with zinc-dust (Goldschmiedt a, Hepp, B. 6, 1504; Elbs a. Förster, J. pr. [2] 30, 30(0), and by besting distably furgers. Co. 39, 300), and by heating dip-tolyl fumarate, Cobeing evolved (Anschütz, B. 18, 1948). Plates, v. sol. CHCl₂. Yields a dibromide [204°]

u-Di-tolyl-ethylene CH₂:C(C₆H₁Me)₂ (305°). Formed by the action of alcoholic potash on CH₂Cl.CH(C,H₁)₂ (Hepp, B. 7, 1413). Oil Yields di-tolyl-ketrne [94°] on oxidation.

Tetra-tolyl-ethylene $C_{10}H_{10}$ i.e. $(C,H_{1})_2C:C(C,H_{2})_2$ [215°]. A product of the action of chloroform and Al(I₃ on toluene (Schwarz, B. 14, 1529). Plates, with greenishyellow fluorescence, sol. benzene.

References .- Bromo- and Di-chloro- Tolti-

ETHYLENE.

A-TOLYL-ETHYLENE-DIAMINE

C,H,NH.C,H,NH, (c. 267°). Formed from c-tolylamido-ethyl-phthalimide and HCl (Newman, B. 24, 2194). Sol. water and alcohol.— B"2HCl. [168°-178°].—B"2C₄H₄N₃O₄. [148°]. Green needles.

Di-benzoyl derivative [164.5°]. Needles.

Di-bensoyl derivative [164:57]. Needles.
p-Tolyl-ethylene-diamine. Formed in like
manner (N.). Liquid.—B"2HCl. [218].—

C.H.NH.CH._NHC.H., [71°]. 48. 3 at 100°.
S. (cold alcohol) 9. S. (ether) 14. Formed by
the action of o-toluidine on ethylene bromide in presence of Na₂CO₂ (Bischoff, B. 23, 1982, 2031; 25, 3257; cf. Mauthner a. Suida, M. 7, 230; Colson, Bl. [2] 48, 799). Plates (from ligroin), v. sol. alcohol. Yields indole on leating with zine-dust. CH₂Cl.CO₂H and NaOAe from ditolyl-pyrazine hexahydride [1514]. -B"2HCL.-B"H_PtCl_a.—B"H_SO, (dried at 100)).—B'2HBr. [222°]. S. 3 at 100°.

Acetyl derivative C2H4(NAc.C,H2).

[153°].

Bromo-acetyl derivative C2H4(NC,H,.CO.CH2Br)2. [205]. Sl. sol. cold HOAc and ligroin.

Bromo-propiogyl derivative C₂₂H₂₈N₂Br₂O₂. [181°].
Bromo-n-butyryl derivative

 $(C_{2i}H_{30}N_2Br_2O_2)C_0H_a$ (from benzene). [190°].

Bromo-isobutyryl derivatives C,H,NH.C,H,NC,H,CÖ.CBrMe, [137°]

C₂₁H₃₀N₂Br₂O₂ [173°]. Di-p-tolyl-ethylene-diamine [97.5°]. Formed by heating p-toluidine with ethylene browide at 150° (Gretillat, M. S. [3] 3, 383; Bischoff, B. 25, 3260). Crystals, v. e. sol. alcohol. - Hydrobromide [255°].

Acetyl derivative C,H,(NAc.C,H,),

[139°].

Bromo-acetyl derivative C. H. N. Br. O. [196°].

Bromo-propionyl derivative. [182°]. Bromo-n-butyryl derivative C₂₁H₃₀N₂Br₂O₂. [125°]. Bromo-isobutyryl derivative

C₂₄H₃₀N₂Br₂O₂. [175°]. Di-o-tolyl-di-ethylene-diamine [171°]. Formed, together with die-tolyl-ethylene-diamine, by heating o-toluidine with C₂H₄Br₂ (M. a. S.). Needles, sl. sol. alcohol. Forms indole when distilled with zinc-dust.

rorms indoie when distilled with zinc-dust.

Di-p-tolyl-di-ethylene-diamine [190°].

(360°). Formed by heating C,H,Cl.OH with p-toluidine at 220° (Wurtz, A. Suppl. 7, 94°, Demole, A. 173, 138). Prisms, v. sl. sol. alcohol. B'H,PtCl.

Tri-p-tolyl-tri-ethylene-triamine

N₂(C,H),(C,H), (C,H), (E,H). Formed by heating p-toluidine with C,H,Br₂ (G.). Needles, v. alcohol. Is perhaps identical with the preceding body. Its hydrochloride melts at 189°.

Reference .- NITRO - DI - TOLYL - ETHYLENE - DI-

p-TOLYL ETHYLENE ETHYL DIONIDE C.H.Me.O.CH.CH.OEt. (244°). Formed from O.H.O.C.H.Br and alcoholic potash (Schreiber, B. 24, 195).

DI-p-TOLYL ETHYLENE DIKETONE

C₁₆H₁₆O₂ i.s. C₄H₄(CO.O₄H₄Me)_p Di-toluyl-ethane. [159°]. Formed by the action of suc-cinyl chloridg and AlCl, on toluene (Hollemann, R. T. C. 6, 70; Claus, B. 20, 1877). Needlos, v. sl. sol. cold alcohol, insql. alkalia. AcCl converts it into di-p-tolyl-furfurane C18H10 [1645]. Ammonium acetate and HOAc on boiling form di-p-toly]-pyrrolo [197°]. P₂S, forms di-p-tolyl-thiophene [171°]. DI-p-TOLYL-ETHYLENE-DI-METHYL-DI-

AMINE C_{1.}H_{1,}N₂ .i.c. C_.H₁(NMe.C_.H₁Me). [80°]. Formed by boiling its di-methylo-di-bromide with NH₃Aq (Hübner, A. 224, 337). Tables or prisms (from filcohol), v. sl. sol. water.— B"H₂HgCl₄. [190°]. - B"H₂PtCl₆. Orange-

yellow powder.

Methylo-iodide B"Mel. Noedles. De-

composed at 100°. M. sol. hot water.

Methylo-bromide B"2MeBr. Formed by heating di-methyl-p-toluidine with C₂H₁Br₂ at 105 tor some days. Yields B"Me₂H₂Cl₆ [159 - 162], B'Me₂Sn**C**|_a, B'Me₂PtCl_a, and B"45, HMe₂N₂O₃, [197], which crystallises from classical. alcohol.

TOLYL ETHYLENE OXIDE v. ETHYLENE

ETHER OF CRESOL.
DI-p-TOLYL ETHYLENE DISULPHONE (C.H. SC₂)₂C.H₁, [201°]. Made by boiling sodium (Otto, J. pr. [2] 30, 351; 40, 534). Got also by boiling the same salt with CH₃CCl₂CO₂Na. Needles or plates. Dilute KOHAq converts it into believe sulphinic acid and C.H., SO, C.H., OH [55°], which yields C.H., SO, C.H. (OI [79], C.H., SO, C.H., [100°], C.H., SO, C.H., [100°], C.H., SO, C.H., [100°], C.H., SO, C.H., [100°], Ammonia forms (C.H., SO, C.H., S.H., chloride (201°

DI-p-TOLYL-ETHYLENE-UREA

CH_N(C,H) CH_N(C,H) CO. [228"]. Formed from dip-tolyl-ethylene-diamine and COCL (Michlet a. Keller, B. 14, 2181). Needles.

Relier, B. 14, 2181). Needles.
p. TOLYL. DI. ETHYL. PHOSPHINE
C.H., PEt. (210°). Formed from C.H., PCl.
and ZnEt. (Czimatis, B. 15, 2016). Liquid.—
B'Mel. [137°].—B'.Me., PtCl., Yellow plates.
p. TOLYL ETHYL SULPHONE
C.H., SO., C., H., [56°]. Formed by oxidation of
C.H., SEt and by the action of EtBr on sodium

column p-sulphinate (Otto, B. 13, 1276; 18, 161). Formed also by warming the acid C.H. SO. CHMC.CO.H with KOHAq. Trimetric plates; qb:c=526:1:721. Sol. alcohol and

p-TOLYL ETHYL SULPHONE a-CARB-OXYLIC ACID C.H., SO., CHMe.CO., H. Tolyl-sulphonogropionic acid. [37°]. Formed by heating G.H., SO., ha with CHI., CHBr.CO., Et and alcohol at 150° and baponifying the product (Otto, J. pr. [2] 40, 555). Grystals (from alco-hol), converted by Cl into CH., CHCl. SO., C.H., TOLYL ETHYL DISULPHOXIDE v. Ethyl

her of Tolurne thiosulphonic acid.

TOLYL ETHYL THIOBIURET C, E, N, S, [134°]. Formed from tolyl-thiobiuret, alcohol, aqueous NH₂, and EtI (Tursini, B. 17, 585). Needles (from alcohol).

o-TOLYL-ETHYL-THIOSEMICARBAZIDE

C.H.NH.NH.CS.NHEt. [180°]. Formed o-tolyl-

hydrazine and an alcoholic solution of ethylthiocarbimide (Dixon, C. J. 57, 262). Needles, v. sl. sol. cold water. CuSO₄ colours its alcoholic solution deep blue.
TOLYL ETHYL DI-THIO-CARBONATES

CS(OEt).S.C.H.Me. The o-, m-, and p- compounds formed by the action of potassium xanthate on cold solutions of o., m., and p-diazotoluene chloride are oils (Leuckart, J. pr. [2] 41, 188). They are converted into tolyl mercaptans by boiling with alcoholic potash.
o-TOLYL-ETHYL-THIO-UREA

CS(NHEt).NHC,H,Me. [84°]. Formed from o-tolyl-thiocarbimide and ethylamine (Staats, B. 13, 136). Prisms, insol. water, sol. alcohol and other.

p-Tolyl-ethyl-thio-urea [96°]. Formed in like manner (Weith, B. 8, 1530). Tables, v. sol. hot water.

o-Tolyl-di-ethyl-thio-urea CS(NEt.).NHC,II,. [102°]. Formed from o-tolyl-thiocarbimide and NHEt, (Gebhardt, B. 17, 3038). Needles or

p-TOLYL-ETHYL-TOLUTRIAZINE DISIY. DRIDE C₁₇H₁₀N₂ i.e. C₆H₃Me $< \stackrel{N.CHEt}{\dot{N}.N.C_6H,Me}$

[168°]. Formed by heating toluene-azo-toluidine with propionic addelyde at 140° (Goldschmidt a. Poltzer, B. 24, 1009). Needles (from hot benzene).— B'HC. [96°]. — Platinochloride [221°]. Sinall yellow needles.

p-TOLYL-ETHYL-UREA

 $C_{10}H_{14}N_2O$ NHC,H,.CO.NHEt. Formed from p-toluidine and ethyl cyanate (Sell, A. 126, 162). Crystals,

insol. water, v. o. sol. alcohol.

DIo-TOLUZ-FORMAMIDINE C_{1.5}H₁₀N_{.2} i.c.,
NHC₂H_{.7}CH:NC₂H_{.7} [151°]. Formed by boiling the formyl derivative of o-toluidine for a long time, or by heating it with o-toluidine and PCl_s (Ladenburg, B. 10, 1260). Formed also by distilling the thioformyl derivative of o-toluidine in vacuo (Senier, C. J. 47, 762). Prisms (from alconol), insol. dilute NaOIHAq. Yields crystal-line C₁₆C₁₆N₂Br₂.—B'₂H₂PtCl_n.

Di-m-tolyl-formamidine NHC,H,.CH:NC,H,.

[123°]. Formed by boiling m-toluidine with for-[123]. Formed by boiling m-tolundine with formic acid (Niementowski, B. 20, 1893). Needles or plates, in.ol. water. Br in CS, yields crystalline NHC, H, CHBr. NBrC, H,...—B'HCl. [214°].

—B'₂H, PtCl_a.—B'C_aH, N₁O_r. Yellow needles.

Di-p,tolyl-formamidine [141°]. Formed by distilling C,H,NH. CHS in vacuo (Senier, C. J. 47, 767; B. 18, 2296). Prisms.—B'_2H, PtCl_a.

Di-p-TOLYL-FURFURANE C₁₈H₁₀O i.e.

CH:CÔC.H.).

CH:C(C,H.)>O. [164°]. Formed by the action of AcOl on C.H. (CO.C.H.), telolleman, R. T. C. 6, 72). Small plates, converted by P.S. into discovering the converted by P.S. into dis tolyl-thiophene, and by ammonium accuste into di-tolyl-pyrrole.

p-TOLYL-GLYOXAL C.H.Me.CO.CHO. [102°]. Formed from the oxim by dissolving in aqueous NaHSO₃, stirring the crystalline mass with alcohol and a little HOAo, filtering, and boiling with dilute H₂SO₄ (Müller a. Pechmann, B. 22, 2556). Needles (from hot water), v. sol. alcohol. Reduces cold ammoniacal AgNO, but not Fehling's solution. When shaken with benzene (containing thiophene) and H₂SO₄ it solours the benzene green. Yields p-tolyl-glyoxylic soid and p-toluic soid on oxidation.

Phenyl hydrazide C,H,C(N,HPh),CH(N,HPh) T145°]. Yellow needles (from dilute alcohol)

Oxim C,H,.CO.CH:NOH. Tolyl nitroso. methyl ketone. [100°]. Formed from tolyl methyl ketone, amyl nitrite and NaOEt. Needles (from benzene).

Acetyl derivative of the syn-oxim C.H., CO.CH:NOAc [68°]. From the oxim and Ac.O (Söderbaum, B. 25, 3461). Tables (from MeOH). Cold NaOHAq splits it up into NaCy and p-toluic acid. Conc. H₂SO₄ acts in like manner. Ac₄O at 100° forms C,H,CO.CN [52°],•

whence boiling NaOIIAq forms p-toluic acid.

Acetyl derivative of the anti-oxim
C.H.,C(OII),CH:NOAC. [148°]. From the oxim and AcCl at 0°, followed by water. Cold NaOHAq forms C,H,CH(OH).CO,H [146°], v. sol. ether. Conc. H₂SO₄ converts this acetyl anti-oxim into the oxim. Converted by KCy dissolved in dilute alcohol into p-toluyl-formoïn C.H..CO.CH(OH).CO.CO.C,H, [161°] baum, B. 25, 3473)

p TOLYL GLYOXALINE C10H10N2 $\mathbf{c}_{r}\mathbf{H}_{r}\mathbf{N} <_{\mathbf{CH:N}}^{\mathbf{CH:CH}}$. (285°). Got by warming

C7H7N C(SH):N with dilute HNO, (Marckwald, B. 25, 2365). Yale-yellow crystals, sl. sol. water. Smells like mushrooms. -B₂H₁PtCl₆. -B'AgNO₂.-Picrate. [179°]. Golden needles. p-TOLYL-GLYOXALYL MERCAPTAN

 ${}^{\circ}C_{7}H,N < \stackrel{CH}{\underset{C(SH):N}{\leftarrow}} \stackrel{CH}{\underset{N}{\leftarrow}} .$ [205°]. Got by action of boiling HClAq on the product of the action of amido-acetal on p-tolyl thiocarbimide (Marckwald, B. 25, 2363). Silvery leaflets, m. sol. hot water. Yields (C_{ip}H_{ip}N₂S),PtCl, MeI in alcohol forms (C_{ip}H_pMeN,S)HI [95°], which yields the base C₂H₁N₂C(SMe):N [90°], which forms a

picrate [140°].

p-TOLYL-GLYOXYLIC ACID C_yH_yO₂ i.e. C_bH₁Me.CO.CO.H. [97°]. Formed by the action of AlCl, on a mixture of toluene and Cl.CO.CO.C.H. (Roser, B. 14, 1750). Formed also by oxidising p tolyl methyl ketone with cold alkaline K₃FeCy₅ (Buchka a. Irish, B. 20, 1762, 2213). Needles (from ligroïn), sl. sol. hot water, v. sol. alcohol and ether. Yields p-toluic and terephthalic acids on oxidation. Benzene (containing thiophene) when shaken with tolyl-glyoxylic acid and H2SO, is turned red, and finally bluish-violet.

(Claus a. Krose-Salts.—KA'.—NaA' ½aq (Claus a. Kroseberg, B.20, 2018).—BaA', —BaA', 8aq.—CaA', aq. -AgA'. Needles, v. sol. hot water. Ethyl ether EtA'. (260°-270°)

Amide C,H,NO,. [160°]. Prisms. Phenyl hydrazide [144°].

Phenyt hydrazine [122].

DI-o-TOLYL-GUANIDINE C₁₃H₁, N₃ i.e.

C(NH)(NHC,H₂).

[179°]. Formed by the action of NH₃, lead acetate, and KOHAq on di-o-tolyl-thio-urea (Berger, B. 12, 1855). Crystals, sol. ether. Cyanogen passed into its alcoholic solution forms the dicyanide C₁,H₁,N₂ [174°] which is converted by HCl into the oxalyl derivative C1,H1,N3O2 [207°], whence boiling with alcoholic HCl forms CO NC,H,.CO. [214°]. The dicyanide is converted by boiling with aniline into C_mH_{nl}N_s, which yields crystalline B'HCl aq.—B'₂H₂PtCl₄: yellow pp.
Di-p-tolyl-guanidine NH.C(NHC₁H₂)_s. [108°].

Formed by passing cyanogen chloride into fused p-toluidine (W. Wilson, C. J. 3, 154; A. C. Perkin, C. J. 37, 696). Formed also by desulphuration of di-tolyl-thio-urea in presence of NH₃ (Hofmann, B. 7, 1739). Needles (from ligroïn). Nitric acid (S.G. 1-5) gives a di-nitro-derivative [197°], which forms crystalline B'HNO. Alcohol and HNO, (S.G. 1.4) produce di-nitrop-tolyl-urea. Cyanogen passed into its ethereal solution forms C₁₃H₁, N₂Cy₂, crystallising from ether in prisms, converted by dilute HClAq into NH.C \(\begin{align*}
N(C,H,).CO \([188.5^\circ]\) (Landgrebe, B. 10,

The cyanide is converted by boiling in alcoholic solution with aniline hydrochloride into

C₂₄H₂₁N₃ aq [110°-115°].—Salt B'.H.PtCl₃.
Tri · o · tolyl · guanidine C₂₄H₂₃N₃ i.c.
C(NC,H,)(NHC,H.)₂. [131°]. Formed by the action of o-toluidine in alcoholic solution in presence of lead oxide on di-o-tolyl-thiourea (Berger, B. 12, 1857; cf. Girard, B. 6, 415). Formed also when di-o-tolyl-thiouren is boiled for a long time (Barr, H. 19, 1769). Minute prisms. Yields a dioyanide C₂H₂₃N₅ [141°], converted by cone. HClAq in alcoholic solution into C₂H₂₁N₃O₂ [179°]. B'₂H₂P(O)₈: yellow prisms.

Tri-p-tolyl guanidine C₂H₂₃N₅. [123]. S. (alcohol) 7.4 at 0°. Formed by heating di-p-

tolyl-thio-urea with copper (Merz a. Weith, Z. 1868, 610), or, in alcoholic solution, with ptoluidine and PbO (Hofmann, B. 2, 459). Got by heating p-toluidine with PCl, and p-tolyl, cyanate (Weith, B. 9, 820). Formed also when di-p-tolyl-urea is boiled for a long time (Barr, B. 19, 1768), and likewise by the action of p-toluidine on the product of the action of p-toludine on the product of the action of chlorine on tolyl cyanate (Nef. A. 270, 322). Needles (from ligroin). Yields a dicyanide C₂H₂N₃ [184°], which forms BTHCl 3aq and B'₂H₂PtCl₄ and is converted by boiling with alcoholic HCl into di-tolyl-parabanic acid.

Salts.—B'HCl aq. S. 6 at 0°.—B'₂H₁PtCl₄.
S. 045 at 0°.—B'HO₃. S. 07 at 0°.—B'₂H₃O₄.
Plates (from hot water). Neutral in reactions.

Neutral in reaction. Plates (from hot water). p-TOLYL HEPTADECYL KETONE

HYDRIDE C.H., N., i.e. C., H., Me N., C., H., Me N.N., C., H., Me [165°]. Formed by heating cenanthol with toluene-o-azo-toluidine at 175° (Goldschmidt a. Poltzer, B. 24, 1010).

Needles, sol. hot benzene.—BilCl. [96°].—
B'_H_PtCl_. [171°]. Yellow crystalline pp.

o-TOLYL.HYDANTOIN C₁₀II₁₀N₂O₂. [17g°].
Formed by heating o-tolyl-amido-acetic acid with urea at 180° (Ehrlich, H. 16, 742). Light-rellow plates, sol. alcohol and hot water. On poiling with baryta-water it gives o tolylnydantoïc acid, which, when set free from its salts, at once splits up into water and o-tolylnydantoin.

p-Tolyl-hydantoin C, H, N,O, i.e. 20 \\(\text{NH}_{\text{N}(C,H_1).CH_2}\). [210°].

Formed, together with p-tolyl-hydantoic acid CO(NH.).N(C,H.).CH.,CO,H, by fusing p-tolylamido-acetic acid with urea (Schwebel, 1128). Needles (from water), v. sol. alcohol. p-Tolyl-hydantoic acid is crystalline, sl. sol. hot alcohol and hot water.

Di-o-tolyl-hydantoin [275°]. Got from o-tolyl-amido-acetic toluide and COCl. (Bischoff, B. 25, 2275).

 $\text{CO} {<_{N(\text{C},\text{H}_s),\text{CH}_s}^{N(\text{C},\text{H}_s),\text{CH}_s}}$ Di-p-tolyl-hydantoïn [175°]. Formed from p tolyl-amido-acetic toluide and COCl₂ (Bischoff, B. 25, 2280). Plates (from alcohol), sl. sol. ligroin.

TOLYL - HYDRAZIDO - METHYL-THIAZOLE

DIHYDRIDE CHIMC.S C.NH.NHC,H, Formed by heating tolyl-allyl-thio-semicar-azide with cone. HClAq at 100' (Avenarius, B. 21, 270). The p- compound melts at 133'. Both the o- and the p- compounds form crystalline hydrochlorides.

a TOLYL HYDRAZIDO - PROPIONIC ACID H.Me.NH.NH.CHMe.CO.H. [143°]. Formed by the action of sodium-amaigam on the o-tolylhydrazide of pyruvic acid (Japp a. Klingemann,

(P.); [56°] (F.); [59°] (Gallinek a Richtor, B. 18, 3175). Prepared from o-toluidine in the same manner as phenyl-hydrazine is obtained from aniline (Fischer a. Bösler, A. 212, 338; Preund, B. 24, 4200). Glittering plates, slowly oxidised by air, forming a brown oil.—BHCl aq: needles. B'HNO₃: plates. Wi^{ch} SOCl₂ and other it forms C₂H,NH.N:SO, a yellow oil smelling like geraniums (Michaelis, A. 270, 119). Glucose yields o-tolyl-glucosazone $C_{20}H_{20}N_1O_4$ [201] (Raschen, A. 239, 229). Di-methyl di-ketone forms CH₂C(N₂HC,H₁).C(N₂HC,H₂).CH₃ [198°] (Japp a. Klingemann, A. 247, 221).

Formyl derivative C. II Me.NH.NHCHO. [121°]. Formed from o-tolyl hydrazine and formamide. Needles (Gattermann, B. 25, 1078).

Acetyl derivative C,H,NH.NHAc. [104°].

Formed from o-tolyl-hydrazine and Ac.O (G.). Propionyl derivative

C.H., NH.NH.C.H.O. [84°]. Formed from otolyl-hydrazine and propionic acid (G.). Colourless tables.

• Benzoyl derivative C,H,.NH.NHBz. [180]. Got from the hydrazine and BzCl in Et.O (G.). Needles. Gives off all its nitrogen

[31,9] (c.). Needles. Gives oil all its nitrogen in the free state on boiling with Fehling's solution (Strache a. Iritzer, H. 14, 38).
m. Tolyl-hydraziss C, II, NII, NH., (242°) (Buchka a. Schachtebek, H. 22, 841; cf. V. Meyer a. J.ecco, B. 16, 2976).
Oil. — BHCl. Negdles, v. sol. water and alcohol.

p - Tolyl - hydrazine C.H.NH.NH₂. [61°]. (242°). Obtained from p-toluidine (Fischer, B. 8, 589; 9, 890). White plates (from ether), al. sol. water.

Reactions.—1. With SOCl, and ether it forms C.H.NH.N:SO [112°], crystallising in yellow needles (Michaelis a Jtuhl, 4.270, 118).—2. C.H.PCl, forms C.H.NH.N:PC.H. [162°], crystallising in prisms.—3. POCl, forms (C.H.NH.NH.).PO [189°].—4. Acetons forms OMe2(N2HO,H1) [52°]. - 5. Acetoacetic ether.

forms C₁₃H₁₈N₂O₃ [98°] (Knorr, B. 17, 550).— 6. Oxalic ether forms NHC,H, NH.CO.CO,Et. 1138°] (Preund, B. 24, 4198).—7. Di - methyl diketone yields CH₂.C(N₂HC,H₁).C(N₂HC,H₂).CH₃ [280°], and CH₃.C(N₂HC,H₃)Ac [161°] (Japp, C.J. 53, 544).

Salt.-B'C, H, PH, O2. [148°] (Michaelis, A.

270, 134).

Toluene-p-phosphinate P'C,H,PH,O2.

Formyl derivative

C.H.Me.NH.NH.CHO. [164°]. Formed by heating the alcoholic solution of p-tolyl-hydrazine with chloroform and potash. Formed also by heating p-tolyl-hydrazine with formamide at 130° (Ruhemann, C. J. 55, 248). Plates (from water), v. sol. alcohol.

Acetyl derivative C.H.Me.NH.NHAc. [121°]. Formed from p-tolyl-hydrazine and AcOH (Gattermann, B. 25, 1080). Plates.

Propionyl derivative [170°]. Dibenzoyl derivative [188°] (Fischer). Di-o-tolyl-hydrazine.

Formyl derivative (C,H,),N.N.H.O.HO. [130°]. Formed from C,H,N.H.N.H.C.HO and CuSO, (Gattermann, B. 25, 1078). Plates.

Acetyl Alerivative (C,H,),2N.N.H.Ac.

Acetyl oderivative (C,II,),N.NHAc. [191°]. Formed in like manner from acetyl-o-Propionyl derivative [167°]. Needles.

Propionyl derivative [167°]. Needles.

Benzoyl derivative [209°]. Needles.

Needles.

u-Di-p-tolyl-hydrazine (C,H,),N.NII, [172°]. Formed by reduction of di-tolyl-nitrosamine with zinc-dust and HOAc (Lehne, B. 13, 1546). Plates, v. sol, alcohol and benzene. - B'HCl.

Formyl derivative (C,H,)2N.NH.CHO. [146]. Formed from formyl.p-tolyl-hydrazine and CuSO, (Gattermann, B. 25, 1079). Plates. Acetyl derivative. [170]. Needles. Propionyl derivative [171:5]. Needles. Benzoyl derivative. [1873]. Needles.

∽ s-Di-o-tolyl-hydrazine C,H,NH.NHC,H,. o-Hydrazo-toluene. [165°] (P.); [146°] (S.). Formed by reduction of o-toluene-azo-toluene by Bodium amalgam (Petrieff, B. 6, 557; Schultz, B. 17, 467). Converted into di-amido-ditolyl B. 17, 467). Converted into di-amido-ditolyl [8:4:1]C_uH_Me(NH_u).C_uH_Me(NH_u)[1:3:4] [128°] by heating with HCl. The diamido-derivative $C_tH_u(NH_u)$.NH.NH.C.H $_u(NH_u)$ [180°] is a product

of the action of sodium-amalgam on nitro-ptoluidine (Buckney, B. 11, 1453). s-Di-m-tolyl-hydrazine C,H,NH.NHC,H,. Formed by reducing m-toluene-m-azo-toluene by

alcoholic ammonium sulphide (Goldschmidt, B. 11, 1626; Barsilowsky, A. 207, 116). Liquid, converted by H.SO, into . di-amido-ditolyl.

s-Di-p-tolyl-hydrazine C,H,NH,NHC,H,. [126°]. Formed in like manner from p-toluenep-azo-toluene (Melms, B. 3, 553) and by the action of zinc-dust and NaOHAq on p-nitrotoluene (Janovsky, M. 9, 829). Tables or needles, v. e. sol. alcohol. In alcoholic solution it is readily oxidised by air to C,H, N₁,C,H,. Dilute H₂SO₂ convorts it into toluidine and toluene-azo-foluene. On treatment in alcoholic solution with hydrochloric soid it changes to tolylenetolyl-diamine. The di-amido-derivative [1:2:4]O,H,Me(NH,).NH.NH.C,H,Me(NH,)[4:1:2] obtained from C,H,Me(NH,).N,-C,H,Me(NH,) by reducing with sodium-amalgam, is crystalline and yields B"H,SO,, B"2HCl, B"2HBr, and B"H,PtCl, (Graeff, A. 229, 852).

Reference.—Oxy-tolyl-hydrazine.

o-TOLYL-HYDRAZINE SULPHONIC ACID CaH, Me(N2H2).SOaH [1:2:4]. Formed by adding o-diazo-toluene p-sulphonic acid to a cold solu-tion of SnCl₂ (Limpricht, B. 18, 2193). Colourless needles, v. sol. hot water, nearly insol. alcohol.—KA' 2aq: orange-red prisms.—BaA': yellow crystalline powder.
o-Tolyl-hydrazine sulphonic acid

 $C_{a}H_{a}Me(N_{2}H_{3}).SO_{a}H$ [1:x:2]. Formed by heating o-tolyl-hydrazine (1 pt.) with conc. H,SO, (5 pts.) at 100° (Gallinck a. Richter, B. 18, 3175). Thin needles (containing faq). By boiling with aqueous CuSO, it is quantitatively decomposed

aqueous CuSO, it is quantitatively decomposed into a toluene sulphonic acid and nitrogen.—
NaA' 3½aq.—BaA', 4aq.— ZnA', 2aq.—PbA', 6aq.—PbA', 6q.—PbA', 6q. sl. sol. cold water. Decomposed by fusion. Not attacked by warm H₂SO₄.

attacked by warm H,SO,.

p-Tolyl-hydrazine m-sulphonic acid

C₈H,Mc(N₂H₃),SO₂H [1:3:4]. Obtained by reducing p-diazotolugne m-sulphonic acid by cooled SnCl₂ (Limpricht, B. 18, 2193). Slender prisms, sol. hot water. FeCl₃ evolves nitrogenin the cold. Conc. H,SO₄ at 80° forms a red amorphous substance (Schneider, Am. 8, 271).

p-Tolyl-hydrazine disulphonic acid

C₈H,Mc(N₂H₃)(SO₂H₁. Formed by adding 2-diazotolugne disulphonic acid to a cold soln.

C₀H₂Me(N₂H₃)(SO₂H)₂. Formed by adding p-diazo-toluene disulphonic acid to a cold solution of SnCl2 (Limpricht, B. 18, 2193). Nodules,

v. sol. water.—BaH.A", 21 aq: tables.
Di-tolyl-hydrazine disulphonic acid

C.H.Me(SO.H).NH.NH.C.H.Me(SO.H). duct of the reduction of the corresponding azocompound by SnCl₂ (Neale, A. 203, 72). Crystalline powder (containing 2 aq), sl. sol. water. — BaA" 5aq.—CaA" 3 aq: monoclinic efflorescent

Reference .- NITRO - TOLYL - HYDRAZINE SUL-

PLONIC ACID.

o-TOLYL-IMIDO-DIACETIC ACID

[1:2]C H, Me.N(CH, CO, H), [c. 160°]. Formed by heating o-tolyl-amido-acetic acid (1 mol.) with chloro acetic acid (1 mol.), Na CO, (1) mols.) and a little water at 140° (Bischoff, B. 1005. And a noise water at 140 (Discholl, B. 23, 1994; 25, 2270). White crystals, insol. ligroin, sl. sol. ether, m. sol. alcohol.—NH,A'. [100]. V. sol. Aq. Amide C,H,N(CH,,CO.NH.), [164]. Plates. Di-o-toluide C,H,N(CH,CO.NHC,H,),

[150°].

Imids C,H,N < CH,CO NH. [146°]. Prisms (from alcohol), sl. sol. water.

o-Tolylamic acid C.H.N(CH, CO, H).CH, CO.NHC, H, f148°7. Crystals (from ; lcohol).

p-Tolylimido-diacetic acid

[1:4]C₄H₁Me.N(CH₂CO₂H₂, Diglycotolylamic acid. [c. 140°]. Formed by the action of Ch₂Cl.CO₂H₂ on p-tolyl-glycocoll (Meyer, B. 14, 1323; Bischoff, B. 23, 2000). Needles (from water). Very unstable.— CuA'₂aq: green needles.—Ag₄A'(NO₄): needles.—p-Toluidine

salt (C,H,NH,)HA'. [119°]. Crystals, sol. | hot water.

Mono-amide. [222°]. A product of the action of Ac₂O on the compound [108°] got from chloro-acetic acid and p-toluidine (Bischoff, B.

Di-amide C,H,N(CH,CO.NH,), [250°], Di-p-toluide C,H,N(CH,CO.NHC,H), Di-p-toluide C.H.N(CH..CO.)
[251°]. Long needles (from alcohol).

Amide p-toluide C,H,N(CH,CO.NH.)CH,CO.NHC,H, [210°]. p-Tolylamic acid

C.H.N(CH., CO., L). CH., CONIIC, H., [222°]. Needles, insol. water, sol. hot alcohol.

p.TOLYL-IMIDO-DIACRYLIC ETHER
C.H.MEN(CH:CH.CO,Et). [73°]. Formed from p-toluidine and formyl-acetic ether (Von Pechmann, B. 25, 1053). Yellow needles (from dilute alcohol).

o - TOLYL - 8 - IMIDO - BENZYL - MALONIC

ETHER C₂₁H₂₃NO₄ i.e. C₈H_.,C(NC,H₂).CH(CO₂Et)₂. [95°]. Formed by the action of w-chloro-benzylidene-o-toluidine upon sodium-malonic ether (Just, B. 19, 985). Crystals, v. sol. ether. Split up by dilute HClAq at 120° into acetophenone and o-toluidine. The p-isomeride is liquid.

o-TOLYL-8-IMIDO-BUTYRIC ACID

C.H.Me.N:CMe.CH., CO.H. . [112]. Formed by heating acctoacetic other with o-toluidine at 150° (Knorr, B. 17, 542; Pawlewski, B. 22, 2203). Needles (from hot water), converted by conc. H₂SO₄ into (Py. 1) oxy-(B. 4, Py. 3)-dimethyl-quinoline.

p-Tolyl-\$\beta\$-imido-butyric acid. Formed inc like manner from p-toluidine. Crystals. Converted by H₂SO₄ into (Py. 1)-oxy-(B. 2, Py. 3). di-methyl-quinoline.

p-TOLYL IODO-ETHYL SULPHONE

C,H,SO,CH,CH,I. [100°]. Formed from tolyl oxy-ethyl sulphone and HIAq at 160° (Otto, J. pr. [2] 30, 357). Crystals, v. sol. hot alcohol.

TOLYL IODO-METHYL SULPHONE

C.H., SO, CH.I. (126'). Formed by heating sodium toluene sulphinate with CH.I. and alcohol (Otto, B. 21, 655). Small needles, v. c. sol, hot alcohol.

DI-p-TOLYL KETONE CO(CaH, Me) .. 1920]. (333°) at 725 mm. Fornfed by oxidation of di-(355) is (25 mm. Former by oxidation of in-tolyl-methane (Weiler, B. 7, 1183), of n-di-tolyl-ethane (O. Fischer, B. 7, 1195), and of n-di-tolyl-ethylene (Hepp, B. 7, 1414) by chromic acid mixture.

Preparation .- 50 g. AlCl3, 65 c.c. toluene, 50 c.c. CS, and 11 c.c. of a solution of COCl, in CS, saturated at 0° are put into a corked halflitre flask and gently warmed. After 20 minutes HCl is allowed to escape and a second 11 c.c. of CS₂ saturated with phosgene is added. The operation is repeated 2 or 3 times; the yield is 50 p.c. of the calculated (Elbs, J. pr. [2] 35, 467; cf. Ador a. Crafts, B. 10, 2174).

Properties.—Crystals (from alcohol). Con-

verted by HNO, at 250° into benzoyl-terephthalic acid. Reduced by HI and P to di-tolyl-methane (Ador a. Rilliet, B. 12, 2303):

Oxim (C,H,),C:NOH. [163°]. Prisms (Goldschmidt, B. 23, 2746). Decomposes on keeping with sudden evolution of nitrous fumes. Conc. H2SO, at 100° forms the p-toluide of p-toluie

Di-p-tolyl diketone Di-p-tolyl discone C,1,, Cloud P, Tolil. [105°]. Formed by boiling toluon (1 pt.) with HNO₂ (2 pts.) (Stierlin, B. 22, 381). C,H,.CO.CO.C,H,. violet colour when boiled with alcoholic potash.

(a)-Oxim C.H.,C(NOH).C(NOH).C.H., [217°]. Plates or needles, sl. sol. alcohol. Yields a diacetyl derivative [134°]. (B)-Oxim [225°]. Formed, together with the (a)-oxim, by the action of hydroxylamine hydrochloride on the ketone. Needles, v. sol. alcohol. Yields a di-acetyl derivative [144°].

Di-n-tolyl tetraketone C.H. CO.C(OII), CO.CO.C.H., [88°], Formed by the action of nitric acid (S.G. 1°3) on C.H., CO.CH(OH).CO.CO.C.H., (Söderbaum, B. 25, 3474). Prisms (containing (Callino,), CS2) (when crystallised from CS.).

C.H..C(NOH).CO.CO.C(NOH).C.H,. [1819]. Plates (containing Emil) (from alcohol).

C.H..CO.C(NOH).C(NOH).CO.C.H., So called '(\theta)-nitro-cymene. [125"]. Mol. w. 324 (by Raoult's method). Formed by the action of nitric acid on cymene and on p-tolyl methyl ketone (Holleman, R. T. C. 6, 60; cf. Landolph, Recome (Hoheman, R. T. C. 6, 60; c). Landolph, B. 6, 937; Fittica, A. 172, 311). Needles, v. sol. warm alcohol. Converted by NaOHAq into p. toluic acid. Zinc-dust and HOAc reduce it to C.H.,CO.CH.,CH.,CO.C,H, [159°]. Alcoholic NH, forms p-toluic amide and C.,H,N,Q,[162°]. Alcoholic Boiling Ac₂O forms C_{In}H_{In}N₂O₄Ac₂O [167°

Reference .-- OXY-DI-TOLYL KETORE TOLYL-MALONAMIC ACID v. MALONIC ACID. TOLYL-MELAMINE v. Cyanuramide in the article on Cyanic acids.

o-TOLYL-MERCAPTAN [1:2]C,H,Me.SH. [15°]. (188) (H.); (193°) (V.). Formed by reducing (4,1,2)-bromo-tolyl mercaptan (Hübner, A. 169, 30; Vallin, B. 19, 2953). Prepared by boiling o-tolyl ethyl dithiocarbonate with alcoholic potash, the yield being 70 p.c. of the theoretical amount (Leuckart, J. pr. [2] 41, 188). Plates. - Pb(SC,H,), Brick-red pp., turning

m-Tolyl mercaptan [1:3]C,H,Me.SH. [c. 200]. Formed by reducing toluene m-sul-phonic chloride with tin and HCl (Hübner, A. 169, 51) and by boiling m-tolyl ethyl xanthate with alcoholic potash (L.). Colourless liquid with intense odour of mercaptan. Volatile with steam. In ammonincal alcoholic solution it is oxidised by air toen-tolyl disulphide.

p-Tolyl mercaptan [1:4]C₆H₁Me.SH. [48°]. (188°) (J.) a (191°) (Crafts, B. 19, 3180; Otto, B. 419, 3129); (194°) (Vallin, B. 19, 2953). Formed by reducing toluene p-sulphonic chloride with tin and HCl (Märcker, A. 136, 79; Javorsky, Z. 1865, 222). Formed also by heating p-tolyl ethyl xanthate with alcoholiopolash (L.). Formed also from di-p-tolyl disulphide, alcohol, and H.S. (Otto a. Rössing, B. 19, 3180). Unctuous Raine (from ether), volatile with steam. Conc. H. 804 forms a blue solution. Readily oxidised to di-patolyl disulphide [46°]. Chloro-acetone forms C,H,S.CH,CO.CH, (151° at 15 mm.); S.G. 114 10986 which yields a phenyl-hydrazide [62°] (Delisle, A. 260, 268).—Hg(SC,H,)₂.—C,H,S,HgCl. Plates.

Ethyl ether C,H,SEt. (221°). 1.0016. Colourless oil (Otto, B. 13, 1277).

References.-AMIDO and BROMO-

o-TOLYL-MESITYL-THIO-UREA

CH.,NH.CS.NHC,H.Me., [167°]. Formed from o-toluidine and mesityl thiocarbimide (Eisenberg, B. 15, 1014). Needles, in Sol. Aq. DI. TOLYL-METHANE CH.2(C,H.)2. [23°].

Formation.—1. From forms aldehyde (or methylal), toluene, and H.SO. (Weiler, B. 7, 1181).—2. By reducing di-tolyl ketone with HI and P (Ador a. Billiet, B. 12, 2302).—3. A product of the action of AlCl, and toluene on CH₂Cl₂, on CH₂Cl, or on CCl₃NO₂ (Friedel a. Crafts, A. Ch. [6] 11, 266; Bl. [2] 43, 50; Elbs a. Wittich, B. 18, 347).

Properties.—Prisms, v. sol. ether. Oxidised by chromic acid mixture to di-tolyl ketone, toluyl-benzoic acid, and C^(C₈H₁.CO₂H)₂. Yields

stiehl a. Gerber, A. Ch. [6] 2, 353). Crystalline. References. DI-BROMO- and DI-CHLORO-, DI-

TOLYL-METHANE.

o-TCLYI METHYL-p-AMIDO-PHENOL

Methyl derivative C,H,NMe.C,H,OMe. (336° cor.). From C,H,NH.C,H,OH, KOH, and MeI (Philip, J. pr. [2] 34, 59). Oil.

TOLYL-METHYL-AMINE v. Метнуь-TOLUIDINE, METHYL-BENZYL-AMINE, and AMIDO-XYLENE.

Di-p-tolyl-methyl-amine (C.H.)2NM2. (235°-240° at 20 mm.). Formed from ditolylamine, MeOH, and HCl at 250°-280° (Girard, Bl. [2] 24, 120). Does not combine with acids.

DI-TOLYL-DI-METHYL-DI-TRIAZYL

NN(C,H,)>0.C \leq N(C,H,).N CMe.N | CMo (259°-260°). Formed by boiling p-tolyl-hydrazine cyanide (C,H,NII,NII,),Cy, with Ac₂O (Bladin, B. 22, 3114). Crystals (from alcohol), m. sol. alcohol.

p-TOLYL-METHYL-BENZYL KETONE C.H.Mc.COCH...C.H.Me. [102°]. Got by re-ducing p-toluoin with zinc and alcoholic HCI (Stierlin, B. 22, 383). Needles, insol. water, v. sol. benzene.

o-TOLYL-METHYLENE-AMINE

C,H,N:CH₂ (?). Formed by adding o-toluidine to a solution of formic aldehyde (Wellington a Tollens, B. 18, 3307). Colourless syrup.

p-Tolyl-methylene-amine C,H,N:CH₂ (?). [o. 122°]. Formed, together with a polymeride sol. sol. benzene and alcohol, by adding p-toluidine to a solution of formic aldehyde (W. a. T.). Crystals, v. sol. benzene.

Di-o-tolyl-methylene-diamine (C,H,NH),CH2. (over 350°). Formed, together with the following solid isomeride, by heating o-toluidine with CH₂Cl₂ at 116°-115° (Grünhagen, A. 256, 305). Liquid, v. sol. ether and alcohol. -B', H.PtCl.:

brown amorphous powder.

Isomeride [c. 185°]. Crystalline powder,
al. sol. cold alcohol. — Salts: B"2HCl. ¬B"2HCl. ¬-B"H,SO₁. — B"3H₂C₂O₂.

—B"3H₂C₂O₄. Radiating aggregates,

Di-p-tolyl-methylene-diamine

(C,H,.NH)2CH2. (above 350°). Formed, together with the solid isomeride, by heating p-toluiding

with CH₂Cl₂ (G.). Oil, v. sol. ether.—B"HCl.—B"₂H₂PtCl₃.—B"HAuCl₄.

Isomeride C₁₃H₁₈N₂. [c. 156°]. (over 350°).

Amorphous, sl. sol. ether. — B"2HCl (?). — B"H,PtCla.-B"2HAuCl.-B"2H,C2O4. Crystal. line crusts.

Di-p-tolyl-di-methylene-diamine

C,H,N CH₂ NC,H, [90°]. A product of the action of CH₂Cl. on p-toluidine at 100° (Grünhagen, A. 256, 296). Granules, sol. hot alcohol. Converted by nitrous acid into a crystalline nitroso- derivative (C,H,N),C,H,(NOH) (?) — B"2HGI.—B"2HAuCl,.—B"2HBr.—B"H,SO. o-Tolyl-trimethylene-diamine

C₃H_o(NH₂).NHC,H, (281°). Formed by reducing o-tolyl-pyrazole dihydride in alcoholic solution by sodium (Balbiano, G. 18, 354). Oil. p-Tolyl-trimethylene-diamine

C₃H_a(NH₂).NHC₂H₂, [c. -15°]. (287°). A product of the action of Na on an alcoholic solution of p-tolyl-pyrazole (Balbiano). Liquid. Oxalate. [208°]. Spherical groups of minute needles.

p-TOLYL METHYLENE METHYL SUL-PHONE KETONE C,H,.SO,CH,.CO.CH,. [51°]. Formed from chloro-acctone and sodium toluene p-sulphinate (Otto, J. pr. [2] 36, 401). Silky needles. Yields a bromo-derivative [130°].
m-TOLYL-METHYLENE-PHTHALIDE

C₄H₄COC(CHC,H₂) O. [153°]. Formed by heating m-tolyl-acetic acid with phthalic anhydride and a little NhOAc (Heilmann, B. 23, 8157). Needles (from ligroin), sl. sol. ether.

p-Tolyl-methylene-phthalide $C_{le}H_{lp}O_{r}$ p-Xylal-plthalide. [151°]. Formed in like manner from p-tolyl-acetic acid (Ruhemann, B. 24, 3965). Yellow needles (from alcohol), sl. sol. ether. Nitrous acid passed into its solution in chloroform forms $C_s\Pi_1 < C(C(NO_2), C_7H_7) > 0$ [140°], which may be reduced to the compound $C_0^*H_4 < \stackrel{CH:C.C,II}{CO.O}$. [116°].

Reference .- NITRO-TOLYL-METHYLENE-PHTHAL-

m-TOLYL-METHYLENE-PHTHALIMIDINE $C_{s}H_{i} < C(CHC, H_{i}) > NH.$ [165°]. Formed by heating m-tolyl-methylene-phthalide with alcoholic ammonia (Heilmann, B. 23, 3161). Yellowish needles.

p-1.3lyl-methylene-phthalimidine C_{1e}H_{1,}NO. [2042]. Formed by heating p-tolyl-methylene-phthalide with alcoholic NH₃, the compound NH₂CO.C₄H₁,CO.CH.C.H, being first formed (Ruhemann, B. 24, 3908). Converted by passing nitrous acid through its solution in chloroform into C_oH_i C(C(NO₂).C,H₂) NH [227°].

Isomeride C,H, CH:C.C,H, [228°]. Formed by heating $C_0H_1 < CO.O.H_2$ with alcoholic ammonia (R.).

Reference .- NITEO-TOLYL-METHYLENE-PHTHAL-IMIDINE.

DI-p-TOLYL TRIMETHYLENE DISUL. PHONE C.H. (80.C.H.), [125°]. Formed from trimethylene bromide and sodium toluene p-sulphinate (Otto, B. 24, 1834). Plates. Converted by alcoholic potash at 120° into the compound O(CH,CH,CH,SO.C,H,), [80°].

TOLYL-METHYL-IMESATIN v. Toluide of

Methyl-IBATIN

m-TOLYL METHYL KETONE C,H,.CO.CH, Methyl-acetophenone. (219°). Formed by discilling calcium m-toluate with calcium formate

(Buchka a. Irish, B. 20, 1766).

Tolyl methyl ketone. (225°). S.G. 22 ·9891. V.D. 4.58. Formed, together with the p-compound, by the action of AcCl on toluene and AlCl, (Essner a. Gossin, Bl. [2] 42, 95). This is

perhaps the o-compound.

perhaps the o-compound.
p-Tolyl methyl ketone. (217°) (M.); (230°
cor.) (W.). Formed by the action of AlCl, on a
mixture of toluene and Ac,O or AcCl (Michaelis,
B. 15, 185; Claus, B. 19, 234). Formed also by
heating toluene with HOAc, ZnCl, and POCl;
(Frey, J. pr. [2] 43, 114) and as a by-product in
the oxidation of (a)-nitro-cymene (Widman, B.
19, 587). Oil. Yields a dibromide C_bH_bBr_cO
[100°]. KMnO_b torms terephthalic acid. Alkaline
K.FeCv. forms p-toluic and p-tolyl-glyoxylic [100°]. KMnO, forms terephthanic acid. Aikanne K,FeOy, forms p-toluic and p-tolyl-glyoxylic acids (B. a. K.). HNO, forms C₁₈H₁₄N₁₀, [125°], which is reduced by zinc-dust and HOAc to C₂H₄(CO,C,H₂), (Hollemann, Z. T. C. 10, 211). Oxim [88°]. Crystals (from ligroin). Phenyl-hydrazide [97°]. Prisms. Peterone.—Awthor. Iono. and Oys. Tolyl.

Reference. - AMIDO., IODO., and OXY., TOLYL METHYL RETONE.

METHYL o-TOLYL KETONE TETRA-**HYDRIDE** $OH_2 < CH_2 \cdot CM_2 > C.CQ.CH_2$. (206°).

Formed from a di-acetyl-pentane by treatment with conc. H₂SO₄ (Kipping a. Perkin, jun., C. J. 57, 18). Oil, smelling like peppermint. Does not combine with NaHSO₂. In moist ether it is reduced by Na to the been by highlight reduced by Na to the hexabydride.

Oxim C, H, NO. Liquid. Phenyl hydraside C.H., N., Tolyl methyl ketone hexahydride v. METHYL-HEXAMETHYLENYL METHYL KETONE

m-TOLYL-METHYL-MALONIC ACID [1:3]C₄H₄Me.CH_{...}CH(CO₂H)₂. [133°]. Formed by saponification of the ether (Poppe, B. 23, 110). Rhombohedra, sl. sol. water. K.A" : needles.

Methyl ether Me₂A". • (c. 300°). Ethyl ether Et,A". (320°). Formed from -bromo-m-xylene and sodium malonic ether. Oil. Converted by alcoholic NH₂ at 150° into C₆H₄M₆.CH₂.CH(CO₂Et).CO.NH₂[186°], which on warming with water forms the ammonium salt C.H.Me.CH, CH(CO,Et).CO,NH, [77°]. Et ... is converted by methylamine into the methylamide C₅H₄Me.CH₂CH(CO₂Et).CONHMe [120°], and by aniline into C₅H₄Me.CH₂CH(CO.NHPh)₂ [188°]. •

Di-m-tolyl-di-methyl-malonic ether (C₆H₄Me.CH₂)₂C(CO₂Et)₂. [122°]. A product of the action of w-bromo-m-xylene on sodium

malonic ether (Poppe, B. 23, 109)?
o-TOLYL-METHYL-QXAZOLINE C₁₁H₁₈NO i.e. CHMe.O C.C.H. (258°). Formed by boiling C,H,,CO.NH.CH, CHMeBr with alcoholic potash (Salomon, B. 26, 1323). Oil.—B'C,H,N,O,, [129°].—B',H,PtOl, Vol. IV.

p-Tolyl-methyl-oxazoline C, H, NO. (265°). Formed from the bromopropyl-amide of p-toluio acid (Salomon, B. 26, 1826). Oil.—Picrate B'C.H.N.O., [183°].—B',H.PtOl., [184°].
p-TOLYL-DI-METHYL-PHOSPHINE

C.H.PMe. (210°). Formed from C.H.PCl, and ZnMe. (Czimatis, B. 15, 2014). Oil, oxidised by HgO to C.H.PMe.O. CS. forms C.H.PMe.OS.

[110] crystallising in red plates.

Methylo-iodide B'Mel. [255]. Needles.

Yields B'Mel, and B'_Me.PtCl.

Benzylo-chloride. Yields

B'2(C,H,).PtCla [226°], a yellow crystalline pp.

p-TOLYL METHYLPHTHALIMIDE [4:2:1]C_aH_aMe:C_aO₂N.C_aH_aMe. [180]. Formed by distilling (4,2,1)-methyl-phthalic acid with p-toluidine (Niementowski, M. 12, 630). Crystalline mass, v. e. sol. chloroform, insol. water.

p-TOLYL-METHYL-PHTHALIMIMINE C₆H₄ CO CH(CH₂·C₆H₄Mo) NH. [149°]. Formed from p-tolyl-methylene-phthalimidine, HI and P (Ruhemann, B. 24, 39(%). Needles.

DI-D-TOLYL-METHYL-PIPERAZINE C₁₉H₂₁N₂. [105°]. Formed from di-p-tolyl-propylene-diamine, ethylene bromide, and C19H21Ñ2. Needles (from alcohol) (Bischoff, B.

o-TOLYL-METHYL-PROPYLENE. .. THIO. UREA CHMe.S C.NMe.C.H., (c. 295°). Formed • from o-tolyl-propylene-ψ-thio-urea and MoI (Prager, B. 22, 2999). Yields (β)-methyl-taurine on oxidation.—B'C₀H₁N₃O₇. [138°].—B'HI. [166°].—B'₂H₂PtCl₃. Decomposes over 200°.

p-TOLYL-DI-METHYL-PYRROLE

(C,H,)N < CMe:CH. [46°]. (255°). Got by heating the di-carboxylic acid (Knorr, B. 18, 808). Crystals, volatile with steam.

Reference .- AMIDO-TOLYL-DI-METHYL PYRROLE. p-TOLYL-DI-METHYL-PYRROLE DICARBO

OXYLIC ACID (C,H,)N CMe;C,CO,H Got by saponifying its ether, which is formed by mixing acetic acid solutions of di-acetyl-succinic ether and p-toluidine (Knorr, B. 18, 304). Needles, decomposes at about 250°, with evolution of CO₂.

—K₂A".—AgHA".

Ethyl ether Et, A". [67°]. Tables. Reference. - AMIDO-TOLYL-DI-METHYL-PYRROLE DICARBOXYLIC ACID.

p-TOLYL-DI-METHYL-SULPHAMIDE SO₂(NMe₂).NHC,H,. [91°]. Formed from N. fe. SO Cl and p-toluidine (Behrend, A. 222,

120). Crystals, v. sol. alcohol and ether.

p. TOLYL METHYL SULPHONE
C.H., SO., C.H., [87°]. Formed by the action of conc. Kelling on p. tolyl-sulphono-acetic acid (Otto, B. 18, 161). Got also from C.H., SO.Na and Mel (Otto). Needles (from very dilute

alcohol), v. sol. hot water o-TOLYL-METHYL-THIAZOLINE

CHMe.S C.C,H,. (284°-295°). Formed by beating o-toluic bromo-propylamide with P.S. at 150° (Salondon, B. 26, 1328). Oil.

at 150° (Salomon, 2. 2007).
B'C,H,N,O., [186°].
p-Tolyl-methyl-thiazoline C,H,,NS. (295°).
Oil.—B'C,H,N,O., [141°].—B',H,PlOl.

o-TOLYL-METHYL-THIOHYDANTOIN

 $HMe < \stackrel{CO.N(C,H,)}{NH.CS}$ [198°]. Formed from o-tolyl-thiocarbimide and alanine (Marckwald, B. 24, 3281). Crystals.
p - Tolyl-methyl - thiohydantoïn.

Formed in like manner from p-tolyl-thiocarb-imide and alanine (Aschan, B. 17, 427). Minute prisms. On heating with alcoholic potash it is converted by hydrolysis into a salt of the oily NHO,H,CS.NH.CHMe.CO,H, which slowly changes, in the free state, back into the hydantoïn.

o-Tolyl-di-methyl-thiohydantoin

CMe₂ CO .N(C,H₁). [175°]. Formed from o-tolylthiocarbimide and a-amido-isobutyric acid (Marckwald, B. 24, 3284). Needles, v. sol. hot

p-Tolyl-di-methyl-thiohydantoin. [85°]. Formed in like manner from p-tolyl-thiocarbimide. Crystals, v. sol. most solvents. o-TOLYL-METHYL-TWIO-UREA

NHMe.CS.NHC,H,. [153°]. Formed, from methyl-thiocarbimide and o-toluidine in alcohol (Dixon, C. J. 55, 622). Pearly crystals, m. sol. hot water, sol. alcohol.

p-Tolyl-me.hyl-thio-urea. [126°]. Formed inlike manner from p-toluidine. Vitreous prisms, v. sol, hot water.

Reference .- TOLYL-THIO-UREA

Reference.—TOLYL-THIO-UREA.

o-TOLYL-(a)-NAPHTHYLAMINE O₁,H₁₅N
i.e. O₁₀H₁,NH.O₄H₁Mo. [95°]. Formed by heating (a)-naphthol (1 mol.) with o-toluidine (2 mols.) and CaCl₂ (1 mol.) in sealed*tubes at 290°, the "rield being 37 p.c. of the theoretical amount (Friedländer, B. 16, 2084). Flat needles, v. sol. alcohol and ether.

o-Tolyl-(8)-naphthylamine C₁₀H,NH.C₆H₄Me. [96°]. Formed by heating a mixture of (3)-naphthol with o-toluidine and CaCl, at 280°. B'laghinou with o-toming the county plates (from ligroin), v. sol. alcohol.—B'2C.H.N.O., [110°]. Reddish-brown needles.

Bensoyl derivative [118°]. Plates.
p-Tolyl-(a)-naphthylamine C.,H.N. [79°].

(360° at 528 mm.). Formed by heating (a)-naphthylamine to the county of the county o

thol with p-toluidine and CaCl, at 280°, the yield being 50 p.c. Short prisms (from alcohol). Its solutions exhibit blue fluorescence.

p-Tolyl-(β)-naphthylamine. [104°]. Formed by heating p-toluidine hydrochloride with (3)-naphthol for 8 hours at 200° (Witt, B, 20, 578; cf. Friedländer, B. 16, 2078). Plates (from alcohol). Its solutions have violet-blue fluor-escence. Dissolved in isoamyl alcohol it is reescence. Dissolved in isoamyl alcohol it is reduced by Na to a hydride [44°] (Lamberger/a. Müller, B. 22, 1809). With nitroso-dimethylaniline hydrochloride and HOAo it yields c. saffranine C₁H₁N₂Cl(C₁H₁):C₆H₁NMe₂ (Witt, B. 21, 724). p-Tolyl-naphthyl-amine (10 6.), heated with nitroso-dimethylaniline hydrochloride (4 g.), ZnCl, (10 g.), and HOAc (100 c.c.), forms $C_{20}H_{12}(NH.C_{u}H_{4}Me)_{2}$ [225°], which yields an acetyl derivative [225°].

Acety bederivative [85°]. Needles. "Benzoyl derivative [139°]. Needles. Reference. — TETRA-BROMO-TOLYL-NAPHTHYE

DI-p-TOLYL-NAPHTHYLENE-DIAMINE $C_{10}H_{c}(NHC_{b}H_{r})_{p}$. [237°]. Formed by heating di-oxy-naphthalene with p-toluidine and p-toluidine hydrochloride (Annaheim, B. 20, 1373 Needles (from xylene). Gives a red colour o heating with solid ZnCl...
o-TOLYL-(a)-NAPHTHYL-THIO-UREA

CS(NHC, H.)(NHC, H.). [168°]. Formed be the action of o-tolyl thiocarbimide on (a)-napl thylamine or of (a)-naphthyl thiocarbimide of the control of the con o-toluidine (Mainzer, B. 15, 1416). Shon needles, sol. alcohol. Split up by cone. HClA ct 150° into o-toluidine, (a)-naphthylamino-tolyl-thiocarbimide, and (a)-naphthyl thic carbimide.

o - Tolyl - (β) - naphthyl - thio - urea [194° Formed from o-tolyl thiocarbimide and (3)-napl thylamine (M.).

 $p - \text{Tolyl} - (\alpha) - \text{naphthyl} - \text{thio} - \text{urea}$ Formed from p-tolyl thiocarbimide and (a)-naph thylamine (M.). Slender white needles.

p-Tolyl-(β) - naphthyl-thio-urea [164°]

Formed from p-tolyl thiocarbimide and (β) naphthylamine (M.). Decomposed by HClAq a 150° into p-toluidine, (β)-naphthylamine, p-toly thiocarbimide, and (B)-naphthyl thiocarbimide. p-TOLYL p-NITRO-BENZYL OXIDE

C.H.M.O.C.H., C.H., NO. [91°]. Formed from p-nitro-benzyl chloride and alcoholic C.H., ON (Frische, A. 224, 144). Yellowish plates, so ether.

TOLYL NITROSO-METHYL KETONE 2 Oxim of TOLYL-GLYOXAL

TOLYL-OXAMIC ACID v. vol. iii. p. 654. TOLYL-OXAMIDE v. OXALIC ACID.

o-TOLYL-OXAZOLINE $CH_2, N > C.C_1H_1$.

(255°). Formed by dissolving o-toluic bromo cthyl-amide in hot water and adding alkal (Salomon, B. 26, 1322). Oil. Evaporating with aqueous HCl (1 mol.) forms the compound C₁H_.,CO.O.CH_.,CH_.,NH_., while excess of HC gives C,H.,CO.NH.CH_.,CH,Cl. — B'C₂H₂N₁O₁, P. Tolyl-oxazoline C₁H₁NO. [66°]. (265°) Formed by decomposing C,H.,CO.NH.CH_.CH_.B with alkali. Needles.—B'C.H.N.O. [188°].

with alkali. Needles.—B'C₈H₁N₃O₇. [188°].—B'₂H₂PtCl₆. [186°].

DI-o-TOLYL OXIDE (C.H.Me)2O. Cresy ether. (272°-278°). S.G. ^{24°8} 1.047. A produc of the distillation of Al(OC₆H₄Me), (Gladstone a Tribe, C. J. 49, 27). Oil, smelling like geraniun

Di-m-tolyl oxide $(C,H_1)_2O$. $(284^\circ-288^\circ)$ μ_a 1-5576 at 16°. V.D. 193-9. A product odistillation of aluminium thymol Al $(OC_{10}H_{12})$ (Gladstone a. Tribe, C. J. 41, 13). Oil. Fi-p-tolyl oxide $(C,H_1)_2O$. (50°) . $(270^\circ-800^\circ)$

Formed by distilling aluminium p-cresol (C. a T.). Prisms (from alcohol).

Isomeride [165°]. Formed by heating p-cresol with ZnCl₂ (Busch, B. 17, 2688). Crys tals, volatile with steam.

DI-TOLYL-OXINDOLE $C_0H_1 < \binom{C(C_1H_1)_2}{NH} > CO$

Toluisatin. [200°]. Formed by adding toluent to a solution of isatin in H₂SO₄ (Baeyer a Lazarus, B. 18, 2638). Needles, v. sol. alcoho. and ether, sol. aqueous alke, iis. Yields an acety derivative O₂H₁₂O(NAc) [143°] and an ethy derivative O₂H₁₂O(NEt) [108°], both being crystalline. talline.

TOLYL-OXY-ACETIC ACID v. Tolyl derivative of GLYCOLLIC ACID and OXY-TOLYL-ACETIC ACID. p-TOLYL OXY-ETHYL SULPHONE

The Solution of the state of the solution of t C, H, S, O, [84°].

Bensoyl derivative C.H., SO₂, C₂H₄, OBz. [176°]. Needles, sl. sol. hot alcohol. DI-o-TOLYL-PARABANIC ACID C₁, H₁₄N₂O₂

6.c. CO (N(C,H₁),CO [203°]. Formed by boiling ar alcoholic solution of oxalyl-di-tolyl-guanidine with conc. HClAq (Berger, B. 12, 1856). Small needles.

Di-p-tolyl-parabanic acid [144°]. Formed by boiling di- (or tri-) p-tolyl-guanidine dicyanide with alcohol and HCl (Landgrebe, B. 11, 978).

Vita atconol and HCI (Landgrees, B. 11, 978). Plates. Oxidised by potassium permanganate to CO\N(C_6H, CO_7H).CO [159°?].

p-TOLYL PENTADECYL KETONE
C_1H_1,CO.C_H,Me. [50°]. (262° at 15 mm.). Formed from palmityl chloride, toluene, and AlCl. (Krafft, B. 21, 2266). Needles (from alcohol). Vields at toluic acid on oxidation. Yields p-toluic acid on oxidation.

o-TOLYL-PENTHIAZOLINE C,III,NS i.e. C,H,C.S,-CH₂. Got by heating trimethylene

chlorobromide with thio toluic amide (Pinkus, B. 26, 1081). Oil, volatile with steam. hydrochloride gives a white compound with HgCl₂

p-Tolyl-penthiazoline [53°]. p-TOLYL-PHENTLIAZINE. Dihydride

C.H. N = N CH₂N.C.H., [151°]. Formed by the action of HNO2 on o-amido-benzyl-p-toluidine hydrochloride (Busch, B. 25, 450). Yellow plates (from alcohol).—B'HCl.—B₂H₂PtCl_e. [190°].—B'C₄H₃N₃O₇. [132°]. Dark-yellow needles.

p-TOLYL-PHENYL-ACETAMIDINE C₁H₁₈N₄

p-10111-FHENTE-ACETAMIDINE C_{1,}H₁₀N₂
de. C_{c,}H_{v,}CH₂C(N.O.,H,Me).NH₂ [119²). Formed
by heating phenyl-acetonitrile with p-toluidine
hydrochloride (Bernthsen, A. 184, 342). Crystals (from alcohol).—B'_{v,}H_pF(C₁; yellow prisms.
DI - p - TOLYL - DIPHENYLACETYLENE DIAMINE C₂₈H_{2,}N₂ i.e. C,H₁N·OPh.CPh:NO.H₁.
Idi²]. Formed together with B₂ C(B.N.O.H.

[161°]. Formed, together with Bz.CPh:NO,H, [116°], by heating benzil (1 mol.) with p-toluidine (2 mols.) at 130° (Bandrowski, M. 9, 690). Triclinic plates.

DI - TOLYL - PHENYLENE -DIAMINE v. PHENYLENE-DI-TOLYL-DIAMINE.

TOLYL PHOSPHATES.

Tri-o-tolyl-phosphate (C,H,O),PO. Formed by heating o-cresol with POCl, the yield being 95 p.c. (Heim, B. 16, 1767; Rapp, A. 224, 173). Oil, sol. alcohol and ether.

p-Tolyl phosphate PO(OC,H,)(OH), [116°]. Formed by the action of water on PO(OC,H,)Cls which is a product of the action of POCl, on p-cresol (Rapp, A. 224, 168). Plates, sol. alcohol, ether, and water.

Tri-ptolyl phosphate PO(OC,H,),. [78°]. Formed by heating p cresol with POCl,, the yield being 95 p.c. eColourless tables, insol. Aq. p - TOLYL - PHOSPHINE C,H,NH. [4°]. (178°). Formed by the action of AlCl, on a mixture of toluene and PCl, the resulting

C,H,PCl₂ [20°] (245°), being converted by water into C,H,P(OH)₂, which splits up on heating into tolyl-phosphine and toluene phosphonic acid C,H,PO,H, (Michaelis, B. 12, 1009; 18, 659; A. 212, 230). Oil with strong odour. Rapidly oxidised by air to C.H.P(OH). HI forms C.H.PH.I, crystallising in colourless needles.

p . TOLYL . PHTHALIDE C ... H ... O. i.c. $C_0H_1 < \frac{CO}{CH(E,H_2^2)} > 0.$ [129°]. Formed by reducing C,H,.CO.C,H,.CO,H in alcoholic solution with Zn and HCl (Gresly, A. 234, 235). Needles, sol. hot alcohol, imsol. NH, Aq.

Di - p - tolyl - phthalide $C_0H_4 < \frac{CO}{C(O_1H_1)_2} > O$. [116°]. Formed by heating phthalyl chloride (100 g.) with tolueno (450 g.) and AlCl. (Berchem, Bl. [2] 42, 168; cf. Friedel a. Crafts, Bl. [2] 35, 505). Prisms, sol. alcohol and ether.

TOLYL - PHTHALIMIDE v. Tolylimide of

PHTHALIC ACID. m-TOLYL-PROPIOLIC ACID C,H, CiC.CO,H. [109.5°]. Formed by boiling di-bromo-tolyl-propionic soid C.H., CHBr.CO.H with alcoholic potash (Müller, B. 20, 1215). AgNO.

gives an explosive white pp.
o-TOLYL-PROPIONIC ACID C,H,C,H,O,Monoclinic prisms (Young, B. 25, 9102).

m-Tolyl-propionic acid C,H,.CH2.CH2.CO.H. [43°]. Formed by reducing m-tolyl-acrylic soid with sodium-amalgam (Müller, B. 20, 1214; von Miller, B. 23, 1899). Needles (from ligroin), sol.

water, alcohol, and ether. Volatile with steam.

m-Tolyl-propionic acid [125°]. Formed by oxidation of m-isobutyl-toluene by HNO, (Effront, B. 17, 2330). Needles, sl. sol. hot water. AgA': crystals, sol. hot water.

p-Tolyl propionic acid. [116°] (Von Miller, B. 23, 1898); [120°] (Kröber, B. 23, 1033). Formed by reducing p-tolyl-acrylic acid. Condensed by hot H2SO, to oxy-methyl-indonaph-

Di-a-tolyl-propionic acid CII₂.C(C,H,)₂.CO₂H. [152°]. Prepared by adding toluene to a solution of pyruvic acid in H2SO, at -10° (Böttinger, B. 14, 1596; 15, 1474). Monoclinic crystals, sol. hot alcohol. Give u-di-tolyl-ethane on distillation with lime. Oxidised by KMnO, to di-phenyl-ethane tri-carboxylic acid .-- AgA'.

Ethyl ether EtA'. [145°]. Prisms. References. -- BROMO-, NITRO-, and OXY-,

TOLYL-PROPIONIC ACIDS.
7-TOLYL-PROPIONIC ALDEHYDE

C.H., CH2, CH2, CHO. (223°). S.G. 11 9941. Formed by the action of water on the corround (223°). S.G. 11 .9941. of CrO₂Cl₂ with the dymene got from camphor and P₂O₃ (Richter a. Schüchner, B. 17, 1931). Got also by distilling calcium p-tolyl-propionate with calcium formate (Miller, B. 23, 1082). Oil, smelling like peppermint. Volatile with steam. Yields p-toluic and terephthalic acids on oxida-

DI-o-TOLYL-PROPYLENE-DIAMINE

OHMe(NHC,H,).CH2.NHC,H, (280° at 120 mm.). Got by heating o-toluidine with propylene bromide (Bischoff, B. 25, 3276).

Acetyl derivative Cz, Hz, N.O. [1207].

Di.p-tolyl-propylene-diamine

C.H. (NHO,H.);. (277° at 48 mm.) (Bischoff, B.
25, 3277). Got from p-toluidine and C.H.Br. Oil.

Acetyl derivative C₂₁H₂₈N₂O₂. [114°], Bensoyl derivative C₂₁H₂₀N₂O₂. [152°]. o-TOLYL-PROPYLENE-y-THIO-URBA

C,H,NH.C N.CH. [126°]. Formed from s-o-tolyl-allyl-thio-urea and HCl (Prager, B. 22, 2999). Tables, sl. sol. hot water.—B'₂H₂PtCl₄. [178°]. Prisms.—B'C₆H₃N₄O₇. [176°]. Cubes. DI-o-TOLYL-PROPYLENE UREA

C.H. NC,H. CO. [93°]; Formed from di-otolyl-propylene-diamine and COCl, (Bischoff, B. 25, 3276). Prisms (from dilute alcohol).

Di-p-tolyl-propylene-urea. [130°]. d-TOLYL ISOPROPYL METONE

C.H.Me.CO.Pr. (236°). Formed from toluene, isobutyryl chloride and AlCl. (Claus, J. pr. [2] 46, 480). Oil, with bitter taste and aromatic odour. Yelds p-toluic and terephthalic acids on oxidation. Yields an oxim [92°]. May be reduced to p-tolyl-isopropyl-carbinol; an oil boiling above 300°.

DI-o-TOLYL-PYRAZINE HEXAHYDRIDE $\textbf{C}_{\bullet}\textbf{H}_{\bullet}\textbf{Me.N} \diagdown \begin{matrix} \textbf{CH}_2 \textbf{\cdot} \textbf{CH}_2 \\ \textbf{CH}_2 \textbf{\cdot} \textbf{CH}_2 \end{matrix} \searrow \textbf{N.C}_{\bullet}\textbf{H}_{\bullet}\textbf{Me.}$ Di-o-tolul-Formed from ethylene piperazine. [171°]. bromide, o toluidine, and Na CO, at 160° (Bischoff, B. 22, 1781; 23, 1982; cf. Mauthner a. Suida, M. 7, 233). Crystals (from ether).

Isemeride. [154°]. Formed by heating dio-tolyl-ethylene-diamine with chloro-acetic acid and NaOAc (Bischoff, B. 23, 2031). Thin needles (from alcohol).

Di-p-tolyl-pyrazine hexahydride

C,H,N,CH,N,CH, [188°]. Formed from p-toluidine and C.H.Br. in presence of NaOAc or Na₂CO₂. Prisms, sl. sol. alcohol. With NaNO₂ and HOAc it yields a di-nitrosoderivative [167°].

 $CH {\gtrless}^{CH.N.C_7H_4Me}_{CH:N}$ o-TOLYL-PYRAZOLE

(246.5° cor.). S.G. § 1.0868; 15 1.0753. Formed by boiling epichlorhydrin (1 mol.) with o-tolyl-hydrazine (2 mols.) and benzene, boiling off the

hydrazine (2 mols.) and benzene, boiling off the benzene, and heating the residue at 150° (Balbiano, G. 18, 368). Not reduced by boiling with alcohol and Na.—B',H,PtCl, [201°].—B'EtI. [100°]. Needles, v. e. sol. water.

Dihydritle O,H,N,,C,H,. (271°). S.G. a 1.084. Formed from acroloin tolyl-hydrazide and dilute (2 pc.) H,SO, Oil. Sol. fuming HClAq, but reppd. by water. K,Cr,O, and H,SO, give an indigo-blue colour.

-T-Tulyl-pyraxole. [33°]. (259° cor).

p-Tolyl-pyrazole. [33°]. (259° cor.). Formed, in like manner, from epichlorhydrin and p-tolyl-hydrazine. Yell-wish plates, sl. sol. hot water.—B'H.PlCl, 2aq: needles. [184°].—B'Etf. [105°]. Prisms, v. sol. water.

Dihydrids. [60:5°]. (282° i.V.). Formed from acrolein p-tolyl-flydrazide and dilute H.SO.. Got also hy verbaling actally negraph in the label of the state of the s

Got also by reducing p-tolyl-pyrazole in alcoholic solution by Na. Iridescent plates, sl. sol. hot water. Its acidified solution is coloured violetred by K,Cr,O,

CHMe.N.C.H. (262°). Formed by heating piperidine with p-promotoluene at 270° (Lellmann a. Just, B. 24, 2099). V. sol. alcohol and benzene.

p-TOLYL-PYRROLE C₁₁H₁₁N i.e. CH:CH>NC₆H₆Me. Got by dry distillation of

p-toluidine mucate (Lichtenstein, B. 14, 933). Converted by AcCl into crystalline C,H,NC,Ac. -B',HgCl,.

Di-p-tolyl-pyrrole CH:C(C,H,)

[197°]. Formed by treating di-p-tolyl-furfurane or (O,H,CO)₂C₂H₄ with NH₄OAo (Hollemann, R. T. C. 6, 73). Small plates with bluish lustre. Does not form a K derivative. Boiling HClAq gives a red resin. With isatin, after several days, it gives an intense red colour.
o-TOLYL-QUINAZOLINE DIHYDRIDE

 $C_{13}H_{14}N_2$ i.e. $C_6H_4 < \stackrel{N}{\underset{CH_2,N.C_6}{\text{CH}_2,N.C_6}}H_4Me$. Formed by reducing the formyl derivative of o-nitro-benzylo-toluidine with tin and HClAq (Paal a Busch, B. 22, 2701). Oil.—B'HSnCl,—B'HCl: amorphous.—B',H,PtCl, [210°]. Needles (from alcohol containing HCl).

Formed in like manner. Plates, v. sol. alcohol.

-B'HSnCl. (1859) Pure 2 -B'HSnCl₃. [165°].-B'HCl 2aq. [85°].-B'HCl. [251°].-B'₂H₂PtCl₆. [216°]. Yellow needles.

Methylo-iodide B'MeI. [186°]. Needles. p-Tolyl-quinazoline tetrahydride

C₆H₄ NH.ÇH₂ [127°]. Formed by reducing the dihydride in alcoholic solution by sodium. Needles, m. sol. alcohol. nitrosamine [100°]. Yields a crystalline hydrochloride.

 $\begin{array}{c} \textit{Reference.}{-} \text{Oxy-tolyl-guinazoline.} \\ \textit{(Py. 3)-o-Tolyl-Quinoline } \text{C}_{16}\text{H}_{13}\text{N} \quad \textit{i.e.} \\ \text{C}_{6}\text{H}_{1} {<} \text{CH:CH} \\ \text{N=C.C}_{6}\text{H}_{1}\text{Me}. \quad [77^{\circ}]. \quad \text{Formed by dis-} \end{array}$

tilling oxy-tolyl-quinoline (pseudoflavenol) with zinc-dust (Weidel a. Bamberger, M. 9, 108). Silky needles (from benzene).—B'₂H₂PtCl₆ (dried at 105°). Orange tables. m-Tolyl-isoquinoline $C_cH_i < CH:C.O_rH_r$

[52°]. Formed by heating (1)-chloro- (3)-m-tolyl-isoquinoline with HI and P for three hours at 170° (Heilmann, B. 23, 3168). Needles (from

pcTolyl-isoquinoline C.H. CH; C.C.H.

[78°]. Formed in like manner (Ruhemann, B. 3975). 24, 3975). Needles.—B'HI.—B'H,OrO,—B'₂H₂PtOl₈.—B'C₈H₃N₃O₇. Yellow needles.

Reference.—OXY-TOLYL-QUINOLINE. TETRA-m-TOLYL-SILICANE Si(C,H.),. [1512]. (above 550°). S.G. 22 1-1188. Formed from m-bromo-toluene, SiCl., and sodium (Polis, B. 19, 1021). Prisms (from ether), v. sol. benz-

Tetra-p-tolyl-silicane Si(C,H,), [228°]. (above 450°). S.G. 20 1.0793. Formed from SiCl,, p-bromo-toluene, ether, Na, and a little EtOAc (Polio, B. 18, 1542; 19, 1019). Monoclinic crystals (from chloroform). Decomposed by conc. HNO, forming silica and di-p-nitrotoluene [72°].

TETRA-O-TOLYL SILICATE Si(OC,H,) (c. 437°). Formed by heating o-cresol with Sicl, the yield being 90 p.c. of the theoretical quantity (Hertkorn, B. 18, 1686). Oil, v. sol. alcohol. Decomposed by hot water into silica and o-cresol.

Tetra-m-tolyl silicate Si(OC,H,),. (445°)

at 720 mm. Syrup (H.).

Tetra-p-tolyl silicate Si(OC,H.),. [70°]
(444°). Tables or prisms, v. sol. benzene (H.). [70°].

p-TOLYL SILICO CHLORIDE C,H,SiCl, 219°). Formed from Hg(C,H,), and SiCl, at 310° (Ladenburg, A. 173, 165). Liquid, converged by dilute aqueous ammonia into C,H,,SiO.OH c. 150°], which is converted at 200° into solid C,H,SiO),O.

TOLYL SULPHATES. o-Tolyl sulphuric acid

[1:2] C.H.Me.O.SO.OH. Occurs in small quanrity in the urine of horses (Preusse, H. 2, 355). Prepared from C₆H₄Me.OK and K₂S₂O₇ (Baumann, B. 11, 1911). The K salt crystallises in plates, m. sol. water.

m-Tolyl sulphuric acid C.H.Me.O.SO.OH. Occurs in very small quantity in horses' urine (P.).

p-Tolyl sulphuric acid C.H.Me.O.SO...OH. Occurs in the urine of horses and cows (Baumann, B. 9, 1389, 1716; Städeler, A. 77, 18). Formed by boiling potassium p-cresol with K₄S₂O₂. The K salt is sl. sol. cold alcohol.

DI-o-TOLYL-SULPHAZIDE C14H18N2SO2 i.e. [2:1] C.H.Me.NH.NH.SO..C.T. Me [1:2]. Tolyl-toluene-sulphazide. [142]. Obtained by the action of SO, upon o-diazo-toluene in alcoholic solution. White glistening needles (Limpricht, B. 20, 1241). When boiled with baryta-water it decomposes into o-toluene-sulphinic acid,

toluene, and nitrogen.
Di-p-tolyl-sulphazide C₁₄H₁₆N₂SO₂ i.e. Tolyl-[4:1] C.H.Me.NH.NH.SO., C.H.Me [1:4]. Tolyltoluene-sulphazide. [140°]. Formed in like manner from p-diazo-toluene (L.). Small needles. By boiling with baryta-water it is decomposed into p-toluene-sulphinic acid, toluene, and nitrogen.

Reference. - NITRO-DI-TOLYL-SULPHAZIDE.

DI-p-TOLYL SULPHIDE S(C₄H₄Me)_r [57°]. (above 300°). Formed by distillation of lead p-tolyl-mercaptide (Otto, B. 12, 1175). Small needles, insol. water, sol. alcohol. Yields di-p-tolyl-mercaptide (District March 1988). tolyl sulphone on oxidation by KMnO.

Di-m-tolyl disulphide C.H.

C₁₁H₁₁S₂ (C₄H₄Me)₂S₂. Formed from m-tolyl morcaptan by treatment with dilute HNO₄ (Hübner a. Post, A. 169, 51). Liquid at -22°. Decomposed on boiling or by atmospheric oxidation of its ammoniacal alcoholic solution (Leuckart, J. pr. [2]

Di-p-tolyl disulphide (C.H.Me)2S2. Formed from p-tolyl mercaptan by atmospheric oxidation (Märcker, A. 136, 88) or by the acor by treatment with ICy (Thurnauer, B. 23, 769). Formed also by the action of H₂S on a warm dilute solution of toluene p-sulphinic acid in alcohol (Otto, J. pr. [2] 37, 211). Crystals, v. e. sol. ether. Begins to boil at 307° i.V. but decomposes on dissillation. Alcoholic K.S. forms p-tolyl mercaptan (Otto a. Rössing, B. 19, 8129).

Di p-telyl tetrasulphide (C.H.Me), SO...
°]. Formed by the action of H.S on a cong. solution of toluene p-sulphinic acid (Otto, J. pr. [2] 87, 211). Small plates, insol. water, v. sol. ether.

References .- DI-AMIDO-, DI-BROMO-, and OXX-DI-TOLYL-SULPHIDE.

o-TOLYL SULPHOCYANIDE C.H.Me.S.CN. (c. 245°). Formed by adding cuprous sulphocyanide in KSCy to a solution of o-diazo-toluene (Thurnauer, B. 23, 770). Yellowish-red oil with

(Intrinator, B. 25, 170). Itellowish-red on with unpleasant odour.

p-Tolyl sulphocyanide. (c. 248°). Formed in like manner, and also by passing CyCl through alcohol containing lead p-talyl mercaptide. Liquid, solidifying below 0°.

DI-p-TOLYL SULPHONE (C.H.Me), SO., [158°]. (405°) at 714 mm. Prepared by the action of AlCl, on a mixture of toluene and telepane assulphonic chloride (Bockurta, a. Otto.) toluene p-sulphonic chloride (Beckurts a. Otto. B. 11, 2068; 12, 1177; cf. Michael, B. 10, 584). Formed by the action of fuming H₂90, or SO₂ on tolucne (Deville, A. 44, 306; Otto a. Grüber, A. 154, 193) and by the action of KMnO, and HOAc on di-p-tolyl sulphide. Prisms (from benzene), gl. sol. cold acohol and ether. Potashfusior yields p-cresol and diphenyl (Otto, B. 19, 2426).

DITOLYL DISULPHONIC ACID

[1:4:5] C₀H₃Me(SO₃H).C₀H₃Me(SO₄H) [5:1:4]. Formed from di-amido-ditolyl disulphonia acid by diazotisation followed by boiling with alcoby diazonstation followed by boiling with acco-hol (Halle, A. 270, 363). Crystalm v. e. sol. water, m. sol. alcohol, insol. ether.—K.A". Hexa-gonal plates.—KHA": prisms.—BAA" 5aq.

Chloride C₁₄H₁₂S₂O₂(Cl., [229°].

Amide C₁₄H₁₂S₂O₃(NH₂)₂.

Needles.

p-TOLYL-SULPHONO-ACETIC ACID.

C.II.Me.SO.,CH.,CO.H. [118°]. Permed from sodium benzene sulphinate and chloro-acetic sodium renzene supninate and chloro-accuc acid (Gabriel, B. 14, 834). Crystals (from benz-ene), sl. sol. hot water. Cl passed into its aqueous solution forms C,H_850_CHCl_ [114°]. Br forms C,H_850_CHBr, and C,H_850_CH_Br (Otto, J. pr. [2] 40, 542).—AgA': trimetric tables. Ethyl ether EtA'. Converted by bromine (2 mols.) at 90° into C,H_850_CBr_CO_Et which on sanonification by cold NaOHAc yields

on saponification by cold NaOHAq yields C,H, SO, CHBr, [1179

p.TOLYL-SULPHONO-ACETONE CH, CO.CH, SO, C, H, Me. [51°]. Formed by heating sodium toluene p-sulphinate with chloroneeding southm tolucing-supplinate with chloro-acctone in alcohol (Oito, J. pr. [2] 36, 425). Needles, v. sol. alcohol. Bromine forms Cha.Br.CO.CH.,SO.C.H., [130°], m. sol. alcohol. Di.p-tolyl-di-sulphono-acctone CO(CH.,SO.C.H.,Me). Formed by heating CH.,Br.CO.CH.,SO.C.H., with sodium tolucine p-

sulphinate in alcoholic solution. Plates, v. sol. hot HOAc and chloroform

DI-TOLYL DI - SULPHONO - DI - ETHYL . AMINE NH(C₂H₁,SO₂C₂H₁)₂. Formed by heating di-tolyl ethylene disulphone with NH₂Aq (Otto, J. pr. [2] 30, 859).—B'HCl. [201°].—B'HAuCl; dark-yellow needles.

DI - TOLYL - DI - SULPHONU - DI - ELINE OXIDE O(C.H., SO., C.H.), [84°]. Formed by the action of conc. KOHAq on C.H. (SO.C.H.), and as a by-product in the preparation of C.H., SO., C.H., Q.H. (55°) by the action of dilute KOHAq on the same body (Utto a. Tröger, B. 26, 944; cf. J. pr. (2) 80, 171, 321).

TOLYL DISULPHOXIDE v. Tolyl ether of DI - TOLYL - DI - SULPHONO - DI - ETHYL

TOLUENE THIOSULPHONIC ACID.

Di-p-tolyl sulphoxide SO(O,H,Me), [92°]. Formed from toluene, SOCl,, and AlCl, (Parker, B. 28, 1844). Flat needles (from ligroin), v. e. sol. benzene. Reduced by sodi.m and alcohol to di-telyl sulphide [56°]. KMnO, in HOAo to di-tolyl sulphide [56°]. KMnO, in HOAc forms di-tolyl sulphone [158°].

DI-o-TOLYL-TETRAZINE C₁₈H₁₈N₄ i.e.

C,H,N < N:CH NC,H,. [141°]. Formed from o-tolyl-hydrazine, chloroform, and alcoholic potash (Ruhemann, C. J. 57, 52). Crystals. Yields crystrlline C₁₄H₁(SO₂H)N₄ and O₁₈H₁₆(NO₂)N₄ (207°).—B'HCl: needles.

Methylo-iodide B'Mol. [198°). Nodules. Di-p-tolyl-tetrazine C₁₄H₁₆N₄. Formed in

like manner. B'HCl: very unstable white needles. Methylo-iodide B'MeI. [242°]. Needles. o-TOLYL-THIAZOLE DIHYDRIDE

C.H.Me.C.N.CH. (282°). Formed from thioo-toluic amide and ethylene bromide (Gabriel a. Heymann, B.24, 786). Got also by heating o-toluic bromo-ethyl-amide with P2S3 (Salomon, B. 26, 1329). Converted by bromine-water into taurine and o - toluic acid. - B'2H,PtCla. [199°].brd.H.N.O., [132°].
p-Tolyl-thiazole dihydride. [81°]. Prepared in like manner. Tables.

in like manner. Tables.
p.TOLYL-THIOBIURET C.H., IN., S... [158].
Formed by fusing p-toluidine (2 pts.) with persulphocyanic acid (1 pt.) (Tursini, B. 17, 584).
Minute needles, sol. NaOIIAq. Yields C.H., NAS, Et [134], crystallising from alcohol in needles, and C.H., aAoN, S. [166], orystallising in needles.
p.TOLYL-S-THIOGARBAMIC ACID

[1:2]O.H.Mt.NH.CS.OH.

Ethyl ether C.H.N:C(SH).OEt. Tolyl-thiourethane. Formed by heating o-tolyl-thiocarbinide with alcohol at 130° (Liebermann a. Natanson, B. 13, 1576; A. 207, 161). Oil, sol. alkalis.—Q₀H_{1,2}AgNSO: white pp. insol. NH₁Aq. Converted by Mel into C₂H₁N(OEt).SMe, and by Let into C₂H₂N(OEt).SEt, both being oils boiling above 250°

m-Tolyl-\$-thiocarbamic acid

(1:81C.H.Me.NH.CS.OH.

Ethyl ether C,H,N:C(SH).OEt. [68°].

Formed in like manner (L. a. N.). Yields

C₁₆H_{1.}AgNSO and oily C₁₆H₁₂EtNSO.

p-Tolyl.3-thiocarbamic acid. Ethyl ether Yields

p-Tolyl-\$\text{0.th}\t

ether.

O-Tolyl-a-thiocarbamic acid C.H.NH.CO.SH.

Methyl ether MeA'. [70°]. Formed by
heating C.H.NH.C(NC.H.).SMe with dilute
H.SO. at 140° (Will a. Bielschowski, B. 15

1817). Plates.

Ethyl ether Eth'. [60°]. Tables.

**Tolyl-a-thiocarbamic acid NHC.H.,CO.SH.

Methyl ether MeA'. [107°]. Formed by
heating C.H.NH.C(NC.H.).SMe with dilute
H.SO. at 170°. Needles. v. sol. alcohol and

H.SO, at 170°. Needles, v. sol. alcohol and

Ethyl ether EtA'. [79°]. Formed from

p-toluidine and Cl.CO.SEt. Needles. EtSH and tolyl cyanate on distillation. Yields.

Ethylene derivative
CO \(\frac{N(C,H,)}{S} \rightarrow C_8 H_4. \quad [88°] [88°]. Long slender needles.

o-Tolyl-di-thio-carbamic acid

C.H.NH.CS.SH.—NiA'₂. Brown needles, insol. water.—BaA'₂. Plates (Losanitsch, B. 24, 3027). Forms di-o-tolyl-thio-urea on heating.

Methyl ether Med. [132°]. Formed from the Ba salt and Mel. White needles.

Ethyl ether Eth. [72°]. Formed by heating C,H,NH.C(NC,H,).SEt with CS₂ at 160° (Will a. Bielschowski, B. 15, 1817). Prisms. Ethylene derivative CieHuNS, i.e.

 $CS < N(C,H_1) > C_2H_4$. [129°]. Formed by heating

C,H,N.C S C2H, with CS2 at 200°. Yields

C10H11NS2MeI, crystallising in prisms [151°]. m-Tolyl-di-thio-carbamic acid

C,H,NH.CS.SH.

 $Salts.-BaA'_2$. Formed from m-toluidine, CS_2 , and $Ba(OH)_2$ in alcohol (Losanitsch, B.24, 3027). Needles, sol. water, insol. cold alcohol.-

A'. Yellowish-brown plates.

Methyl ether McA'. [89°]. Needles.
p-Tolyl-di-thic-carbanic acid C,H,NH.CS.H. CS₂, alcohol, and NH₃Aq (Losanitsch, B. 24, 3026). Yellowish prisms, sol. water, insol. alcohol.—BaA'₂. Needles.—NiA'₂. Formed from p-toluidine, CS₂, ammoniaçal NiSO₄, and alcohol. Brown needles, sol. alcohol, insol. water.

Methyl ether MeA'. [84°]. Prisms. Ethyl ether EtA'. [74°]. Formed by heating NHC,H,.C(NC,H,).SEt with CS₂ at 160° (W. a. B.). Needles, split up by heat into p-tolyl thiocarbimide and EtSH.

Ethylene other CS < S C,H, [126°]. Crystals. Yields a methylo-iodide [107°]. which is converted by aniline into C₁₆H₁₈N₂S [128°], and by o-toluidine into C₁₇H₁₈N₂S [82°]. Reference. - NITRO - TOLYL - THIOCARBAMIC ETHER.

q. TOLYL - THIOCARBAZIC ACID o - Tolyl hydrazide C,H,NH.NH.CS.SNH,NHC,H,. Formed from o-tolyt-hydrazine, ether, and CS. (Preund, B. 24, 4200). Prismatic tables, insol. ether, decomposed by water and alcohol. The p-isomeride melts at 109°.

DI-o-TOLYL-THIOCARBAZIDE C15H18N4S i.e. CS(NH.NHC₆H,Me)₂. [130°]. Formed from o-tolyl-thiocarbazic acid and o-tolyl-hydrazine at 90° (Preund, B. 24, 4201). Needles, sol. alco-

hol, insol. Aq.
DI-p-tolyl-thiocarbazide. [121°]. Formed in like manner at 110° (Preund, B. 24, 4194).

Plates, v. sol. hot alcohol.

Di-o-tolyl-thiosemicarbazide C15H17N2S i.e. itisol. Aq.

Di-p-tolyl-thiosemicarbaside. [154°]. Formed in like manner (D.). Prisms, v. e. sol. hot alcoop-Di-telyl-thiosemicarbaside [4:1]C_H_Me.NH.CS.NH.NHC_H_Me [1:2]. [142°].

Formed from p-tolyl-thiocarbimide and o-tolylhydrazine (D.). Prisms, sl. sol. hot alcohol. Isomeride

[2:1]C.H.Me.NH.CS.NH.NHC.H.Me[1:4]. [163°]. Formed from o-tolyl-thiocarbimide and p-tolylhydrazine (Dixon, C. J. 61, 1015). Prisms, m. sol. hot alcohol.

DI-0-TOLYL-THIOCARBAZONE C15H16N.Si.s. C.H.N.N.CS.NH.NHC,H,. [168°]. Formed from di-o-tolyl-thiocarbazide and alcoholic potash (Preund, B. 24, 4201). Blue-black needles, v. sol. chloroform, sl. sol. alcohol. Conc. H.SO. forms a bluish green solution.

Di-p-tolyl-thiocarbazone. [105°]. Formed in like manner. Dark-blue amorphous flakes.

o-TOLYL-THIOCARBIMIDE C.H.NS [1:2]C.H.Me.N.CS. (239°). Formed from dio-tolyl-thio-urea by distilling with P₂O₃ (Staats, B. 13, 136), by heating with aqueous H₂PO₄ (Hofmann, B. 15, 986; Mainzer, B. 16, 2017), or by boiling with fuming HClAq (Girard, B. 6,

Reactions .- 1. Chlorine forms C.H., NCLCSCI (218°), which is converted by alcohol into a mixture of di-o-tolyl-urea and o-tolyl-carbamic ether (Lachmann, B. 12, 1349) .- 2. Chloro-acetic acid and alcohol at 150° form C,H, N:C<S,CH₂ crystallising in needles [120°], decomposed by boiling baryta-water into o-toluidine, CO2, and 3. PhOMe and AlCl₂ on warming form C,H,NH.CS.C₆H,OMe [95°] (Tust a. Gattermann, B. 25, 3528). PhOEt and AlCl₂ give C₁₆H₁₇NSC [116°].

m-Tolyl-thiocarbimide C.H.N.CS. at 732 mm. Formed by boiling di-m-tolyl urea with conc. HClAq (Weith a. Landolt, B. 8, 719). Heavy oil. Converted by copper-powder at 220°

into m-toluic nitrile.

n-town intrie.

p-Tolyl-thiocarbimide [1:4] C_sH₁Mc.N:CS.

[26⁵]. (237°). Formed by heating di-p-tolyl
thio-urea with P₂O_s or aqueous H₁PO_s of S.G.

17 (Hofmann, B. 1, 173; 15, 986; Staats, B.

13, 135). Formed also, together with phenyl
thiocarbimide, by heating PhN:C:NC.H, with

CS₂ at 190° (Huhn, B. 19, 2409). Needles (from

other) v sol elsebol.

ether), v. sol. alcohol.

Reactions .- 1. Ammonia forms tolyl-thiourea, and other bases act in like manner.— 2. Bromine forms C.H.NBr.CSBr, which readily gives off Br, leaving (C,H,NCS)2Br2 crystallising in plates decomposing at 210° (Helmers, B. 20, 790).—2. Chlorins forms (O,H,NCS),Cl., whence dilute alcohol gives (C,H,NCS),O [139°] crystallising in needles.—3. CH,Cl.CO,H and alcohol at 150° form C,H,N:C < S.CH₂ [162°] (Völtzkoff. B. 13, 1579).—4. Warmed with toluene and AlCl, it gives O.H.NH.CS.C.H., [106].—5. Heated with AlCl, it yields (C.H.N.CS).S [176°] (Friedmann a. Gattermann, B. 25, 3525).6. C.H.OMe and AlCl, react, with formation of O.H.NH.CS.C.H.,OMe [157°].—7. C.H.OEt and AlCl, give O.H.N.CS [151°], which may be oxidised to C., H., NOS [170°].

DI.-TOLYL DI-THIO-CARBONATE

CO(S.C.H.Me)... [91°]. Formed from p-tolyl

CO(SC,H,Me), [91°]. Formed from p-tolyl mercaptan and COCl₂. It is also a by-product

in the action of p-diazo-toluene chloride on potassium xanthate (Leuckart, J. pr. [2] 41, 190). Needles (from alcohol).

TRI-TOLYL TRI-THIOGYANURATE
(O₄H₄Me.SCy), [114°]. Formed from sodium
p-tolyl mercaptan and cyanuric shloride
(Klason, J. pr. [2] 33, 120). Crystals (from HOAc).

o-TOLYL-THIOHYDANTOIN C,H, NSO i.e CS<NH. CH₂>CO. [136°]. Formed from o-tolyl-thiocarbimide and amido-acetic acid (Marckwald, B. 24, 3281). Plates, v. sol. alcohol, sl. sol. ligroin.

p-Tolyl-thiohy lantoin [210°] (M.). Formed as above (M.; cf. Aschan, B. 17, 426). Flat prisms, sol. alkalis.

Isomeride [183°]. Formed by fusing CH_Cl.CO.NHC,H, with thio-urea (P. Meyer, B.

DI-p-TOLYL-THIOPHENE C18H18 $CH: C(C_{\bullet}H_{\bullet}Me) > S.$ [171°]. Formed bу heating di.p-tolyl-furfurane with P.S. (Hollemann, R. T. C. 6, 74). Small plates (from alcohol). Gives an intense dark-green colour with isatin and H2SO,.

o-TOLYL-THIO-UREA NH ... CS.NHC, H, Me. [155°]. Formed from o-tolyl thiocarbimide and NII, Aq (Staats, B. 13, 136). V. sol. hot water and alcohol, sl. sol. ether.

Acetyl derivative NHAc.CS.NHC, H.Me.

[184°]. Formed from acetyl thiocarbimide and otoluidine in alcohol (Dixon, C. J. 55, 804). Pale lemon-yellow prisms, insol. water, sol. alcohol. Benzoyl derivative

NHliz.CS.NHC,H.Me. [119°]. Formed in Wke manner (Dixon, C. J. 55, 623). Pale-yellow Formed in Wke

prisms, blackened by AgNO₃.

Di-o-tolyl-thio-urea CS(NH.C₄H₄Me)₂. [158°]. Formed from o-toluidine and CS₂ (Girard, B. 4, 985; Berger, B. 12, 1854; Ador a. Rilliet, B. 12, 2301). Long needles, v. sol. hot alcohol. Converted by heating with MeI into the hydroidide of di-tolyl-methyl-thiourea C. H., N.S. which may be represented as 'methyl di-oblylwhich may be represented as 'methyl di-o-tolyl-imido- thiocarbamate' C.H.N.C(SMe).NHC,H., This body melts at 60°, while the corresponding ethyl derivative melts at 51°. The ethylene de-rivative [91°] may be represented by the formula C,H,N:C \(\frac{N(C,H_1)}{S} \) C2H4 (Will a. Bielschowski, The isomeric compound B. 15, • 1316). got by boiling the methylo-iodide of the ethylene derivative of p-tolyl-di-thio-carbamic acid with o-toluidine.

m-Tolyl-thio-urea NHC,H,. S.NH2. [103°]. Formed from m-tolyl thiocarbimide and ammonia (Weith a. Landolt, B. 8, 719). Prisms, monia (Weith a. Landolt, B. 8, 719). Prisms, m. sol. hot water, v. sol. shochol and ether. Di-m-tolyl-thio-urea CS(MHC,H.), [1229]. Formed from m-toluidine, CS, and alcohol (W.

a. L.). Needles, v. sol. alcohol, nearly insol. hot water.

p-Tolyl-thio-ures NHC,H, CS,NH₂. [188°]. (O. s. W.); [182°] (S.). Formed by heating p-toluidine hydrochloride with ammonium sulphocyapide (De Clermont a. Wehrlin, C. R. 83, 347). Formed also from p-tolyl-thiocarbimide ammonia (Staats, B. 18, 136). Plates (from alcohol) with bitter taste, sl. sol. cold water, m. sol, alcohol.

Acetyl derivative NHC,H,CS.NHAc. [176°]. Formed from acetyl sulphocyanide and p-toluidine (Miguel, Bl. [2] 28, 103). Needles, v. e. sol. hot alcohol, v. sol. ether.

Di.p-tolyl-thio-urea CS(NHC,H,Me), [176°]. Formed by boiling p-toluidine with CS₂ and alcohol (Sell, A. 126, 160). It is also a product of the action of allyl-thiocarbimide on an alcoholic solution of p-toluidine (Maly, Z. [2] 5, alcoholo solution of p-toluidine (Maiy, Z. [2] 5, 258). Trimetric prisms (Levin, J. 1882, 384), insol. water, nearly insol. cold alcohol. In alcoholic solution it is converted by HgO into di-p-tolyl-urea. In benzene solution COCl, forms C₁₈H_{1,1}N₂S₂ [116°] (Will, B. 14, 1487). CSCl, forms C₁₈H_{1,1}N₂S₂ [109°] (Freund a. Wolf, B. 25, 1465). MeI forms C,H,N:C(NHC,H,).SMe 1465). MeI forms C,H,N:C(NHC,H,).SMe [128°], orystallising in needles, split up by heat into C(NC,H,), [60°] and HSMe, converted by heating with acids or alkalis into di-o-tolylurea and MeSH, and forming the salts B'HCl [173°] and E'H,SO, [156°]. Et I forms the corresponding O,H₂₀N, [8 [87°], while ethylene bromide gives C,H,N:C(NC,H) [112°], which yields B'H.SO, [194°] and a hydrochloride [219°] (Will a. Bielschowski, B. 14, 1492; 15, 1309).

Reference.—Nitro- and Оху- толул-тню-

p-TOLYL - TOLUTRIAZINE C₁₂H₁₂N₂ i.e. CH:CH.C.N.CH₂ CMe:CH.C.N.NC₂H₄Me Formed by heating o-amido-azo-toluene with formic paraldehyde and alcohol at 140° (Goldschmidt a. Poltzer, B. 24, 1008). Prisms, v. sol. hot alcohol.—B'HCl. [220°].—B'₂H₂PtCl₂. [216°]. Yellow crystalline pp. o-TOLYL-URAZOLE C₂H₂N₃O₂ i.e.

C,H,N<NH.CO. [170°]. Got by heating otolyl-hydrazine hydrochloride with urea (Pinner,

B. 21, 1219). White leaflets, v. sol. hot water. p-Tolyl-urazole. [274°]. Yellowish needles, v. sl. sol. hot water. o-TOLYL-UREA C.H. N.O i.e.

NH, CO.NH.C, H; Me [1:2]. [185°]. Formed from o-toluidine hydrochloride and potassium cyanate/ (Cosack, B. 18, 1089). Plates, sol. alcohol, ether, and hot water.

Bensoyl derivative CO(NHBz).NHC,H,. [210°]. Formed from o-tolyl cyanate and benzamide at 125° (Gattermann a. Cantzler, B. 25. Needles. 1088).

m-Tolyl-urea NH,.CO.NHC,H,Me [1:8]: [142°]. Formed from m-toluidine hydrochloride and potassium cyanate (Cosack, B. 12, 1450; 13, 1089). Needles or tables (from alcohol) or plates (from water).

p-Tolyl-urea NH_xCO.NHC_xH₄Me [1:4]. [172°] (C.); [180°] (St.; P.). Formed in like manner (C.; cf. Sell, C. J. 16, 190). Formed also by the action of p-toluidine on mercuric

fulminate (Steiner, B. 8, 519), and also from p-toluamidoxim, benzene sulphonic acid, NaOH, and CHCl₂ (Pinnow, B. 24, 4167). Needles, sol. hot water, v. sl. sol. ligroin.

Di-o-tolyl-urea CO(NHC,H.), [248°] (B.); [254°] (W.); [256°] (Barr, B. 19, 1769).

Formation.—1. By the action of 'alcohol or water at 100° on the dichloride of o-toluic nitrile (Lachmann, B. 12, 1849).—2. From otolvidine hydrochloride and cyanamide (Berger, B. 12, 1859.—8. From tolyl cyanate and water (Nevile a. Winther, B. 12, 2325).—4. From o-toluidine and COCl₂ (Girard, B. 6, 444).—5. By heating o-toluidine with urea (G.).—6. A product of the distillation of o-tolyl-amido-acetic (W.).—6. A product of the control of the cont acid (Widman, J. pr. [2] 38, 303).—7. By the action of Ac₂O and benzene on the o-toluide of o-tolyl-imido-diacetic acid (Bischoff, B. 23, 1995).

Properties.—Needles (from HOAc), insol. ether, sl. sol. alcohol. Not volatile with steam. bi-m-tolyl-urea CO(NH.C.+H,Me), [203°] (G. a. C.); [217°] (C). Formed from m-tolyl cyanate and m-toluidine (Gattermann a. Cantz-leaft and m-toluidine) ler, 25, 1089), by the action of ClCO₂Et on m-toluidine, by heating m-tolyl-carbamic ether with water, and by heating m-tolyl-urea with m-toluidine at 160° (Cosack, B. 12, 1450; 13,

1090). Needlos (from alcohol), insol. water.

Di-p-tolyl-urea CO(NH.O₂H.Me)₂. [255°].

Formation.—1. By boiling an alcoholic solution of di-p-tolyl-thio-urea with HgO as long as HgS is formed (Sell, C. J. 16, 190; A. 126, 161).—2. By passing COCl, into p-toluidine dissolved in chloroform (Michler, B. 9, 710; Kühn, a. Henschel, B. 21, 505).—3. By heating tolylurea with p-toluidine at 160° (Weith, B. 9, 821).
4. From p-tolyl-cyanate and p-toluidine (Gattermann a. Cantzler, B. 25, 1089).

Properties.-Needles, insol. water, sl. sol. cold

alcohol.

Tri-p-tolyl-urea C₂₂H₂₂N₂O. [189°]. Got from (C,H,)₂N.COCl and p-toluidine (Hammerich, B. 25, 1822). Needles, sol. warm benzene, insol. ether. Gives a benzoyl derivative [137°].

Tetra-p-tolyl-urea C.,H.,N2O. [80°]. Got from $(C_7H_7)_2N.COC!$ and di-p-tolyl-amine. Needles, v. e. sol. alcohol.

References .- AMIDO. NITRO-, and Oxy-

TOLYL.XYLIDINE C.H., N i.e.

C.H., Me.NH.C., H., Mey. [70°]. (c. 800° at 487 mm.). Silky needles (from alcohol) (Girard a.

mm.). Sury necessive Vogt, Bl. [2] 18, 69).

o-TOLYL m-XYLYL KETONE 'C₁₆H₁₁O i.e. (330°) at and [1:2] C_tH₄Me,CO.C_tH₄Me, [1:2:3]. (830°) at 728 mm, Formed from o-teluic chloride and m-xylene (Smith, B. 24, 4050). Oil. Converted by hydroxylamine at 120° into a mixture of anilides

TONKA BEANS, the fruit of Dipterize oderata, contains coumarin (q. v.) (Boullay s. Boutron-Charlard, J. Ph. 11, 426; [3] 7, 160).

TRAGACANTH GUM. Exudes from Astra-

galus verus, a treb growing in Armenia and the north of Persia. It swells up in water, about one-half of it dissolving. It contains arabin,

TRANSPIRATION. Graham, in 1846 and 1849, applied the term 'transpiration' to the passage of gases through capillary tubes into a

vacuum (c. T. 1846, 578; 1849, 849). The rates of transpiration of different gases bear constant relations to each other; but these rates have not been connected in any definite ways with the compositions of the gases. M. M. P. M.

TREE GUM v. XYLAN. TREHALOSE v. SUGAR.

TREHALUM $C_{2,H_{\rm p}O_{\rm pl}}$. S. 06 at 17°; 1·8 at 100°. [a]_D = +179°. Occurs in Trehala manna (Scheibler a. Mittelmeier, B. 26, 1336). Tasteless, minute prisms. Very hygroscopic. Does not reduce Fehling's solution. Does not react with phenyl-hydrazine. Boiling dilute H2SO, forms glucose. At 180° it slowly forms Boiling dilute trehalin, which is v. sol. water and ppd. by alcohol. Trehalin dissolves in phenyl-hydrazine. Iodine colours trehalum and trehalin violet. Diastase, yeast, and invertin have no action. Ac₂O and NaOAc yield an acetyl derivative

[above 210°]. TRI-. In the alphabetical arrangement of this dictionary the prefix 'tri,' when indicating the presence of three radicles, is treated as if it did not form part of a name, except where the entire name is numerical, as in 'tridecane.'

TRIANOSPERMIN. A crystalline substance occurring in Trianosperma ficifolia, a climbing plant of Brazil (Peckholt, Ar. Ph. [2] 113, 104; Parodi, Ph. [3] 10, 667). It has a pungent taste, is alkaline in reaction, sol. water, alcohol, and ether, and is ppd. by Pb(OAc), and PtCl.

TRIAZOLE NSCH.NH. [120.5°]. (260°). V.D. 2.39 (calc. 2.49). Formed by heating its carboxylic acid alone or with boiling water (Andreocci, B. 25, 229; Bladin, B. 25, 745). Needles (from ether), v. sol. water and alcohol, may be sublimed. The di-oxy-derivatives of alkyl-triazoles $N \leqslant_{C(OH),NR}^{C(OH);N}$ named by

Pinner 'urazoles,' are obtained by heating hydrazines with urea (Pinner, B. 20, 2358).

TRIAZOLE CARBOXYLIC ACID

N C(CO₂H).NH. [137°]. Obtained by oxidising methyl-triazole (Andreocci, B, 25, 229) or amido-phenyl-triazole carboxylic acid and alkaline KMnO₄ (Bladin, B. 25, 744). Amorphous powder.—CuA'₂aq. Green crystalline powder.—TRICARBALLYLIC ACID 2. vol. i. p. 679.

TRICOSANE v. TRI-ICOSANE.

TRIDECANE C₁H₂₈. [-6°]. (234°). S.G. 9. 771; 4° 761. Formed by reduction of methyl dodecyl ketone or of tridecoic acid by HI and P (Krafft, B. 15, 1699). Formed also by distilling barium myristate with NaOMe (Mai, B. 22,

TRIDECOIC ACID C₁₂H₁₃.CO₂H. [41°]. (236° at 100 mm.). Formed by oxidation of methyl tridecyl ketone (Krafft, B. 12, 1669). Crystals.

-AgĂ′.●

Amide C₁₂H₂₂.CO.NH₂. [98·5°]. Formed by digesting the nitrile with conc. H₂SO₄ and pouring into water (Lutz, B. 19, 1439). Plates (from alcohol).

Nitrile C,H,CN. (275°). Formed from tridecylamine, Br. and NaOH. Oil, vs sol. alcohol and ether.

TRIDECYL ALCOHOL (C.H.,), CH.OH. [42°]. Formed by reducing di-hexyl ketone (Kipping, C. J. 57, 536). Plates (from dilute alcohol),

insol. water. May be distilled. HBr forms $(O_aH_{11})_a$ CHBr [89°].

TRIDECYLABINE $O_{11}H_{21}NH_{21}$. [87°]. (266°).

FOrmed by boiling myristyl-tridecyl-urea with KOHAq (Luts, B. 19, 1437). Unctuous mass, v. sol. alcohol and ether. Absorbs water and CO. from the ar. REHCl: readles decomposing CO2 from the air. -B'HCl: needles, decomposing at 100°.—B',H,PtCl,.—B',H,SO,: needles, insol. cold water.

TRIDESYLENE Q₁₁H₂₈. (238° cor.). S.G. 2 8445. Occurs in petroleum from Burmah (Warren a. Storer, Z. 1868, 232).

TRIDECYL-UZEA. Myristyl derivative C., H., N.O. i.e. C., H., N.O. i.e. C., H., N.H. CO. NHO, H., O. [108°]. Formed by the action of Br and KOHAq on the amide of myristic acid (Reimer a. Will, B. 18, 18). 2016). Crystals (from alcohol), almost insol. cold water, sol, ether.

TRIGENIC ACID v. ETHYLIDENE BURET.

TRIGONELLIN C,H,NO, i.c.

CH CH CH CO Occurs in the seeds of CH:NMe O CHINNe O Trigonella Fienum-gracum (Jahns, B. 18, 2518;

20, 2840). It is also produced by saponification of the product of the reaction of MeI on potassium pyridine (β)-carboxylate (Hantzsch, B. 19, 31). Colourless prisms (containing 1q), converted by HOlAq at 265° into pyridine (B)-carboxylic acid (q. v., Reaction 4).—B'HOl.—B', L.P.Ol.—B'HAuCl. [186°]. Slender needles.

n-TRI-IOOSANE C₂₂H_{4s}, [48]. (234° at 15 mm.). E.G. 4⁵·7785; ⁸¹·7570. Formed from laurone (C₁₁H₂₂)₂90 by treatment with PCl, and reduction of the resulting (C₁₁H₂₃) CCl₂ with HI and P at 240° (Krafft, B. 15, 1712). Obtained also by fractional distillation of paraflin oil from brown coal (Krafft, B. 21, 2203). Glittering plates (from ether-alcohol), sl. sol. alcohol.
TRI-ICOSANE DICARBOXYLIC ACID

C₂₇H₄₆(CO₂H)₂. [102·5°]. Formed by heating di-oxy-penta-icosylene with soda-lime (Stärckee A. 223, 300). Flocculent pp. (from ligroin-ether).

TRI-ICOSYL ALCOHOL (C,H,,),CH.OH. [76°]. Formed by reducing laurone with Na and the property of the state of th

an acetyl derivative [65°].

TRIMELLITIC ACID v. vol. iii. p. 2014 TRIMESITE ACID v. vol. iii. p. 230.
TRIMESITIC ACID, v. Pyriding TRICARD-

OXYLIC ACID.

TRIMETHYLENE v. vol. iii. p. 304.

TRIMETHYLENE v. vol. iii. p. 304.

TRITCIN C₁₃H₂₂O₁₁. [a]_b = -43·6° (Reidemeister, J. Th. 1881, 69). Extracted by dilute alcohol from the root of couch-grass (Triticum repens) (H. Müller, Ar. Ph. [3] 2, 500; 3, 1).

Tasteless hygroscopic powder, v. sol. water, insol. alcohol and ether. Laworotatory. On boiling with water capacilly in researce of saids it. with water, especially in presence of scide, it changes into lavulose. Its solutions are not ppd. by metallic salts, nor coloured by iodine.

TROPEUNES v. Azo- compounds.
TROPEUNES. A name given by Ladenburg to alkoyl derivatives of tropine (q. v.).

TROPIC ACID &. Oxy-PHENYL-PROPIONIC

TROPIDINE v. METHYL-ETHYLENE PYRIDINE TETRAHYDRIDE.

(a) Methyl-tropidine C,H, N i.e. CH, CH.CH.CH.CH.CH.CH, NMe, (Ladenburg) or CH CH:CH OH.CH, NMe, (Merling). Formed by distilling tropidine methylo-hydroxide with water (Roth, B. 17, 157; 'Meiling, B. 24, 3118). Oil. HClAq forms 'hydrochloro-(a)-methyl-tropidine' which gradually changes into the isomeric tropidine mathylo-chloride. -

Methylo-iodide B'Met. [162°]. Needles. (8)-Methylo-iodide B'Met. [162°]. Needles. (8)-Methyl-tropidine C.H.,N. (205°). S.G. 14 922. Formed by heating (a)-methyl-tropidine at 150°-200°. Oil. Converted by HCl into

TROPIGENIN C, II₁₃NO. [161°]. Got by oxidation of tropine by alkaline KMnO, (Merling, B. 15, 287). Got also by boiling 'homohydroapotropine' with baryta water (Pesci, G. 12, 329). Needles, sol. water and alcohol. Reconverted by MrV into transp. Oxidized by chronic acid MeI into tropine. Oxidised by chromic acidmixture to ecgonic acid and a small quantity of tropic acid (Liebermann, B. 24, 615).-B'HI.-B',CO₂: crystalline pp. — B',H₂PtCl_e aq. -B'HAuCl₁: golden-yellow plates, sol. alcohol.

TROPILENE C,H,O i.e. 2403; 15, 1028; A. 217, 138). Formed also from (B)-methyl-tropidine and cold HClAq (Merling, B. 24, 3123). Oil, smelling like oil of bitter almonds and acetone, sol. dilute HClAq, v. sol. alcohol and ether. Reduces warm ammoniacal AgNO, forming a mirror. Reduces Fehling's solution and KMnO, in the cold. Not attacked by Accl. Combines with NaHSO₃ (M.). Nitric acid forms an adipic acid $C_0H_{10}O_4$. Slowly combines with methylamine, forming (β)-methyl-

TROPILIDENE C,H, i.e.

CH < CH.CH. > C:CH₂. (114°). S.G. 2 ·9129.

Formed by distilling methyl-tropine methylo-iodide with KOH (Ladenburg, A. 217, 133; B. 14, 2403; 26, 1067). Formed also, together with methylamine, by distilling tropine with soda-lime. Oil, smelling somewhat like toluene, but combining readily with bromine, forming

CH-CH-CH-VIII) MMc (Merning). Metnyl-cery-cylindric tetrahydride. [62°] (229°d). Totals: harether with tropic acid, by hydrosthy). Need: ne or hyoscyamine by baryta or Formed, water). A. 128, 281; 133, 87; Lader-lysis, of atrophil (; 217, 115; "B. 18, 608; 20, HCIAq (Kraut, II, 66, 1067). Hygroscopic tables burg, A. 206, 2. sol. water and alcohol. Does 1653; 23, 1763 chrom the air. Its aqueous solution of the control of th (from ether), v. not absorb CO.

tion ppts. metallic oxides from their salts. Not attacked by nitrous acid. Not volatile with steam. According to Eykman (B. 26, 1400) the refractive index agrees best with Merling's formula.

Reactions .- 1. Decomposed by distilling with Reactions.—1. Decomposed by distilling with soda-lime into tropilidene, methylamine, and H₂O.—2. Loses H₂O, being converted into tropidine by heating with fuming HCl and HOAc at 180° or by heating with H₂SO₄ (1 pt.) and water (14 pts.) at 230°.—3. Conc. HIAq and red P at 150° form tropidine and tropidine periodide, but at 140° they form 'tropine iodide' C₂H₁,NI₂, which extendings from water in prignal [1148]. which crystallises from water in prisms [116°], whence silver chloride followed by PtCl, give (C₈H₁₇NICl)₂PtCl₄ crystallising in red octahedra. By treatment with Ag.O followed by HCl and PtCl₄ very soluble (C₈H₁₇NCl₂)PtCl₄ is got.—4. PtCl₄ very soluble (C_bH₁,NCl₂)PtCl₄ is got.—4. Alkaline KMnO₄ forms tropigenin and, finally, oxalio acid and NH₂ (Merling, A. 216, 341).—5. CrO₃ forms tropinic acid C_bH₁₁N(CO₂H)₂.—6. Aqueous HOCl yields prisms [111°], whence alcohol produces C_aH₃NCl₄,CH.OH [108°], which forms a hydrochloride [162°] crystallising in plates (Einhorn a. Fischer, B. 25, 1391).

Salts.—B'HCl.—B'₂H₁PtCl₄. Orange-red proposition crystals [200°] (Schmidt A. 208

Salts. — B'HCl. —B'.H., P. U., Orange-rea monoclinic crystals. [200°] (Schmidt, A. 208, 214).—B'HAuCl., [212°].—B'HCl6HgCl., [246°] (Ladenburg, B. 24, 1631).—B'C., H., ONO., N. Nitroxyl Ucrivative C., H., (ONO., N.

Nitroxyl Ucrivative C,H, (ONO,)N.
Nitro-tropein. Formed by warming tropine (2 g.)
with HNO, (12 g. of S.G. 1.25) at 100° (Ladenburg, B. 15, 1025).
Alkaline liquid, sol. water, alcohol, and ether.
KOH.—B',H,PtCl. Needles.—B'HI. Prisms.
Benzoyl derivative C,H, (OB2)N.

Benzoyl-tropeine. Formed by heating tropine hydrochloride with benzoic acid and dilute HCl (Ladenburg, B. 13, 1983; d. 217, 96). Crystallises as C₁₃H₁₉NO, 2aq [58°], C₁₅H₁₉NO, 2aq [58°], C₁₅H₁₉NO, 2aq ed there. B'₁H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₁₉NO, B'₂H₂NO, B'₂H₂

С_кH₁₁(O.ČO.**C**₈H₄.ÕП)N. Salicyl-tropeine. Formed in like manner, using salicylic acid (Gaebe a. Caro, B. 13, 106; L.). Silky plates. Feeble poison, 025 g. killing a frog in a few hours. Has no apparent effect on the pupil.—B'HCl.—B'H.PtCl.—B'HAuCl.; yellow plates.

(n-Oxy-bentoyl derivative C₁₃H₁₉NO.

('n-Oxy-bentoyl derivative C₁₃H₁₈NO₂. [226°]. Small plates, v. sl. sol. water. Acts slightly on the pupil of the eye.—B'HCl.—B₁₂H₂SO₄4aq.—B'₂H₂PtCl₃: orange plates.
p-Oxy-bensoyl derivative C₁₄H₁₈NO₂. [227°]. Trimetric plates (containing 2aq).—B'HNO₃.—B'₂H₂PtCl₃ 2aq. Orange plates.
Fhenyl-acetyl derivative C₁₄H₁₈NO₃. is. C₄H₁₈N(O.CO.CH₂h). Phenylacettroperae. Aromatic oil.—B'HBr.—B'₂H₄PtCl₃.—B'HAuCl₄.—B'₂H₃SO₄. Soluble tables.
Mandelyl derivative C₁₄H₁₈UO₃. is. C₄H₁₁N(O.CO.CHPh.OH). Homatropine. Formed by heating tropine with mandelic acid, HCl (1pt.), and water (40 pts.), the yield being 50 p.c. of the theorefical amount (Ladenburg, C. R. 90, of the theoretical amount (Ladenburg, C. R. 90, 921; A. 217, 82). Deliquescent prisms (from ether), sl. sol. water. A solution of its hydrochloride is ppd. by potassio increaric iodide, but not by tannin. It enlarges the pupil of the eye almost as energetically as atropine, but the en-largement passes off much more rapidly (Völkers,

TRUXENE.

4.217.86; Bertheau, Berl. Klin. Wochenschrift, 4.217, 85; Bertheau, Bert. Aun. mocnessumy, 1680, No. 41; Tweedy a. Ringer, Lancet, 1880, No. 21).—B'HBr. Trimetric crystals; a:b:c='414:1:'472.—B'C₆H₃N₃O₇. Yellow plates.—B'HAuCl₄.—B'₂H₂SO₇. Needles.
Cinzamoyl derivative C₁, H₂₁NO₂. [70°].

Small plates (from dilute alcohol). Gives pps. with tannin, pieric acid, potassio-mercuric iodide, and I in KI. Strong poison, '03 g. killing a frog in three minutes. Has little action on the Physil,

B'HCl.—B'HLPtCl₅.—B'HAuCl, Needles.

Atropyl derivative C₁H₁NO₂. Atroptropeine. Oil.—B'HAuCl₄. Small needles.

Atrolactyl derivative C,H2NO [120°]. Formed from atro-Pseudo-atropine. lactic acid, tropine, and dilute HCl (1:400) by repeated evaporation (Ladenburg, A. 217, 87). Needles (from water). Resembles atropine in physiological action, two drops of a 1 p.c. solumodation for a week.—B'HAuCl., [114°].

Phthalyl derivative C₂,H₂,N₂O₄. [70°].

Formed, in very small quantity, by evaporating phthalic acid with tropine and dilute HCl.

Mass of silky needles. - B'H. PtCl. Methylo-iodide C. H. NOMeI. crystals, nearly insol. alcohol. Yields B'McOH and B'₂Me₂PtCl_e (Merling, B. 14, 1829; Ladenburg, A. 217, 131).

Ethylo-iodide B'EII. Crystalline. Yields B'Et.PtCl, a yellow crystalline powder.
(a)-Methyl-tropine C.H.,MeNO. (243°).
Formed by distilling tropine methylo-iodide. Liquid, v. sol. water and alcohol. Strongly-alkaline. Its hydrochloride, distilled with solid KOH, yields dimethylamine. -B'HAuCl,. Very unstable.

Methylo-iodide (C,H,MeNO)MeI. Deliquescent needles, decomposed by distilling with solid KOH into tropilidene and trimethylamine.

-(C,H₁,MeNO)₂Me₂PtCl₃. Orange crystals.
(B) Methyl-tropine C,H₁,NO. (198-205°).
Formed by shaking tropliene with an aqueous solution of dimethylamine (Ladenburg, B. 14,

solution of dimethylamine (Ladenburg, B. 14, 2404). Liquid, split up by gaseous HCl into tropilene and NMe,H. B'HAuCl. Prisms.

(γ)-Methyl-tropine C_pH₁,NO. Formed in small quantity by distilling the methylo-hydroxide of (a)-methyl-tropine (Merling, B. 15, 288). V. sl. sol. Aq. B',H. PtCl., V. sl. sol. Aq. Metatropine C_pH₁,NO. (238°). Formed by shaking tropine iodide with water and Ag₂O. Not colid et 30° - RTICl. tables.

shaking tropine iodide with water and Ag₂O.

Not solid at -30°.—B'HCl: tables.

Hydrotropidine C₂H_{1,N}N. (168°). S.G. 2°.937;

15°.926. Formed by reducing tropine iodide

C₂H_{1,N}I₂ with zinc-dust and HClAq (Ladenburg,

B. 16, 1408). Liquid, m. sol. water. B'HCl:

deliquescent crystals.—B'₂H₂PtCl₈. Tables.

Norhydrotropidine C₂H_{1,N}N. (60°). (161°).

Formed by distilling hydrotropidine by distilling hydrotropidine by distilling hydrotropidine.

nornydrotropidine C.H.N. [60°]. (161°). Formed by distilling hydrotropidine hydrochloride in a current of HCl (Ladenburg, B. 20, 1649). Crystalline.—B'HCl. [281°].—B'HPCl.—B'HHgCl.—B'C.H.N.O. [281°].

chloride in a current of HCI (Ladenburg, 5. 20, 1649). Crystalline.—B'HCl. [287°).—
B'H.PtCl.—B'HHgCl.—B'C.H.N.O., Needles,
Nitrosamine C.H.,N.O. (117°). Cubes.
Paratropine C.H.,N.O. (202°). Formed from hydrotropine and K.FeCy, (Ladenburg, B. 24, 1626).—B',H.PtCl. [197°].—B'HAUCL. [182°].—B'HClBHgCl. [225°]. V. sol. water.

4. Tropine C.H.,NO. [108°]. (242°). Formed, together with tropic acid, by warning hyoscine with haveta water (Ladenburg, B. 13, 1551: 17.

with baryta-water (Ladenburg, B. 13, 1551; 17,

151; Liebermann, 24, 2587). Formed also by dissolving its benzoyl derivative in hot conc. HClAq (Hesse, A. 271, 210). Hygroscopic prisms (from chloroform), v. e. sol. water. Yields tro-(from chloroform), v. e. sol. water. Inside tro-pinic and ecgonic acids on oxidation.—B'sH_SO,. Hygroscopiq crystals.—B'HAuCl., [198] (Ladenburg); [202"] (H.); [225"] (Lieber-mann).—B'sH_2PtCl₀ 4ad. [206", anhydrous]. Trimetric prisms; abice -7021; *379. Methylo-iodide B'McI. [270"]. Rhom-bohedra. Yields B'McI. and B'sMe,PtCl₀.

[216°] crystallising from water.

Benzoyl derivative C13H19NO2. [48°]. Occurs in the leaves of Java coca (Liebermann, B. 24, 2336; Lesse, A. 271, 208). Colourless plates (from ether). - B'HCl. [270°]. -B'₂H₂PtCl_a. Pale-yellow needles. - B'MeI. -B'McCl. - B'MeAuCl₁. - B'Me₂PtCl_a 2aq.

Mandelyl derivative C,H,,NO(CO.CH(OH),C,H,). ψ-Homatropine. Formed by heating 4-tropino with mandelic an-hydride at 200' (Liebermann a. Limpach, B. 25,

hydride at 200' (Liebermann a. Limpan, — 931).—B'HCl.—B'.H.J.PtCl., —B'HAuCl., — B'HAuCl., — "rop'y derivative C.H.,NO(C.H.O.). Isomeride of hyoscine. [88]. [a]_p = -4'9'. water. sol. alcohol.—B'HCl. Nodules, insol. water, sol. alcohol. — [183°].—B'₂H₂PtCl₆.—B'HAuCl₄. [135°].

Atropyl derivative. [129]. Formed from tropide and \(\psi\)-tropine at 200°. Crystals, Formed sol. water. Split up by HClAq into atropic acid and \-tropine.

Oxy-tropine carboxylic acid CH.CH.CH.CH(OH).CH(OH).CO.H. Dioxyan-CH.CH..NMe hydroccgonine. Formed by oxidising hydroegonine with KMnO, and aqueous Na₂CO₂ at 1° (Einhorn a Rassoff, B. 25, 1395). Decomposes

eegonine with KMnO, and aqueous Na,CO, at 1-(Emhorn a. Rassoff, B. 25, 1395). Decomposes at 280°. V. e. sol. water and MeOH, insol. EtOH.—B'HICl. [251°].—B'C H_N,O,.—KA'. Methyl ether MeA'. [139°]. Tables, v. e. sol. CHCl., Vields B',H,PtCl., [210°]. Benzoyl derivative of the methyl ether C,H,MeN.CH(OH).CH(OB2).CQ.H. 1100°1. Nacdlee B'HNO. [216°].—B'HCl. $\begin{array}{llll} [108^\circ]. & \text{Needles.--}B'\text{HNO}_{\text{\tiny 3}}. & [216^\circ].--B'\text{HCl}. \\ [203^\circ].--B'\text{HAuCl}_{\text{\tiny 4}}. & [173^\circ].--B'_2\text{H}_2\text{PtCl}_{\text{\tiny 6}}. & [208^\circ]. \end{array}$

Di-benzoyl derivative of the methyl ether C,H,MeN.CH(OBz).CH(OBz).CO,H.
Needles.—B'HNO₂. [190³].—B'HCl. [280°].—
B'₂H,PtCl₂. [205°].—B'HAuCl₁. [203°].

Reference.—OXYTROPINE.
TROPINE DIHYDRIDE C.H., NO i.e.

CH_CH_CH_CH_CH_OH CH_CH_NMe Hudrotropina. Methyloxyethylpyridine hexahydride. (238). Formed from oxy-ethyl-piperidine and KMeSO, (Ladenburg, B. 24, 1622). V. sol. water and alcohol. — B'HCl5HgCl₂. [214²]. — B'HAuCl₄. [170²]. Crystals.

TROPINIC ACID C.H.; NO. [253] (L.); [220] (M.). A product of oxidation of tropine and of ecgonine by chromic acid mixture (Merling, M. 216, 348; Liebermann, B. 23, 2519). Meedles, v. sol. water, sl. sol. alcohol, insol. benzene. Gives off CO, when heated. Forms salts with acids and bases.—BaA'₂. Very hygroscopic.—CaA'₂.—AgA'. Readily reduced.—(HA),PtCl.,—HA'HAuCl., Golden prisms.—

HA'HCl aq.

TROPYLENE v. TROPILENE,
TRUXENE (C.H.). Formed by heating
truxone with red P and HIAq (S.G. 1.7) at 180°

(Liebermann a. Bergami, B. 22, 786; 23, 817). Formed also by heating hydrindone with conc. Hollaq, and by heating phenyl-propionic acid with P₂O₂ (Hausmann; Kipping, C. J. 65, 269). Needles or plates, melting above 860°, insol. CHCl₂. Uxidised by boiling HOAc and CrO, to crystalline 'tri-benzoylene-benzene,' which is not melted at 860°. HNO₂ forms (4,2,1)-nitrophthalic acid.

(a)-TRUXILLIC ACID Cit HisO, i.e.

CO₂H.CH—CHPh. (?) (γ)-Isatropic acid

[274°]. Formed, together with (\$)-truxillic acid, by the action of boiling HClAt on isatropylcocaine, which is a by-product in the preparation of cocaine (Liebermann, B. 21, 2342; 22, 124, 783, 2242). Small needles (from alcohol), sol. hot HOAc. Yields cinnamic acid on distillation. Nitric acid (8.6, 1.52) forms two di-nitro-deri-Nitric acid (S.G. 1-52) forms two di-nitro-derivatives, [229°] and [290°]. Yields two isomeric sulphonic acids.—Na,A" 10aq (Drory, B. 22, 2256),—BaA"8,aq. Crystalline, v. sol. water.—CaA"aq.—Ag,A". Flocculent pp., sol. NH,Aq. Methyl ether Me,A". [174°]. (c. 300°). Ethyl ether Et,A". [146°]. H.C.p. 2,720,900 (Liebermann, B. 25, 92). Yields C₁₈H₁₂(NO₃),Et,O₈ [138°] (Homans, B. 24, 2500). Isoamyl ether (C,H₁),A". [83°]. Prisms. Ac,O at [50° forms (a)-truxillic anhydride, while at 170° the product is (x)-truxillic anhydride.

at 170° the product is (γ)-truxillic anhydride.

Di-amide C₁₈H₁₄O₂(NH₂)₂. [265°]. Needles,
v. sl. sol. hot water, sl. sol. alcohol (Drory, B. 22, 2261).

22, 2201).

Di-piperidide C₁₄H_{1.1}(CO.NC, H₁₀)... [259°].

Got from the chloride and piperidine (Herstein, B. 22, 2264). Orystalline powder, sol. alcohol.

Mono-piperidide
C₁₄H₁₄(CO,H).CO.NC, H₁₀. [250°]. Yields MeA'

[151°] crystallising from ether in needles.

Anhydride (C₃₀H₃₀O₇)₃. [191°]. Mol. w. 1712 (1703 obs. by Raoult's method). Formed Ly beating the acid with Ac,O and NaOAc at 100°. Needles (from benzenc-ligroïn). Gives no fluorescein. When heated for an hour at 200° it changes to (γ)-truxillic anhydride.
(β)-Truxillic acid C_{1s}H_{1e}O₄ i.e.
CHPh.CH.C O.H
(?)

(8)-Isatropic acid. [206°]. Formed at the same time as the (a)- acid (Liebermann, B. 21, same time as the (a)- acid (inevermann, B. a., 2342; 22, 783, 2243; 25, 90; 26, 837). More sol, water than the (a)- isomeride. Yields benzil on oxidation. Nitrio acid (S.G. 1-52) forms a di-nitro- derivative [216°] (Homans, B. 24, 2590). Forms cinnamic acid on distillation.—Na, A° 2aq.

—BaA" 2aq. Sl. sol. water.—CaA" 3 aq. —Ag,A".

Reference.—OXY-TRUXILLIO ACID.

TRUXONE (C,H₄O)₂, x = 2vr 8. [289°]. Formed from (a)-truxillio acid and fuming H,SO, (S.G. 1-96)- at 15° (Liebermann a. Hergami, B. 22, 784; 23, 320). Plates (by sublimation), insol. water, acids, and bases. Not attacked by HNO₂. Yields (C,H₂Ol₂), [178°]. Aniline and HOAs on

boiling form the anilide (C, H,: NPh), crystallising

boiling form the anilide (C,H₄:NPh)_z crystallising in needles, [270°], decomposed by fusion.

Phenyi-hydrasids (C₂H₄:N₂HPh)_z. [c. 270°]. Needles, v. sl. sol. alcohol.

Oxim (C,H₂:NOH)_z. Very unstable, easily changing to an anhydride. Boiling Ao₂O yields (B,H₂:NOAc)_z [261°], m. sol. HOAc.

TULUCUNIN C₂₂H₄O₄. Occurs in the bark of Tarapa Tulucuna (Caventou, J. Ph. [3] 35, 1201 Light-vallow amperphase resin with very 189). Light-yellow amorphous resin, with very bitter taste, sl. sol. water, v. sol. alcohol, finsol. ether. Turned blue by cold H.SO.

TUNGSTATES, and derivatives of; v. Tung-STEN OXYACIDS, SALTS, AND DERIVATIVES OF, p. 802;

Also TUNGSTEN. W. (Wolfram.) At. w. 183-6.

TUNGSTEN. W. (Wolfram.) At. w. 183-6.

Mol. w. is unknown. S.G. 18-77 (Waddell, Am. 8, 280); 18-77 (Moissan, C. R. 116, 1225); 19-13 at 4° (Roscoe, C. J. [2] 10, 286); for other determinations v. Bernoulli (P. 111, 576), Zettnow (P. 111, 16). S.H. (6° to 15°) 035 (De la Rive a. Marcet, A. Ch. [2] 75, 113). S.V.S. c. 9·7. Historical.—In 1785 a new acid was prepared

by J. and F. d'Elhujar from the mineral wolframite, and shown to be identical with an acid obtained three years before from tungstein by Scheele (Opusc. 2, 119). The metal of the new acid was isolated by J. and F. d'E. For many years the new metal was known as wolfram or tungsten (from Swedish = heavy stone); the latter name has gradually driven out the former in England and France, but the metal is generally called wolfram in Germany; the symbol W is universally employed.

Occurrence .- Never uncombined. Wolframite (tungstate of Fe and Mn) is found in considerable quantities in Cornwall, Saxony, Bohemia, &c.; tungstenite, or scheelite (tungstate of Ca), scheeletine (tungstate of Pb), and come other tungstates occur in various localities; wolframine or wolfram-ochre, WO., is also found. Some tin ores contain compounds of W. and W. is therefore not infrequently found in specimens

Formation.-1. By reducing WO, by heating to redness in H (Berzelius, P. 4, 147; Wöhler, A. 77, 262; Zettnow, P 111, 16; Roscoe, C. N. 25, 61, 78).—2. By heating WO, with Na and NaCl (Z., lo.).—3. By reducing WO, by mixing with 10 p.c. charcoal and 2 p.c. resin, and heating in a closed crucible for some hours to a white heat (Filsinger, S. C. I. 1878, 229).—4. By passing vapour of oxychloride of W and H passing vapour of expendence of W and H through a red-hot tube (von Uslar, A. 94, 255).

5. By heating WCl, in H, in a zinc bath (Roscoe, Lc.).—6. By strongly heating the salt (NH₄), WO₄ in a carbon crucible (Bucholz, P. 111, 576).—7. By strongly heating the nitride (q. v., p. 800) in H (Wöhler, A. 73, 190).

**Preparation.—1. Pure WO₄ is heated to bright redness in a Pt tube in a stream of property.

redness, in a Pt tube, in a stream of pure dry di (v. Hormation, No. 1).—2. A mixture of pure WO, and dry lampblack is heated in an electric

Wo, and dry lampoison is neated in an electric furnace (Moissan, C. R. 116, 1225).

WO, is prepared from wolframits by heating the very finely powdered mineral with conc. HClAq, pouring off the solution from time to time and adding more HClAq, and after some time adding a little HNO, Aq until most of the brown solid is changed to yellow WO, xH,O, washing the residue thoroughly by decantation,

adding a considerable quantity of NH, Aq and warming, filtering from quartz, unchanged wolframite, &c., evaporating the solution until small lustrous crystals of an acid ammonium tungstate separate, boiling these crystals for a long time with HNO, Aq, washing, and heating the residue (Scheibler, J. pr. 83, 239; cf. Bernoulli, P. 111, 590).

Properties.—A steel-grey, hard, brittle, crystalline powder (Riche, A. Ch. [3] 50, 5). By reducing the nitride in H, Wöhler (A. 78, 190) obtained W as a black powder. By reducing WO. by C in an electric furnace, Moissan (C. R. 116, 1228) obtained a lustrous, very hard, greyish white solid. As produced by passing the vapour of WO,Cl, mixed with H through a red-hot tube, W forms a shining, dark steel-grey, mirror-like deposit, which can be detached from the tube in hard, brittle crusts (von Uslar, A. 94, 255). W can be melted in the O-H flame, part of it burning to WO₄ (Riche, l.c.); or by using a current from 600 Bansen cells, in an atmosphere of N (Desprez, C. R. 29, 549). Considerable masses may be malted by employing the current from a dynamo (v. Huntington, C. N. 46, 163). W was regarded by Faraday as diamagnetic (T. 1846. 49). The emission spectrum is described by Thalen (A. Ch. [4] 18, 202). Wis unchanged in air, but when the pulverulent metal is heated it burns to WO,; compact W burns in air only at very high temperatures; as obtained by reducing WCla by H, W is said to be pyrophoric. Water is decomposed by W at a red heat. The metal is scarcely acted on by HClAq or H_SO, Aq; it is oxidised by HNO, Aq to WO, xH,O; the pulverulent metal dissolves slowly in caustic alkali solutions. Finely divided W reduces and ppts. many metals from solutions of their salts. combines directly with Br, Cl, I, or S. acted on by heating in NII, nor in CO (v. Rideal, C. J. 55, 45; Smith a. Oberholtzer, Zeit. f. anorg. Chemie, 5, 63).

The at. w. of W has been determined (1) by reducing WO, in H, and again oxidising W to

WO3 (Berzelius, P. 4, 151 [1825]; Schneider, J. pr. 50, 158, 161 [1850]; Marchand, A. 77, 263 [1850]; von Borch, J. pr. 54, 254 [1851]; Riche, A. Ch. [3] 50, 10 [1856]; Dumas, A. Ch. [3] 55, 143 [1859]; Bernoulli, P. 111, 597 [1860]; Persoz, 130 [1609]; Periodini, 2-111, 597 [1600]; Persoz, A. Ch. [4], 1, 93 [1864]; Roscoe, C. N. 25, 61, 73 [1872]; Waddell, Am. 8, 280 [1887]); (2) by determining H₂O in BaW₂O₁, 9H₂O' [Scheibler, pr. 83, 324 [1861]); (3) by reducing WO₂ in H and determining H₂O produced (Bernoulli, P. Hand actermining H₂O produced (Bernoulli, P. 111, 597 (1860)); (4) by analysing Ag, WO,, and FeWO, (Zettnow, P. 130, 16, 240 [1867]); (5) by enalysing WCl₂ (Roscoe, C. N. 25, 61, 78 [1872]); (6) by determining & H. of W (De la Rive a. Marcet, A. Ch. (2) 75, 113 [1840]); (7) by determining V₂D. of WCl₂, WCl₃ and WOCl₄ (v. these compounds). The older determinations gave values for at. w. varying from 186 to 189; the most fecent determination (by Waddell) gave 184.04; Roscoe's determinations, made by reducing WO, to W and oxidising W again to WO, by finding the ratio of WCl, to AgCl and to Ag, and by reducing WCl, in H, gave value—sarying from 183-25, to 183-77. The number 183-6 is probably correct to half a finit. The atom of W ds pentavalent in the gaseous molecule WCl, and hexavalent in the gaseous molecule WCL.

W is the fourth member (the third is as yet unknown) of the even series, or chromium, family of Group VI. in the periodic arrangement of the elements. Wis followed in its family by U, and it succeeds Mo and Cr. W very closely resembles Mo; like that element W is both metallic and non-metallic; the balance of these properties being, however, not quite so evenly maintained in W as in Mo. It is doubtful whether any definite salt has been isolated derived from an oxyacid by replacing H by W. The oxide WO, acts as a fairly acidic oxide; like MoO, it is remarkable for the large number of compounds it forms, simultaneously, with oxides that are more basic and oxides that are less basic than itself. The chemical relations of Ware discussed in the article Chromium group of elements, vol. ii. p. 168.

Reactions.—1. Heated in air burns to WO₃; finely divided W burns easily; compact W only at a very high temperature (v. Roscoe, C. N. 25. 61, 73).-2. Heated to redness in steam gives H and oxide (? WO3).-3. Reacts with hot nitric acid, or aqua regia, to form WO, xH₂O; the same product is obtained by heating W with conc. sulproduct is obtained by heating W with conc. sul-phuric or hydrochloric acid, but oxides inter-mediate between WO, and WO, are formed at first (Riche, A. Ch. [3] 50, 15).—4. Pulverulent W dissolves in boiling conc. potash solution, giving H and a tungstate of K (Riche, Lc.). 5. Heated ir carbonyl chloride to 150°-200° "WOCL is produced, mixed with C (Smith a. Ober-bellton, West of george Chemic E 63) 6. Per holtzer, Zeit. f. anorg. Chemic, 5, 63).-6. By heating to redness with sulphur chloride a red, crystalline thiochloride, probably W2S.Cls, is formed as, a sublimate, unstable in air (S. a. O., l.c.) .- 7. Finely divided W reduces solutions of several metallic salts; AgNO, and AuCl, solutions are reduced to Ag and Au, HgCl, to HgCl, Cu, Pd, Pt and Rh are partially ppd. from solutions; Bi, Cd, and Pb are not ppd. (Smith, Zeit. f. anorg. Chemie, 1, 360).

Combinations .- 1. Heated in oxygen, WO, is formed .- 2. Combines with chlorine, to form WCl, at c. 800°; with bromine, to form WBr, at a higher temperature; and with iodine, to form WI, when strongly heated.—3. Heated with sulphur, forms WS,—4. The compound W,P, is said to be formed by strongly heating Win phosphorus vapour (Wöhler a. Wright, A.

79, 244).

Detection and Estimation.—Compounds of W form colourless beads with borax or micro cosmic salt in the outer blowpipe flame. The borax bead is yellow in the inner flame if a considerable quantity of a compound of Wis present. The microcosmic salt bead is blue in the inner flame in the absence of compounds that themselves form coloured beads; in presence of iron compounds the bend is blood-red, but addition of tin causes it to become blue. Soluble alkali tungstates are formed by fusion with alkali carbonate or nitrate; addition of excess of H.SO.Aq, HClAq, H.PO.Aq, H.C.O.Aq, or HC.H. Aq to an aqueous solution of a tung-state, followed by immersion of a piece of zinc in the liquid, produces a blue colour; addition of H.S to an acidulated solution c! a tungstate gives no pp., but a blue colour. According to Mallet (O. J. 28, 1229), the successive addition of small pieces of zinc to the solution obtained by adding excess of sone. HClAq to an alkaline tungstate produces various colours, the most marked of which is a brilliant magenta-red. By adding KCNSAq and then small pieces of zinc to a solution of an alkaline tungstate in excess of conc. HClAq, a deep green colour is produced; and an amethyst colour is noticed when KCNSAq is added to the solution of an alkaline tungstate, the solution is then diluted, HClAq is then added, and lastly zinc in placed in the liquid. Very minute quantities of W can be detected by adding SO₂Aq and Zn to solution of an alkaline tungstate, whereby a light-blue colour is obtained (M., l.c., p. 1233). W is estimated as WO₂, obtained by evaporation and strongly heating; for separation from other elements a Manual of Analysis must be consulted.

Tungsten, alloys of. By reducing mixtures of WO₃ with oxides of Sb, Bi, Co, Cu, Pb, Ni, or Zn, Bernoulli (P. 111, 573) obtained alloys of W with these metals, provided there was not more than 10 p.c. of the foreign metal present. An alloy with aluminium, approximately WAI, was obtained by Wöhler a. Michel (A. 115, 102) by heating a mixture of WO3, Al, cryolite, and NaCl and KCl. W alloys with iron; v. Poleck a. Grützer (B. 26, 35) for an alloy approximately W₂Fe. An alloy of 9 or 10 p.c. W with steel is extremely hard (v. Bornoulli, l.c.; Philipp, Hofmann's Ber. àber chem. Industrien, 745; Le Guen, C. R. 56, 593; 59, 786; 63, 967; 64, 619; 68, 592; Caron, A. Ch. [3] 68, 143; Osmond, C. R. 104, 985; Gruner, C. R. 96, 197). Tungsten, amidonitrides of, v. Tungsten

LITRIDES, AND ALLIED COMPOUNDS, p. 799.

Tungsten, bromides of. The elements com-bine when heated together to form WBr,, and by partial reduction in H this gives WBr.

WBr3. TUNGSTEN PENTABROMIDE formula is probably molecular, from the analogy of WCl. Prepared by heating W in excess of Br vapour, taking care that every trace of water and O are excluded. Dark, violet-brown needles. resembling I; melts at 276° and boils at 333°, giving off a dark-brown vapour; decomposed on distillation, with separation of Br; moist air or water forms HBrAq and blue oxide of W; heated to 350° in a stream of H, WBr, is formed (Roscor, C. N. 25, 73; cf. Borck, J. pr. 54, 254; Blomstrand, J. pr. 82, 408).

TUNGSTEN DIBROMIDE WBr. Obtained, as a bluish-black, velvety solid, when WBr, is heated dat c. 350° (in a bath of ZnCl₂) in a stream of dry H; WBr₃, WOBr₄, and Br distil over, and WBr₂ remains. Heated above c. 400° in H gives W and HBr; with HNO, Aq gives WO, HBrAq,

and NH, NO, Aq (Roscoe, l.c.).
Tungsten, chlorides of. When W is heated in Cl the compound WCl, is formed, and by reduction in H or CO, this gives WCl, WCl, and WCl. Great confusion existed about the compositions of the chlorides of W until Roscoe's esearches in 1872 established the formulæ.

TUNGSTER HI KACHLORDE WCl. Mol. w. 395-82. Prepared by heating W in Cl (Roscoe, C. N. 25, 61). The materials must be perfectly dry, and every trace of air myst be excluded, else WOCl, is formed; the WCl, sublimes on the cooler part of the tube, and is then distilled several times in a stream of dry Cl, and then in

a current of dry H (a small quantity of WCl, is formed, and distils off with the H). Teolu (A. 187, 255) obtained WCl, by heating WO, and PCl, in a sealed tube at 170°. WCl, forms dark-POI, in a scaled tube at 170°. WCl. forms dark-violet crystals; crystallises from CS, in brown, six-sided tablets, from POCl. in steel-blue, metal-like, regular crystals (T., l.o.). Melts, out of contact with air, at 275°, and boils at 346°7° at 760 mm. pressure (R., l.o.). V.D. 190 at 350° (Debray, C. R. 60, 820; Roscoe, l.c.); V.D. 168.8 at 440° (D., l.o.; R., l.o.; Rieht, B. 3, 666). Dissolves readily in CS, or POCl, (T., l.o.). Distilled in CO, gives WCl, and Cl; this fact taken in connection with V.D. at 440° shows that at somewhat above b.p. WCl, probably dissolved. at somewhat above b.p. WCl, probably disso-ciates to WCl, and Cl. WCl, is unchanged in ciates to WCl, and Cl. WCl, is unchanged in air; but if a trace of WOCl, is present, HClAq and WO, are formed. Hot water produces WO, and HClAq. Heated in air, or in O, forms WOCl, (Roscoe, l.c.; Blomstrand, J. pr. 82, 417). WOCI, is also formed by heating WO, with WCl. WCl, interacts with NH, at the ordinary temperature, to form NH4Cl and WaN, (Rideal,

C. J. 55, 44).
TUNGBTEN PENTACHLORIDE WCl., Mol. 360.45. Prepared by repeatedly heating WCl, somewhat above its b.p. (346.7°) in a stream of dry H, and when a solid residue has been formed removing the WCl, from less volatile lower chlorides by heating in CO. (Roscoe, C. N. 25, 61). Black, lustrous, heedle-shaped crystals; 61). Black, Instrous, needle-snaped crystals; very deliquescent; melts at 248°, and boils at 275-6° (R., l.c.). V.D. 175-6 to 179-9 at 350°; 185-7 to 186-4 at 440° (R., l.c.). Slightly soluble in CS₂ forming a blue liquid; forms an olivegreen solution in water, but is mostly decomposed to HClAq and blue oxide of W. Heated

posed to HCLR4 and blue battle of W. Heated in O forms WOCl, and Cl (R., l.c.; cf. Blomstrand, J. pr. 82, 425; 89, 230).

TUNGSTEN TETRACHLORIDE WCl. This compound is present in the solid residue obtained by heating WCl, in H in the preparation of WCl, (v. supra); it is prepared by distilling this residue, in a bath of H2SO, in a stream of dry CO2, returning the distillate to the distilling vessel and heating again, and repeating these processes heating again, and repeating these processes several times (Roscoe, l.c.). A soft, crystalline, greyish-brown powder; very hygroscopic; has not been fused or volatilised; heated strongly, it gives WCl, and WCl. Heated in H to ca440° pyrophorio W is produced. Decomposed by water to WO, and a greenish-brown solution

Tungsten Dichloride WCl., Prepared by heating WCl., in a bath of zinc, in a stream of dry CO.; WCl, distils off and WCl, remains. A loose, grey, amorphous powder; water-forms loose, grey, amorphous powder; water_torms WO, and HClAq, with evolution of H; interacts with H which has been passed through HNO, Aq to form WO, HCl. and NH, NO, (R., l.c.).

Tuagsten, cyanides of. No cyanides of W

have been isolated; according to Wyrouloff (A. Ch. [5] 8, 444; cf. Atterberg, Bl. [2] 24, 355), compounds containing W. K. and FcCy, are ob-

compounds containing w, h, and recy, are ortained by adding HClAq to mixture of K tungstates and K ferrogyanide.

Tungsten, fluorides of. No fluoride of W has been isolated According to Berzelius (P. 4, 147), when a solution of WO, H o in HFAG is evaporated and the residue is treated with water, a solid remains which is free from F after being

heated in NH₂. According to Riche (A. Ch. [8] 50, 41), a solution of tungstic hydroxide in HFAq gives crystals of WO₂.H₂O on evapora-

Tungstoxyfluorides. (Fluotungstates.) By dissolving tungstates of the form M.WO. in HFAq, Mavignac obtained a series of compounds of the forms 2MF.WO,F,xH,O and M"F,WO,F,xH,O, and also a few compounds of the form MF.WO,F, H,O (A. Ch. [3] 69, 67). These compounds may be regarded as salts of the hypothetical acids H,WO,F, and HWO,F,; they are similar to some classes of the com-pounds described as fluomolybdates (this vol. p.

The tungstoxyfluorides etch glass even when dry; they react slowly with acids, giving WO, H₂O. The salts of the forms M¹₂WO₂F₄ and MiWO,F, were prepared by dissolving Mi₂WO, and MiWO, in HFAq and evaporating; in some cases also by dissolving WO, H2O in HFAq, adding MOH, and evaporating. salts of the form M'WO,F, were formed by dis-solving acid tungstates in HFAq and evapora-BOIVING Not a compounds were isolated: (1) $M^1_{\nu} \text{VO}_2 \text{F}_{\nu} \text{xH}_2 \text{O}$; $M = \text{NH}_4$, x = 0; M = K, x = 1; M = Na, x = 0; (2) $M^{11} \text{VO}_2 \text{F}_{\nu} \text{xH}_2 \text{O}$; $M = \text{ZH}_1$, x = 10; (3) $M^{11} \text{VO}_2 \text{F}_{\nu} \text{xH}_2 \text{O}$; $M = \text{NH}_4$, x = 1. The salts $(NH_4)_{\nu} \text{VO}_2 \text{F}_{\nu} \text{(NH}_4)_2 \text{VO}_4$ and $\text{CuVO}_2 \text{F}_4 \text{NH}_4$

By dissolving K, WO, F, H,O in 4 p.c. H,O,Aq, . and crystallising from dilute H2O.Aq containing 21) obtained K₂WO₂F₄,H₂O. P. calls this compound fluoroxypertungstate; it might also be

named pertungstoxyfluoride.

Tungsten, haloid compounds of. When Wis heated in a stream of Cl the compound WCl, is nented in a stream of Ci the compound WCl, is formed, and this by reduction in H gives WCl, WCl, and WCl. The compound WBr, is formed by heating W in Br vapour, and WBr, is obtained by partially reducing WCl, in H. Small quantities of WI, are obtained by heating W in vapour of I. No fluoride of W has been isolated. Oxychlorides and oxybromides of the forms WCV and WCV are obtained by heating Forms WOX, and WO₂X₂ are obtained by heating W oxides in Cl or Br, and in other ways. The following compounds have been vaporised, and Word, and Worls, and Words, and W of Mo of the form MozX2z is to be followed (v. vol. iii. pp. 427, 428) it is probable that the molegular formulæ of the dichloride and dibfomide of Ware not less than WaX.

Tungsten, hydroxides of, v. Tungsten oxides AND HYDRATED OXIDES (p. 800), also TUNGSTEN

OXYACIDS (P. 802).
Tungsten, iodide of, WI2. This, the only iodide of W that has been isolated, is obtained, in very small quantities, by passing I vapour, mixed with CO₂, over red-hot W. It forms a metal-like, greenish crust; heated in air it gives

metal-like, greenish crust; heated main a greenish crust; heated with a large word of I and leaves WO, jt it is not decomposed by water (Roscoe, C. N. 25, 78).

Tungsten, nitrides of and allied pounds. Compounds of with N, and greenish also with N and H, are formed by heating words. WCl or WOCl in NH, ; the interaction of NH, and WO, probably produces a compound, or com-pounds, of W, N, H, and O; and a compound of W, N, and O is perhaps formed by heating WO. with NH.Cl.

Tungsten nitrides. By passing dry NH, TUNOSCEN MITRIDES. By passing dry NH₂ over WOl₂, and washing away the NH₂Ol produced, by water, Rideal (O. J. 55, 44) obtained a black lustrous powder, agreeing fairly with the composition W₂N₂. This substance is insoluble in HNO₂Aq, dilute H₂SO₂Aq, or NaOHAq; hot conc. H₂SO₂ produces NH₂ and WO₂; fusion with NaOH forms Na tungstate; heating in air, with accurage region vidiage it to WO₂ (R. Le.).

or with aqua regia, oxidises it to WO, (R., Lc.).

By continued heating WUI, in NH, to a temperature difficult to regulate, as slightly too high a temperature produces W, Uhrlaub obtained a black substance to which he gave the

ormula W₁N₂ (Die Verbindungen einiger Metalle mit Stickstoff, Göttingen, 1859).

Tungsten amidontraides. By the action of NH₂ on WO₁₈, Wöhler (A. 73, 198) obtained a black substance ordining from 86.78 a 90.8 black substance containing from 86.76 to 90.8 p.c. W, and 8.24 p.c. N; W. supposed this substance to be a mixture of two amidonitrides, 2WN₂W(NH₂)₂ and 2WN.W(NH₂)₂. W. oktained similar black substances, which he did not analyse by heating ablerides of W mith NH C. analyse, by heating chlorides of W with NH,Cl (A. 105, 258).

Compounds of tungsten with N, H, and O. Wöhler (4.78, 198) obtained a black substance by heating WO, to dull redness in dry NH,; the percentage of W in this substance varied from 87.65 to 88.47, and it contained 7.15 p.c. N, and c. 2 p.c. To be substance W. gave the formula W.N.H.Q. (= 4WN...W.(NH.)...2WO.). Riden (C. J. 55, 44) passed dry NII, over WO.; heated to a dull gedness until the yellow WO. was changed to a black, amorphous powder; he allowed to cool, and removed excess of NH, by passing a current of dry air through that the tube. The black substance thus obtained contained 85-26 p.c. W, and 7-4 p.c. N; assuming c. 3 p.c. H, the numbers agreed fairly with the formula O.H.N.Y

Compound of tungsten with N and O. Rideal (l.c.) obtained a black powder, agreeing in composition approximately with the formula WN, WO, by heating WO, with NH,Cl until the weight became constant. According to Rideal (Lc.) finely divided W does not change when heated in a stream of dry NH, after having been heated to redness in dry H; nor does NH, react with the blue oxide of W when

heated therewith.

Tungsten, oxides and hydrated oxides of. When pawdered W is heated in O it combines to form WO, by heating this oxide in H a blue oxide is formed, to which various formulæ intermediate between WO, and WO, have been assigned; by further heating in H, or, with C, the dioxide WO, in produced. There are indications of an oxide with more O than WO. WO, dissolves in acids, but corresponding salts have not hean isolated; the blue oxide apparent for solves in acids, but corresponding salts have not been isolated; the blue oxide separates from these solutions; WO₂ is also soluble in alkali solutions. WO₂ is insoluble in acids; it dissolves in alkali and alkaline carbonate solutions, forming tungstates (v. under Tungstan oxxaodes, p. 802). WO₂ coabines with many acidic exides to form compounds which react as acidic exides to form the compound of (v. p. 801). WO, is the anhydride of more than

one tungstic soid (v. p. 801). None of the oxides has been vaporised; the mol. w. of none is known.

TUNGSTEN DIOXIDE WO. (Brown oxide of

tungsten.)

Formation .- 1. By heating a mixture of **Mormation.—1. By neating a mixture of WO, and C to redness (Buchholz, S. 8, 1).—2. By heating WO, to incipient redness in H (Wöhler, A. 73, 198; 77, 262).—3. By decomposing WOl,, or WOl., or y H.O (Roscoe, C. N. 25, -61, 73).—4. By the reaction of Zn and HClAq on WO, (Wöhler, P. 2, 345), or on solution of a way to weather (Pick I. 1).

metatungstate (Riche, Lc.).

Preparation.—WO, is placed in a porcelain tube closed at one end and provided with a long opening in the middle; this tube is placed inside another porcelain tube which is kept at red heat, while H is passed through as long as water continues to be formed (Wöhler, A. 77, 262 note); the product is allowed to cool in H, and is kept

in H for 24 hours (Riche, A. Ch. [3] 50, 29).

Properties.—A brown powder with a slight violet sheen; prepared by reducing WO₂ by Zn and HClAq, the oxide is obtained in metal-like

ustrous crystals, pseudomorphs of WO₂. S.G. 12·11 (Karsten, S. 65, 394).

Reactions.—1. Moist WO₂ oxidises rapidly in air to WO₃; as prepared by reducing WO₃ in H it is pyrophoric, but if allowed to cool slowly in H the product is not pyrorhoric (Berzelius, P. 4, 147; 8, 267; Wöhler, l.c.; Riche, l.c.).-2. Heated strongly in hydrogen gives W.—
3. Chlorine forms WO.Cl. when heated with WO. (Roscoe, L.c., p. 63).—4. Heated to dull redness in a stream of ammonia, a compound, or compounds, of W with N. H., and O is formed (v. Compounds of W with N, H, and O, under Tungsten nitrides, supra). — 5. By heating with sal ammoniac, Rideal (C. J. 55, 44) obtained a black powder approximately Wn. WO, (v. Compound of W with N and O, supra).—6. Moist WO, dissolves easily in warm hydrochloric or sulphuric acid, forming reddish-brown solutions from which blue oxide of W separates. WO, prepared in the dry way is scarcely acted on by acids, except aqua regia, which oxidises it to WO₃.—7. WO₂ dissolves in conc. potash solution, giving off H, and forming K tungstate. 8. Reduces mercuric chloride to HgCl, and ppts Cu.O from solutions of copper salts (Riche, A. Ch. [3] 50, 5).—9. Heated in nitric oxide to below 500° gives the blue oxide; oxidised to WO, by heating in nitrogen dioxide to c. 800° (Sabatier a. Senderens, C. R. 114, 1429; 115, 236).

BLUE OXIDE OF TUNGSTEN. Blue compounds of W and O are obtained by heating WO, with of W and O are obtained by heating WO, with reducing agents; analyses lead to formule such as W₂O₃, W₂O₄, or W₂O₁₁, intermediate between WO₂ and WO₂. Malaguti (A. Ch. [2] 60, 273) gave the formula W₂O₄ to the blue product of heating WO₂ in H to c. 250°; von. Uslar (Beiträge sur Kenntniss des W und Mo [Göttingen, 1835]) gave the formula W₂O₄. Gmelin said that a blue oxide of the composition W₂O₁₁ is formed by strongly heating WO₂ in CO.

Blue compounds are also obtained by strongly heating. WH tungstates of the context with air

heating NH, tungstates out of contact with air (Malaguti, I.c.; von Uslar, I.c.). Aqueous solutions of WO, or tungstates are coloured blue by the action of very weak reducers, e.g. by exposing moist WO, on paper to sunlight (Liesegang,

C. C. 1865. 948), or by the action of SnCl, Aq on Scheibler, J. pr. 83, 313). Conc. H.SO, or HClAq gives a blue colour when heated with W (Riche, A. Ch. [3] 50, 15). Tungstates boiled with acetic acid and then electrolysed give blue coloured sabstances (Smith, B. 13, 753).

PEROXIDES OF TUNGSTEN. Fairley (C. J. 31, 141) obtained indications of an oxide with more O than WO,, by dissolving WO, 2HO in H,O,Aq, and evaporating over H,SO, in vacuo; the green, transparent, yellow scales thus obtained dissolved in water, forming a solution which could be titrated with KMnO, Aq, with separation of WO, xH,O. Cammerer (Chem. Zeitung, 15, 957) found that WO, dissolved in boiling H2O2Aq, with evolution of O; on evaporation he obtained yellow powder, to which he gave the formula WO₃.H₂O₂.H₁O (cf. reaction of H₂O.Aq with CrO₃Aq, vol. ii. p. 166). According to Péchard (C. R. 112, 1060), a salt Na₂O.W₂O₂.2H₂O is formed by boiling Na paratungstate solution with H2O2Aq and evaporating in vacuo.

TUNGSTEN TRIOXIDE WOs. (Tungstic anhydride. Sometimes erroneously called tungstic

acid.)

Occurrence.—As tungstic ochre or wolframine in Cumberland, Connecticut, North Carolina, &c. Formation.—1. By strongly heating in air tungstate of NH₄ or of Hg⁴.—2. By strongly heating WO₄:xH₂O.—3. By burning W in air

Preparation. -An aqueous solution of commercial Na, WO, is poured into boiling HClAq (1:1); the ppd. WO, is washed with HClAq until NaCl is completely removed; it is then washed with water to remove all HCl, and dissolved in NH, Aq; the solution is evaporated to dryness, and the NH, salt thus obtained is heated in an open crucible until every trace of NH₄ is driven off (Roscoe, C.N. 25, 73). Bernoulli (P. 111, 590) recommends to boil the NH₄ salt for a long time with successive quantities of HNO, Aq (to remove traces of Na salts), and to wash the residual WO, quite free from acids (cf. Zettnow, P. 130, 16, 240). WO, is obtained in crystals by very strongly heating the amorphous oxide (Bernoulli, P. 111, 595; Schafarik, W. A. B. 47, 246); by dissolving WO, in molten borax (Nordenshiold, P. 114, 612); by strongly heating the oxide in a current of HCl (Debray, C. R. 55, 287); or by heating to whiteness a mixture of Na2WO, and Na₂CO₂ imbedded in NaCl, when crystals of WO, sublime (D., l.c.).

Na, WO, may be prepared from wolframite by heating a mixture of 150 pts. of the finely powdered mineral with 100 pts. calcined Na₂CO₃ and 15 pts. NaNO, for four or five hours, in an iron vessel, lixiviating with water and crystal-lising (g. Franze, J. pr. [2] 4, 238; cf. Huntington, B. 17, 203; Scheibler, J. pr. 83, 239).

Waddell (Am. 8, 380) prepares pure WO, from tungstenite, by treating the powdered mineral with aqua regia, washing the residue, fusing it with KHSO, dissolving in water, and fractionally ppg. by HgNO₂Aq; the first pps. are then decomposed by aquaggia, the WO₂ thus obtained is dried and fused with Na₂CO₂, the fused mass is dissolved in water, tartaric acid is added, and H.S is passed into the solution; the filtrate Vol. IV. from ppd. MnS, &c., is boiled till H₂S is expelled, and is then fractionally ppd. by HgNO₂Aq; the later pps. are collected, washed, and decomposed by heating in an open vessel. For a method of preparing WO₂ from wolframite v. Preparation of Tunusten, p. 197.

Properties .- A heavy, canary-yellow powder; becoming orange-coloured when heated (Roscoe, C. N. 25, 73). Crystalline WO, is described as C. N. 25, 73). Crystalline WO, is described as wine-yellow, very lustrous, rhombic tablets (Nordenskjold, P. 114, 612). A trace of Na tungstate gives a green colour to WO, (R., Lo.). S.G.: amorphous, 7-13, to 7-16 (Zetmow, P. 130, 16, 240; Karsten, S. 65, 394); crystalline, 7-23 at 17° (Z., Lo.); 6-38·(N., Lo.). S.H. (8° to 98°) 07983 (Regnault, A. Ch. [3] 1, 129); (22° to 52°) 0894 (Kopp, T. 1865, 74). Melts readily in the blowpipe (Riche, A. Ch. [3] 50, 29); can be sublimed by mixing with Na CO, and heating be sublimed by mixing with Na CO, and heating to whiteness (Debray, C. R. 55, 287); also by strongly heating in HCl (Schafarik, W. A. B. 47. 246). Not decomposed at m.p. of Pt (c. 1750° (Read, C. J. 65, 313 [1894]). On exposure to light WO₃ turns, greenish, dwing to partial reduction (Roscoe, *l.c.*; cf. Liesogang, C. C. 1865, 943) WO, is insoluble in water or acids, even in boiling conc. H2SO4; it dissolves in hot KOHA4. NH3Aq, or K.CO3Aq, also in molten K2CO3, KHSO3, or K2WO1; also in molten alkali chlorides. in air, with evolution of Cl (Schultze, J. pr. [2] 21, 437, 441). WO₃ acts as an acidio oxide, forming tungstates (v. Tungsten oxyacids, p. 802).

Reactions .- 1. Heated in hydrogen, WO, is reduced to the blue exide, then to WO2, and finally to W (v. Blue exide of Tungstenep. 800; TUNGETEN DIOXIDE, p. 800; and TUNGETEN, p. 797).—2. Reduction to WO, or W is effected by heating with carbon.—3. Heated with potassium or sodium, WO, gives W .- 4. Reduction to the blue oxide, and then to WO, brought about by zine and hydrochloris acid, by stannous chloride, and also by heating with water and different organic compounds .- 5. Heating with carbon in chlorine produces WO,Cl., and WOCl, -6. WOCl, is formed by passing vapour of tungsten hexachloride over heated (Roscoe, C. N. 25, 63) ...- 7. A mixture of WO, and (Moscoe, C. N. 23, 03).—7. A mixture of WO₂ and calcium chloride heated to reduess in carbon dioxide gives WO₂Cl₂ (Schultze, J. pr. [2] 21, 441).—8. Mixed with carbon and heated in bromine, WO₂ gives WOBr₄; and WO₂Br₁ is formed by passing vapour of tungsten pentabromids over hot WO₂ (Roscoe, Lc. p. 73).— WO, is said to dissolve in molten alkali chlorides, in air, giving off Cl; heated in absence of air (in a stream of CO₂) with chloride of calcium, cobalt, iron, magnesium, or nickel, it is said to give WO₂Cl₂ and MWO₄ (Schultze, L.c.).—10. Heating with phosphorus pentachoride produces WCl, and POCl, (Teclu, 2. 187, 255) but WO,Cl, and WOCl, are also formed, accordbut WO, 13, and WOG1, are also formed, according to the relative masses of WO, and PCI, and the temperature (Schiff, A. 197, 185).—
11. WO,CI, WOCI, and CO, are formed by heating WO, in vapour of carbon tetrachloride (Watts a. Bell, C. J. 33, 442).—12. Compounds of W with N, H, and O (v. p. 800) are formed by heating WO, in ammonia; and a compound of Wwith N and O is probably produced by heat. Wwith N and O is probably produced by heating WO, with sal ammoniac (v. p. 800).-13. WS.

is formed by passing sulphur vapour, or hydrogen sulphide, over WO, heated to whiteness (Berzelius); also by heating to redness a mixture of WO, with 6 pts. of mercuric sulphide (B.; Brock, J. pr. 54, 254).

Hydrates of Tungsten Trioxide. Various compounds of the form WO. xH,O have been Various isolated; as these compounds act as acids, they are described under Tungsten oxyacids.

Tungsten oxyacids, salts, and derigatives of. Several hydrates of WO, that react as acids are known. WO, also combines with many acidic oxides—such as $\mathcal{P}_2\mathcal{O}_3$, $\mathcal{B}_2\mathcal{O}_3$, $\mathcal{S}i\mathcal{O}_2$, &c.—and the compounds so formed combine with basic oxides to form salt-like bodies.

TUNGSTIC ACIDS. The hydrates of WO. fall into two classes: tungstic acids, which are insoluble, or nearly insoluble; in water; and

metatungstic acids, which dissolve in water. Tungstic acids. The monohydrate WO, H.O, or orthotungstic acid WO₂(OH), is obtained by dissolving WO₂ in liot alkali or alkaline carbonate solutions, and boiling these solutions with excess of a mineral acid. It is also said to be obtained by decomposing an ammoniacal solution of WO, by Cl (Dumas, A. Ch. [3] 55, 144); and also by boiling powdered wolframite with aqua regia. This acid is a yellow solid; it reddens litmus; is insoluble, or almost insoluble, in water. According to Braun (J. pr. 91, 39), it is changed to $2WO_3$. H_2O at 100° ; according to Zettnow (P. 130, 16, 240), this change is effected at 50°. The acid is slowly reduced by Zn and HClAq, the final product being WO. (O. v. d. Pfordten, B.

The dinydrate WO₃.2H₂O is said to be formed by adding a mineral acid to a dilute solution of by adding a mineral acid to a dilute solution of an alkali tungstate M₂WO₄, and drying in the air; also by decomposing WCl₂, WOCl₄, or WO₅Cl₂ by water (Forcher, W. A. B. 44 [2], 173; of. Riche, A. Ch. [3] 50, 36; Anthon, J. pr. 9, 6). Forms WO₅H₂O by drying over H₂SO₄ (Braun, J. pr. 91, 89). This hydrate is described Ostaun, J. pr. 91, 33). This hydrate is described as an amorphous, white solid; reddens litmus; somewhat soluble in water, but insoluble if a little acid is present. By boiling with dilute acids is said to give WO.H.O.

The heminydrate 2WO.H.O. or distinguish

acid H₂W₂O₃, is said by Braun (l.c.) to be formed by heating the monohydrate to 100°; the change is complete at 50° according to Zettnow (P. 130,

METATUNGSTIC ACIDS. Acids of the composition 4WO₃.xH₂O are obtained by decomposing hot could. BaW₄O₁₃Aq by the equivalent position 4WO_{3.}ER.O are obtained by mosapposing hot coile. BaW,O_{1.}Aq by the equivalent quantity of H.SO₄, filtering from BaSO₄, and evaporating (Scheibler, *J. pr.* 83, 310); also by decomposing PbW,O_{1.}Aq by H.S. filtering, and evaporating (Forcher, W. A. B. 44 [2], 173). The composition of the acid formed by evaporating in vacuo over H.SO₄ is probably H.W,O_{1.}, ?H_O (Scheibler, *l.o.*; cf. Persoz, C. R. 34, 185; Lotz, A. 91, 52). BaW,O_{1.} is dotained by ppg. a hot cone. solution of (NH,)₂W,O_{1.} shop balling (NH₂)₂Aq; (NH₂)₂Ny,O_{1.} by ppg. (NH₂)₂Aq by Pb(O₂H₂O₃)₂Aq; (NH₂)₂Ny,O_{1.} is formed by boiling (NH₂)₂W₄O₄ and evaporating. According to Zettnow (P. 100, 16, 240), the pp. obtained by decomposing Na, WO₄Aq by a mineral acid has the composition 4WO₂H₂O(=H₂W₄O₁₂) after drying at 200°.

4WO₃.H₂O(=H₂W₄O₁₂) after drying at 200°.

Metatungstic acid crystallises in sulphur. yellow octahedra; the acid is readily soluble in water, forming a very sour, intensely bitter liquid. A cone solution gives a pp. of WO₂.BL_O on standing; when a dilute solution is boiled it congulates and gives a pp. of white WO, 2H₂O, and then of yellow WO, H₂O. The heats of neutralisation of H₂W₁O₁Aq by Na₂OAq, K₂OAq, BaOAq, and SrOAq are given by Péchard (C. R. 108, 1167); the values are nearly the same as those for HNO, Aq and H, SO, Aq. When four equivalents of base are added to H2W4O13Aq,

orthotungstates M, WO, are formed (P., Lc.).

By long-continued boiling 2 pts. Na, WO, with 1 pt. As₂O₃, evaporating, treating with alkali solution, and repeatedly crystallising, Lefort (A. Ch. [5] 25, 205) obtained fine, very lustrous crystals, which were very soluble in water and in alcohol; to this acid L. gave the composition H2W1O13.6H2O, and the name luteometatunastic acid.

Colloidal (meta?) tungstic acid. By adding to 5 p.c. Na₂WO₄Aq rather more HClAq than sufficed to neutralise the Na, and dialysing, with addition from time to time of a little HClAq, Graham (C. J. 17, 318) obtained a solution in water of tungstic acid. The solution was not gelatinised by acids, salts, or alcohol at the ordinary temperature; it remained clear at 200°. According to Sabanéeff, (J. R. 21, 515; Abstract in C. J. 58, 1215), determinations of the freezing-point of an aqueous solution of Graham's soluble acid point to the formula $3WO_3.H_2O(=H_2W_3O_{16})$. As the values for mol. w. obtained by S. varied from 679 to 995, there

seems little reason for acopting the formula H₂W₁O₁₀ (713) rather than H₂W₁O₁₁ (944).

TUNGSTATES. A great many tungstates have been prepared. The proportion of basic to acidic radicle varies much in these compounds. The better studied tungstates have been divided into three classes-orthotungstates MO.WO, 8MO.7WO, paratungstates paratungstates 8MO.7WO₂, or perhaps 5MO.12WO₃, and metatungstates MO.4WO₂ but as many tungstates are known which do not fit into any of these classes it seems better to adopt a nomenclature and arrangement similar to those employed for the molybdates (cf. vol. iii. p. 423), based on the number of WO, radicles in the salts. Arranging the tungstates on this plan we get the following table. R = divalent metal, or two atoms of a monovalent metal.

(Ortho) Monotungstates RO.WO, or RWO,

derived from the acid H₂WO₄.

Ditungstates RO.2WO₂ or RW₂O₇; derived from the acid H2W2O7.

m the acid 12 w 20,.

(3:7 tungstates 3RO.7WO, or R, W, O₂₄.

(Para) { 5:12 tungstates 5RO.12WO, or R, W, O₁₁.

2:5 tungstates 2RO.5WO, or R, W, O₁₂.

3:8 tungstates 8RO.8WO₃ or R₃W₃O₂₅₀ Tritungstates RO.3WO₃ or RW₃O₁₀; ?derived from Graham's colloidal acid.

(Meta) Tetratungstates RO.4WO, or RW,O101 derived from the soid H2W4O11

Pentatungstates RO.5WO, or RW, O100 Hexatungstates BO.6WO, or RW.O. Octotungstates RO.8WO, or RW.O.

The tungstates which have been most thoroughly examined are the monotungstates or orthotungstates; the paratungstates, which

are either 3:7 or 5:12 salts; and the tetra- or metatungstates.

For thiotungstates v. Tungsten, Thio-Acids

AND SALTS OF, p. 810.

ORTHOTUNGSTATES OT MONOTUNGSTATES. BO.WO, or RWO. Salts of H₂WO, which is the monohydrate of WO. The alkali ortho-tungstates are obtained by dissolving WO, or WO₃.H₂O in alkali or alkali-carbonate solutions; or by fusing WO₂ with alkalis, alkaline carbonates, or alkali acid sulphates, and dissolving in water. The other orthotung states are generally obtained from solutions of the alkali salts by ppn.; also by strongly heating WO, with metallic oxides or carbonates; also by fusing the alkali salts with metallic chlorides, and washing with water (Manross, A. 81, 243; 82, 356; Geuther a. Forsberg, A. 120, 268; Schultze, A. 126, 56). The orthotungstates are insoluble in water, except the alkali salts and the Mg salt. Soluexcept the alkali saits and the Mg sait. Solutions of the alkali saits give pps. of WO₃.H₂O (yellow) or WO₂.2H₂O (white), with dilute H₂SO₄Aq, HClAq, HNO₃Aq, or H₄PO₄Aq; the pp. by HClAq dissolves in a considerable excess of conc. HClAq (Mallet, C. J. 28, 1228); cold solutions of metatungstates are not ppd. by acids. According to Marignac (A. Ch. [3] 69, 5) the pp. obtained by adding an acid to a solution of an alkali tungstate sometimes contains alkali, and sometimes the ppg. acid, according to the relative quantity of acid used, the dilution, and probably also the temperature. Orthotungstates which are insoluble in water, and the metals of which form carbonates that are insoluble in alkali carbonate solutions, can be brought into solution by fusion with alkali carbonates and treatment with water.

Solutions of orthotungstates give a white pp. with HgNO₂Aq; a bluish-white pp. with Cu(NO₂)₂Aq; a brown floculent pp. on adding K,FeCy,Aq, after adding HClAq; no pp. with tincture of galls until an acid is added, when a copious chocolate-coloured pp. is formed; and a yellow pp. with SnCl2Aq, which pp. turns blue when it is warmed with a little HClAq or H₂SO₄Aq. For the reactions with Zn and acid, and with KCNSAq, Zn and acid, v. Tuyssten,

STECTION OF, p. 798.

Barium orthotungstate BaWO, Prepared by fusing 7 parts BaCl₂ with 4 parts NacPand 2 parts Na₂WO₄, and washing with water; white octahedra (Geuther a. Forsberg, A. 120, 270); fusible with difficulty (Zettnow, P. 130, 256); S.G. 5-0035 at 13-5° (Clarke, Am. S. [3] 14, 281). BaWQ, 2H₂O, by adding four equivalents BaO in a column of BaBO, 208); (2) BaWO, H₂O and BaWQ, 2H₂O, by adding four equivalents BaO in a column of BaBO, 208); (2) BaWO, H₂O and BaWQ, 2H₂O, by adding four equivalents BaO in a column of BaBO. solution to H₂W₄O₃,Aq (Péchard, C. R. 108, 1167).

Cadmium orthotungstate CdWO. Obtained. s a yellow crystalline powder by fusing together as a yellow crystalline powder by using sognificant 11 parts CdCl₂, 16 parts NaCl, and 4 parts Na₂WO₄ (G. a. F., Lc., p. 268; Z., Lc., p. 240). The dihydrate CdWO₄, 2H₂O is obtained by ppg. a solution of a salt of Cdby Na₂WO₂Aq (Anthon, 100). J. pr. 8, 399; 9, 337; Smith a. Bradbury, B. 24, 2935).

Galcium orthetungstate CaWO₄. Occurs native as scheelite, S.G. 6.02 (Bernoulli, J. 13, 783). Obtained by adding K, WO, Aq to CaCl, Aq. Quadratic octahedra are formed by fusing Na, WO, with excess of CaCl, (Manross, A. 81, 243; 82, 348); also by heating the ppd, salt with CaO in a stream of HCl (Debray, C. R. 55,

Chromium orthotungstate $Cr_*(WO_4)_*, 20H_*O_*$. Obtained as a green pp. by adding Na, WO, Aq to $CrCl_*Aq$; loses 13H₂O at 100° (Lotz, A. 91, 66).

Cobalt orthotungstate CoWO .2H,O. violet powder; obtained by ppg. Co salt solutions by K₂WO Aq (Anthon, J. pr. 9, 344).

Copper orthorngstate CuWO, 2H₂O.

green powder, melting at a red heat and cooling to chocolate-coloured crystals? formed by ppg.

Cu salts by Na. WO. Aq (A., l.c.).

Ferrous orthogungstate FeWO. Obtained as opaque crystals by heating WO, and Fe,O, in a stream of HCl (Debray, C. R. 55, 288); also by fusing 2 parts FeCl, 2 parts NaCl, and 1 part Na.WO, (Geuther a. Forsberg, A. 120, 278; Zettnow, P. 130, 30). The trihydrate FeWO.3H O was obtained by Anthon (J. pr. 9, 343) as a brown powder by ppg. a ferrous salt by K₂WO₄Aq. Doublg compounds of the form mFeWO₁...MnWO₃ with the ratios m:n=7:1, 4:1, 3:1, 3:2, 1:2, and 1:7 were obtained by fusing FeCl, MnCl, NaCl, and Na, WO, in varying proportions (G. a. F., l.c. p. 270; cf. Z., l.c. p. 250). Wolframite has approximately the composition FeO.MnO.WO3

Lead orthotungstate PbWO4. Occurs native as scheeletine; obtained, as a white pp., by adding K, WO, Aq to solution of a salt of Pb (A., l.c., p. 342); quadratic octahedra are formed by fusing 10 parts Na₂WO₁ with 47 parts PbOl₂, S.G. 8.245 (Manross. A. 82, 357).

Magnesium orthotungstate MgWQ. Formed, in white octahedra, by fusing 2 parts MgCl, with 2 parts NaCl and 1 part Na, WO, (G. a. F.,

Lc. p. 272).

Manganese orthotungstate MnWO. Garnet-brown, lustrous, rhombic crystals; S.G. 6-7; obtained by fusing 2 parts MnCl., 2 parts NaCl, and 1 part Na, WO. (G. a. F., l.c.; Z., l.c.).

Mercurous orthotungstate Hg, WO. A

yellow pp., formed by adding solution of a mercurous salt to solution of an alkali tungstate (A., l.c.).

(A., L.C.).

Nickel orthotungstate NiWO. Formed by fusing 2 parts NiCl. with 2 parts NaCl and 1 part Na,WO.; brown, lustrous crystals (Schultze, A. 126, 56); S.G. 6.8845 at 20.5°, 6.8522 at 22 (Clarke, Am. S. [3] 14, 281). The hexahydrate, NiWO.6H.O. is obtained by ppn.

Potassium orthotungstate K.WO. . White. Potassium orthotungstate K.WO... White, triclinio needles; obtained by boiling WO. with an equivalent weight of KOHAq or K.CO.3Aq, and evaporating (Marignac, A. Ch. [3] 69, 18: Anthon, J. pr. 8, 399; 9, 337). Decrepitates when heated; melts at sed heat (M. l.c.), taking up CO. (Ulkk; W. A. B. 56 [2], 148; cf. Knorre, J. pr. 27, 89). Various hydrates are electrical by correctlining a solution of WO. obtained by crystallising a solution of WO, in K.CO, Aq under different conditions (M., l.c.; A., l.c.; Riche, A. Ch. [3] 50, 45).

Silver orthotungstate Ag, WO,. Appale-yellow, amorphous pp. by adding Na, WO, A solution of a salt of Ag; malts below redness, and becomes crystalline on cooling; easily soluble in HNO.Aq; soluble in NH.Aq (Zettnow, P. 130, 30; cf. Muthmann, B. 20, 984; Wöhler a.

Rautenberg, A. 114, 120). By evaporating a solution in NH,Aq over CaO and NH,Cl, Wid. mann obtained the compound Ag, WO, 4NH,

(Bl. [2] 20, 64).

Sodium orthotungstate Na, WO, .2H,O. Obtained by crystallising a solution of WO, in the equivalent quantity of NaOHAq or Na₂CO₃Aq. Transparent, colourless, rhombic tablets (Marignac, A. Ch. [3] 69, 22). Effloresces in vacuo, righao, A. Oh. [5] 09, 22). Enforcesces m vacua, or in dry air. Loses all H₂O at 190°. S.G. 3-2588 at 17.5°, 3-2314 at f9°; S.G. of Na₂WO₄. 4-1743 at 20.5°, 4-1833 at 18.5° (Clarke, Am. S. [3] 14, 281). Solubility = 41 at 0°, 55 at 15°. 123.4 at 100° (Riche, J. pr. 69, 10). For S.G. of Na WO Aq of different concentrations, v. Franz (J. pr. [2] 4, 238). For E.C. of Na₂WO₄Aq v. Walden (Z. P. C. 1, 529).

Strontium orthotungstate SrWO4. Obtained by ppn. (Anthon, l.c.); also by fusing 2 parts SrCl₂, 2 parts NaCl, and 1 part Na₂WO₄ (Zettnow, Lc.; Schultze, A. 126, 56).

Zine orthotungstate ZnWO. Colourless tablets; formed by fusing 2 parts ZnCl, with 2 parts NaCl and 1 part Na, WO, (Couther a. Forsberg, A. 120, 270; cf. Zettnow, P. 130, 240).

Paratungstates. A number of acid tungstates have been isolated, the composition of which is expressed by one of the formulæ 3RO.7WO, or ShO.12WO. The former formula was given by Lotz (A. 91, 49) and Scheibler (J. pr. 83, 273); the latter formula by Laurent (A. Ch. [3] 21, 54) and Marignao (A. Ch. [3] 69, 5). The two formulæ represent salts of almost identical composition, and no way has been found of deciding which formula is the better (cf. Knorre, J. pr. [2] 27, 83). The acid tungstates of this series are more easily formed and crystalhse better than the other acid salts; they are generally called paratungstates, following the suggestion

made by Marignac.

The alkali paratungstates are obtained by seturating hot alkali solutions with WO, and crystallising; most of the other paratungstates are prepared by ppn. from solutions of the alkali salts. The alkali salts are soluble in water, the other salts are insoluble. Solutions of alkali paratungstates give, with dilute HClAq, white pps. which become yellow on boiling (WO, 2H, O). Metatungstates, RO.4WQ, are formed by gradually adding HClAq to boiling solutions of paratungstates; meta-salts are also formed by boiling para salts with WO3.H2O. Solutions of paratungstates are not ppd. by SO,Aq, HIAq, bitrie, tartarie, or oxalic acid; but the presence of one of these acids does not hinder ppn. by HClAq. Solutions of alkali paratungstates give pps. with salts of almost all the heavy metals. H₂S reacts with alkali paratungstates in solution to form solutions of thiotungstates which give frown pps. with skids, soluble in (NH.) SAq. Paratungstate: readily react with H.PO, H.Aso., &c., to form complex acids (v. p. 807), solutions of which are not ppd. by soids, except these are added in considerable by sats, sat, whose of paratungstates are, therefore, not ppd by HClAq in presence of H₂PO₄, H₂B₂O₄, &c. For the reactions of paratungstates with PtO₄H₂ v. Rosenheim (B. 24, 2897; the reaction is rather indefinite).

If the simpler (3:7) formula is adopted, the

paratungstates are represented as 3Rt,0.7W0 BRUO.7WO, and Ruy.0.7WO, i.e. as salts of the hypothetical acid H_wW.0.2w therein 6H are replaced by 6R', 3R', or 2R'm; if the less simple formula (5:12) is adopted, the paratungstates of monovalent and divalent metals are regarded as salts of the hypothetical acid $H_1 W_{12} O_0$ $'=12WO_3.5H_2O$), wherein 10H are replaced by [=12WU₃.0H₂U₃, wherein 10H are replaced by 10R¹ or 5R¹¹; paratungstates of R¹¹ must be represented in this scheme by the complicated formula $R^{III}_{lo}(W_{12}O_{4l})_s$. In the paratung states which have been best examined $R^* = NH_{4}$, Li, Hg, K, Ag, and Na; RII = Ba, Cd, Ca, Co, Cu, Pb, Mg, Mn, Ni, Sr, and Zn; and Rin = Al and Cf. The simpler formulæ are employed in the descriptions of the individual salts.

Aluminium paratungstate Al, W,O₂₄.9H,O. A flocculent pp., drying to gum-like lumps; obtained by adding (NH₄)₆W₄O₂₄Aq to a solution of a salt of Al (Lotz, A. 83, 65; Anthon, J. pr.

8, 399; 9, 337).

Ammonium paratungstate (NH₁)_aW,O₂,6H₂O. Obtained by dissolving WO₃,H₂O in NH₃Aq and crystallising at the ordinary, or a little above the ordinary, temperature (Lotz, A. 91, 55). Crystallises in white, rhombic needles (Marignac, A. Ch. [3] 69, 25; Kerndt, J. pr. 41, 190); also in rhombio tablets (M., l.c.); and is, therefore, dimorphous. Solubility = 2.8 to 4.5 at 15°-22°; when the solution is boiled the 'very soluble meta-salt (NH₄)₂W₄O₁₃ is formed. Loses 3.9 p.c. H₂O at 100°; when heated to redness the blue oxide of W remains mixed with compounds containing N (M., l.c.). Marignae (l.c.) gave the formula (NH₄)₁₀W₁₂O₄₁.11H₂O to this salt; Berzelius, and Anthon (l.c.) gave the formula (NH₄)₂W₂O₂,H₂O; and Richo (v. Marignac, l.c.) the formula (NH₄)₂W₁O₁₃·5 or 6H₂O.

Various double salts have been isolated; with Na₆W₇O₂₄ (v. Knorre, B. 19, 821; Gibbs, Am. 7, 236); with $K_0W_0O_2$ (v. Laurent, A. Ch. [3] 21, 59; Marignao, A. Ch. [3] 69, 55); with $Mg_3W_0O_2$ v. M. (i.c.), Lotz (A. 91, 61); with $Zn_3V_0O_2$ v. Lotz (i.c.); with $Cd_3W_0O_2$ v. Lotz (i.c.); with $Cd_3W_0O_2$ v. L. (i.c.); with $Cd_3W_0O_2$ v. Lotz (i.c.); with $Cd_3W_0O_2$ v. Lotz (i.c.); with $Cd_3W_0O_2$ v. Anthon (J. pr. 8, 399; 6 227)

Barium paratungstate Ba₃W,O₂₄.8H₂O. A white pp. formed by adding (NH₄)₆W,O₂₄Aq to excess of BaCl_AA₅, washing and drying over H.SO₄ (Lotz, A. 93, 50; cf. Knorre, B. 18, 327; 19, 826). Forms a double salt with Na₆W,O₂₄ (Scheibler, J. pr. 83, 314).

Cadmium paratungstate Cd, W,O2,.16H2O; white needles, obtained by adding Na, W,O2,Aq to excess of solution of a salt of Cd (Gonzalez,

J. pr. [2] 36, 44).

Calcium paratungstate Ca, W,O2.18H2O; a orystalline pp. formed by ppg. excess of CaCl_Aq by Na₈V,O₂₄Aq, and drying in the air (Knorre, B. 18, 328). Forms a double salt with Na₈W,O₂₄ (Conzalez, l.c.).

Chromium paratungstate Cr, W,O₂₄.9H₂O; a grey powder, obtained by heating CrCl₂ with (NH₁), W,O₂₄; shooluble in water, but dissolves in

CrCl,Aq (Lotz, A. 91, 66), Coralt paratungstate Co, W,O2, 25H2O (Gonzalez, l.c.); forms a double rait with Na, W,O2, (G., l.c.).

Copper paratungstate Cu, W,O24.19H2O; pale-green pp. formed by adding Na W,O MAQ to excess of CuSO,Aq (Knorre, B. 19, 826; v. also Gonzalez, J. pr. [2] 86, 44). Forms a double salt with Na,W,O_{2t} (K., Lc.).

Lead paratungstate Pb₃W,O₂₁; a white pp. formed by adding (NH_.)₂W,O₂₄Aq to Pb(NO₃)₂Aq (Lotz, A. 91, 49). Forms a double salt with Na₂W,O₂₄ (Gonzalez, l.c.).

Lithium paratungstate Li₆W,O₂₁.19H₂O. Large prisms, unchanged in air; obtained by boiling the proper quantities of WO, and LiCO. in water, and allowing to crystallise (Scheibler, J. pr. 83, 321).

• Magnesium paratungstate Mg₃W₂O₂₁, 24H₂O; obtained by ppn. (Knorre, B. 19, 824). Forms a double salt with Na₃W₂O₂₁ (K., l.c.).

Manganese paratungstate Mn, W, O2, 34H, O (Gonzalez, J. pr. [2] 36, 44). ◆ Forms a double salt with Na_eW₁O₂₄ (K., l.c.).

Nickel paratungstate Ni, W,O2,.14H2O (An-

thon, J. pr. 9, 344).

thon, J. pr. 9, 344).

Potassium paratungstate K₄W,O₂₁,6H₂O (Marignac, A. Ch. [3] 69, 33, gave the formula K₁₀W₁₂O₄₁.11H₂O). Prepared by saturating hot KOHAq with WO₂.xH₂O, and allowing to cool; by boiling K₂WO₄ with H₂O; or by fusing wolframite with § of its weight of K₂O₃, boiling the product with water, saturating the aqueous solution with CO₂, and crystallising (M., I). White whombic crystall isong (M., I). Lo.). White shombic crystals, isomorphous with the NH, salt (M., Lo.). Decomposed by melting, to K₂WO₄ and 5K₂O.14WO₃, without forming any meta-salt (Knorre, J. pr. [2] 27, 91). Solubility = 2.15 cold water, 6.6 boiling water.

Various hydrates have been obtained (v. Zettnow, P. 130, 211; cf. Lefort, A. Ch. [5] 9, 93; 15, 321; 17, 470; 25, 200). Forms double

93; 10, 521; 11, $\frac{1}{4}$ (7), $\frac{1}{2}$ (7), $\frac{1}{4}$ (7), $\frac{1}{4}$ (7), $\frac{1}{4}$ (8), $\frac{1}{4}$ (8), $\frac{1}{4}$ (9), $\frac{1}{4}$ (9), $\frac{1}{4}$ (1), $\frac{1}{4}$ (1) excess of AgNO₂Aq (Gonzalez, *J. pr.* [2] 36, 44).

Sodium paratungstate Na₃W₂O₂₄.16H₂O.

This formula is given by Scheibler (J.pr. 83, 285); This formula Na₁₀V₁₀O₄ is given by Laurent (l.c.), Marignae (l.c.), and by Friedheim a. Meyer, (Zeit. f. anorg. Chemie, 1, 81). Prepared by saturating hot NaOHAQ, or Na₂CO₂Aq, with WO₃xH₂O and evaporating to the crystallising point; also by passing CO2 into Na2WO4A o until the reaction is only faintly alkaline. Large, well-formed, white, triclinic crystals (Scheibler, I.c.; Marignac, A. Ch. [3] 69, 39). Effloresces in air; loses c. 3 of its H₂O over H₂SO₄; is dehydrated without decomposition at 300° (S., *l.c.*); heated to dull redness leaves a residue, insoluble in water, containing more than 5WO₂ to Na₂O (M., Lc.; also Knorre, J. pr. [2] 27, 71). Melts above dull redness, giving Na, WQ, and Na, WQ,; (meta-salt). Heated with water to 150° gives much meta-salt (K., Lc.). Solubility 8 to 9 at 35° to 40°; for the salts obtainable from an aqueous solution v. M. (l.c.), and also K. (B. 18, 2362). By boiling a solution with Na₂CO₂ transformation to Na₂WO₄ is complete (v. Schmidt, Am. 8, 16). A hydrate with 21H₂O has been obtained (M., l.c.). Forms double salts with Sr,W,O₂, (Gonzalez, J. pr. [2] 36, 44), and with Zn,W,O₃, (Knorre, B. 19, 823).

Strentium paratungstate Sr,W,O₂,8H₂O

(Knorre, B. 18, 327).

Zine paratungstate Zn.W.Ou.xH.O (Gonzalez, J. pr. [2] 86, 44). METATUNGSTATES or TETRATUNGSTATES METATUNGSTATES OF TETRATUNGSTATES, RIVA, VO, or RIVA, O, Salts of the acid H₂W₂O₁, (v. METATUNGSTIC AGIDS, p. 802). The metatungstates may be obtained by causing metatungstic acid H₂W₂O₁, xH₂O (v. p. 802) to interact with carbonates, chlorides, or nitrates; also by the reaction of a weak soil (H,PO,Aq is the best) with orthotungstates, the acid being added as long as the pp. of WO, xH,O which is at first formed re-dissolves; also from the alkali salts by double decomposition, or better from the Ba salt by interacting with sulphates; the alkali metatungstates are prepared by boiling solutions of the ortho-tungstates for some time with WO, xH,O.

Most of the metatungstates are very soluble in water and are crystallisable from aqueous solutions; aqueous solutions are not ppd. by acids in the cold, but pps, are obtained after long standing or boiling. Metatungstates are changed to orthor salts by excess of alkali; when strongly heated, orthorungstates are formed. Solutions of metatungstates are not ppd. by H2S; (NH4)2SAq gives a blue pp.; pps. are not obtained with salts of the heavy metals except Pb and Hg1; K, FeCy, Aq does not form a

Ammonium metatungstate (NH₁)₂W₁O₁₈BH₂O. This formula is given by Scheibler (J. pr. 83, 303); more complicated formulæ are given by Margueritte (A. Ch. [3] 17, 477), Laurent (A. Ch. [3] 21, 62), and Lotz (A. 91, 55). Obtained by boiling the para-salt (NH₂)₃W₁O₁₈H₂O with WO₂H₂O (Ma gueritte, A. Ch. [3] 17, 477); disc by boiling the para-salt with a little HNO₂Aq (Laurent, A. Ch. [3] 21, 62); also by heating the dry para-salt to 250°-300° (Scheibler, J. pr. 83, 304; cf. l'ersoz, A. Ch. [4] 1, 101; and Marigmae, A. Ch. [4] 3, 71). White octahedra; effloresces in air: Ammonium metatungstate 14] 3, 71). White octahedra; effloresces in air; loses 7H,O at 100°. Solubility in cold water = 120 (Lotz, l.c.), = 286 (Riche, A. Ch. [3] 50, 45). The solution is optically refractive. Insoluble in alcohol or ether. Forms a double

salt with NH₄NO₃ (Marignac, A. Ch. [3] 69, 61).

Barium metatungstate BaW₄O₁₂.9H₂O. Ob-Barium metatungstate Iaw (0,19H,0. Obtained by adding BaCl,Aq to a hot cone. solution of Na, W,O, a acidified by HClAq (Scheibler, J. pr. 83, 304). Crystallises in large, white, tetragonal octahedra; S.G. 4.298 at 14°; loses 6H,0 at 100°; easily soluble in hot water, decomposed by much cold water to WO, and BaW,O, 6H,O, which dissolve spain on heating.

Cadmium paratungstate CdW,O₁,10H₂O.
Lustrous, white octahedra; unchanged in air; obtained by decomposing BaW₂O₁,Aq by CdSO,Aq (S., Le., p. 273).

Calsium metatungstate CdW,O₁,10H₂O.

Quadratic octahedra; obtained by dissolving CaCO, in H.W.O. Ac. Quadratic octahedra; obtained by dissolving CaCO, in H.W.O.Aq and crystallising (S., Lc., p: 314).

Cobalt metatungstate CoW.O. 9H.O (S. l.c. p. 317). Copper metatungstate CuW₄O₁₂.11H₂O (S.,

l.c p. 317). Magnesium metatungstate MgW.O., 8H.O.

(S., Lc.).
Manganese metatungstate MnW,O,s.10H,O (S., l.c. p. 278).

Mercurous metatungstate Hg, W,O,,.25H,O. | Obtained, as a white pp., by adding HgNO, Aq to solution of H.W.O. or a meta-salt (S., l.c.,

Nickel metatungstate NiW.O.s.8H.O (S., l.c.,

p. 273).

Potassium metatungstate K.W.4O,2.8H.O. Lustrous octahedra; obtained by boiling K.W.1O.2.4Q with WO.2.2H.O; very soluble in hot water, considerably less soluble in cold water (S., Marignac (A. Ch. [4] 3, 71).

Silver metatusgstate Ag. W. O.; Obtained,

as a crystalline crust, by adding AgNO₂Aq to Na₂W₄O_{1,2}Aq. evaporating, useparating from Ag₂WO₄, and evaporating again (S., *l.c.* p. 318). Sodium metatungstate Na₂W₄O_{1,2}10H₂O. Obtained by boiling Na₂W₂O_{1,2}Aq with WO₂XH₂O

and allowing to evaporate; white, lustrous octahedra; S.G. 3.8647 at 13°; very soluble in hot, but less in cold, water (S., L.c, p. 303).

Strontium metatungstate SrV 40,3.81120 (S.,

i.c. p. 314). Zinc metatungstate ZnW₄O₁₃.10H₂·20 (S., l.c.

p. 273).

TUNGSTATES OTHER THAN ORTHO-, PARA-, AND META- SALTS.

Ditungstates. Salts of the $\mathbf{R}^{\mathbf{I}}_{2}\mathbf{O}.\mathbf{2}\mathbf{W}\mathbf{O}_{2} = \mathbf{R}^{\mathbf{I}}_{2}\mathbf{W}_{2}\mathbf{O}_{1}.$ Salts of K and Na of this composition were said by Lefort (A. Ch. [5] 17, composition were said by Lettort (A. Ch. [5] 17, 470) to be formed by neutralising cold solutions of K₂WO₄ and Na₂WO₄ by acetic acid; Knorre (J. pr. [2] 27, 83) obtained only metatungstates, B₂W₄O₁₃, by this method.

Two to five tungstates. The existence of salts of the class 2R₂IO.5WO₂=R₁IW₂O₁₇ is doubtful. Marignac obtained a salt to which he gave the formula Na WO (11M O along mith

gave the formula Na₄W₅O₁,.11H₂O along with the para-salt Na₅W₇O₂,.16H₂O (A. Ch. [3] 69, 50). The same salt scems to have been obtained by Lefort (l.c.; cf. Forcher a. Gibbs, J. 1880. 341) by adding acetic acid and alkali to Na, WO, Aq and allowing to stand for some time (cf. also Schmidt, Am. 8, 16).

Three to eight tungstates. A salt $(NH_4)_aW_aO_{22}.8H_2O=3(NH_4)_2O.8WO_3.8H_2O$ secms to have been prepared by Marignac (A. Ch. [3]

69, 61).

Tritungstates R¹¹O.3WO₃ = R¹¹W₃O₁₀.

Lefort (A. Ch. [5] 17, 470) prepared a salt to which he gave the formula Na₂W₃O₁₀cH₂O, by pouring a boiling solution of Na₂W₃O₁₀CH₂O (contained by adding acetic acid to Na₂WO₄Aq until the liquid shows an acid reaction) into boiling acetic soid, allowing to cool, separating the lower syrupy layer, and crystallising it. (A corresponding salt K,W,O₁₀,2H₂O was obtained by a similar method; and a series of tritungstates was prepared by mixing equivalent quantities of the Na salt and metallic acetates, in solution, and adding alcohol. L. de cribes the tritungstates as easily decomposing in aqueous solutions to diand tetra- salts. The following salts were formed and tetra saits. The flowing saits were then by L.:

— BaW₂O_{1.0}4H₂O; CdW₂O_{1.2}4H₂O; CaW₂O_{1.0}6H₂O; CoW₂O_{1.0}4H₂O; FeW₂O_{1.0}4H₂O; PbW₂O_{1.0}2H₂O; MgW₂O_{1.0}4H₂O; MnW₂O_{1.0}5H₂O; NiW₂O_{1.0}4H₂O; Al₂O; PsyV₂O_{1.0}6H₂O. Kaorre's experiments led him SrW₂O₁₆,5H₂O. Knorre's experiments led him to regard Lefort's tritungstates as mixtures (J. pr. [2] 27, 83).

Penta- and octo- tungstates.

of K and Na of the composition R.W.O. and R₂W₈O₂₅ are said to have been isolated, former by fusing mixtures of R₂WO₄ and WO₃, the latter by fusing R₂W₄O₁₃ with R₂WO₄ (Knorre, J. pr. [2] 27, 81, 91).

A few tungstates that do not find places in any of the foregoing classes have been described by different observers (v. especially Lefort, A. Ch. [5] 9, 93; 15, 324; 17, 470; 25, 200; also Schreibler, J. pr. 83, 237; Gonzalez, J. pr. [2] 36, 44; Knorre, J. pr. [2] 27, 93; Lotz, A. 91, 49; Feit, B. 21, 133; Cleve, Bl. [2] 43, 170; Högborn,

Bl. [2] 42, 2).

PERTUNCSTATES. By boiling a solution of the paratungstate Na₆W₁O₂₁.16H₂O with H₂O₂Aq, and then evaporating in vacuo, Péchard (C. R. 112, 1060) obtained small white crystals of a salt to which he gave the formula Na O.W.O, 2H,O= NaWO, H₂O; and by treating (NH₂), W₂O₂, 6H₂O in a similar way he isolated the corresponding NH, pertungstate. According to P. these salts are decomposed by alkalis with evolution of O; solutions of them set free I from KIAq, and

react with HClAq, giving off Cl.

TUNGSTEN BRONZES. Bright-coloured, lustrous, metal-like, crystalline solids, obtained by the action of reducers—such as H, coal-gas, Sn, or Fe-on tungstates of Li, K, or Na; also by the electrolysis of these tungstates when molten. The composition of these compounds, which are known as bronzes and are used as pigments, is represented by the formula $M_r(WO_s)_p$, where M = Li, K, or Na. The constitutions of the compounds are not known; they may be represented as compounds of tungstates with WO, by the general formula xM2O.yWO3.zWO2; they may also be represented as compounds of M2O with a radicle composed of W and O in a ratio greater than W:20 and less than W:30-that is, as compounds of M₂O with oxides intermediate between WO₂ and WO₂. The tungsten bronzes are insoluble in most acids, also in alkali solutions.

Sodium tungsten bronzes. These compounds are formed by the interaction of Na tungstates and H (Wöhler, P. 2, 350), Sn (Wright, A. 79, 221), coal-gas (Schnitzler, D. P. J. 211, 484), Zn or Fe (Zettnow, P. 130, 261), or by electrolysing Na tungstates (Scheibler, J. pr. 83, 321). According to Philipp (B. 15, 499), the different processes yield the same bronze if the same tungstate is used, and the more WO, there is in the tungstate employed the richer in WO, is the broaze produced. All the compounds are insoluble in acids or alkalis; they dissolve in NaClOAq; heated with NH,Aq and AgNO,Aq they give Ag and WO, (cf. P. a. Schwebel, B. 12, 2234; 15, 500; Knorre, J. pr. [2] 27, 51). These compounds are slowly oxidised to tungstates by heating to redness in air (K., l.c.). Philipp (l.c.) gave S.G. of all the sodium Bronzes as 7.2 to 7.8 at 16° to 18°.

Purple-red bronze Na, W₂O₂ = Na, O.2WO₃, WO₃ = Na₂O, W₂O₃ = Na₂WO₄, W₂O₄. Prepared by fusing for c. haff an hour a mixture of 10.9 g. fusing for c. half an hour a mixture of 10.9 g. Na₂CO₃, 71.7 g. WO₃ and 0 g. tinfoil, and boiling successively with H₂O, NaOHAq, and HOlAq. Red cubes; the powder transmits green light when suspended in water (P., l.c.).

Red-yellow bronze Na₄W₃O₁ = 2Na₂O.3WO₂2WO₂ = 2Na₂O.W₃O₂... Prepared by

melting 60 to 80 g. of a mixture of Na₂WO₄ and WO₄ in the ratio 2Na₂WO₄WO₃, adding 30 g. finfoil, and keeping molten for 1 to 2 hours feed-yellow cubes; the powder is brownish yellow, and transmits blue light when suspended in water (P., l.c.).

10 Water (T., 5.0.).

Gold-Bellow bronze Na, W.O., =

5Na,O.7WO_1.5WO_2 = 5Na,O.W. 20,1.

Prepared by heating Na, W.2O, to dull redness in H, powdering and again heating in H, and then boiling with H.O. HClAq, and Na, CO, Aq successively. Golden yellow, crystalline powder (P., l.c.; cf. Wöhler, P. 2, 350; Wright, A. 79, 221).

Blue bronze Na₂W₃O₁₅ = Na₂O.4WO₃, WO₂ = Na₂O.W₃O₄₄. Prepared by fusing Na₃WO₄ with more than 2WO₂, and adding tinfoil; also by melting Na,W,O₂₄ (paratungstate) and electro-lysing with 6 Zn-Pt elements P., Lc.; Scheibler, J. pr. 83, 321; cf. Knorre, J. pr. [2] 27, 49; and Zettnow, P. 130, 261). Dark-blue cubes, with a red sheen: S.G. 7.28 at 17°.

Potassium tungsten bronzes. $K_2W_4O_{12} = K_2O.3WO_3.WO_2 = K_2O.W_4O_{11}$ pound seems to be the only one of this class that has been isolated. Prepared by fusing K₂WO₄ with WO₃ and adding tinfoil; also by fusing K₂CO₄ wo, and adding timoli; also by tusing K.O., with from 3WO, to 4WO, and reducing by H or coal gas; also by electrolysing a molten mixture of K, WO, and WO,. Reddish-violet prisms, giving a blue powders which transmits greenish light when suspended in water; S.G. c. 7-1 (Laurent, A. Ch. [2] 67, 219; Zettnow, P. 130, 262; Knorre, J. pr. [2] 27, 63).

Lithium tungsten bronzes. A compound of this class, probably Li₂W₃O₁₅, is obtained by fusing Li₄W₂O₂₄ (paratungstate) with tin. Darlablue crystals (Scheibler, J. pr. 83, 321; Knorre, I.c., p. 69; Feit, B. 21, 133).

A potassium sodium bronze and a potassium lithium bronze have been obtained (Knorre, l.c.

p. 66; Feit, l.c.).

TUNGSTIC ACIDS AND COMPLEX SALTS. Tungstic oxide WO, combines with several anhydrides, e.g. B.O., P.O., As.O., SiO., &c., and water, to form acidic compounds, and also with these anhydrides and basic oxides to form salt-like compounds; the whole of these compounds are usually grouped together as complex tungstic acids and complex tungstates, and they are divided into such classes as arsenotungstates, phosphotungstates, &c.

ANTIMONOSTUNIORITIC ACIDS AND SALTS. According to Lefort (A. Ch. [5] 17, 487), the compounds Sb₂O₃.5WO₂.4H₂O and Sb₂O₃.5WO₂.8H₂O are formed by dissolving tarter emetic in Na₂O.3WO₂Aq and Na₂O.2WO₂Aq respectively. Gibbs (Am. 7, 392) obtained 4BaO.6Sb₂O₂22WO₃36H₂O and 6K₂O.4Sb₂O₂12WO₂25H₂O.

ARSENOTUNGSTIC ACIDS AND SALTS. Compounds of the form As₂O₃16WO₃.xH₂O have been 6b-tained by Kehrmann (A. 245, 45; cf. Fremery, B. 17, 296); and series of compounds of As.O. with WO, and basic oxides (Na.O. K.O. BaC. &c.), in which the ratio of As.O.: WO, is 1:6 and 1.3, have been described by Gibbs (Am. 7, 313). Compounds of WC, with As.O, and bases, and finely with As.O, and bases, and finely with As.O, and P.O. and bases, are described by Gibbs (Lc.).

BOROTUNGSTIC ACIDS AND SALTS. Two com-

pounds of B.O. and WO. have probably been isolated, in which the ratios of the oxides are 1:14 and 1:9 respectively; compounds of each of these with bases are known (Klein, A. Ch. [5] 28. 350).

Borotungstic acid and salts

B₂O₂.14WO₂.eH₂O. A solution containing B₂O₃ and WO₂ in the ratio 1:14 is obtained by boiling and WO, in the father 1.14 is considered by bothing N_a , WO_a , Aq with B_2O_aAq , ppg. by $HgNO_aAq$, decomposing, the pp. by H_aS , and expelling H_aS from the filtrate by warming (for actuals $x \in K$, Lc.). Compounds of the form $xMO.B_2O_s.14WO_s.yH_2O$ have been formed, where x=2, 3, and 4, and M is Ba, K_2 , Ag_2 , Na_2 , Ag_2 , Na_3 , Ag_3 , Ag_4 , Ag_3 , Ag_4 , and Sr.

Tungstoboric acid and salts. The compound B₂O₂.9WO₂xH₂O, usually known as tungstoboric acid, is obtained in yellowish octahedra by evaporating the solution of borotungstic acid. A considerable number of compounds of bases A considerable number of compounds of bases with B₂O₂ and WO₂, in the ratio B₂O₂9WO₃, has been obtained; most of them are of the form 2MO.B₂O₂9WO₃.wH₂O₄ M= (NH₁)₇, Ba, Cd, Ca, Co, Cu, Li₁, Mg, Mn, H₁G, Ni, K₂, Na₂, Tl₁; a few salts 2M₂O₂.B₂O₃.9WO₂.xH₂O₄ (M-Al or Cr) are also described by Klein (l.c.).

FLUOTUNGSTATES and allied compounds; v.

TUNGSTOXYFLUORIDES (p. 799).

IODOTUNOSTATES. Blomstrand (J. pr. 40, 327) described a compound 2K,0.1.0, 2V 43.3H,0, obtained by adding the calculated quantity of HIO, to K.WO, Aq.

Phosphotungstic acids and salts. The oxides WO, and P2O, combine in several proportions, in presence of H2O, to form complex acids which contain large quantities of WO, relatively to the P₂Q₃. A great many compounds are known containing WO₃ and P₂O₅ combined with basic oxides

Phosphotungstic acids. Compounds of the form $P_2O_*xWO_*yH_*O$; compounds wherein = 24, 21, 20, 16, and 12 seem to have been isolated. The existence of these compounds was made known by Scheibler (B. 5, 802); they have been investigated chiefly by Gibbs (Am. 2, 217, 281; 4, 377; 5, 361, 391; 7, 313, 392; Péchard, C. R. 109, 301; 110, 754; and Kehrmann, B. 20, 1805, 1811; 24, 2326; 25, 1966; A. 245, 46; Zeit, f. anorg. Chemie, 1, 428; also Drechsel, B. 20, 1452; and Brandhorst a. Kraut, A. 249, 373). The phosphotungstic acids are obtained by boiling HaPO Aq with HaW,O13.xH2O meta-acid); by decomposing the merourous salts by HClAq; and by boiling Na,W,O₃,xH,O (para-salt) with Na,HPO,Aq decomposing by HClAq, and dissolving the acids thus formed in other. The phosphotungstic acids are unchanged in solutions in dilute acids; these solutions are scarcely acted on by H2S, and very slightly by zinc they give phosphates and tungstates when hoiled with alkalis; characteristic pps. are produced with alkaloids, urea, albumen, &c.

Phosphoduodecitungstic acid and salts

Phosphoduodecitungstic and and salts estimated by August 19,0,24W0,xH,0. The acid is obtained by evaporating a solution of H,PO, and H,W,O,,xH,O iff the proper proprition (Péchard, l.c.); by boiling a solution of tungstate and phosphate of Na, in the ratio 24Na,WO,:2Na,HPO, acidulating with HNO,Ad, decomposing the Hg salt hy pg. by HgNO, Aq, decomposing the Hg salt by HClAq, filtering, and evaporating in vacue

(Gibbs, Am. 2, 217); by boiling H,PO,Aq with BaWO, in the proper proportion, decomposing by a small excess of H.SO.Aq, removing H.SO. by BaOAq, filtering, and evaporating (Sprenger, J. pr. [2] 22, 418). The acid crystallises in white, regular octahedra, or cubes. The value for x in the formula P.O. 24WO. xH2O varies according to different observers, from 40 to 53, 59, and 61. The salts yMO.P.O.24WO.xH.O are obtained by mixing tungstates (normal or para-salts) with H,PO,Aq or a phosphate, and decomposing by slight excess of HClAq, HNO,Aq, or H.SO, Aq; in most cases the salts ppt. as fine. white powders; in some cases it is advisable to evaporate to dryness, extract with alcohol and ether, and evaporate. The saits have been described by Gibbs (i.c.); Kehrntann (Zeit. f. anorg. Serined by Gross (1.2.1), Rentmann (200.), Lattory, Chemie, 1, 430); K. a. Freinkel (B. 24, 2327); Sprenger (J. pr. [2] 122, 418); and Brandhorst a. Kraut (A. 249, 373). Salts have been obtained wherein MO = (NH₂), BaO, CuO, K₂O, Ag₂O, and NaO, and and 1.2, and 2.3, and 2.3, and 3.3, and Na₂O, and y=1, 2, and 3.

Phospholuteotungstic acid and salts. P₂O₅.16WO₃.xH₂O and yMO₂.P₂O₅.16WO₃.xH₂O. The acid is obtained by boiling Na₂WO₄Aq₁.with He acid is obtained by boiling Na, Wo, Adwith H, PO, Aq. acidulating with HNO, Aq. adding NH, Cl and boiling, crystallising the pp. from NH, ClAq. evaporating the NH, salt thus produced with agata regia, and crystallising the acid so formed from water (for details v. K., I.c.). To an acid obtained by decomposing the K salt by H₂SiF₂Aq, or the Ag salt by HClAq, K gives the formula P₂O₂.18WO₁.xH₂O; and he says that the salts are yMO.P₂O₂.18WO₂.xH₂O. The acid forms citron-yellow, six-sided tablets; it melts by the heat of the hand, and is very soluble in water. According to K. (B. 20, 1805; A. 245, 45), salts of this series are obtained by boiling any phosphotungstates with excess of H,PO,Aq in presence of an alkali salt. It is probable that two series of salts exist -one with 16WO, and another with 18WO₃ (cf. Gibbs, l.c.; and Péchard, l.c.). Salts have been obtained wherein MG = (NH₁)₂O, BuO, CaO, CuO, PbO, and K₂O, and y = 1, 3, 4, and 6.

Other phosphotungstic acids and salts.

I. Salts of the form yMO.P.O.,22WO, xH_O have been obtained, wherein MO = (NII), O, BaO, and K_O, and y = 2, 3, 4, and 7 (v. K. a. F., B. 21, 2327; 25, 1966; K. //cit. f. anorg. Chemie, 1, 435; Sprenger, l.c.; Gibbs, l.c.).

by c

Sprenger, i.e.; Gibbs, i.e.).

II. An acid of the form P₂O₂.21WO₃.xH₂O, and salts yMO.P₂O₂.21WO₃.xH₂O, where MO = (NH₂)₂O₂. K₂O, and Ag₂O and y = 3, have been isolated (K₁ a. F., i.e.; K₁, i.e.).

III. The acid P₂O₂.20WO₃.xH₂O and a salt 6BaO.P₂O₂.20WO₃.xH₂O were obtained by effectand (i.e.) and Gibbs (i.e.).

IV. For the acid P₂O₂.12WO₃.xH₂O and the salts yMO.P₂O₃.12WO₃.xH₂O, where MO = (NH₂)₂O₃. Back CaO, CuO, PbO, Li₂O, Mg₂O, Hg₂O, K₂O, Ag₂O, Na₂O, Tl₂O, and ZnO, v. Féchard (C. R. 110, 754).

V. A few salts of the form

V. A few sults of the form yMO.P.O., TWO, xH2O have been obtained (MO = (NH4), O. **BaO, CaO, Hg2O, Na2O; y doubtful) (Gibbs, L.c.; K., L.c.).
VI. Compounds of alkali phosphates with

WO_s, and with phosphoric acids and WO_s, have been isolated; also compounds of alkalis with H.PO. and WO., and with H.PO. and WO., 2Na, 0.P.O. 24WO, xH.O.

are described by Gibbs (Am. 5, 361; 7, 318, 892).

4 1 14 1 45 1

PLATINITUNGSTATES, v. this vol., p. 283,

SILICOTUNGSTIC ACIDS AND SALTS. Three compounds of SiO, with WO, and H,O, which react as acids, have been isolated, and many compounds of bases with SiO, and WO, Rave been obtained (Marignac, A. Ch. [4] 3, 5).

Silicoduodecitungstic acid, and SiOr.12WO_{3.07}H_{2.0}; as most of the salts contain 4M₂O (or 2MO) the acid is usually written 4H₂O.SiO_{2.12}WO_{3.07}H₂O (=H₂SiW_{1.2}O_{4.07}H₂O). According to Drechsel (B. 20, 1452), the acid is most easily obtained by dissolving Na, WO, in boiling water, nearly neutralising with HNO.Aq, boiling water, nearly neutralising with HNO₂Aq, dissolving the crystals that separate in cold water, boiling this solution with gelatinous SiO₂xH₂O until HClAq ceases to give a pp., filtering, evaporating, adding a large excess of H₂SO₂Aq, extracting with ether, separating the lowest layer and evaporating (for details v. D., l.c.). Large, colourless, dimetric octahedra (with x = 29); loses 25H₂O at 100°, and all H₂O at 350°. Very soluble in water and alkali colutions. Most of the salts of this acid have the composition 4MO.SiO.12WO.xH.O. or the composition 4M₂O.SiO₂12WO₃.xH₂O, or 2MO.SiO₂.12WO₄.xH₂O; M₂O = (NH₄)₂O, Hg₂O, K₂O, Na₂O; MO = BaO, CaO, MgO; x varies from 7 to 28 (Marignao, Lc.).

Tungstosilicic acid, and salts. is generally given to an acid containing SiO, and WO, in the same ratio (1:12) as silicoduodecitungstic acid. The formula of the acid is generally written 4H₂O.SiO_{...}12WO_{...}20H₂O. The acid is obtained by evaporating a solution of silicodecitungstic acid to dryness, taking up with water, filtering from separated SiO2, evaporating to a syrup, and allowing to crystallise. Forms short, white, triclinic prisms; melts under 100°, giving off 16H,O and again solidifying. salts of this acid are obtained by dissolving carbonates in a solution of the acid, and evaporating; they are more soluble and less easily crystallised than the salts of the duodeci-acid; the salts are of the forms

(1) $2MO(4M_2O).SiO_2.12WO_3.xH_2O$, where $M \neq Ca$, or $M_2 = K_2$; (2) $2M_2O.2H_2O.SiO_2.12WO_3.xH_2O$, where

M2 = K, or Na2; some more complex salts have also been isolated (Marignac, l.c.).

Silico-lecitungstic said, and selts. The acid 4H₂O.SiO₂:10WO₂:xH₂O (x probably = 3) is obtained by decomposing the Ag salt by HClAq, filtering, and evaporating in vacuo; the Ag salt is prepared by adding AgNO, Aq to the Ag salt is prepared by adding AgNO₂Aq to the NH₄ salt which is obtained by boiling an acid tungstate of NH₄ with SiO₂xH₂O, filtering, and evaporating. The acid forms a clear, yellowish, glassy solid, which does not wholly dissolve in water; loses 3H₂O at 100°; on boiling with water most of the SiO₂ separates, and the filtrate contains tungstosilicie acid. A few salts have been obtained, they are difficult to prairie have been obtained; they are difficult to purify from silicotungstates and tungstosilicates (Marignac, l.c.).

STANNIPHOSPHOTUNGSTATES. 892) obtained the salt 2(NH₄)₂O.P.O. 2SnO₂.22WO₃.15H₄O by the reaction of SnCl₄.2NH₄Cl and

TITANOTUNGSTIC ACIDS. Two acids. IH_O.TiO_12WO_xH_O and

1H₂C.TiO₂.10WO₂.xH₂O, are described by Lesarme (v. Klein, Bl. [2] 36, 17).

parme (v. Klein, Bl. [2] 30, 11).

Vanadorungstic acids and salts. Several compounds of WO₃ with V₂O₃ and H₂O have seen described by Gibbs (Am. 4, 377; 5, 361, 391) and Bosenheim (A. 251, 197); hey belong to the forms V₂O₃,10WO₃,xH₂O₄, V₂O₃,18WO₂,xH₂O₄, and V₂O₃,4WO₃,xH₂O. Compounds of these with yM₂O and yMO are the described; and a great variety of compounds of these with yM₂O and yMO are also described; and a great variety of com-pounds coming under the general formula mMO.nV.O.pWO.xH.O have been obtained (cf. Friedheim, B. 23, 1505; and Rothenbach, B.

Tungsten, exybromides of. Two exybromides, WO Br. and WOBr, are formed by the reaction of Br on WO, and in other ways. The formula WOBr, is very probably molecular, from the malogy of WOCl4.

TUNGSTEN DIOXYDIBROMIDE WO2Br2. ained by heating WO, in a stream of Br vapour, ulso by passing vapour of WBr, over heated VO, (Roscoe, C. N. 25, 73); also by heating VS, or a mixture of WO, and C in Br (Borck, 7. pr. 54, 254). Red, transparent, prismatic rystals; appearing black when hot, and giving yellow powder. Volatilised at red heat with rystats; appearing with yellow powder. Volatilised at red heat with artial decomposition to WO₃ and WOBr.

TUNGSTEN OXYTETRABROMIDE WOBr. Ob-

ained by passing Br vapour over a hanixture of equal parts of WO, and W, autiously distilling from less volatile WO₂Br₂ Roscoe, C. N. 25, 73). Also formed by passing Br aixed with some Ooverheated W, or by heating a nixture of WO, and C in Br vapour (Blomstrand, . pr. 82, 430). Brownish black, lustrous, rystalline needles; melts at 277' and boils at 27°. Heated in moist air gives WO, and HBr. nd is decomposed to the same products by water.

Tungsten, oxychlorides of. Two oxy-hlorides, WO₂Cl₂ and WOCl₄, are formed by Two oxyeating W in Cl mixed with some O, and in other

eactions.

TUNGSTEN DIOXYDICHLORIDE WO.Cl., TUNGSTEN DIOXYDICHLORIDE WO.Cl.. Obained by heating WO. in a stream of Cl, and ubliming (Roscoe, C. N. 25, 63); also by pasing CO. over a mixture of WO. and CaCl. heated o redness (Schultze, J. pr. [2] 21, 439). Also ormed, along with WOCl., by heating W in Cl aixed with O; by heating WO. and C in Cl; by leating WO. in CCl. (Watts a. Bell, C. J. 33, 42); and by heating WO. with PCl. (Schiff, 4. 97, 185; cf. Tungsten trioxide, Reactions, io. 10, p. 801). Yellow, four-sided tablets; ublimes without melting at c. 266°, with pulling at c. 266°, ublimes without melting at c. 266°, with partial ecomposition to WO, and WOCl. Not decomosed in moist air, nor by cold water (R., l.c.). leated in dry NH, gives off NH, Cl and leaves VO, (Rdeal, C. J. 55, 48); in this reaction VO, Cl, behaves like CrO.Cl, (R., C. J. 49, 367) eccording to Smith a. Shinn (Zeit. f. anorg. hemie, 4, 881), a black compound W, O, N, H, is ormed by heating WO2Cl2 in dry RH,

TUNGSTEN OXYTETRACHLORIDE WOCI,. 841.04. Formed by heating W in Cleconaining a little O; siso by passing Cl over a hot nixture of WO, and C; by heating WO, in CCl, Watts a. Bell, C. J. 33, 442); by heating VCl, or WCl, in O and Cl; by heating WCl, with

H₁C₂O₄; and by heating WO₂Cl₂. Prepared by passing vapour of WCl₂ over heated WO₂ in a current of Cl (Boscoe, C. N. 25, 63). Also by heating WO₂ and PCl₃, in the ratio WO₂:PCl₃ or WO₂:PCl₃, distilling off POCl₃ and the small quantities of WCl₃ and WCl₃ that are formed, washing the reddish residue with a little cold CS (15, 2000). CS, (to remove WCla), then dissolving in a larger quantity of warm CS, evaporating, and carefully heating the residue in a stream of CO, whereby the more volatile WOCl, is separated from WO, Cl., (Schiff, A. 197, 185).

WOCI, forms suby-red, transparent needles; melts at 210.4°, and volatilises at 227.5°, forming a yellow vapour (Ref.c.). V.D. 170-2 to 175-8 at 850°, 171-5 at 440° (R., l.c.; of. Debray, C. R. 60, 820). Exposure to air produces a crust of yellow Wo.Cl.. Heated in NH, probably gives W.N. (Rideal, C. J. 55, 43). Decomposed by water, with a hissing sound, to WO, and HClAq

(Roscoe, l.c.). Tungsten, oxyfluorides of. No compound of W with O and F has been isolated, but com-pounds are known which may be regarded as containing WO.F.. These compounds, ontaining WO.F., These compounds, WO.F., 2MF and WO.F., MF, and also a compound WO.F., 2KF, are described under Tungsr-OXYPLUORIDES (p. 799).

Tungsten, phosphides of. By heating W in vapour of P, a dark-grey powder was obtained by Wohler a. Wright (A. 79, 214), to which they gave the composition W₂P_e. By heating a mixture of WO₂ and P₂O₃ in a graphite crucible, W. a. W. (l.c.) obtained large, dark-grey, lustrous, six-sided prisms; S.G. 5.207; insoluble in acids, including aqua regia, soluble in a molten mix-ture of Na₂CO₃ and NaNO₃; unchanged by heating in air, but burns brilliantly in O. From an estimation of the P, W. a. W. gave the formula W.P.

Tungsten, salts of. No salts have been isolated by replacing the H of oxyacids by W. Except the halides, the only salts of W that are known are those wherein W forms part of the

negative radicle.

Tungsten, selenides of. By saturating a solution of Na.W.O., with H., Se, and then adding dilute H., SO.Aq, Uclsmann (A. 116, 125) obtained a black pp., to which he gave the formula WSe, (one estimation of W is given); by heating this in a tube a grey solid was obtained, said by U. to be WSe, (no analyses). WSo, is said to be easily soluble in solutions of alkalis, alkali sulphides, or alkali selenides.

Tungsten, sulphides of. Two compounds of Wand S are known, WS, and WS,; the latter is saidic, forming salts M.WS. The V.D. of

reither has been determined.

TUNGSTEN DISULTRIDE WS. Obtained by heating WO, to whiteness in vapour of S or in H.S (Berzelius); also by leating W and S; also by heating WO, with 6 pts. HgS out of contact with air (Borck, J. pr. 54, 254). According to Carnot (Bl. [2] 32, 164), WS, is usually formed when a compound of W is heated in a stream of dry H.S (v. also von Uslar, A. 94, 256; Corleis, A. 232, 262). A dark-grey, graphite-like, lustrous, crystalline powder (v. Riche, d. Ch. [8] 50, 26). Is said to decompose steam at a full red heat: reduced to W by very long continued heating in H.

TUNGSTEN TRISULPHIDE WS. Obtained by | tusing powdered wolframits with 2 pts. C. 3 pts. S, and 3 pts. Na₂CO₃, dissolving in water, decomposing the Na₂WS₄Aq thus produced by HClAq, washing the pp. completely out of contact with O, and drying at 100° (von Uslar, A. 94, 256; Corleis, A. 232, 264). A black powder; slightly soluble in water, more soluble on boiling, probably with partial decomposition. Soluble in alkali sulphide solutions, forming thio- salts (v. TUNGSTEN, THIO- ACIDS AND SALTS OF, infra). By adding to Na₂WS₄Aq a little more HClAq than was needed to combine with the Na. Winssinger (Bl. [2] 49, 452) obtained a colloidal form of WS.

Tungsten, sulpho- acids and salts of, v. next article.

Tungsten, thio acids and salts of. saturating (NH₄)₂WO₄Aq and K₂WO₄Aq with H₂S, Berzelius obtained (NH₄)₂WS₄ and K₂WS₄ (P. 8, 267); these salts were more fully examined by Corleis (A. 232, 258), who also obtained Na,WS, and also some thio-oxy-tungstates. All the thio-tungstates that have been isolated are ortho-salts, i.e. salts of H₂WS, Very dilute solutions of thiotungstates can be titrated with IAq in presence of KHCO₃ (C., l.c.).

Ammonism thiotenystate (NII₁)₂WS₄. Ob-

tained by passing H.S for four or five hours into solution of 10 g. WO3.H2O in 100 c.c. NHAQ S.G. 94, +20 c.c. water, allowing to stand for some hours in a closed vessel, and washing the crystals that separate with alcohol and ether. Forms orange-yellow prisms, isomorphous with (NH4), MoS4; very easily decomposed in moist air; easily soluble in water, slightly soluble in alcohol. Heated in CO2 gives WS, (B., l.c.;

Ammonium dithio-oxy-tungstate

(NH₄)₂WS₂O₂. Obtained by passing H₂S into a solution of 10 g. WO₃H₂O in 40 c.c. NH₃Aq S.G. 90, + 10 c.c. water, until the liquid becomes *turbid, and washing the crystals that form with alcohol and ether. Forms yellow, prismatic orystals. When dry, the salt is unchanged in Decomposed by re-crystallising from water, giving paratungstate (NH,),W,O24.6H2O (C., l.c.).

Potassium thiotungstate K.WS. Obtained by warming (NH₁)₂WS₄ with KHSAq, adding alcohol, and crystallising from conc. KHSAq. Forms yellow, prismatic needles; easily soluble in water. By continued boiling with KHSAq paratungstate is formed, K_aW,O₂,6H₂O (C, l.c.). Forms a double salt with KNO₃, with the composition K. WS. KNO, (B., l.c.).

Potassium trithio-oxy-tungstate K,WS,O.H,O. Obtained in citron-yellow, quadratio tablets, by passing H₂S for three or four hours into a solution of 10 g. K₂WO₄ in 10 c.o. water, and evaporating in vacuo, or precipitating by alcohol (C., l.c.).

Potassium monothio-oxy-tungstate K, WSO, H,O. Obtained, in almost colourless, very hygroscapic, crystalline masses, by passing H,S, into a solution of 10 g. K,WO, in 5 c.c. water until the liquid is turbid, filtering, adding 4 to 5 vols. alcohol, separating the under layer of liquid, allowing to crystallise, and washing with alcohol and ether (C., Lc.).

Sodium thiotungstate Na.WS. Obtained.

but not pure, by Corleis (Le.), by decomposing (NH₄)₂WS₄ by NaHSAq.

Tungsten, thiochloride of. By heating W to redness with S₂Cl₂, Smith a. Oberholtzer (Zcit. f. anorg. Chemie, 5, 63) obtained a red, crystai. line sublimate, unstable in air, probably W.S.Cl. M. M. P. M.

STEN FLUORIDES, p. 799.
TUNGSTEN, ORGANIC COMPOUNDS OF. Tungsten, heated with MeI at 240°, forms WMe,I₂ [110°], which crystallises in tables, and is converted by Ag O into WMe,O, which dissolves in acids Riche, C. R. 42, 203; Cahours,

A. 122, 70).
TUNICIN v. Animal Cellulose, vol. i. p. 718. TURMERIC. The root of Amomum Curcuena.

It contains curcumin (q. v.) and turmerol.

TURMERIC ACID C₁₁H₁₄O₂. [35°]. A product of oxidation of turmerol by cold KMnO₄ (Jackson a. Menke, Am. 6, 77). Needles, sl. sol.

water, v. sol. alcohol.—CaA', 3aq. S. (of CaA',)
1-28 at 16°. White needles.—AgA',

TURMEROL C₁₁H₂₀O (?). (193°–198° at 60
mm.). S.G. ¹⁷ 902. [a]₀ = 33·5°. An oil occurring in turmetic. Distils with decomposition at 285°-290° (Jackson a. Menke, Am. 4, 368; 6, 77). Dextrorotatory. Does not combine with NaHSO₃. KMnO₄ oxidises it to acetic, terephthalic, turmeric, and apoturmeric acids. PCl, forms C₁₉H₂Cl, which is also got by henting turmerol with conc. HCiAq at 150°. Sodium forms C₁₀H₂,ONa, whence isobutyl iodide forms oily C₁₉H₂,OC,H₃.

Apoturmeric acid C₅H₈(CO₂H)₂(?). [221°].

Woolly mass, sol. boiling water.

TURPENTINE. Semi-fluid resins exuding from coniferous trees. They consist of resin dissolved in oil of turpentine. On distillation oil of turpentine passes over and colophony remains behind. The various oils of turpentine are described under TERPENES. The chief constituent of colophony is abietic anhydride (v. ABIETIC ACID and Sylvic ACID). On oxidation by dilute HNO, colophony yields isophthalic, trincellitic, and terebic acids (Schreder, A. 172, 93). On the products of distillation of colophony v. RESINS

v. Resins.

TURPETHIN C₁₄H₂₆O_{1s} [c. 183°]. Occurs in the root of Convolvulus Turpethum (Ipomea Turpethum) (Boutron-Charlard, J. Ph. 8, 131; Spirgatis, J. pr. 92, 97; A. 139, 41). Purgative yellewish-brown resin, v. sol. alcohol, insol. ether (difference from jalapin). Conc. H.804 forms a red solution. Boiling alkalis convert it into turpethic acid. Boiling dilute mineral acids yield glucose (3 mols.) and turpetholic acid (1 duol.).

Turpethic acid C₁₁H₂₀O₁₅. Amorphous yellowish mass, v. sol. water. Split up by boiling HClA'u into glucose and turpotholic acid.—BaA".—BaH₂A'₂c'dried at 100°).

acid.—BaH.—BaH.A., dried at 100°).
Tarpetholic acid C. H., O. [c. 88°]. Minute reedles (from dilute alcohol.), sl. sol. ether.—NaA' (dried at 100°).—BaA'. Amorphous.—AgA'. Amorphous pp. A'. Amorphous pp. Ethyl ether Eth'. [72°]. Plates.

TYLOPHORINE. An alkaloid in Tylophora asthmatica (Hooper, Ph. [3] 21, 617). Crystalline, al. sol. water, sol. alcohol and ether.

TYPE METAL. An alloy of 15-20 parts Sb with c. 70 parts Pb, and 10 to 15 parts Sn; v.

107 N. Phys. 11 1 1 1975.

LEAD ALLOYS, vol. iii. p. 124.

TYPES. The object of classification is to put together like things, and to put apart things that are unlike. A perfect system of chemical classification would place side by side those elements and compounds that are chemically similar, and it would also indicate the relations that exist between all the elements and all the compounds. Inasmuch as the object of chemistry is the study of the connections between composition and properties, and between changes of composition and changes of properties, a com-plete scheme of chemical classification must indicate the relations of the substances classified, both as regards composition and also as regards properties. To connect composition with properties necessitates a thorough knowledge of both, and this knowledge can be gained only by comparing one substance with other substances. But, because of the large amount of detailed investigation that is required before the chemical properties of an element or a compound are known, chemists have often forgotten the larger issues of their labours, and have busied themselves rather with the examination of individual bodies than with the comparative study of many bodies. And, because of the imperfection of chemical knowledge at any time, those who have attempted the classification of chemical substances have generally paid chief. attention either to the composition or to the properties of the substances to be classified. Hence systems of classification have sometimes prevailed that were founded chiefly on similarities of composition, and at other times classifica-tory schemes have been in vogue that rested mainly on similarities of properties. But there has always been a desire, and generally an effort, to classify on the bases of composition and pro-perties. To classify satisfactorily demands the recognition of a simple class-mark, which shall also be clear, definable, and invariably applicable. It is probably correct to say that none of the larger classes of chemical compounds has a class-mark of this description. Hence the main difficulty in chemical classification. Take, for instance, the great class of acids. What is the class-mark? What must be known about the composition of a compound before it is put into the class of acids? There is no single and sufthe class of acids? ficient class-mark to be gained by studying the compositions of acids. What, then, about the properties of acids? Here, too, no simple, definable, and applicable property has been found nnane, and applicance property has been touted which serves to distinguish acids from all other compounds. Acids, it is usually said, are compounds containing replaceable hydrogen. But the expression replaceable hydrogen has not been, and cannot be, exactly defined. Hence, all that can be done is to set up an ideal or typical acid, and to place in the class acids those compounds which fairly closely approach this type as regards both properties and composition. And as with acids so with other classes of compounds. A classification by means of types ounds. becomes inevitable in such a science as chemistry,

but a typical classification cannot be final in any exact science.

Lavoisier's system of classification rested on oxygen; compounds were regarded as formed by the union of oxygen with other elements or groups of elements; the non-oxygenated part of a compound was called by Lavoisier the rest or radicle; compounds of oxygen with certain radicles were bases, compounds with other radicles were acids, and salts were formed by the union of bases with acids. Lavoisier used the term radicle to include elements and groups of elements.

J'al dejà fait observer, que dans le règne minéral presque tous les radicaux exitables et aciditables etalent simples; que dans le règne vegétal au contraira, et surtout dans le règne aqui me existait presque paqui ne fussent composes au moins de deux substances, d'hydrogene et de carbone; que souvent l'acte et le phosphore s'y reinfissaient, et qu'il en résultait des radicaux à quatre bases. — Tratié élémentaire de Chime, [1793], p. 251.

About twenty-four years after Lavoisier made this statement Berzelius repeated it.

Nachdem wir den Unterschied zwischen den Pro-ducten de organischen und der unorganischen Natur, und de verschiedene Art und Weise wie ihre entfernteren und die verschiedene Art und Weise wie ihre entfernteren Bestandtheile untereinander verbunden sind, niher kennen gelerut, haben wir gefunden, dass dieser Unterschied eigentlich darin besteht, dass in der unorganischen Natur alle oxyditten Körper ein einfachs Radical haben, während Hagegen alle organischen Suffeianzen aus Orgden mit zusammengestiem Radical be-tehen, "Lehrbuch der Chemie, 2 Auff. [Stockholm, 1817], vol. 1, p. 644.

Why do acids and bases unite to form salts ? What is the cause of the formation of compounds by the union of radicles, either simple or compound? These questions were answered by Berzelfus by appealing to the fact that the electric current very often resolves compounds into two parts, and in many cases also effects the combination of elements or groups of elements. Radicles combine, said Berzelius, because the negative electricity on one is thereby neutralised by the positive electricity on the other. Thus arose the electro-chemical conception of dualism (v. Dualism, vol. ii. p. 415; cf. Radical, vol. iv. p. 393).

In 1832 Liebig and Wöhler made an exhaustive study of compounds obtained from bitteralmond oil; they showed that the relations of composition and properties of these compounds were brought together, and expressed in a consistent conception by supposing that all the compounds contained a radicle having the composition C,H₂O(C = 12, O = 16); this group of elements, common to all the derivatives of bitteralmond oil, they called benzoyl. The work of Liebig and Wöhler marked a great advance in chemical classification; it was the actual working out of the connections between composition and properties of a number of compounds, and the expression of these connections in clear and definite language. The term scalels became henceforth the expression of a vivifying conception. The compounds derived from bitteralmond oil had certain common properties, and they had also a common composition; they belonged to the same type. The compounds of belonged to the same type. The compounds of benzoyl examined by Liebig and Woller included such compounds as these: C,H,O,OH, C,H,O,H, C,H,O,C,N, C,H,O,NO, The medicle C,H,O is common to all; this radicle is united with H, Cl, NO, CN, or some other radicle, in the different compounds; neverthe-

less, the properties of the compounds are so similar that all are said to belong to one type. To what extent, then, it was asked, may the properties of one radicle differ from those of another before the replacement of one of these by the other carries with it a change of type? The answer generally given to this question was: If the replacing radicle is chemically similar to the radicle replaced the type will not be destroyed. In 1834 Dumas, from the study of the action of chlorine on various organic compounds, an-nounced the empirical laws of substitution as follows: (1) When a compound containing hydrogen is subjected to the dehydrogenating action of chlorine, bromine, iodine, oxygen, &c., one atom of chlorine, bromine, indine, or oxygen, is taken up for each atom of hydrogen lost by the compound. (2) The same rule applies, without modifications, when the compound contains oxygen. (3) If a hydrogenised compound contains water the hydrogen of the water is given up without replacement, and then another quantity of hydrogen is absorbed, so that the final result is a replacement of hydrogen. A year or so later Laurent propounded a theory of substitution, which asserted that when equivalent substitution of hydrogen by chlorine or bromine occurs the chlerine or bromine takes the place of the hydrogen, and to a certain extent plays the same part as the hydrogen, and hence the chlorinated or brominated product must be similar to the compound from which it has been prepared. Laurent's views were much opposed, for a time by Dumas himself; but they gradually prevailed, and chemists became familiarised with the notion of the replacement of such a decidedly electro-positive element as hydrogen by an element so decidedly electro-negative as chlorine, resulting in the production of a compound of the same chemical type as the original substance.

About 1839 Dumas sought to distinguish 'mechanical types from chemical types. Compounds formed one from the other by the replacement of a certain number of equivalents of one radicle by the same number of equivalents of another radicle, and having their radicles similarly combined, and exhibiting similar properties, were said to belong to the same chemical type. Compounds were said to belong to the same mechanical type when they were composed of equal numbers of equivalents of radicles, but differed essentially in their properties. Dumas at this time regarded the properties of com-pounds as conditioned more by the arrangement than by the nature of their parts. He compared compounds to planetary caystems, the planets being represented by the atoms of the compounds. One atom, he said, might be replaced by another atom, or an atom by a group of atoms, without destroying the system; if the number of replacing atoms, or radicles, were the same as the number of atoms, or radicles, replaced, and the relative arrangement of all the atoms or radicles were not altered, the compounds belonged to the same type. By some such development as this the theory of types came to include the older theory of radicles.

It is evident that the terms used by Dumas and others to express the conceptions of the theory of types are vague and incapable of

exact definition. The expression 'equivalent radicles' cannot be defined, nor can an exact and invariable connotation be given to the expressions 'radicles similarly combined' and compounds having similar properties. But if it had been possible to classify chemical substances in an ideally perfect way the theory of types would not have arisen. If there is to be a typical classification the language whereby that classification is expressed must be more or less vague. Whether a compound formed from another by replacing equivalents of one kind by an equal number of equivalents of another kind does or does not belong to the same type as the parent compound can be determined only by a careful study of the properties of both compounds and by a comparison of the compounds one with another. The application of the theory of types was possible only when the properties and the compositions of compounds were exhaustively compared. The theory of types produced much fruit, because it suggested and demanded much inquiry into the fundamental

problem of chemistry.

In 1849 Wurtz prepared two compounds which resembled ammonia in their prominent characters. These compounds were found to have the compositions C_2H_1N and C_1H_1N respectively (G=6). The similarities between the properties of these compounds and ammonialed Wurtz to regard them as substituted ammonias, and to express this conception by the formula these compounds were prepared consisted in treating methyl and ethyl bromides (C₂H₃Br and C_iH_aBr ; $C=\vec{0}$) with ammonia, and then decomposing the products by potash. These reactions suggested the view that the new compounds were derived from methylic and ethylic ethers (C,H,O and C,H,O, according to the notation then used) by substituting NH₂ for O. Both views agreed in representing the new compounds as C₂H₃,NH₂ and C₄H₃,NH₂ respectively. But the properties of the compounds resembled those of ammonia; hence the view that Wurtz's compounds were derived from ammonia prevailed. This view was expressed by saying that these compounds belonged to the ammonia type, and by comparing the formula of the typical compound with the formula of the compounds formed after that exemplar; thus:

Type: Derinatives: Ammonia NH, H. Methylamine NH, C, H, Ethylamine NH, C, H,

Very soon after Wurtz's preparation of methylamine and ethylamine Hofmann argued that it should be possible to substitute each of the three atoms of hydrogen in NH, by the radicles three atoms of hydrogen in AH_1 by the radices C_1H_2 and C_1H_3 , and so to obtain the compounds $NH(C_2H_3)_2$, $N(C_2H_3)_3$, $NH(C_4H_3)_4$, and $N(C_4H_5)_4$ ($C^{\underline{o}\underline{o}}$ 6), all which compounds ought to results ammonia in their properties. Hormann fulfilled his own prophecy by preparing diand tri-methylamine and diand tri-ethylamine and diand tri-ethylamine and diand tri-ethylamine. amine; and, basing his methods on the concep-tion of the ammonia type, he prepared a large series of ammonia-like compounds derived from NH₃, 2NH₃, &c., by substituting for H various radicles composed of carbon and hydrogen. The ammonia type was thus established.

TYPES.

About the year 1850 Williamson studied the relations of ether to alcohol. The formula of ether was then written C_4H_3O (C=6, O=8), and that of alcohol $C_4H_4O_2$. Williamson heated that of alcohol C₄H₆O₂. Williamson heated potassium alcoholate (C₄H₅KO₂) with ethylic odide (C.H.I), expecting to obtain ethylated alcohol (OH, (C.H.JO₂); but he obtained common ether. Williamson suggested that the formula then accepted for ether should be doubled, and written (C.H.), O. He also found that by heating common alcohol with sulphuric acid, and adding methylic alcohol to the hot mixture, an etherlike compound was obtained, the simplest formula of which was C_2H_4O (C=6, $O_2=8$). Williamson argued that if common other is C.H.O. then the ether of methylic alcohol must be C.H.O, and that, in the reaction of sulphuric acid with ethylic and methy to alcohols simultaneously, a mixture of these two ethers might be expected to be produced. To account for the facts he had observed Williamson proposed to double the formulæ of the two ethers and to write them $(C_4H_3)_2O_2$ and $(C_2H_3)_2O_2$; and for the formula of the ether formed by the action of sulphuric acid on the two alcohols simul-taneously he proposed the formula C₄H₃(C₂H₃)O₂ $[=2C_0H_1O]$. Williamson compared the relations between the alcohols and ethers with the relations between water, potash, and potassium oxide. These relations are made clearer if the formulæ are expressed in terms of the atomic weights C = 12 and O = 16; thus:

Type: Water H.H.O Derivatives:
Alcohol C,H,HO
Ether C,H,C,H,O
Potash K.H.O
Potassium oxide K.K.O.

Thus arose the water type. To this were referred such compounds as acetic acid C₂H₂O.I.O., anhydrous acetic acid C₂H₂O.C₂H₂O.O, and many others.

Gradually the greater number of compounds, both organic and inorganic, came to be referred to four fundamental types—the hydrochloric acid type HCl, the water type HHO, the animonia type NHHH, and the marsh gas type CHHHII. To these were added so-called condensed types and mixed types; sulphuric acid, for instance, SO₂.OH.OH, was said to belong to the double water type.

Oxamic acid CO.NH, CO.OH was regarded by Wurtz as derived from the water-ammonia type.

Thus: $\begin{array}{ccc}

H
\end{array}$

The great danger attending the development of the theory of types was, that careful investigations into the reactions of compounds might easily be abandoned in favour of a superficial examination of a compound, followed by a relegation of it to this or that type. The theory began by being very vague and eelastic; she adoption of a few definite types rendered it more axect; but the temptation to manipulate for

mulæ on paper, and to invent condensed types and mixed types, gradually led chemists to see that the theory had done its work, and that it must give place to wider views, which should also be more accurate, regarding the connections between composition and properties.

818

The conception of types carried with it, from the first, more or less vague notions regarding the arrangements of the atoms in those collocacompounds; at any rate, this conception was bound up with the general conception of atomic arrangement. The reacting units of compounds that showed similar properties were thought of as composed of atoms similarly arranged. Moreover, the type was said to be maintained when an atom, or a group of atoms, in the parent compound was replaced by an equivalent number of atoms, or groups of atoms. These two conceptions, that of equivalency, and that of atomic arrangement, led gradually to the representation of the reacting unt, or molecule, of a compound as a definitely arranged group of atoms he'd together by actions and reactions between individual atoms; these conceptions led to the wider conception of valency, and to a system of classification based on the notion that each kind of atom is capable of directly com-bining with a limited, and determinable, number of other atoms. The formula given to chloro-sulphonic acid, with the object of connecting the composition with the properties of this compound. and of suggesting relations between this and other compounds, may be taken as an example of the merging of the notion of types into that of valency. This acid was regarded as derived both from water and hydrochloric heid; it was supposed to belong to the mixed water-hydrochloric acid type. Hence the formula, ClSO,H, was written thus:-

The radicle SO₂ was regarded as equivalent to 2H; and it was said that the residues of the two parts of the mixed type, i.e. Cl and OH, were bound together by the radicle SO₂. Again, monochlorhydrin, C₃H,ClO₂, was regarded as a derivative of the triple type HHO.HCl.HHO, and was said to be formed by the binding together of the three residues OH, Cl, OH by the radicle C₃H, regarded as equivalent to 3H. Thus:

The moment the conceptions underlying these formule, and formule like these, were expressed in the language of atoms and molecules, the nation of atomic valencies was gained. The group of atoms SO, replaces two atoms of hydrogen, one atom in the molecule HCl and one atom in the molecule HIO; and as the atomic group SO, is capable of directly combining with two atoms of hydrogen, or such a number of atoms as is equivalent to two atoms of hydrogen, this group binds together the atom Cl and the atomic group OH, and so the new molecule

S14 TYPES.

SO_rOH.Cl is produced. This statement contains the fundamental conception of atomic valency; it also contains the conception of types, and that of radioles.

The radicles were compared at regards their equivalency, generally in terms of hydrogen; then the elementary atoms were compared, and arranged in classes, such that all in one class were exchangeable, any number of one kind for the same number of another kind.

kind for the same number of another kind.
When the atoms had been classified in accordance with the number of atoms of hydrogen, or atoms equivalent thereto, with which each was capable of combining, the loundations had been laid of a system of classification which was more accurate than that based on the notion of types, and which at the same time included the essential characters of the typical system. article CLASSIFICATION in the first edition of this Dictionary cepresents the stage which had then (1863) been reached in the process of fusion of the theories of radicles, types, and valency. The system of classification developed in that article is based (1) on the compesitions of compounds interpreted by help of the theory of valency, and (2) on the properties of the compounds interpreted by the help of the theory of types ; the study of the properties of a compound is used to determine the fadicles that the compound contains, and a knowledge of the valencies of these radicles determines the form of the compound, and, taken along with the reactions of the compound, the type to which it is to be referred.

Although the introduction of the principle of atomic equivalency widened the conception of chemical types, it also tended towards a method of classification which was based on too slight a study of the bodies to be classified. A super-ficial examination of a compound generally sufficed to bring out some similarities between it and a well-known typical substance; the new compound was at once referred to its type; the form of the type determined the form of the compound under examination; it was then only necessary to manipulate the empirical formula by arranging the elements in groups, or radicles, and to assign to each radicle such a valency as satisfied the general rules that had been deduced from the study of a few typical compounds. The conception of types became very mechanical in its applications, so mechanical indeed that it was in danger of becoming metaphysical. New radicles were easily invented, and their valencies were deduced by a priori arguments. Kekulé recalled chemists to the study of properties by insisting that the properties of a compound are conditioned by the properties of the atoms which composithe molecule of the compound; and at a later date Mendeléeff made the same demand by asserting that the properties and the compositions of all compounds are periodic functions of the atomic weights of the elements.

The notion of types plays an important part in the classification of elements and compounds that has arisen from the practical examination of the meaning of Mendeléeff's periodic law. The periodic classification of the elements lays considerable stress on the study of the typical oxides, hydrides, hydroxides, &c., of each group of elements; for instance, the highest salt-forming oxide of Group L belongs to the type R.O.

that of Group II. to the type R₂O₂, and so on. But the word *type* is not used here with quite the same connotation as was given to it by the theory of types. All that is implied in statements such as those just made is, that the elements of Group I. combine with oxygen in the ratio of two atoms of element to a single atom of oxygen, that these oxides are salt-forming, and that they are characteristic of the elements of this group. The typical oxide-form of each of this group.

The omposition of that oxide which contains the greatest number of atoms of oxygen relatively to one atom of the group-element, and which oxide reacts either with acids or with alkalis to form corresponding The oxides that belong to the typical oxide-form of a group may be acidic or basic, or some of them mae be acidic and some basic; all that is asserted of their properties is that they are salt-forming. The properties of the typical oxide of any individual element are conditioned by the general character of the group, and the general character of the series, wherein the element is placed; by the special character of the element itself; and by the position of the element in the whole periodic system of classification. The term type is used in the nomenclature arising from the comparative study of the elements and compounds based on the periodic law with a wider, and at the same time a more exact, meaning than that which was given to it when the notion of types was made the basis of chemical classification. In the older classification the conception of types was the basis of the system; the conception was of necessity vague, and hence it was necessary sometimes to widen, and sometimes to narrow, the application of the conception. The modern system of classification is based on the relative weights of the atoms of the elements, and the conception of types plays a subsidiary part; the form of the typical oxide, or hydroxide, or other compound, is determined, as the compositions of all the compounds are determined, by the relative masses of the atoms of the elements; and the general character of the typical oxide, hydroxide, &c., of each group is determined, as the special character of each compound of each element is determined, also by the relative masses of the atoms of the elements.

The periodic classification of the elements and compounds makes use of the notion of types in another way, by applying the conception to certain elements. The elements placed in series I and 2, viz. H, Li, Be, B, C, N, O, and F, exhibit almost the whole range of properties of all the elements. The properties of the succeeding elements may almost be said to be but variations on the theme announced in the change from hydrogen to fluorine. These eight elements are types of all the others. In a comewhat narrower sense the element lithium summarises the range of properties shown in Group I.; beryllium summarises the range of properties of Group IV.; nitrogen, the properties of Group VI.; and fluorine, the properties of Froup VII. Each of the seven elements is the typical element of its group. Objections have been raised to this use of the term typical, on the ground that each

of the elements in question differs more from any member of its group than any other two members of the group differ from one another. But if an element is to summarise the properties of some ten or eleven other elements, it must differ considerably from each of these, while at the same time it resembles them all. The question of typical elements, and also that of typical oxide-forms, &c., are discussed in the article Periodic LAW (vol. iii. p. 808); that article should be consulted.

The older classification by types prepared the way for the wider conception of valency, which took up and utilised the permanent features of the typical arrangements of elements and compounds. The study of valency led chemists to see the importance of examining the properties of the atoms of the elements and thus made them ready to accept the more elastic, and more exact, generalisation of the periodic law. The theory of types developed into the theory of valency, and the theory of valency has been included in the theory of the periodicity of the connection between the atomic weights of the elements and the compositions and properties of the compounds of the elements. The general conception of types remains; we are still obliged to picture to ourselves a typical acid, a typical base, a typical salt, a typical alcohol, a typical amide, and so on. But this conception is no longer the basis of chemical classification. We have gone deeper down, and laid the foundations of our system on the firmer basis of the atomic weights of the elements. M. M. P. M.

An alkaloid TYPHOTOXINE C,H,, NO. obtained from pure, cultures of the typhogen bacillus (Gautier, Bl. [2] 48, 13).

TYROSINE C. H., INO, i.e.
C. H., (OH), CH, (NIL.), CO. H. p. Oxy-a-amido-menul-premious acid. Mol. vs. 121 (1925)

phenyl-propionic acid. Mol. w. 181. [235°]. S.G. 1 456 (Siber, B. 17, 2837). S. 04 at 20°; 65 at 100°. S. (90 p.c. alcohol) 0074 in the cold. H.F. 156,400. H.C.v. 1,070,800. H.C.p. 1.071.200 (Berthelot a. André, Bl. [3] 4, 227). $[a]_D = -8^\circ$ in HClAq at 16° ; -9° in KOHAq at 20° (Mauthner, M. 3, 843).

Occurrence.—Occurs abnormally in the liver and urine (e.g. in cases of poisoning by phosphorus (Frerichs a. Städeler, J. 1855, 729; 1856, 702; Blendermann, H. 6, 242), in the cutaneous scales in pellagra (Schmetzer, Dissert., Erlangen, 1862), in cochineal (De la Rue, A. 64, 35), in 1802), in cochineat (De la Ruc, A. 04, 53), in sprouting pumpkin seeds (Schulze a. Barbieri, J. pr. [2] 20, 401; 32, 457), in the roots of Stachys tubesiera (Planta, B. 23, 1699), in dahlia bulbs (Leitgeb, C. O. 1888, 1897), in alcoholic extract of woad leaves (Schunck, C. N. 37, 223), and in beetroot molasses (Lippmann, B. 17, 2835).

B. 17, 2835).

Formation.—1. By potash fusion from casein (Liebig, A. 57, 127; 62, 269), globulin, feathers, hairs (Leyer a. Köller, A. 68, 332), and albumen (Nencki, J. pr. [2] 17, 97).—2. By the action of boiling dilute H.5O, on ox-horn (Hinterberger, A. 71, 72), on fibrin (Städeler, A. 111, 12; 116, 57), and on silk (Weyl, B. 21, 1529).—3. By putrefaction of yeast A. Müller, J. pr. 57, 162; Báchamp, C. R. 74, 115, 184), albumen and gelatin (Jearmeret, J. pr. [2] 15, 853).—4. En amall quantity by heating conglutin with HClAq small quantity by heating conglutin with HClAq (Siegfried, B. 24, 419).—5. From p-amido-

phenyi-alanine and HNO, (Friediander a. Mahly, B. 16, 854; Erlenmeyer a. Lipp, A. 219, 161)

Properties .- Stellate groups of slender silky needles (from water), insol. alcohol and ether, m. sol. NH, Aq and KOHAq. Lævorotatory. Its solution is not ppd. by lead acetate or subacetate until NH, Aq is added. Boiling Hg(NO₂), containing HNO, turns its solution red, forming a brownishred pp. (R. Hoffmann, A. 87, 123; L. Meyer, A. 132, 156). After warming with conc. H. SO., diluting with water, and neutralising with BaCO₃, the solution is turned violet by FeCl., Tyrosine gives off less N, when its solutions are decomposed by NaOH and III in presence of NH₃ than when the NH₃ is absent.

Reactions.—1. At 270° it splits up into CO₂

and C.H.(OH).CHI. CHI...NH. (Schmitt a. Nasse, A. 133, 211).—2. Polash-jusion forms p-oxybenzoic and acetic acids (Barth, A. 136, 110; ost, J. pr. [2] 12, 159; Baumann, II, 4, 304). 3. KClO₂ and HClAq form tetra-chloroquinone.—4. By putrefactive fermentation it is converted into hydro-p-coumanic acid, and inally into p-cresol and phenol (Weyl, B. 12, 1450), 5. Hild and P at 150° from NH, and p-oxy-phenyl-propionic acid (Hüfner, Z. [2]) 4, 391; 6, 113). Conc. HClAq and HBrAq at 240° have no action.—6. Conc. H₂SO₄ (4 pts.) at 100° forms crystalline C₂H₁₀(SO₂H)NO₂, v. sl. sol. cold water, which also occurs in a hydrated son con water, which also containing 2aq). He yields (NH,)||fA" aq, Ba(HA"), 4aq, and Ca(HA"), 5aq (Städeler, A. 116, 57). BaC, H,NO, 3aq is obtained from the product of the action of H2SO4 \$10 pts.) on tyrosine (1 pt.).—7. MeOH, potash, and Mef yield crystalline C, H, NIO, K, sol. and Met yield crystalline C_{1,111,8}NlO₂K, sol. water, decomposed by warm KOHAg into NMe, and the methyl derivative of p-coumaric acid (Körner a. Menozzi, G. 11, 550).—8. Potassium cyanata added to boiling water containing tyrosine forms tyrosine-hydantoic acid C_{6,11,1}(OH).CH₂.CH(NH.CO.NH₂).CO₂H crystallising from water in needles, insol. ether (Jaffé, H. 7, 310). This body legisles to melt at 1553 H. 7, 310). This body begins to melt at 1552, being decomposed above 170°. It gives a red colour and pp. on warming with Millon's reagent. KA'aq, crystallising from alcohol-It forms KA'aq, crystallising from alcohol-benzene. 9. Tyrosine administered to a dog appears in the urine as tyrosine-hydantoin C_oH₄(OH).CH₂.CII NH.CO [275°-280°], which crystallises from water in needles, and is decomposed by heating in sealed tubes with baryta-water into CO,, ammonia and tyrosine. Other products found in the urine of a rabbit after a dose of tyrosine are hydro-p-coumaris and p-csy-phenyl-acetic acids and phenols (Blendermann, H. 6, 251).

Di-bromo-tyrosine C,H,Br,NO, 2aq. S. ·46 at 16°; 4 at 100°. Formed from dry tyro-sine and Br vapour (Gorup-Besanez, A. 125, 281). Needles or tables (from water), sl. sol. alcohol. Ag, C, H, Br₂NO, 2aq. — B'HCl 1 aq. — B'HBr. — B'₂H₂SO₄. Prisms, sol. water and alcohól.

Mitro-tyrosine C₀H₁₆N₂O₃ i.e. C₀H₁₆(NO₂)NO₃. Formed from tyrosine (1 pt.), water (4 pts.), and nitric acid (4 pts. of S.G. 1·3) in the cold (Strecker, A. 73, 70; Städeler, A. 116, 77). Pale-(Siffector, 2. 70, 70, Business, 1. 17), 17). Lawyyellow needles, sl. sol. cold water. — Salts: Ba $(C_bH_bN_2O_b)_2$ (dried at 100°). Blood-red amorphous mass.— $^{-1}A_5C_bH_bN_2O_a$; orange ppohanging to a red powder.—B'HOl $_2$ loq. Tufts of lemon-yellow needles.— D'HNO $_2$. S. 20.

Lemon-yellow needles.-B'.H.SO.. Yellow needles or granules.

Di-nitro-tyrosine C₂H₂(NO₂)₂NO₂. [115°]. Formed by warming nitro-tyrosine with dilute HNO. Golden CaC,H,N,O, 3aq. Golden plates (from water). - Salts; Golden six-sided tables. BaC.H.N.O. 2aq. Ruby-red prisms with vellow reflex, exploding when heated.

Reference.—Amido-tyrosine.

TYROTOXICON. A poisonous substance formed in milk, containing the butyric acid ferment, which has stood for some days. Occurs also sometimes in cheese (Vaughan, Ph. [3] 18. 479; H. 10, 146). When its alcoholic solution is mixed with PtCl, and evaporated violent explosion takes place.

sol. chloroform, insol. ether. Poison, paralysing respiration (Bradford, J. Physiol. 8,79). Possibly identical with sytisine. -B'HCl. Deliquescent.

D'H.PtCl....B'2HAUCl..
ULTRAMABINE. The blue-coloured material contained in lupis-lazuli. Until 1828 ultramarine was obtained by powdering and washing lapis-lasuli; but since that year it has been manufactured by heating to bright redness mixtures of Al silicate (china clay), Na2CO3 (carbonated soda ash), S, and charcoal, and washing, powdering, drying, and sifting the product. (For details of the manufacture v. Dierronany of APPLIED CHRMISTRY, vol. iii. p. 891.) The constituent elements of ultramarine are Al, Na, Si, S, and O. Treated with HClAq, ultramarine gives off H₂S; the solution contains NaCl AlCl₃, and FiO₂, and the residue consists of SiO₂, S, and some Al2O3; these reactions point to ultramarine being a compound of silicates and polysulphides. Much work has been done on the constitution of ultramarine, but the results obtained have not finally settled the question. From analyses and investigations made in 1891, Brögger a. Bäckström (W. J. 1891. 454) conclude that the composition of the essential colouring compound in natural ultramarine is represented by the formula Na₁[A'(S₃Na)]Al₂(SiO₄)₂. They also conclude that artificial ultramarines may be expressed by the following formula:-

 $Na_3Al_3Si_3O_{12} = N$ $\begin{array}{l} Na_3Al_3Ol_3Ol_2= \Lambda \\ Na_2Al_2Sl_0Ol_2= \Lambda \\ Na_4[Al(SNa)]Al_2Sl_3Ol_2= U(S_1) \\ Na_4[Al(S_Na)]Al_2Sl_3Ol_2= U(S_2) \\ Na_4[Al(S_Na)]Al_2Sl_3Ol_2= U(S_3). \end{array}$

The main constituents of the different varieties of blue ultramarine are N, A, and $U(S_1)$; of green ultramarine $U(S_2)$ and N; and $U(S_1)$ is the main contituent of white ultramarine, according to B. a. B. Formulæ more or less approaching those given above have been assigned to ultramarine by other observers; thus Silber in 1880 represented blue ultramarine as Si₂Al₄Na₂S₄O₂₀ (B. 13, 1854). On the other hand,

ULEXINE C. H., N.O. [1519]. An alkaloid some chemists have regarded the essential conin the seeds of common furze (Ulex europeeus) stituent of ultramarine as a sodium thiosilicate; (Gerrard a. Symons, Ph. [3] 17, 101, 229; 19, 1029; 20, 978, 1017). Deliquescent crystals, v. S.Si(ONa), as the composition of 'ideal ultra-S.Si(ONa), as the composition of 'ideal ultra-marine blue'; and he regards artificial ultramarine as a mixture, the only essential part of which is sodium thiosilicate. Clarke (Am. 10, 126) suggested a formula for ultramarine which should indicate the relations of this body to various natural silicates; in this respect Clarke's formula is important (v. this vol. p. 451).

White ultramarine is obtained by completely white utrimarine is obtained by completely cutting off air during the roasting of the materials; it is changed to blue by heating in O, SO, or Cl (v. Ritter, W. J. 1160. 226; cf. Philipp, B, 9, 1109; 10, 1227; Böttinger, A. 182, 311; R. Hoffmann, A. 194, 1).

Red ultramarine was observed by Scheffer, in 1873, to be formed in preparing the ordinary substance in a muffle furnace very strongly heated and freely exposed to the air; it contains less Na and more Al than the blue variety (B. 6, 1450; v. also Bächner, D. P. J. 231, 446; Zettner, B. 8, 259, 353).

Yellow ultramarine is formed by heating the red variety in the air a little above 360°, for a short time (R. Hoffmann, A. 194, 1). According to Büchner (B. 7, 990), both the yellow and red forms are produced by heating blue ultramarine red and then to yellow. If Cl is passed over ultramarine before the formation of the blue variety is completed, at 410°, the colour goes green, and then reddish-yellow (Zettner, B. 8, 259, 353); by heating the product with alkali. all CF is removed and a violet ultramarine is produced. This variety goes to the red form when heated in vapour of HNO or HCl at 130°-150° (Zettner, l.c.).

Green ultramarine is formed when a little Sa'ls used in the roasting process; it is converted into the blue substance by roasting with S. This form seems to be intermediate between white and blue ultramarine. According to Philipp (B. 9, 1109), S is not taken up in the change from green to blue; by heating the green form in sealed tubes with water, at 100°, he obtained the blue the material the blue the tained the blue, the water removing a very small quantity of sodium compounds.

Sabstituted ultramarines. Blue to green, and reddish-grey, substances have been formed by hesting ultramarine with AgNO, Aq, and by treating the product of this reaction with KI, LiI, BaL, ZnI, &c. These substances, known as silver ultramarine, potassium ultramarine, &c., probably contain Ag, K, Li, Ba, &c., in place of Na (v. Unger, D. P. J. 212, 224, 301; Philipp, B. 10, 1227; Heumann, A. 199, 253; 201, 262; Forerand a. Ballin, Bl. [2] 30, 112). By heating silver ultramarine with various alcofictio iodides, Forerand (C. R. 88, 30) obtained ultramarines containing alcoholic radicles, such as cethyl ultramarine, amyl ultramarine, &c. Selenion and tellurium ultramarines have also been produced, wherein S is substituted by Se or Te (v. Leykauf, W. J. 1876, 555; Guimet, A. Ch. [5] 13, 102; Pliequa, Bl. [2] 28, 518; Morel, Bl. [2] 28, 522). Various substituted ultramarines have been examined by Wunder (Chem. Zeit. 1890, 1119).

M. M. P. M.

ULMIC ACID. C. 66-4-63-9; H. 46-4-5; O. 29-31-5. C₁₂H₁₁O₂ or C₁₂H₁₂O₃. 11.C. 1983, 200. H.F. 266,200. Formed by action of HCl on cane sugar. Is an anhydride or mixture of anhydrides C₁₂H₁₂O₄ (humic anhydride) (Berthelot a. André, Bl. [3] 7, 441, 451). Turnsyllow in air and sunlight, giving off CO₂. The same thing happens with the humic acid extracted from vegetable mould by KOHAq and ppd. by HCl. Dilutte alkalis cause it to swell up, forming insoluble satts and a small quantity of a soluble basic salt. When cone. KOHAq is used a salt is formed, from which two-thirds of the alkali can be removed by washing, leaving KC₁H₁₁O₄, aq, and is reconverted into the acid. C₁₂H₁₂O₄ by HClAq. Animonia converts humic anhydride (ulmic acid) into an amido-acid C₃₄H₁₁O₄ wh₁₁ whence HCl sets free C₃₄H₁₁NO₄. Salts. -KC₁₅H₁₅O₄ aq. Hard, black, in-

Salts. – KC₁₈H₁₈O, aq. Hard, black, involuble mass, yielding a brown powder. The ulmin of Malaguti. Forned by shaking the anhydride with KOH (1 pt.) and water (120 pts.). – NaC₁₈H₁₃O, aq. – Na₂C₁₈H₁₃O, xaq.

References.—HUMIG, SACCHARUMIG, and SACCULMIG ACIDS.

UMBELLIC ACID C. H.O. i.e. [4:2:1] C.H.(OH), CHI:CH.CO.H. Mol. w. 132. Dr. oxy-cinvante acid. Formed by warming its lactone, umbelliferone with KOHAq (Tigmann a. Reimer, B. 12, 994; Posen, B. 14, 2745). Yellowish powder. Turns brown at 240°, and decomposes below 260°. Sol. alcohol and warm water, insol. ether. Resinified by boiling its aqueous solution. Reduces warm ammoniacal AgNO₂, forming a mirror. FeCl. gives a brown pp.

Methyl derivative C₁₆H₁₆O₄. [180²₂-185⁵]. Got by heating herniarin with alcoholic potash at 160° (Barth a. Herzig, M. 10, 165). Needles (tagg. water).

(a) Di-methyl derivative

C.H. (OMe), CH:CH.CO.H. [138°]. Formed by
the action of MeI and KOH in MeOH on the
methyl derivative of umbelliferone in the cold

(W. Will, B. 16, 2115; 19, 1277). Needles, v.
sol. alcohol and ether. Converted into the
(8)-isomeride by boiling alone or with HCIAq.
Both isomerides are reduced by sodium-amalgan
to the same C.H. (OMe), CH, CH, CO, H, and are
oxidised by KMnO, to the same C.H. (OMe), CO, H.

—CAA', 2aq: crystals.—BaA', 2aq: needles.

Vol. IV.

(3) Di-methyl derivative. [1847]. Formed as above, and also by saponification of its methyl ether C.H.(OMe). CH:CH.CO.Me [877], which is got by evaporating methyl-umbelliferone (1 mcl.) with NaOH (2 mols.) nearly to dryness, and digesting the residue with McI and McOH (Tiemann a. Will, B. 15, 2079). Needles, sol. alcohol and ether. Sl. sol. cold water.

(a)-Di-ethyl derivative [4:2:1] C.H. (DEI), C.H., CO.H. Di-ethyl-umbellic acid. [107°]. Formed by mixing ethylumbelliferone (5g.) with Etl (10g.) and a solution of KOH (4g.) in alcohol (Will a. Bock, B. 19, 1780). Small plates, v. 201. alcohol, ether, and benzene.

(β) Diethy' derivative. [200°]. Formed by boiling the (a) Asomeride for some time, and also by heating ethyl-umbelliferone (10 g.) with EtI (9 g.) and a solution of Na (2\) g.) in alcohol for six hours at 150°. Crystals, m. sol. alcohol, sl. sol. water.

UMBELLAFERONE C,HO, i.e.

C_H_3(OII) C_CO. Mol. w. 162. [224]. S. 1 at 100°. Formed by the dry distillation of various resins, chiefly those derived from umbelliferous plants, e.g. galbanun, sagapenum, and asafactida (Sommer a. Zwenger, A. 115, 15; Mössmer, A. 119, 260; Hlasiwetz a. Grabowski, A. 139, 100; Hirschsohn, C. C. 1877, 182). Formed by heating malic acid (1-mol.) with resorcin (1 mol.) and H_SO, (Pechmann, B. 17, 932). Prepared by distilling the alcoholic extract of gum galbanum (Tiemann a. Reimer, B. 12, 993). Needles, sl. sol. cold water and ether, v. sol. alcohol. Dissolves in acids, without charge. Alkalis above 50° form embellic acid. Its solution in dilute alkalis shows blue fluorescence. It SO, forms a solution with green fluorescence. Reduces AgNO₃ on boiling. Yields (4,2,1)-di-oxy-benzoic acid on oxidation (Tiemann a. Parrisius, B. 13, 2354). Funning JiNO₃ and H SO₄ form C₉H₃(NO₂),O₃ [216°] (Posen, B. 14, 2744).

Acetyl derivative C₁₁H_aO₄. [140°]. Formed by acetylation, and also by boiling di-oxy-benzoic aldeliyde with Ao₄O and NaOAe (Tiennann, B. 10, 2216; 12, 995). Needles, sl. sol. water.

Methyl derivative C, H,O, i.s.

C.H. (OMe) < CH: CH [114°]. Formed by heating umbelliferone with KOMe and MeI (T. a. R.). Ledlicts, nearly insol. water. Appears to be identical with herniarin [118°], which is extracted by alcohol from Herniaria hirsuta (Barth a. Herzig, M. 10, 161).

Ethyl derivative C₁₁H₁₀O₂. [88°]. Plates y. sol. alcohol (Will a. Beck, B. 19, 1779). Oxim of the methyl derivative

[4:2:1] C.H. (OMe) CHI.TH [138°]. Formed from the methyl derivative of thio-umbelliferone and hydroxylamine (Aldringen, B. 24, 3465). Reedles, v. sol. hot water and alcohol. Fell. colours its solution brownish-red.

Phenyl-hydraside of the methyl defivative C.H.(OMe) CHCH [115]. Yellow needles, giving a blue colour with H.8O.

Thio-umbelliferone. Methyl derivative C.H. (OMe) CH:CH. [114°]. Formed by heating the methyl derivative of umbelliferone with P₂S₃ (Aldringen, B. 24, 3465). Needles, sol. alcohol, v. sl. sol. water.

Di-chloro-oxy-methyl-uracil. · Dünydride $\operatorname{CCr} <_{\operatorname{CO}}^{\operatorname{CMe(OH).NH}} > \operatorname{Co}.$ i.e. Formed by the action of chlorine on methyluracil suspended in water (Behrend, A. 236, 59). Tables (from water); slowly decomposed by boiling water. M. sol. alcohol; not decomposed by boiling alcohol. M. sol. ether. A solution of SnCl, in HClAq at 100° reduces it to chloromethyl-uracil O₂H₂ClN₂O, which crystallises from water in needles. Fuming HNO, gives diahloro-barbituric acid.

Di-bromo-oxy-methyl-uracil C.H.N.Br.O. i.e. CBr₂ CMe(OH).NH . From methyl-uracil (or bromo-methyl-uracil), and bromine water (Behrend, A. 229, 18; 236, 57). Cubes (from hot water). Boiling alcohol converts it into bromomethyl-uracil CaH, N2BrO2. Fuming HNO2 forms di-bromo-barbituric acid.

Di-chloro-oxy-tri-methyl-uracil. Dihydride $CO \stackrel{NMe.CO}{\sim} COl_2$ [144°]. by passing Cl into an aqueous solution of trimethyl-uracil (Hagen, A. 244, 14). Crystals, sl. sol. hot water. Reduced by boiling with SnCl. to chloro-tri-methyl-uracil, which crystallises in prisms, m. sol. hot water.

Nitro-ethyl-uracil v. Nitro-di-oxy-ethyl-

PYRIMIDINE.

Methyl-ethyl-uracil v. DI-OXY-METHYL-ETHYL-PYRIMIDINE.

Nitro-methyl-ethyl-uracil v. NITRO-DI-OXY-METHYL-ETHYL-PYRIMIDINE.

Amido-uracil carboxylic acid v. Di-oxy-AMIDO-PYRIMIDINE CARBOXYLIC ACID.

References .- THIO-METHYL-URACIL and UR-AMIDO-CROTONIC ACID.

URAMIDO - ACETIC ACID v. HYDANTOÏO ACID.

p-URAMIDO-BENZENE SULPHONIC ACID NH₂.CO.NII.C_aH₄.SO_aH. Formed by evaporating a solution of p-amido-benzene sulphonic acid and potassium cyanate (Pellizzari, A. 248, 156), and also by heating dry p-amido-benzene sulphonic acid (1 mol.) with urea (1½ mols.) (Friedel, C. R. 112, 868). Pearly plates (from dilute alcohol), v. sol. water. -BaA', 3aq; mono-

clinic prisms, sol. Aq.
o-URAMIDO-BENZOIC ACID C₈H₈N₂O₃ i.e. NH₂.CO.NH.C₆H₄.CO₂H. Formed from potassium cyanate and the hydrochloride of o-amido-

beingoic acid (Griess, J. pr. [2] 5, 371; B. 11, 1730). HNO₃ yields only one di-nitro-derivative. n. Uramido-benzoic acid CH_mN_O. S. 1 at 10°. S. (96 p.c. alcohol) 72 at 16°. S. (ether) 127 at 16°. Occurs in urine after a dose of m-amido-benzoic acid (E. Salkowski, H.

7, 113).

Formation.—1. By adding potassium cyanate to a boiling saturated solution of the sulphate of m-am do-benzoic acid (Menschutkin, A. 153, 84; Z. [2] 4, 275).—2. By fusing m-amido-benzoid acid with urea (Griess, Z. [2] 5, 312; B. 2, 47). . By boiling m-cyanamido benzoic acid with

HClaq (Traube, B. 15, 2122).

Properties.—Small prisms (containing aq),
v. sl. sol. hot water. At 200° it yields v. sl. sol. hot water. At 200° it yields CO(NF, C₄H, CO₂H), On distilling m-uramido-benzoic acid (4 pts.) with P₂O₃ (1 pt.) m-amido-benzoic nitrile [54°] is formed (Griess, B. 8, 224). Boiling KOHAq splits it up into m-awido-

Benzoic acid, CO₂, and NH₃.

"Salts.— NH₁A'aq. — KA'. — CaA'₂4aq. —
PbA'₂2aq.—AgA': curdy pp., becoming crystalline.

Ethylether Eth'. [176°]. Formed from m-amido-benzoic ether and KCyO (Griess, J. pr. [2] 4, 293). Plates, sl. sol. hot water.

'Amido C,H,N,O. Formed from m-amido-benzamide and KCNO (Monschutkin). Scales

(from water), decomposed by fusion, al. sol.

p-Uramido-benzoic acid C₈H₈N₂O₃. Formed in like manner (Griess, J. pr. [2] 5, 369). Plates, almost insol. cold water, v. sl. sol. hot water, m. sol. hot alcohol. Yields some p-amido-benzonitrile [86°] on distilling with P₂O₃.—BaA'₂. Plates, v. e. sol. cold water.

Di.uramido-benzoic acid C,H,ON,O4 i.e. (NH,CO,NH),C,H,CO,2H. Formed by fusing diamido benzoic acid with urea (Griess, B. 2, 47). Small granules, v. sl. sol. hot water.— InAA's (dried at 130°). Noulles, v. sol. hot water.

References.—Amno-, Nitro-, and Oxy. UR-

AMIDO-BENZOIO ACIDS.

• URAMIDO-BENZOYL v. OXY-QUINAZOLINE.
p-URAMIDO-BENZYL-UREA C.H.,2N,O2 i.c.

NH₂CO.NH.C₂H₄CH₄NH.CO.NH₂, [197°], p-a-Di-uramido-toluene. Formed by heating toge-ther p-amido-benzyl-amine, hydrochloride (1 mol.), and KCNO (2 mols.) in aqueous solution (Amsel a. Hofmann, B. 19, 1289). Small needles. Sol. hot water.

URAMIDO-ISOBUTYRIC ACID v. ACETON-

TRAMIC ACID.

o-URAMIDO-CINNAMIC ACID Cullin N.O., i.e. NH .. CO.NH.C H .. CH: CH.CO .. H. Formed from o-amido-cinnamic acid and aqueous KCNO (Rothschild, B. 23, 3341). Sol. NII Aq and hot HClAq.
(β)-URAMIDO-CROTONIC ACID C₂H₈N₂O₃

i.e. CH, C(NH. CO.NH.): CH. CO.H. The ether is converted by NaOHA into the salt NaA', which crystallises in needles, v. sol. water; but on adding acids to this salt di-oxy-methyl-pyr-imidine Q₂H₁N₂O₂ is produced. Methyl-uracil is reconverted by NaOHAq into sodium uramido-

crotonate (Behrend, A. 229, 5).

Ethyl ether EtA', [166]. Formed from acctoacetic ether and urea. Needles, v. sol. ether, m. sol. alcohol. Decomposed by warm HCIAq into urea, acetone, CO., and alcohol. Alcohol forms CH., C(NH.CO,Et):CH.CO,Et [29°] (Meister, A. 244, 234).

CH3.C(NH.CO.NH2):CH.CO.NH2. Amide [131°]. Crystals (containing EtOII) (Meister). Amido-uramido-crotonic acid. Lactam.

Amido-methyl-uracil. Methyl-uracil (v. DI-oxy-METHYL-PYRIMIDINE) is converted by Br in CS₂ into crystalline bromo-meth fl-uracil C, H, DrN, O, whence conc. NH₃Aq at 150° forms amidomethyl-uracil (Behrend, A. 231, 250). Satiny plates (from water), in Iting near 250. Sol. alcohol. The hydrochloride is converted by potassium cyanate into oxy-methyl-xanthine G₄H_AN₄O₂2aq, crystallising from water in prisms.—B'HCl aq. Monoclinic crystal •; a:b:c =1:629:1:2·345; β · 52° 57',—B'₂H₂PtCl₆2uq:• needles, v. sol. water.

scetyl derivative C.H. (NHAc)N.O. 1 Rg. Formed from oxy-methyl-xanthine and Ac.O at 170°. Thick trimetric prisms (from water). Decomposes near 210° without melting. Sol.

alkalis and reppd. by acids.
URAMIDO-ETHANE SULPMONIC ACID NH, CO.NH.CH, CH, SO.H. Taurocarbanic acid. Occurs in small quantity in urine after as dose of taurine (E. Salkowski, B. 6, 744, 1191). Formed by evaporating a solution of taurine with KCyO. Formed also by the action of B. 22, 1142). Dimetric plates, v. sol. water, sl. sol. alcohol, insol. ether. Decomposed by baryta-water at 140° into CO, taurine, and NH₂.—BaA'₂: tables (from alcohol).—AgA'. Radiating tufts of crys-

URAMIDO - HEXOIC ACID C,H,,N,O, i.e. NH, CO.NH.CH(C,H,e),CO,H. [200°]. Formed by boiling isobutyl-hydantom with baryta-water (Pinner a. Spilker, B. 22, 696). Needles, v. sol. alcohol and hot water. - BaA'a: nodular groups of prisms.

Ethyl ether EtA'. [135°]. Formed by heating isobutyl-lydantoïn with KOH and EtBr. Needles, v. sol. alcohol and flot water.

Nitrile. NJL.CO.NH.CH(C.H.o.).CN.

Formed by heating the cyanhydrin of isovaleric aldehyde with urea (Pinner a. Lifschütz, B. 20, Oil, sol. alcohol and ether. On warming with HClAq it yields isobutyl-hydantoin C,H,,CH

CO,NH [210°].

Amide NILCO.NH.CH(C,H,),CO.NH.

[170°]. Formed from the nitrile (1 pt.) and cone. H.So. 3 pts.) in the cold. Crystals, v. sol. water and alcohol.

URAMIDO-HIPPURIC ACID C10H11N,O Formed by fusing m-amido-hippuric acid with urea (Griess, J. pr. [2] 1, 235). Nodules, v. e. sol. hot water. Decomposed by boiling conc. HClAq into glycocoll and m-uramido-benzoic acid.—AgA'. Crystalline pp.
URAMIDO-NITRO-AMIDO-PHENOL

C,H,N,O, i.e. C,H,(NO,)(NH,)(NH.CO.NH,).OH. Formed by reducing di-nitro-oxy-phenyl-urea with a monium sulphide (Griess, J.pr. [2] 5, 1). Reddish-brown needles, sl. sol. hot water and alcohol.—B'HCl: white scales.—BaA', 3\angle actel-blue needles, v. sol. hot. water. Boiling HClAq converts it into amidocarboxamidonitrophenol C.H.N.O., which yields BaA', xaq and B'HClaq, and is reduced by tin and HClAq to diamidocarboxamidophenor C,H,N,O, which yields B'HCl, crystallising in plates.

URAMIDO DI NITRO-PHENOL v. DI-NITRO-OXY-PHENYL-UREA.

p-URAMIDO-PHENYL-ACETIC ACID NH, CO,NH.C,H, CH, CO,H. [174°]. Formed by boiling p-cyanamido-phenyl-acetic acid with HClAq (Traube, B. 15, 2122). Small crystals

(containing 1 aq), sol. water, alcohol, and ether, a Uramido-phenyl-acetic acid. Ethyl her NH. CO. NH. CHPh. CO. Et. [130]. Formed by the action of aqueous KCyO on the hydrochloride of a-amido-phenyl-acetic ether (Kossel,

B. 24, 4150). V. sol. alcohol and hot water.
Nitrite NIL.CO.NH.CHPh.CN. [17 [170°] Formed by heating the cyanhydrin of benzoic aldehyde with urea (Pinner a. Lifschütz, B. 20, 2351). Converted by acids into C.H.N.O. [1827], crystantising in scales, v. sol. alcohol and hos water. water.

ter. g. uramido-phenyl-crotonic Acid. Nitrile CHPh:CH.CH(NH.CO.NH.).CN.

[160°]. Formed by heating urea with the cyanhydrin of cinnamic aldehyde (Pinger a. Lifschütz, B. 20, 2351). Needles, v. sol. hot alcohol. Boiling HClAq converts it into di-oxy-styryl-pyrazole (q. v.).

Amide CHPh:CH.CH(NH.CO.NH.).CO.NH. Formed from the nitrile and cold cone. H.SO bromine-water on ethylene-v-thio-ures (Gabriel, (Pinner a. Spilker, B. 22, 692). Microorystalline powder, decomposing at 210°-220° with evolu-tion of NH,. Sol. alcohol, al. sol. hot water. a-URAMIDO-PROPIONIO ACID C,H,N,O,

i.e. CH, CH(NH.CO.NH₂).CO.H. Lacturanic acid. [155°]. Formed by evaporating a solution of alanine sulphate mixed with KCyO (Urech, A. 165, 99). Formed also by boiling lactyl-urea with baryta-water (Heintz, A. 169, 128). Prisms, sl. sol. cold water and alcohol, insol. ether .-BaA'2 aq (dried at 100°).—PbA'2aq -AgA': needles, m. sol. water.

Nitrile CH, CH(NH.CO.NH,).CO.H. [106°] (Franchimout a. Klobbie, R. T. C. 7, 16). Amide CH, CH(NH.CO.NH,).CO.NH,

[196°]. Small needles (from a rohol), sol. water. URAMIDO-SUCCINIC ACID. Amic acid Amic acid NH, CO.CH, CH(NH.CO.NH,).CO.H. [138°] (G.); [157°] (P.). Succinuranide. Amido-succinuric acid. S. 54 at 23°. Formed by evaporating the mixed solutions of asparagine KCyO (Guareschi, G. 7, 404; B. 10, 1747). Dextro-asparagine gives a hevo-compound, while levo-asparagine gives a dextro-compound (Piutti, B. 19, 1693). Prisms, nearly in ol. alcohol and ether. According to Piutti, the dextroand lavo- compounds both melt at 157°.

Reactions.-1. Decomposed by fusion, with formation of malyl-ureide C.H.N.O. [230°-235°], which is also formed by heating urea with asparagine at 125° (Grimaux, Λ . Ch. [5] 11, 400) and Erystallises from water in pointed Phombohedra.—2. Boiling HClAq (S.G. 1-12) forms malyl-ureidic acid C₅H₆N₁O₄, which is also got by heating aspartic acid with urea at 130°. Malyl-uredic acid crystallises in orisms [215°-220°], S. 25 at 100°, which yields BaA', aq and is converted by heating with bromine-water into C,H,Br,N,O,, S. 3 at 100°, C,H,Br,N,O,, S. 25 at 100°, C,H,Br,N,O,, which is v. sol. water, C,H,BrN,O,, S. c. 6 at 100°, and C,H,Br₂N₂O₃, S. 10 in the cold and c. 22 at 100°

URAMIDO-THIO-FORMIC ACID v. THIO-

ALLOPHANIC ACID.
DI-URAMIDO-TOLUENE v. URAMIDO-BENZYL-

DI-p-URAMIDO-DI-o-TOLYL-SULPHIDE [2:1:4] S(C,H,Me.NH.CO.NH,), Thio-p-tolyl-di-[151°] (when containing benzene of crystion). Formed by heating the hydrotallisation). tallisation). Formed by nearing the hydrochloride of di-p-amido-di-tolyl-sulphide with KCNO (Trehlar, B. 20, 669). Crystallises from benzene in white silky needles (containing

URAMIL C.H.N.O. i.e.

CO NH.CO CH.NH. Dialuramide, Amidobarbituric acid. Amido-malonyl-urea. Murexan. Mol. w. 148. Formed by boiling alloxantin with NH.Cl (Liebig a. Wöhler, A. 26, 310; Grimaux, O. R. 87, 752) and by boiling ammonium thion-urate with HClAq. Formed also by reducing nitro- or nitroso- barbituric acid with HIAq (Baeyer, 4. 127, 223). It is also a product of the action of acids on murexide (Beilstein, 4. 107, 188).

Properties.—Silky needles, sl. sol. hot water, insol. alcohol and ether. Sol. conc. H.SO, and re-ppd. on dilution. Ats alkaline solution turns red in air, forming purpurates; thus it is converted in ammoniacal solution into murexide by boiling with air or HgO. Conc. HNO, forms alloxan. Bromine at 85° forms orange C,H,BrN,O, (Mulder, B. 14, 1060).

URAMILIC ACID C.H.N.O. (?). S. 14 in the cold; 33 at 100°. Formed by heating uramil with H₂SO, and water, or by evaporating ammonium thionurate with some H₂SO, (Liebig a. Wöhler, A. 26, 314; Gregory, P. M. 24, 187). Transparent, four-sided prisms, sl. sol. cold water. Converted by boiling cone. HNO, into nitro-barkituric acid.

URANATES v. URANIUM, OXYACIDS AND SALTS or, p. 826.

URANIUM. U. At. w. 239 (not determined with very great accuracy). Mol. w. unknown. M.P. not determined accurately; between red heat and white heat. S.G. of fused U at 18° = 18.685 (Zimme...ann, B. 15, 851). S.H. at $100^{\circ} = .0276$ (Z., *l.c.*). S.V.S. 12.8.

Historical.-In 1789 Klaproth prepared some compounds of a new element from pitchblende; to the characteristic element of these compounds he gave the name uranium, from oùpavos = the heavens, in allusion to the planet Uranus which had been discovered a few years before (Crell's A. 1789 [2] 400). The compounds of U were A. 165 [2] 400). The compounds of 6 were examined by Richter (Gehlen's A. 4, 402), Buchholz (Gehlen's A. 4, 17, 134), Lecanu (J. Ph. 9, 141; 11, 279), Brande (S. 44, 1), Berzelius (P. 1, 359), and Artveison (P. 1, 245). In 1840, Péligot showed that the substance supposed till then to be U was really an oxide of U (A. Ch. [3] 5, 5); P. isolated the metal, and determined the at. w. to be 120. Mendeléeff in 1872 (A. Suppl. 8, 133; cf. C. N. 41, 39 [1880]) proposed to double the at. w. of U, making it 240; this proposal was completely justified by the determina-tion of S.H. of pure U by Zimmermann in 1882 (B. 15, 851), and by the determination of the V.D. of UCl, and UBr, (Z., A. 216, 2 [1883]).

Occurrence.—Never uncombined. A minerals containing compounds of U are found sparsely distributed and not in large quantities; the chief of these is pitchblende, which consists of U₃O₃ along with SiO₂ and oxides of Sb, As, Ca, Cu, Fe, Mg, V, &c. Carbonate, sulphate, phosphate, niobate, tantalate, and various other compounds of U are also found in varying quantities in several rare minerals (v. Zimmermann, A. 232, 300; Ridden a. Mackintosh, Am. S. [3] 38, 474; Hillebrand, Am. S. [3] 38, 329; 40, 384). Lockyer (Pr. 27, 49) stated that some of the lines in the emission-spectrum of U coincide with lark lines in the solar spectrum. Hutchins a. Holden (P. M. [5] 24, 325) think there is no trustworthy evidence in favour of the existence of U in the solar atmosphere.

Preparation .- 1. A mixture of UCl., NaCl, and Na is strongly heated in a closed iron cylinder. Zimmermann (A. 116, 14) used a cylinder of soft iron with walls c. 3 centim. thick, bored from a larger cylinder (similar to that employed by Nilson a. Pettersson for preparing Be; B. 11, 383) fitted with a cap which could be screwed on tightly. He placed a layer of pure fused NaCl in the cylinder, then small pieces of Na (c. 3 to 4 pts. for 10 pts. UCl.), then UCt (which must be put into the cylinder as quickly as possible, as it is hygroscopic), and covered the whole with a layer of fused NaCl. Z. raised the cylinder to a white heat, kept it at

URANIUM. 821

that temperature for some time, cooled, and washed the contents with dilute alkali solution, and then with water. According to Z, the metal as thus prepared is quite pure $(v.\ infra)$,—2. Moissan $(C,R.\ 116,\ 847)$ obtained U, containing from 5 to al. 5 p.c. C, by mixing the oxide prepared by strongly heating $UO_{\cdot}(NO_{\cdot})_2$ with excess of charcoal, compressing the mixture in a carbon crucible, imbedding this in MgO, and heating for 10–12 minutes in an electric furnace, using a current of 60 volts and 450 ampères.

UCl₄ is obtained by heating the nitrate $UO_2(NO_s)_2$ in air, mixing the oxide thus obtained (chicfly U_3O_s) with C, and heating in a stream of Cl (v. Uranium tetrachloride, p. 823). The nitrate is obtained from pitchblende by powdering the mineral, walking with water, drying, and washing to remove S and As, dissolving in HNO, Aq, evaporating to dryness, dissolving in water, filtering from Fe₂O₃, PbSO₄, &c., evaporating a little, and allowing to crystallise. The crystals of UO, (NO,), thus obtained are purified by draining in a funnel, washing with a little cold water, drying in the air, dissolving in ether in a wide-mouthed bottle, crystallising by spontaneous evaporation, and re-crystallising from hot water; the crystals of UO2(NO3), are then dissolved in water so as to form a conc. solution, UO2-C2O, is ppd. by adding H.C.O.Aq to this solution, the 14p. is washed with boiling water, and then decomposed by heat, and the UO, thus produced is digested with conc. HClAq, washed, dissolved in HNO3Aq, and the solution is crystallised (Poligot. A. Ch. [3] 5, 5; 12, 258; cf. Ebelmen, A. 43, 286; Wertheim, J. pr. 29,

The oxide U₂O_a used by Zinnmermann (v. supra) for the preparation of UCl₁, from which pure U was obtained, was prepared by him as follows. A warm solution of commercial uranium hydroxide in HClAq was saturated with H₂S; after standing for some time the liquid was filtered off, NH₄Aq and (NH₄)₂CO₄Aq were added in excess, the liquid was warmed and (NH₄)₃SAq was added; after standing the liquid was filtered, saturated with HClAq, and boiled till CO₂ was removed, then mixed with NH₄Aq and (NH₄)₃SAq and heated on the water-bath till most of the (NH₄)₂S was removed; the pp. of UO₂ was collected, washed, and heated over the blowpipe; the U₂O₆ thus formed was dissolved in HNO₂Aq and the solution was crystalised; the crystals of UO₂(NO₂)₂ were dissolved; in ether, the solution was poured off from insoluble substances, evaporated to dryness, and the residue was again dissolved in HNO₂Aq, and the orystals that formed on evaporation were dissolved in ether, and the cthereal solution was evapotated to dryness and the residue decome evapotated to dryness and the residue decome posed by heating.

Properties.—A lustrous, hard, silver-white metal; S.G. 18:685 at 150 (Zimmermann, B. 15, 851); if UCl, is reduced by Na at a red heat, U is obtained as a greyish-black powder. S.H. at 100 = 0.276 (Z., &c.). U is somewhat malleable, but cannot be hammered into third plates. The emission-spectrum, obtained by the aid of electric sparks, shews only a few lines, the most marked being one in the yellow (Thalén, A. Ch.

[4] 18, 289). For the fluorescence, phosphorescence, and absorption-spectra of U compounds v. Beoquerel (A. Ch. [4] 27, 589), also Morton a. Bolton (Am. Ch. 3, 361, 401). U melts towards a white heat; according to Moissan (C. R. 116, 1429), the metal is volatilised by heating in an electric furnace using a current of 350 ampères and 75 volts. After long standing in the air the surface of U becomes covered with a steel-blue to black film of oxide; U that has been fused burns brilliantly when heated on Pt foil in the air; palverulent U burns at 150°-170° in the air; pulverulent U burns at 150°-170° in the air. U combines directly with Ol or Br, also with S; the metal dissolves in dilute H. SO, Aq or HClAq; it is not acted on by acctic acid, nor by KOHAq, NaOHAq, or NH, Aq.

The at. w. of U has been determined (1) by determining U and Cl in UCL (Peligot, A. Ch. [3] 5, 12 [1842]; Rammelsberg, P. 95, 318; 56, 125 [1842]; Q by analyses of UO₂C.O. H₂O (Ebelmen, A. Ch. [3] 5, 191 [1842]; Peligot, A. Ch. (3] 20, 341 [1846]); (3) by analyses of UO₂(C.H₂O₂)...2H₂O (Peligot, Lc.; Wertheim, J. pr. 29, 207); (4) by analyses of the double salt UO₂Na(C.H₂O₂), (Wertheim, Lc.); (5) by transforming UO₂ into U₂O₃, and UO₂Na(C₂H₂O₂), into Na₂UO₄ (Zimmermann, A. 232, 117, 273 [1886]); (6) by determining S.H. of U (Zimmermann, B. 15, 851 [1882]); (7) by determining V.D.s of UBr₄ and UCl₄ (Zr, A. 216, 21883)).

The at. w. of U was formerly taken as c. 120; in 1872 Mendeléeff adduced reasons for doubling this value, based on a comparative study of the properties of compounds of U to which he was led by considering the periodic arrangement of the ekements (A. Suppl. 8, 178; C. N. 41, 39). When the at. w. of U was taken as 120, the formulæ given to the chief oxides, chlorides, and salts of this element were UO, UCl, USO, &c.; U₃O₄; U₂O₃, UOCl, UO₂(NO₃), &c.; and Ü was classed with the iron metals. Mendelégif • pointed out that U was very much heavier than the iron metals, that the oxide U2O, did not form salts similar to those derived from Fe₂O₃, that the salts of UO, i.e. USO4, U(NO3)2, &c., were not isomorphous with the salts of MgO, FeO, NiO, &c. Mendelceff also drew attention to the existence of a chloride which would have to be fepresented as U_2Cl_3 if U=120 and that this chloride was obtained by heating UCl_3 in H. Mendeléeff proposed to double the value then accepted for the at. w. of U, and, following on this, to write the formula of the chlorides, oxides, and salts as UCl, UO₂, U(SO₄), &c.; U₅O₄; UO₅(NO₆), &c.; and UCl, It was pointed out that many of these formulas are analogous to those of the corresponding compounds of Cr, Mo, and W; and it was shown that the properties of compounds of U more nearly resemble those of compounds of Cr. Mo, and W than of any other elements. Especial stress was laid by Mendeléeff on the acidic charetrees was laid by Mendeleen on the actue character of the highest oxide of U., Finally, Mendeléen showed that an element with the properties of U, and an at. w. equal to c. 240, finds its proper place in Group VI, series 12, of the periodic arrangement of the elements. Mendeléen suggested that the S.H. of pure U should be determined; that the V.D. of the volatile chloride should be found; that the action of H

on the chloride then taken to be UCl, should be studied; that salts of the lower oxide (UO if U=120, UO_2 if U=240) should be examined, especially as regards their iso.norphism with salts of ThO₂, SnO₂, ZrO₂, and TeO₂; that the crystalline forms of corresponding compounds of MoO₃, WO₃, and UO₃ (U=240) should be studied, and that an especially thorough crystallographic examination should be made of the compounds R₂UO₂F₄; and that the physical properties of compounds of Cr, Mo, W, and U should be compared. Since the publication of Mendeléeff's mercoir, the S.H. of U, and the V.D.s of UBr, and UCl, have been determined, the action of H on UCl, has been examined, and something has been done in the study of the crystalline forms of compounds of U, including those of the form R2UO,F4; the results of all these invertigations fully confirm the justness of Mendeléeff's view that the at. w. of U is c. 210. and that this element must be classed with Cr. Mo, and W. The exact value to be given to the at. w. of U has not been yet determined; Zimmermann's measurements gave 238.75 from the ratio $UO_2:U_2O_3$, and 238:67 from the ratio $UO_2:Na(C_2:I_3:O_2)$; $Na_2:UO_4$ (O=15:96). The mol. w. of U is not known.

U is the last member of the even-series family of Group VI.; this family also contains, besides O, the elements Cr. Mo, -, and W. The chromium elements are both metallic and nonmetallic in their chemical relations; they form oxides MO, that are acidic, and some of the lower oxides are basic. The oxide UQ, forms some corresponding salts; a series of salts of the form Uo2X is also known, where X ESO, &c. Several series of uranates M₂UO₅, M₂U₂O₇, &c., are known. The haloid compounds are UX, UX, and UX, (For a comparison of the metals of the Cr family v. Curomum group of ELEMENTS, vol. ii. p. 168; cf. CLASSIFICATION, vol.

ii. p. 207.)
The atom of U is tetravalent in the gaseous

Reactions and Combinations .- 1. Heated in air U is burnt to a voluminous deposit of UaOs (perhaps containing also UO2), which stops the further oxidation of the metal. Pulverulent U burns when heated in air to 150°-170°. 2. U burns brilliantly when heated in chlorine, forming UCl.; heated in bromine to c. 240° part of the metal is changed to UBr₁.-3. Heated in sulphur vapour US₂ is produced.-4. It is generally said that J does not react with water; but, according to Moissan (C. R. 116, 347), the metal obtained by him by reducing the oxide by char coal in an electric furnace decomposed water at the ordinary temperature; this specimen of U contained from 5 to 13.5 p.c. C .- 5. J dissolves in dilute sulphuric acid, rapidly on warming, forming USO, and giving off H; pulverulent U dissolves in hot conc. H.SO,, giving off SO2; the compact metal is scarcely acted on by conc. H.SO. -6. U dissolves in hydrochloric acid, dilute or conc., rapidly on warming, forming a hyacinth-red solution of UCl, which goes green on shaking in air, and then cortains UCl,—
7. Conc. nitric acta, even when hot, scarcely acts on U that has been fused; the pulyerulent metal is quickly oxidised by hot conc. HNO, Aq to U.O. 8. Several metallic salts in solution are reduced by U, with ppn. of the metals, e.g. HgNO₃, AgNO₃, CuSO₄, SnCl₂, PtCl₃, AuCl₃, Detection and Estimation.—Uranyl salts

UO, SO, &c.) are formed by heating uranates with acids, also by the reactions of acids with UO3, and also by oxidising uranous ralts (salts of UO). K_LreCy_AAq givos a brownish-red pp. with uranyl salts, soluble in HClAq or in (NH₁)₂CO₂Aq; this reaction is said to be extended delicate; H₂O₂Aq and alcohol give a brown pp. (Fairley, C. N. 62, 227); carbonates give yellow pps., soluble in excess, forming yellow liquids; NaOHAq or KOHAq forms yellow pps., NH,ClAq does not interfere with the ppn., but in presence of sugar or tartario acid pps. are not produced. Uranous salts are produced by reducing uranyl salts in solution by Zn and HClAq. After reduction the solutions give green pps. with KOHAq or NaOHAq, the pps. becoming brown and then yellow in the air; with (NH₄)₂SAq green pps. are formed, quickly becoming dark green, and black on boiling; K,FeCy,Aq produces yellow-green pps. becoming red in the air (v. Zimmermann, A. 213, 285).

U is generally estimated as UO_2 or U_3O_8 (v. Zimmermann, A. 232, 209). Solutions may be reduced by Zn and H.SO, Aq, and then titrated with KMnO,Aq, the quantity of O used corresponding with the change of UO₂ to UO₃ (Z., l.c.; v. also Belohoubek, J. pr. 99, 231).

Uranium, arsenates of. A compound, probably UO Ac O. to it leaving the liberty of the compound of the co

bably UO. As.O. 4aq, is described by Rammels-berg (P. 59, 26). Werther (J. pr. 43, 321) describes UO. H. As.O. 3aq, and various doubte salts of this compound with arsenates of Ca, Cu, and Na.

Uranium, bromides of. UBr₄ is formed by heating U₃O₅ mixed with C in Br vapour; and UBr₄ by heating UBr₄ in H. Zimmermann (A. 216, 5) failed to obtain a compound with more Br by heating UBr, with Br to 230° in a sealed

URANIUM TETRABROMDE UBr., (Uranous bromide.) Mol. w. 558. Prepared by strongly heating a mixture of U3Os and sugar, mixing with sugar charcoal that has been heated to redness, placing the mixture in a tube, and heating it first in a stream of thoroughly dried CO2, and then in Br vapour, and allowing to cool in CO. the Er used must be perfectly freed from Cl, HBr, and H₂O by distillation from KBr, MnO₂, and P₂O₅ (Zimmermann, A. 216, 2; Alibegoff, A. 232, 132; cf. Hermann, J. 1861, 260). UBr, forms block furth leafter, velocities track heat forms black, fusible leaflets; volatile at red heat, giving a vapour with V.D. 281 (Z., l.c.); very hygroscopic; dissolves in water, with a hissing sound, forming a green liquid.

By evaporating a solution of UO.xHO in HBrAq, Rammelsborg (P. 59, 12) obtained green crystals of hydrated UBr₄, probably UBr₄,8H₂O.

Uranoxybromides. (Bromoxy-uranates.)
UO₂Br₂-2MBr or M₂UO Br₁. By the reaction of HBrAq with K. O₂ and (NH₂)₂UO₂ respectively, Sendtner (A. 195, 325) cobtained yellowish, 'vgrosopoic tablets of the composition M₂ UO₂Br₂-2H₂O, where M = NH₂ and K.

URANIUM TRIBROMIDE UBr₂. Mol. w. not determined. Obtained by Alibegoff (A. 233, 119; of Zimmermann. A. 216. 5) by passing dry H

cf. Zimmermann, A. 216, 5) by passing dry H over molten UBr. Dark-brown fieedles; easily

volatilised; not changed by continued heating in H; very hygroscopic; warmed in H,S, in complete absence of air, forms U2S3.

Uranium, chlorides of. By heating U in Cl both UCl, and UCl, are produced; and by heating UCl, in H, UCl, is formed.

URANUM PENTAGILLORIDE UCl₃. Mol. w. not determined; formula probably molecular, from analogy of MoCl₃ and WCl₃.

Preparation .- 1. By heating U in excess of Cl. -2. A slow stream of dry Cl is passed over a mixture of charcoal and any oxide of U, or UO.Cl., heated to dull redness in a glass tube; dark-green octahedral crystals of UCl, are formed near the heated part of the tube, and in front of these needle-shaped xystals of UCl, are deposited, mixed with a loose brown powder, which is also UCl₅. If the stream of Cl is rapid, most of the UCl, is produced as a light-brown, mobile powder (Roscoe, C. J. [2] 12, 933).

Properties and Reactions .- UCl, crystallises in long, dark, needle-shaped forms; the crystals are lustrous, and reflect greenish light, in trans-mitted light they are dark ruby red. Both the crystals and the brown powder are very hygroscopic. Dissolves in water, with a hissing sound, forming a yellow-green liquid and giving off HCl. Decomposed to UCl, and Cl when heated, either alone of in CO, of Cl; decomposition begins at 120° in CO2, and is complete at 235'. ing in NH, probably produces a nitride (Roscoc, l.c.; no amalyses given).

Combination. -A compound UCl₃, PCl₃ is described by Cronander (J. 1873, 222) as an amorphous, yellow solid; formed by heating UO₄ with excess of PCl₃ in a sealed tube for a long time.

URANIUM TETRACHLORIDE UCI, (Uranous

chloride.) Mol. w. 380-48.

Preparation. -1. U is heated in Cl. -2. A mixture of charcoal and an oxide of U, or UO Cl. is heated in a slow stream of dry Cl (Péligot, A. 43, 258; cf. Roscoe, C. J. [2] 12, 933). The crystals that form nearest to the heated part of the tube are again heated in a stream of dry CO₂, whereby traces of UCl, are volatilised and removed (Zimmermann, A. 216, 8).—3. A solution of ammonium uranate in HClAq is reduced by Zn, and the solution is evaporated and crystallised. Arendt a. Knop (C. C. 1857, 164) reduced, by boiling the solution for 15 min. with Cu and a little PtCl, Aq; they then filtered, saturated with H.S. filtered, boiled off H.S. and crystallised.

Properties and Reactions. - Dark green, lustrous, regular octahedral crystals; volatilises at red heat, in complete absence of moisture, giving a red vapour (Péligot, l.c.) with V.D. 192 (Zimmermann, l.c.). Very deliquescent; fumes much in air, giving off HCI; dissolves in water, with a hissing sound, forming a green, water, with a missing sould, nothing a green, solution that is unchanged in air; gives green, amorphous UCl, by evaporation in vacuo, but is decomposed by evaporation in the air. When UCl, Aq is drouped into boiling water all the U is ppd. as UO, xH₂O. Solution of UCl, reduces salts of Au and Ag to the metals, and FeCl, to FeCl., &c. By heating in dry H one-fourth of the Cl is remared and UCl, remains (Péligot, A. 43, 286). According to Péligot (Le.), UCl, com-

bines with several metallic chlorides to form double salts.

Uranozychlorides. (Chloroxyuranates.)
UO_CL_2MCl.2āq, or M_UO_Cl_2aq. Salts of
by cl_2mcl.2āq, or M_UO_Cl_2aq. Salts of
by the reaction of large excess of HClAq with
uranates of NH, and K, (Péligot, A, 43, 279).
The K compound is also formed by acting on
UO_Cl, with excess of KClAq, and separating
the KCl that crystallises with the K_UO_Cl, mehanically Bargaline D_L_1@1. The chanically (Berzelius, P. 1, 366). The K compound forms thick plates (for crystalline measurements b. de la Provostaye, A. Ch. [3] 6, 165); easily loss water; gives off HCl at a little above 100°; melts at red heat, giving off Cl, and leaving UO, and KCl. The ammonium compound forms very deliquescent rhombohedra.

URANIUM TRICHLORIDE UCl3. Mol. w. not determined. Obtained by Péligot (t.e.) by heating UCl₄ in day H as long as HCl was given off. Also formed in solution by long-continued reduction of uranyl salls by Zn and HClAq (Zimmerranni, A. 213, 300). A brownish-red solid; dissolves very readily in water, forming a red solution, which gives off 11 and becomes green (v. P., l.c.; Z., l.c.; also A. 216, 12).

Uranium, ferrocyanides of. Various compounds are described by Wyruboff (A. Ch. [5] 8, 444) and Atterberg (Bl. [2] 24, 355) as obtained by ppg. K,FeCy,Aq by solutions of salts of U. The following formule are given:

(2) UzKzFeCya. 6aq;

(1) U_FeCy_a. 10aq; (3) (UO₂)₄K₂(FeCy_a)₂. 6aq; (4) (UO₂)₅K₆(FeCy_a)₄. 12aq.

Uranium, fluorides of. Only mie compound, UF, has been isolated with certainty.

URANIUM TETRAPLUORIDE UF, (Uranous fluoride.) Mol. w. not determined; formula probably molecular, from analogy of UBr, and UCI, Prepared by adding HFAq to U,O,, boiling, pouring off the yellow solution (which contains UO,F,), washing the green powder that remains, first on a filter and then by decantation, until free from HFAq, and drying at 100° (Smithells, C. J. 43, 125; cf. Bolton, Z. [2] 2, 353). The process of washing is very tedious, and occupies many days. UF, is a green powder; insol. in water and dilute acids; slowly dissolved by cone. acids; boiling NaOHAq produces UO. Heated in a Pt crucible with the lid on, a small quantity of a white, bulky sublimate is obtained; this sublimate is UO.F. (Smithells, l.c.); the residue in the crucible is chiefly UO. Heated on Pt foil, UF, leaves

chieffy U.O., Heated on Pt foil, U.F. leaves

U.O. (S., l.c.).

Double salts.—Bolton (l.c.) obtained the
compands U.F. K.F and U.F. NaF—as green
powders, insoluble in water and dilute acids, giving UO., KF (or Nal), and HF when heated ground out, he for reary, and his waen heated to redness, in closed vessels—by the action of formic or oxalic, acid on UO.F., SKF or UO.F., NaF (v. infra) in sunlight. These combounds may be called uranoflucyides, and written KHE and M. ME

KUF, and NaUF,

Uranium hexafuoride UF, was said by Ditte (C. R: 91, 115) to be formed by heating U,O, with HFAq, evaporating the yellow liquid, and heating the crystals of UF, 8HF thus obtained; but Smithells (C. J. 43, 125) has shown that the substance obtained by avacation 1. that the substance obtained by evaporating the

solution formed by heating U.O. with HFAq is

UO.F. (v. Uranum extriuoride, p. 828).
Uranoxyfluorides. (Fluoxy-uranates.)
These compounds may be regarded either as double, salts of UO,F, with alkali fluorides, or as salts derived from hypothetical ticids H, UO,F, The compounds are formed by adding alkali fluorides to solutions of uranous nitrate, and crystallising under different conditions (v. Bolton, Z. [2] 2, 353; Baker, C. J. 35, 763). The compounds that have been isolated belong to compounds that have been isolated belong to several series: (1) MF.UO.F., xaq = MUO.F., xaq, where M = Na ard x = 2 and 4 (Bolton); (2) 3MF.UO.F., = M, UO.F., where M = NH. and K (Bolton; Baker); (3) 3KF.2UO.F., 2aq — K, U.O.F., 2aq (Baker); (4) 5KF.2UO.F., 2aq (Bolton). Two other series were described by Ditte (C. * R. 91, 166), 4MF.UO.F., and 4MF.UO.F., xaq; but the experiments of Smithells (C. * J. 43*, 131) have shown that these compounds do not exist. compounds do not exist.

Uranium, haloid compounds of. U combines directly with Br and Cl, but not with I'; no iodide, indeed, has been isolated. The haloid sompounds of U belong to the form UX₃, where X = Br or Cl; UX_1 , where X = Br, Cl or F; and UX_2 , where X = Cl. The compounds UBr_1 and UCI, have been gasified, and the formule are molecular. From the analogy of WCI, and MoCI, the formula UCI, is probably molecular; this compound decomposes to UCl, and Cl when heated, either alone or in CO, or Cl. From the analogy of CrCl, it may be supposed that UCl, and UBr₃ are molecular formule. No haloid compounds of U have been isolated corresponding with the chlorides of Cr, Mo, and W, MrCl2. No haloid compounds of U are known containing each more than one halogen. Various oxyhaloid compounds, chiefly UO X, and compounds of these with alkali haloids, are known. , Uranium, hydroxides of, v. Uranium, oxides and hydrated oxides of (infra); also Uranium

OXYACIDS, AND SALTS OF (p. 826).

Uranium, iodides of. No compound of U and I has been isolated. Hermann (J. 1861. 260) and Sendter (Verbind. des Uraniums, Erlangen, 1877) failed to obtain an iodide by heating a mixture of UO, and C in I vapour or

in HI.

Uranium, nitride of, U₁N₁. A greyish-blao'-powder; obtained by heating UCl₄ in NH₃, then mixing with NII,Cl and heating for a long time in a stream of NII, (Uhrlaub, Verbind. einiger Metalle mit Stickstoff, Göttingen, 1853). Roscoe (C. J. [2] 12, 933) states that a nitride is formed by heating UCl, in NH, but no analyses are

Uranium, oxides and hydrated oxides of. When U is burnt in air the product is U.C.; when U is burne in air ine product is y_0 , by heating this oxide with reducers, or for a long time in a stream of N or CO_2 , UO_2 is formed; UO_4 is produced by fusing U_2O_4 with $KCIO_3$, also by heating $UC_1(NO_3)_2$; by adding H_2O_2Aq to $UO_4(NC_4)_2$, Aq a hydrate of $UO_4(NC_4)_3$, Aq or $UO_4(NO_3)_2Aq$ a hydrate of UO_4 is obtained. Besides these four oxides, others, intermediate between UO, and UO, perhaps exist. No definite hydrate of UO, har been isolated; the pp. formed by adding NH,Aq to UCl,Aq, or to solution of a uranous salt (U(SO), &a.), is either a hydrate, or a

mixture of hydrates, of UO₂. A hexahydrate of U₂O₂ probably exists. Uranic acid is the monohydrate of UO₂. UO₂ dissolves in some acids to form corresponding salts; U.O. is said to react with conc. H.SO, or HClAq to form both uranous salts UX₂, and uranyl sales UO₂X, where X = a divalent acidic radicle. UO₂ interacts with several acids to form uranyl salts UOIXII; UO, also reacts as an acidic oxide with strong bases, forming uranates, di-uranates, &c., M¹₂UO₄, M¹₂U₂O₇, &c.

According to Guyard (Bl. [2] 1, 89), two oxides having the compositions UO and U₂O₂ exist; but the more accurate investigations of Zimmermann (A. 213, 301) showed that the substances examined by Guyard were not definite compounds. Péligot described a black oxide U2O3; Zimmermann (A. 232, 273) has shown that the substance is a mixture, in variable proportions, of UO. and U,O,.

URANIUM DIOXIDE UO. (Uranous oxide.)
Mol. w. not known. This oxide was supposed to be the element U until 1840, when Péligot proved the presence of O in the substance

(A. Ch. [3] 5, 5).

Formation.—1. By heating U₃O₈ with such reducing agents as H (Arivedson, P. 1, 245), NH Cl and S (Hermann, J. 1861, 258), a little C (Buchholz, Gehlön's Ann. 4, 17, 134), oxalic acid (Wertheim, J. pr. 29, 211), &c. -2. By heating U.O. for a long time in a stream of N

or CO₂ (Zimmermann, A. 232, 283).—3. By strongly heating UO₂.C₂O₄ in absence of air (Berzelius, P. 1, 359), or in a stream of H (Péligot, A. Ch. [3] 5, 5; Ebelmen, A. Ch. [3] 5, 189).

Preparation.—A mixture of UO.Cl. and

excess of NaCl and NH₄Cl is strongly heated in absence of air; and the product is washed thoroughly with water, and dried (Wöhler, A. 41, 345; cf. Hillebrand, Zeit. f. anorg. Chemie, 3, 243). If air is not excluded during heating, 3, 213). If air is not excluded during heating, some UO, is obtained (H., l.c.). This process gives UO, as a black crystalline powder. In place of using UO₂Cl₂, a solution of ammonium uranate in HClAq may be mixed with excess of NaCl and NH,Cl, and evaporated to dryness, and the residue heated. By fusing any oxide of U with borax for 24 hours, and washing with water and then with dilute acetic acid, or dilute HClAq, Hillebrand (c.c. p. 249) obtained jet-black octahedra of UO, isomorphous with ThO,

Properties .- Prepared by heating Proper tes.—Frepared by neating UO₂(2.0, UO₂) is a dark-brown, pyrophoric powder; if the temperature has been kept high the oxide is lustrous, reddish-black, and not pyrophbrio; prepared by heating UO₂Cl₂ with NaCl and NH₂Cl, UO₂ forms black, non-pyrophoric, octahedral crystals. Púligot gave S.G. 10.15 - according to Hillehrand (I.c.) has fix is 10.15; according to Hillebrand (l.c.), the S.G. is norly 11. UO, is insoluble in water, Hellaq, and dilute H.SO,Aq; it dissolves in HNO,Aq, and in conc. H.SO, in presence of a little water. UO, is oxidised to U.O. by heating in air.

Reactions.—I. Heated in air or oxygen

U.O. is produced; UO, burns brilliantly in the O. H. findine (Clarke, C. A. 62, 853).—2. Heating in chlorine produces UO₂Ol₂; when mixed with carbon and heated in chlorine, UCl₂ and UCl₄ are formed. UBr₄ is produced by heating UO₂ mixed with carbon in bromine vagour.—3. U₂O₂ is formed by heating UO₂ in voater vagour [Regnault, A. Ch. [2] 62, 358).—4. Heating in vapour of carbon disulphide produces $U_{c_0}S_{c_1}$ (Hermann, J. 1861. 258; H. Rose, G. A. 73, 139). UO_a is said to be unchanged by heating in hydrogen sulphide (Arfvedson, P. 1, 245).—5. A solution of UO_a in cone. sulphuric acid gives green crystals of $U(SO_a)_a$ on evaporation.

HYDRATES OF URANSUM DIONIDE. No definite hydrate of UO, has been isolated; NH, Aq produces a reddish-brown pp. when added to UC!Aq or solution of a uranous salt, this pp. becomes black on boiling; when washed with air-free water and dried in vacavo it forms black, coherent lumps. A black pp. is also produced by dropping UC!, Aq into boiling water. These black pps. contain UO,; they are probably hydrates of this oxide. The name vacaous hydroxide is often given to the pp. obtained by either of the processes described; the pp. dissolves in dilute H₂SO₄Aq, HNO₂Aq, and HClAq.

URANOSO-URANIC OXIDE U₃O₃. (Olive-green oxide of uranium. Uranyl uranate UO₂.2UO₃.) Mol. w. not known.

Occurrence.—In combination with SiO₂, and oxides of Sb, As, Ca, Cu, Fe, Mg, &c., in pitch-blende.

Preparation. — U, or a decomposable U compound, e.g. UO₂(NO₃)₂, is heated in the air and then in a stream of O, and s allowed to cool in O (v. Zinnnetmann, A. 232, 283). For a method of preparing U₂O₈ from pitchblends v. URANIUM, Preparation of (p. 821).

Properties.—A dark olive-green powder, sometimes almost black, but always showing a green streak when rubbed on unglazed porcelaif (Z. Lc.). S.G. 7-2 (Karsten, S. 65, 394); 7-31 (Ebelmen, J. pr. 27, 385). S.H. 07979 (Donath, B. 12, 742). Insoluble in water; slightly soluble in dilute HCIAq or H_SO_Aq; soluble in HNO_Aq, also in H_SO, with a little water.

Reactions.—1. Gives off O when heated in air or in an indifferent gas; the final product of heating in N or CO_is UO_2 (Zimmermann, A. 232, 283).—2. Reduced to UO_by heating with hydrogen, carbon, sulphur, potassium, or sodium.
3. Heated in vapour of curbon disulphide U_3O_8, is formed.—4. Heated with conc. sulphuric acid, or with hydrochloric acid to 180?—200°, gives both uranous and uranyl sulphates, or chlorides; reacting as UO_2UO_3 (Z., A. 232, 287).—5. Silver nitrate solution is slowly reduced to Ag (Isambert, C. R. 80, 1087).

HYDRATE OF URANOS-URANIC OXIDE. By adding NH₂Aq to UCl₂Aq and allowing the pp. to oxidise in the air, and drying in vacuo over H₂SO, Rammelsberg (P. 55, 319) obtained a greenish-black solid which may have been a hydrate of U₂O₃; one determination of water only is given which agrees fairly with U₂O₄.62q.

URANIUM TRIONIDE UO₂. (Uranic arible. Uranic anhydride. Uranyl oxide (UO₂)(O.) Mol. w. not known. This oxide is obtained by carefully heating the hydrate UO₂H₂(O. infra) to 800° (Ebelmen, A.Ch. [2] 5, 199); to 250°, temperature being gradually raised (Jacquoline Ph. C. 1845, 183). The oxide is also formed by heating UO₂OO₂2(NH₂)₂CO₃ to 800° (E., Lc.). The preparation of UO₂ may be conducted by heating UO₂(NO₂)₂ in a Pt basic until decomposition begins, then transferring to glass tubes

and heating these in an oil-bath to 250° so long as acid fumes are given off.

UO_I is a chamois-yellow powder. S.G. 5.02 to 5.26 (Brauner a. Watts, P. M. [5] 11, 60). Ebelmen (L.c.) described UO₂ obtained by heating UO₂ CO₂ 2(NH₁) CO₃ as a sealingwax-red powder. When UO₃ is heated to redness it gives off O and U₂O₃ remains (E., L.c.; cf. Read, C. J. 65, 313 (1894)); the oxide seems to be somewhat volatile at the temperature of a porcelain oven (Elsner, J. 1866, 35).

UO, reacts with many acids as a basic oxide, but the salts formed are always basic salts of the forms UX, 2UO, where X = the radicle of a monobasic acid, and UX, 2UO, where X = the radicle of a dibt3ic acid. It is customary to write the formule of these basic salts as UO, Xi, and UO, Xi, and to call them urany! salts

 $(UO_2 = uranyl)$; thus $U(NO_3)_a \cdot 2UO_2 = UO_2(NO_3)_a$,

and U(SO,), 2UO, = UO (SO,).

WO, behaves towards strong bases as an acidic oxide, forming uranates M₂UO, and diuranates M₂UO, &c.; these salts are generally formed by fusing U compounds with bases and O, and by ppg. uranyl salt solutions by strong bases. When KOHAQ, NaOHAQ, NII₃AQ, BaOAQ, or CaOAq is added to a solution of markingly salt, e.g. to UO₂(NO₃)₂Aq, the pp. consists of a uranate of the metal of the base. Alkali carbonates ppt. alkali uranates, but the pps. contain also CO₂; the pps. dissolve in excess of the alkali carbonates forming double carbonates of uranyl and the allisti metal, e.g. UO₂CO₂(NII₁),CO₂. Addition of alkali or alkali carbonate to solutions of uranyl salts containing other metallic salts causes ppn. of a uranate of the metal of the salt present, generally mixed with alkali uranate (cf. Uranium, oxyacids, and salts thereof, p. 826).

By adding KOIIÂq to a cold solution of TCI, or UO₂(NO₃), and dialysing, Graham (T. 1861. 213) obtained a solution, free from acid and alkali, which he regarded as a loose compound of sugar and UO₃, and which he called sucrate of peroxide of uranium.

Hydrates of Uranium Trioxides. Pure hydrates of UO, are not obtained by progurany salt solutions by alkalis (v. supra); but according to Ebelmen (A. Ch. [3] 5, 199) UO, xH_O is produced by boiling an aqueous solution of UO, CO, 2(NH), CO, until a yellow pp. is formed, and allowing this pp. to stand for a long time. By the continued action of sunlight on UO, (CO,) in presence of water, UO, xH_O is said to be formed; after washing and drying in the air, the solid basethe composition UO, 2H_O; and after dwying in vacuo the composition is UO, H_O (E., Ic.). Berzelius (B. J. 24, 118) obtained UO, H_O by heating UO (NO,) on a sand-bath until acid fumes ceased to be given off, washing sile residue with boiling water, and drying in air. The same hydrate is said to be formed by heating U,O, with KClO, until fusion begins, boiling out with water, and drying in air (Dreaksmann, J. 1861, 256). The best method of preparing UO, H,O seems to be that given by Malsgut (A. Ch. [3] 9, 463), viz. boiling a solution of UO₂(NO₂), in absolute alcohol as long as

reaction proceeds, washing the yellow solid that | separates with water, and drying in air or in vacuo; EtNO₂, N₂O₃, C₂H₄O, and H.CO₂H are

formed in the reaction.

UO.H.O is described as a yellow powder; S.G. 5.93 at 15° (Malaguti, l.c.); needens litmus paper; when hot it absorbs CO₂ from the air; heated to 250°-800° water is given off and UO₄ remains (Ebelmen, l.c.; Jacquelin, A. Ch. [3]5, 199); heated to redness gives off O and leaves U.O. UO.H.O is generally called uranic acid; U. URANIUM OXYACIPS, AND SALTS THEREOF (infra).
URANIUM PEROXEE. By adding UO. (NO.)...Aq

to a mixture of H.O.Aq and Q. large excess of H.SO.Aq, and allowing to stand for a considerable time, Fairley (C. J. 31, 13. [1877]) obtained a small quantity of a heavy, crystalline, almost white pp., which when dried (? in air, or at dilute H₂O₂Aq to solution of UO₂(NO₃)₂ or UO₂(C₂H₂O₂)₂, free from acids, Fairley (l.c. p. 127) obtained a yellowish-white pp., which when dried by pressure between filter paper had the composition UO,4HLO, and when dried at 200° the composition UO,2HLO.

Zimmermann (A. 232, 273 [1886]) failed to obtain the tetrahydrate UO, 4H₂O; according to him the dihydrate UO, 2H₂O is very hygroscopic, and begins to decompose at 115°. Alibegoff also obtained only UO, 2II,O; he failed to prepare the anhydrous oxide UO₄ (A. 233, 123 [1886]).

Hydrated uranium peroxide, dried at 100°, is a yellowish-white powder; decomposed by heat, giving off O and leaving much $U_3\tilde{O}_8$; reacts with alkal solutions to give UO, xII,O, and a solution from which alkali peruranate 2M2O.UO. 8aq, crystallises (Fairly, Lc.; v. Peruranates under URANIUM OYYACIDS, AND SALTS

тивнеог, р. 827).

Uranium oxyacids, and salts thereof. UO, H2O = H2UO, reacts with strong baser as an acid, forming uranates M'2UO; di-uranates M'2UO, are also known, and a few tri- and hexa-uranates. A few peruranates are derived from hydrated uranium peroxide UO,xH,O.

The compounds of UO,X, with MX (X=Br, Cl, or F) may be regarded as bromoxy-, chloroxy-, and fluoxy-uranates. The substance known as uranium red is perhaps UO..ONH .SNH, i.e. the ammonium salt of an oxythic uranic acid.

(v. Uranium oresulphides, p. 828).

Uranic acid H₂UO₄. This compound is obtained as a yellow powder, which reddens litmus paper, and is decomposed to UO₃ and H₂O at 250°-300°, and to U₃O₆ and O at a higher temperature, by boiling a solution of UO (NO₃), in absolute alcohol, washing the solid that separates with water, and drying in air or in cacuo. (For other methods of preparation, and mose details v. Hydrates of uranium trioxide, p. 825.) The salts of H₂UO₄, are prepared indi-

URANATES, DY. URANATES, &c. Salts derived from H. 100,; salts derived from the hypothetical actus H. 120, H. 120, H. 120, H. 20, are also

known.

URANATES. Salts of the composition M. UO, and M. UO. These salts are propared by ppg. solutions of uranyl salts by bases in solution, or by adding alkali solution to a mir-

ture of a uranyl salt and a metallic oxide in solution; also, in many cases, by oxidising, U,O, or UO, in presence of a base or a salt of a base. The uranates are insoluble in water, and are not readily decomposed by heat except the ammonium salt. Carson a. Norton (Am. 10, 219) have pointed out that analyses of uranates always show considerable differences between the percentages of U found and calculated; they hate found the same anomaly in analyses of uranates of ammonium and several ammonium

derivatives, such as NEtH₃, NEt₂H₂, &c.
Ammonium uranates. The pure salt does not • seem to have been isolated. An impure uranate containing c. 90 p.c. UO₃ ((NH₁)₂ŪO₄ requires 84:66 p.c. UO₃) is obtained by adding NH₃Aq to a solution of a urangel salt (Péligot); it is a yellow powder, which loses H₂O and NH₂ above 100°, very slightly soluble in water, and insol. NH, Aq (Arfvedson, P. 1, 245). An impure salt is also obtained by adding NH, ClAqor (NH,) SO, Aq to boiling Na, UO, Aq, as long as NH, and CO, are given off, washing the pp., and drying at a low temperature (Anthon, D. P. J. 156, 211). Heated to reduces gives U₃O₄; many of the compounds of U are prepared from ammonium uranate.

Potassium uranate K₂UO₄. Prepared by heating 6 g. U₃O₉ with HClAq and HNO₃Aq, adding 4 g. KCl and 16 g. NH₃Cl, evaporating to dryness, heating very strongly until the fused mass is orange-yellow, and washing with water (Zimmermann, A. 213, 290). The salt is said to be formed also by strongly heating UO, HPO. (obtained by ppg. a uranyl salt by a phosphate) with K.SO, (Grandeau, A. Ch. [6] 8, 223), Orange-yellow, rhombic tablets; insol. water, cold or hot; easily sol. acids (Zimmermann,

Lc.).
Sodium uranate Na.UO₄. Prepared by fusing U₃O₃ with NaCl and Na.CO₃, or with NaCl with gradual addition of NaClO₅, and washing the state of with water; resembles K2UO, (Zimmermann,

Lithium uranate LizUO, has been prepared similarly to K.UO,; it is said to be decomposed by liot water (Z., l.c.). Uranates of Bs, Ca, and Sr-MUO₄- are said by Ditte (C. R. 95, 988) to be formed by heating the chlorides of these metals with U,O,.

DI-URANATES. Salts of the composition

M. U.O. and M. U.O. The formula may also be written M. U.O. and M. U.O., and M. U.O., if the formula by Barium di-uranate Baul.O., Formed by ppg. UO. (C.H.O.). Aq by BaOAq (Berzelius, P. 1, 359); also by heating to redness UO. Ba(C.H.O.). (Wertheim, J. pr. 29, 207). A yellowish-red

Calcium di-uranate CaU₂O₂. Formed, eac-cording to Ditte (C. R. 95, 988), by strongly heating U₃O₈ with Ca(ClO₃)₂; a yellowish-green solid.

Copper di-uranate CuU2O2. This salt is said to be formed, as a green crystalline powder,

said to be formed, as a green crystaline powder, by fusing Cu(UO_PO₁), saq_with Na_CO₂, and vashing with water (Debray, A. Ch. [3] 61, 451).

'Lead di-uranate PbU_O. Cormed by diegesting UO_(O_H_O), Aq with freshly ppd. PbCO₂ (Wertheim, J. pr. 29, 207); also by adding NH_Aq to a mixture of UO_(NO₂), Aq and Pb(NO₂), Aq (Arfvedson, P. 1, 258). A yellowish-

red powder, becoming green when heated; strongly heated in H, gives a pyrophoric mixture

of Pb and UO.

Potassium di-uranate K,U;O,. Formed by melting together UO, and K,CO, and washing with water; also by strongly heating UO₂.K₂(CO₃)₂ or UO₂.K(C,H₂O₂)₃ (Berzelius, P. 1, 359). A yellowish-red powder.

Silver di-uranate Ag₂U₂O₂. Obtained by

adding amorphous K, UO4 to molten AgNO3, and washing with ice-cold water (Alibegoff, A. 232, 129; 233, 117, 143). Also by strongly heating UO₂-Ag(C₂H₁O₂), (Wertheim, *J. pr.*, 29, 221; cf. Rammelsberg, *P.* 59, 10). An amorphous, yellowred solid; easily sol. acids; decomposed by hot

water (Alibegoff, l.c.).

water (Alloegoit, i.e.).
Sodium di-uranate Na. J.O., Gaq. Obtained
by ppg. uranyl salts by NaOlIAq (Patera, J. pr.
51, 125; cf. Stolba, Fr. 3, 74). Loses water of
crystallisation over H.SO. A light-yellow to
darkish-yellow powder. Known commercially darkish-yellow powder. Known commercially as uranium yellow (v. Dictionary of Applied CHEMISTRY, vol. iii. p. 893).

Di-uranate of strontium SrU₂O₇ is said also to exist (Ditte, C. R. 95, 988).

TRI-URANATES. The only salt that has

been isolated is sodium tri-uranate Na₂U₃O₁₀; it is prepared by fusing UO.(SO₄) with NaCl, and boiling out with water. This salt forms yellow leaflets resembling mosaic gold; S.G. 6:912; hygroscopic; insol. water, sol. acids (Drenkmann, J. 1861, 255).

HEXA-URANATES. The potassium salt, U₀O₁₉ 6aq, is described as a yellow micro-K2U6O19

water at 300°-400°; prepared by melting $UO_2(SO_4)$ with KCl (Drenkmann, J. 1861, 255). PER-URANATES. By adding excess of alkali and H₂O₂Aq to solutions of uranyl salts, Fairley (C. J. 31, 134) obtained salts which may beformulated as MI4UO,. xaq and MI2RIIUO,. xaq

where $M = NH_1$, K, or Na, and $R = UO_2$

Ammonium uranyl peruranate (NH₄)₂(UO₂)UO₃, Saq. The formula may also be written (NH₄)₂O₄U₂O₅, Saq, or

(NH1)20.UO2.UO4. 8aq, or, regarding the compound as a double peroxide of U and NII, as 2UO, (NH4).O. Saq. The salt is prepared by 2UO, (NH.).O.8aq. The salt is prepared by adding excess of NH3Aq and H2O2Aq to a solution of a uranyl salt and ppg. by alcohol; it is an orange-yellow solid, readily soluble in water. The quantity of KMnO, in solution decolourised shows that the ratio of U to 'peroxide oxygen' in the salt is U.30.

Potassium per-uranate K, UO, 10aq. salt may also be looked on as a double peroxide of U and K (UO, K.O., 10aq), or as K.O. UO., 10aq, It is prepared by adding alcohol to a solution obtained by treating UO₂(NO₂), Aq with KOHAq and excess of H₂O₂Aq, and rapidly drying the orange-yellow pp. by pressure in filter paper. The salt rapidly absorbs CO₂ from the air and lease O₂ it is regilled decompand by host silicated. loses O; it is easily decomposed by heat, giving

loses U; it is easily decomposed by hear, givingoff H₁O and O. Experiments showed that the
ratio of U to 'peroxide oxygen' is U:3O.
Sedium perurahate Na₁UO₁, 8a₂ The
formula may also be written U₁O₁, Na₂O₂, 8a₃ or
Na₁O₂O₃ O₄ The salt u O₂, Na₃O₄, 8a₃ or 2Na,O.UO, 8aq. The salt is prepared by dissolving 'ordinary uranic hydrate,' or UO, xaq, in excess of NaOHAq along with excess of H₂O₂Aq, allowing to crystallise if conc. solutions

are used, or ppg. by a little alcohol if dilute solutions are used, and drying by pressure in filter paper. Poleck (B. 27, 1051 [1894]) obtained this salt by adding sodium superoxide to solution of a salt of U. The salt is golden-yellow and lustrous; its lowly absorbs CO, from the air, and gives off O. When heated, alone or in CO, it gives off 30; it also loses 30 in contact with acidified Kyno, Aq or other unstable O compounds. The ratio of U to 'peroxide oxygen' is U:30 as measured by the quantity of KMnO. decolourised by a solution of the salt.

Sodium-uranyl per-uran to Na.(UO.)UO. 614. The formula may also be written Na.O.U.U., 6aq or Na.O.UO.,UO. 6aq; or, regarding the compound as a double peroxide of U and Na, as 2UO, Na,O., 6aq. The salt is prepared similarly to Na, UO, Saq, but using only the minimum quantity of NaOllAq required for solution, and adding alcohol, when it separates as a red oil which slowly rystallises to a red solid. The quantity of KMnO, in solution decolourised by a solution of the salt showed that the atio of U to 'peroxide oxygen' is U:30.

Uranium, oxybromide of, UO_Br. (Uranyl bromide.) In preparing UBr, by heating a mixture of U₃O₃ and C in Br vapour, Hermann (J. 1861, 260) obtained a yellow, easily volatile sublimate, which was probably an oxybromide. By heating UO, with Br and water, also by dissolving UO, in HBrAq, a colourless liquid is obtained, which on evaporation gives yellow needles of the hydrated oxybromide UO,Br., 7aq (Sendtner, A. 195, 325). This compound combines with NII, Br and KBr to form UO, Br, 2MBr

(c. Uganoxygromides, p. 822). Uranium, oxychloride of, UO.Cl., (Uranyl chloride.) Formed by strongly heating UO, in Cl; a yellow, crystalline solid, easily fused, but volatilised only at a high temperature; heated with K forms UO and KCl (Péligot A. Ch. [3] 5, 5). By dissolving UO, H.O in HClAq, also by oxidising UCl, by HNO,Aq, and evaporature, yellowish-green crystals of UO.Cl. xII O are obtained (Klaproth, Crell's A. 1789 [2]. 387).

By dissolving UO2Cl2 in other and evaporating, Regelsberger (A. 227, 119) obtained yellow needles of the compound UO₂Cl₂2Et₂O.

UO, Cl. forms compounds with NH, Cl and KCl of the form 2MCl.UO2Cl, (v. URANOXXCHLORIDES,

UO₂Cl₂ combines with MH, to form UO₂Cl₂xNII₃, where x = 2, 3, and 4. The first of these compounds, UO₂Cl₂NII₃ is formed by passing dry NH₃ into UO₂Cl₂ dissolved in ether, adrying the voluminous yellow pp. that forms, and then placing it in vacuo over H.SO, until and then placing if in vacuo over H.SO, until all other is removed; the second compound, UO₂Cb₂3NH₃, is formed by the action of NH₃ on UO₂Cl₂2NH₄; and a mixture of UO₂Cl₂3NH₃ and UO₂Cl₂4NH₄ is produced by passing NH₃ over solid UO₂Cl₂. When strongly heated in air these compounds give off all NH₄ and Cl and deave U₂O₂; heated out of contact with air they give UO₂ (Regelsberger, A. 227, 119). The three compounds are called by R. uranylaminonium and their formulæ are written

""" uO₂(NH₂Cl)(NH₂NH₂Cl), and

""" water reacts thus: chlorides, and their formul UO,(NH,Cl), UO,(NH,Cl)(NE UO,(NH,NH,Cl), Water (1), 3UO,(NH,Cl), + 3H,O = (NH,), U,O, + UO,Cl, + 4NH,Cl;

(2) UO₂(NH₂Cl)₂ + 2H₂O = UO₂(OH)₂ + 2NH₄Cl; the second reaction takes place quickly with

warm water.

Uranium, oxyfiuoride of, UO₂F₂. fluoride.) This compound is produced by boiling U₂U₃ with HFAq, filtering off UF₄ (v. URANIUM TETRAFLUORIDE, p. 823), and evaporating the filtrate; it is also formed, in small quantities, by heating UF, in a closed Pt crucible. The compound differs according to the method of preparation (Smithells, C. J. 43, 125).

a-Oxyftuoride. About 1 gram UF, is heated in a Pt crucible with the lid on, temperature being raised as quickly as possible; after five minutes the crucible is allowed to cool, the light, bulky sublimate is removed, And the crucible is again heated for five minutes, and these processes are repeated several times (S., l.c. p. 129). This form of UO₂F₂ is a very bulky, light, white, crystalline solid; it is very soluble in water,

forming a yellow diquid; heated in air it is gradually changed to U₂O₄.

\$-Oxylluoride. U₂O₄ is the ated with boiling HFAq in a leaden vessel, the yellow solution is poured off from green UF₄, heated until the excess of HF is driven off, and allowed to evaporate; evaporation may be completed over H₂SO₄ and CaO in vacuo; the residue is dried at 100° (S., l.c. p. 130). This form of UO,F, is we fellow saponaccous mass; in one instance the preparation had a semi-crystalline appearance, forming yellow, lustrous scales; it is very soluble in water or alcohol; heated on Pt foil U,O, is formed; heated in a closed crucible probably forms a compound with HF; by evaporating a solution of U₃O₈ in HEAq over H₂SO₂ and CaO until the weight was constant, Smithells (l.c. p. 131) obtained a substance which gave results on analyses agreeing fairly with the formula UO₂F₂.HF.H₂O.

A solution in water of either form of UO,F, mixed with KFAq and KHF Aq, and evaporated, gives the quadratic fluoxy-uranate K₂UO₂F₃ (S., l.o. p. 130-1). For the compounds of UO₂F₂ with MF v. Uranoxy-Luorides (p. 824).

Ditte (C. R. 91, 115) gave the formula UOF₄ to the abbligate abblight of the second of the compounds of UOF₄.

to the sublimate obtained by heating, in a closed Pt crucible, the solid that remained when U2O, was treated with boiling HFAq. Ditte said that this solid was UO_F₂; Smithells (l.c.) has, how, ever, shown that the solid obtained by the method used by Ditte is UF₄, and that the sublimate formed by heating this is a-UO₂F₂.

Uranium, oxysulphides of. Two compounds

probably exist.

probably exist.

URANIUM OXYSULPHIDE U₄O₂S₄. This composition was given by Hermann (J. 1861, 258) to a dark, greyish-black solid, obtained by heating UO₂, U₄O₄, or NH₄, uranstego redness in vapour of CS₄. Dissolves in conc. HClAq; burnp when heated in air (cf. M. Rose, G. A. 73, 139).

URANYL SULPHIDE (UO₂)S. A brown solid, the land the pure a proposition of sultiments.

obtained by ppg an ammoniacal solution of a uranyl salt by cold (NH₄)₂SAq, and quickly washing with cone, alcohol. Probably not obtained ours, as it quickly denomposes; water produces UO.xH.O; at 40°-50° it is changed to UO. and B (Remelé, P. 124, 114; Zimmermann, A. 204, 204). (UO.)S is somewhat sol. water or dilute alcohol; dissolved by conc. HClAq, giving UCl.

and S; dissolved by (NH₄)₂SAq, only in presence of (NH₄)₂CO₂Aq (Zimmermann, l.c.), forming a brown liquid.

Uranium black. By allowing (UO,)S to stand in contact with freshly prepared (NH₄)₂SAq, in absence of air, a dull black amorphous powder is obtained. This solid dissolves in mineral as obtained. This sound dissolves in inherat acids, giving off traces o'H₂S; it dissolves partly in warm (NH₄)₂CO₂Aq, but not in warm (NH₄)₂SAq, nor in caustic alkali solutions; heated in a tube to c. 270° it gives off a very little NH, and H₂O. Zimmermann (A. 204, 204) gives the formula U,O₁₀ to uranium black, neglecting (as impurities) the traces of NH, and S which the substance contains.

. Uranium red. By allowing (UO2)S to stand for 24-48 hours in contact with cold (NH1)2SAq, exposed to air, a deep-red solid is obtained; soluble in dilute mineral acids, with separation of S and evolution of H₂S; gives off NH₃, S, and H₂O when heated to 150° and, at above 200°, leaves U3O, (Zimmermann, L.c.). According to Z., the formation of this red substance takes place only when (NH),2,30, is present in the (NH),2,30 used; (NH),2,30 is formed by the action of the air. Z. gives to Z. gives to uranium red the composition $U_sS(NH_s)_2O_s=UO_xONH_sSNH_s2U_2O_s$ (cf. Patera, J. pr. 51, 122; Remelé, P. 124, 158; Hermann, J. 1861.

Uranium, salts of. Two classes of salts are formed by treating oxides of U with acids; UO₂ forms corresponding salts, UX₂ when X = the radicle of a dibasic acid, and UX₄ when X = the radicle of a monobasic acid; UO₂ forms salts (UO2)X when X = the radicle of a dibasic acid. and (UO₂)X₂ when X = the radicle of a mono-basic acid. The salts UX₁ and UX₁₂ are called uranous salts; and (UO₂)X₁₂ and (UO₂)X¹¹ are called uranyl salts. (For reactions of the two classes of salts v. URANIUM, Detection and estimation of, p. 822.) Besides the normal salts, a large number of basic salts of both classes is known, and also many double salts.

The chief uranous salts are arsenates, phosphates, and sulphites. The chief uranyl salts are arsenates, bromate, double carbonates, chromates, hypophosphite, iodate, nitrates, oxalate, phosphates, phosphite, selenates, selenites, sulphates, and sulphates (v. Nitrates, Sul-PHATES, &c.).

Ursnium, sulphides of. When U is burnt in vapour of S, the disulphide US, is formed; by passing H.S over heated UBr, the sesquisulphide U₂S₃ is produced; and by heating U₂S₃ in H the monosulphide US is obtained. The

mol. w. of none of these is known.

URANIUM DISULPHIDE US₂. Prepared by heating U in vapour of S (Péligot, P. 54, \$22; c), Zimmermann, A. 216, 18); also by heating UCL 40 reduces in H₂S (Hermann, J. 1861. 258). A dark greyish-black powder; becomes crystal-line when fused with borax; oxidises slowly in air, rapidly on heating. Easily soluble in conc. HClAq (Hermann, l.c.).

HULAQ (Hermann, Lc.). Or Unawum sesquisulphine U₃S₃. A stream of dry H₃S, perfectly free from air is passed over heated UBr, as long as HBr is given off. Grey-black all at the stream of the st black solid, forming pseudomorphs of UBra; decomposes in air, giving off HaSt burns when heated in air; scarcely acted an by HClAq or

dilute HNO, Aq; decomposed violently by conc. HNO, (Alibegoff, A. 283, 117).

UBANIUM MONOSULPHIDE US. A black, amorphous powder; obtained by passing dry H over bhous power, obtained by passing dry 11 over U_1S_1 , kept at a red heat, for c. 40 hours, until H_1S is no longer given off. Similar in properties to U_4S_1 (Mibegoff, A. 233, 135).

Uranium thio-acids, salts of. No thio-acid, nor salt of a thio-acid, of U has been definitely isolated. Uranium red (v. supra, p. 828) may perhaps be an ammonium oxythionate of

M. M. P. M. URANOXYBROMIDES v. p. 822, under UBANIUM TETRABROMIDE.

URANOXYCHLORIDES v. p. 823, under URANIUM TETRACHLORIDE.

URANOXYFLUORIDES v. p. 824, under

URANIUM TETRAFLUORIDE.

URANYL COMPOUNDS, compounds of the radicle UO₂; v. Uranyl ammonium chlorides (p. 827), Uranyl bromide (p. 827), Uranyl chloride (p. 827), Uranyl fluoride (p. 828), URANYL SALTS (p. 828), URANYL SULPHIDE (p.

URAZOLE. A name given by Pinner (B. 20, and the property of th 2358) to di-oxy-triazole, which may be repre-

sented as NH.C(OH) N of NH.CO NH.

UREA CH, N₂O, i.e. CO(NH₂)₂. Carbamide.

Mol. w. 60. [132°] (Lubavin B. 3, 205). S.G.
1323 (Schröder, B. 12, 562). S. (alcohol) 20 in the cold; 100 at 78°. H.C.v. 152,500. H.C.p. 152,200 (Stohmann s. Langbein, J. pr. [2] 44, 387); 160,900 (Berthelot a. Petit, C. R. 109,

759; 110, 887). H.F. 80,800.

Occurrence.—In the urine of mammalia, especially in that of flesh-eaters (Fourcroy a. Vauquelin, A. D. 1799). Occurs in small quantity in blood, muscle, chyle, and lymph of mammalia (Wurtz, C. R. 49, 52; Poisseuille a. Gobley, J. 1869, 612; Verdeil a. Dollfus, A. 74, 214; Munk, Pf. 11, 100; Pickard, C. R. 83, 1179; 87, 533; Gréhant a. Quinquand, C. R. 108, 1092; Garrod, Pr. 53, 478). Constitutes about 30 p.c. of the solid substance of the vitreous humour of the eye (Millon, C. R. 26, 119; A. 66, 128). Occurs also in saliva (Rabuteau, J. 1873, 877), in cow's milk (Lefort, Z. 1866, 190; Vogel, J. 1867, 932), and in other animal secretions.

Formation.-1. By evaporating a solution of ammonium cyanate (Liebig a. Wöhler [1828], B. J. 12, 266; P. 12, 253; 15, 619; A. 38, 108).

2. By adding a little NHO, to an ethercal solution of cyanamide (Cannizzaro a. Cloëz, A.78. 230) or by the action of dilute (50 p.c.) H.SO. on cyanamide (Baumann, B. 6, 1373).—3. From COCl₂ and dry NH, (Regnault, A. Ch. [2] 69. Natanson, A. 98, 287), gaanidine and 180; Natanson, A. 98, 287), granidine and NH Cl being formed at the same time (Fenton, NH. Ci being formed as the same carbonic ether, C. J. 385, 793).—4. By heating carbonic ether, with NH, Aq at 180°.—5. By heating ammonium carbamate at 140° (Basaroff, J. pr. [2] 1, 283). 6. By passing an alternating electric current through a solution of ammonium carbamate (Drechsel, J. pr. [2] 22, 481).—7? By electrolysis of ammonia solution using carbon electrodes (Millot, Bl. [2] 46, 248).—8. By passing a mixture of NH, and CO, through a red-hot tube (Dexter, Am. 4, 85).—9. Formed by passing air charged with NH, and vapour of benzene over a red-hot helix of platinum wire (Herroun, C. J.

89, 471). Acetylene, but not ethylene, may be substituted for benzene.—10. By heating ammonium thiocarbamate NH_xCO.SNH_p or by shaking it with water and PbCO₂.—11. By the action of aqueous KMnO₄ on thio-urea (Alaly, M. 11, 277).—12. By the action of KMnO, on KCy in acid solution (Baudrimont, J. 1880, 393).— 13. By the action of NH Aq and H,S on copper fulminate (Gladstone, A. 66, 2) .-- 14. By heating oxamide with HgO (Williamson, Memoires du Congres scientif. deel enise, a.n. 1847). - 15. By oxidation of uric acid.—16. By the action of KGlO₃ and HCl on guantine (Strecker, A. 118, 159).—17. By boiling guandine with baryta (Baumann, B. 6, 1376).—18. By boiling biguanide sulphate or phenyl-biguanide sulphate with baryta (Emich, M. 12, 11). - 19. By the action of baryta on arginin (Schulze a. Likiernik, B. 24, 2701).-20. By boiling creatin with baryta.-2101.—20. By boining creatin with baryta.—21. A product of exidation of froteids by KMnO, (Béchamp, A. Ch. [3] 48, 348; C. R. 70, 866; Ritter, Bl. [2] 16, 323. Stacedeler (J. pr. 72, 251) and Loew (J. pr. [2] 2, 289) failed to obtain urea in this manner. Dreschel (B. 23, 3097) obtained urea from albumen by electrolysis, but not by oxidation.

Preparation. -- 1. Urine, concentrated by evaporation, is treated with nitrig or oxalic acid, and the ppd. nitrate or oxalite of urea is decomposed by CaCO₃, 2. A solution of potassium cyanate mixed with annuonium sulphate is evaporated on a water-bath to dryness, and the residue extracted with alcohol .- 3. A mixture of dry K₁FeCy₆ (28 pts.) and MnO. (14 pts.) is heated still sticky on an iron plate. A cold aqueous extract of the mass is mixed with aqueous extract of the mass is mixed with aqueous extract of the mass is mixed with alcohol (Liebig).—4. Dry K.FeCy. (8 pts.) is fused with K.CO₄ (8 pts.) and PbQ. (19 pts.) and PbQ. mixture is dissolved in water, mixed with (NH₁)₂SO₄ (8 pts.) evaporated, and extracted with alcohol (Clemin, A. 66, 382). Any K₁FeCy left can be removed by FeSO, -5. Lead cyanate is digested with (NII), SO, (J. Williams, C. J. 21, 64), -6. From NH, Aq. COS, and lead carbonate (Schmidt, B. 10, 193), -7. By the action of (NH), SO, on KCyO obtained by heating dry KF-Cy₈ with K-Cr₂O; the yield being 25 p.c. of the weight of ferrocyanide (C. A. Bell, C. N. 32, 99).-8. A stream of dry NII, gas is passed through phenyl-carbonate (from phenol-sodium and COCL), melted in a water-bath, and the mele is then poured into hot water; the aqueous solution after separation from the phenol is evaporated to crystallisation (Hentschel, B. 17, £286).

1'roperties. — Dimetric crystals, v. e. sol. water, m. sol. cold alcohol, insol. CHCl₂, nearly insol. ether. Sublimes at 130°. In vacuo it distils at 135° (Bourgeois, Bl. [3] 7, 45). Urea is not attacked by pure HNO, (Franchimont,

R: T. C. 6, 217).

Reactions .- 1. When heated alone at 1500-170° it yields NH, cyanuric and and biuret; at 140° it yields ammelide.—2. Decomposed into CO₂ and NH, by heating with water in sealed tubes above 100°, by boiling with potash, lime, or magnesia, by warning with cone. H₂SO₄, by evaporating with lead acetate, and by the action of ozone (Gorup-Besanez, A. 125, 207)

UREA. 830

in presence of free alkali. CaO produces cyanamide (Emich, M. 10, 330). A 8 p.c. HCl solution decomposes 4 p.c. of the urea in 24 hours. NaOHAq of the same strength has less effect. Cold water does not decompose urea (Berthelot a. André, Bl. [2] 47, 840).—3. Alcoholic potash forms, on heating in sealed tubes, cyanic acid, NH, and water (Haller, Bl. [2] 45, 705).— 4. Urea hydrochloride at 145° yields NH,Cl and cyanuric acid (De Vry, A. 61, 249):-5, Chlorine passed over melted urea ferms HCl, nitrogen, NH.Cl, and evanuric acid (Wurtz, A. 64, 307).— 6. Hypochlorous acid, hypochlorites, chlorine-water, and hypobromites, set free nitrogen, e.g. $CON_{a}H_{4} + 3HOCl = CO_{2} + 3HCl + 2H_{2}O + N_{2}$ 7. Nitrous acid added to a hot solution forms CO, and nitrogen: CO, II, + N,O, = CO, + 2H,O + 2N, Nitrous acid (2 mols) when added to a cold solution of urea (1 mol.) reacts as follows: 2CON₂H₄ + N₂O₃ = (NH₁)₂CO₃ + 2N₂ + CO₂ (Claus, B. 4, 140)₂ - 8. Neutral KMnO₄ has no action in the cold, and acts but slowly at 100°. In acid solutions KMnO, gives off nitrogen (1 vol.) and CO₂ (2 vols.) (Béchafip, J. 1856, 696; cf. Wanklyn a. Gamgee, C. J. 21, 25).—9. Bromine added gradually to an alcoholic solution of urea forms NH Br, cyanuric acid, and nitrogen. In sealed tubes Br gives NH Br and cyamelide (Smolka, M. 8, 64).—10. Heating with P.O. forms (Smolka, M. 8, 54).— 10. Heating with P.O. Johns oyanic and cyanuric acids, animelide, cyamelide, and NH₃ (Weltzien, A. 107, 219).—11. Yields eyanamide on warming with Na (Fenton, C. J. 41, 262).—12. Conc. HNO₃ reacts thus: CON₂H₁ + 21INO₃ = CO₃ + N₂O + NII, NO₃ + H₂O (Franchimont, R. T. C. 2, 96; 3, 219).—13. P₂S₃ forms crystalline C₂H,N₃PS₂O₂, which yields C₂H,AgN₃PS₂O₂ and C₂H,Ag,N₃PS₂O₂, andegives off PH₃ on warming (Kutschig, M. 9, 406).— 14. Zinc-dust at a red heat forms ZnCy, ammonia, and hydrogen (Aufschläger, M. 13, 272). 15. CS₂ at 100 forms COS and ammonium sulphocyanide. With alcohol and CS, the products ** age meraptan, CO₂, and ammonium's sulphocyanide (Ladenburg, %. [2] 5, 253; B. 1, 273;
2, 271; Fleury, A. 123, 144).—16. Alcohols in sealed tubes form carbamic ethers and alkyl allophanates (Cahours, C. R. 76, 1387).-17. Boiling Ac,O forms acctamide and diacetamide (Hofmann, B.14, 2733). -18. ZnEt, forms CON, H, Zn, which is reconverted into urea by water (Gal, Bl. [2] 39, 648),—19. Oxalic ether at 135-170° forms oxamide, allophanic ether, and alcohol (Grabowski, & 134, 115). Oxamic ether forms, on fusion, oxaluramide (Carstanjen, J. pr. [2] 9, 143) .- 20. Methylamido-acetic acid (sarcosine) forms methyl-hydantoin on fusion (Ruppert, B. 6, 1278).-21. Aniline at 150°-170° gives NH. o, 1210).—21. Amune su, 130.—110. gives NH₂ and di-phenyl-urea (Baeyer, A. 131, 251).—22. Antitine sulphonic acid at 120? gives NH₂CO.NH.C.H., SO₃H (Ville, Bl. [3] 6, 6).—
23. Biguanide sulphate terms, on heating, amulion, NH, SO₃CO. Society of Society and Society of zo. Signature suprate terms, on nearing, ammeline, M. 10, 95). 24. Heated with acctone and ZnCl or P.O. at 110°-140° it gives strimethylpyridine and a base C.H., N [112°]; (320°). (Riehre, A. 238, 22). This base forms hard monoclinic crystals, with metallic ring; its solutions fluoresce. It gives B'2H2PtCle: [225°].-25. Heated with acetyl-acetome (1 mol.), urea: into ammonism carbonate. A conc. aqueous (2 mols.) forms CH₂(CMe:N.CO.NH₂), which solution of furfuraldehyde followed by a drop of crystallises from alcohol [200°] (Combes, Bl. [3] HClAq (S.G. 1·10) colours a crystal of urea

The same body is formed, together **7**, 790). with CH. CMe:N CO [198], by adding HClAq or H.SO, to an alcoholic solution of urea and acetyl-acetone (Evans, J. pr. [2] 46, 852; 48, 499). — 26. Benzoyl-acetone forms, in like Bz.CH, CMe:N.CO.NH, [1919] and CH₂<CMe:N>CO [227°] (Evans, J. pr. [2] 46, 352- 48, 509) .- 27. Acctoacetic ether (2 mols.) and NaOEt (2 mols.) form in the cold C13H22N2O7Na2 [c. 165°] (Ernert, A. 258, 361). Acctoacetic ether in alcoholic solution forms uramido-crotonic acid (q, v_*) , -28. Urca reacts with aldehydes in the cold. In aqueous solution a diureïde R.CH(NII.CO.NH₂)₂ is usually formed, while solid urea forms triureides. On warming with excess of aldehyde, Wi- and tri-ureïdes yield tetraand hexa-ureides (H. Schiff, A. 151, 186). These ureides are sparingly soluble neutral solids, and are split up by warming with acids into the parent substances. Benzoic aldehyde forms benzylidene-di-urea (q. v.), while o-oxy-benzoic aldehyde forms C₀H₁(OH).CH(NH.CO.NH₂)₂aq, which is converted by acctoacetic ether in alcohol into C_aH₄(OH).CH:N.CO.N:CMe.CH_a.CO₂Et [200°], C₀H₄(OH).CH:N.CO.NH.CMe:CH.CO₂Et [204°], and C₆H₄CH:N.CO NH, which decomposes between 260° and 270° (Biginelli, B. composes between 2:00° and 2:70° (Bighield, B. 24, 2963). Acrolein fofms (CON₂H_{1),2}SC₃H₄O, which chars at 2:50° (Liūdy, M. 10, 2:95). o-Nitrobenzoic aldehyde forms nitro-benzylidene-diurea C.H.(NO.).CH(NH.CO.NH.), aq [1900]. In like manner cuminic aldehyde in alcohol forms the di-ureïde C₃H₁,C₃H₂,CH(NH.CO.NH.)₂ [176°] (Biginelli, B. 24, 2964), and cinnamic aldehyde forms Ph.CH:CH.CH(NH.CO.NH.)₂ [172°], and compounds melting at 116° and 212° .-29. Chloral added to conc. aqueous solutions of urea forms (C.HCl,O)CON_H, [150°], v. e. sol. hot water, and (C.HCl,O)CON_H, [190°] nearly insol. hot water, both compounds being crystalline (Jacobsen, A. 157, 246). Chloral cyanhydrin at 105° forms the very stable crystalline C.H. Cl. N.O (Pinner a. Fuchs, B. 10, 1069).-30. Benzene sulphonic chloride at 100° forms 50. Benzene suphonic chloride at 100 forms colourless crystals of C₈H₈SON₄H₅C_{.0}2 aq (Elander, Bl. [2] 34, 207). Naphthalene (a)-sulphonic chloride acts similarly.—31. Cinnamoyl chloride forms C. H₆(N. H. CO. N.I. C. H₆, N. H. CO. N. H. J. [184°] (Biginelli, B. 24, 2965).—32. ClCH₂.OH forms methylene-urea, which is split up by hot dilute H.SO, into formic aldehyde and urea (Von Hemmelmayr, M. 12, 89) .- 33. Trichlorolactic acid and a little water form, on heating, acetyleneurea C₁H_sN₄O₂ (Pinner, B. 17, 1997).—34. Hexachloro-acctons (2 mols.) heated with urea (1 mol.) at 150° forms CO:N₂H₂(C₂Cl₂O)₂, crystallising from alcohol in hexagonal plates (Cloez, \$\textit{L}\$. Ch. [6] 9, 145). Detection.-Urea gives, in conc. solution,

orystalline pps. with nitric and oxalic acids. Urea dissolved in amyl alcohol is completely ppd. by an ethereal solution of oxalic acid (Brücke, M. 8, 195). Mug-lus (C. R. 78, 182) filters cutrid urine, dries the filter at 35°, and employs it as a test for urea, which it converts into ammonism carbonate. A conc. aqueous solution of furfuraldehyde followed by a drop of violet (Schiff, B. 10, 774). o-Nitro-benzoie aldehyde added to an alcoholie solution of urea forms, on warming, a white pp. of o-nitro-benzylidene-di-urea [200°]. When present in small quantities this compound may be detected by resolving into the parent substances by boiling with very dilute H₂SO₄, and then adding a little phenylhydrazine solution, which produces a red colour (Liudy, M. 10, 295). Mercuric nitrate gives a white pp. with solutions of uses. The various methods of estimating urea may also be employed for its detection.

Estimation. - Hypobromite Urea is mixed with NaOH (100g. in 250 c.c. water) to which bromine (25 g.) has been added, and the nitrogen collected and measured (Knop, Art. and margen confected and intensaried (Mop. Fr. 9, 226; Hüfner, J. pr. [2] 3, 1; Dupró, C. J. 31, 534; Simpson a. V'Kecfe, C. J. 31, 838; Russell a. West, C. J. 27, 749; Eykman, R. T. C. 3, 125; Schleich, J. pr. [2] 10, 263; Colquhoun, C. N. 67, 123; Camerer, Zeit. Biol. 29, 239). When this method is applied to urine it must be remembered that uric acid gives off 48 p.c. and creatinin 37 p.c. of its nitrogen in this way (Falck, Fr. 21, 300). Nevertheless, the quantity of nitrogen evolved is 8 p.c. less than the calculated amount (R. a. W.). Using Knop's solution, ammonia, urea, and oxamide give off 93, 923, and 75 p.c. of their nitrogen as gas (Foster, C. J. 33, 470; 35, 170). In the case of urea and oxamide the suppressed 'nitrogen is present as cyanate and as nitrate (Fauconier; Luther, H. 13, 500). The amount of suppressed nitrogen is less in dilute than in concentrated solutions (Hüfner, H. 1, 350; cf. Pflüger a. Bohland, Pf. 38, 325; 39, 1, 143), and is greatly diminished by the addition of 1 to 5 p.c. acetoacetic ether (Jacoby, Fr. 24, 318). According to Duggan (Am. 4, 47), if bromine is added to a solution of urea in NaOHAq the yield of nitrogen is 99.4 p.c. of the theoretical amount. In estimating urea in urine Pflüger (Fr. 26, 117) adds HClAq (1 c.c.) to urine (10 c.c.), ppts. various nitrogenous bodies by phosphotungstic acid, neutralises the filtrate with lime and then adds an equal volume of conc. NaOHAq and, after allowing to stand for some time, decomposes with Knop's hypobromite. Frothing of albuminous urine can be avoided by first shaking with a pilule of fat (Méhu, J. Ph. [5] 15, 607). Hamburger (R. T. C. 2, 181) introduced a volumetric method of employing hypobromite, but Pflüger a. Schwenck (Pf. 37, 399) consider the method to be untrastworthy. E. Salkowski adds two drops of HCl to urine (2.5 c.c.) diluted with 5 or 10 volumes of water until the air is expelled from the flask, then adds the hypobromite, continues boiling, and collects the nitrogen. Fenton (C. J. 33, and contects the introgen. Fenton (C. J. 53, 300) Accommends the use of sodium hypo-chlorite, which was first proposed by E. W. Davy (A.D. 1854). In this case free Nacili must not be present, though excess of Na.CO. may be present.

Mercuric nitrate method. Urea is completely ppd. by a solution of $Hg(NO_s)_2$. The white pp. is not decomposed, and therefore not turned yellow by Na₂CO₂. Urine (2 vols.) als mixed with a solution (1 vol.) frepared from saturated solutions of baryta (2 vols.) and $Ba(NO_s)_2$ (1 vol.); filtered through a dry filter

from the ppd. sulphate and phosphate and 15 c.c. (equivalent to 10 c.c. urine) of the filtrate are titrated with standard mercuric nitrate till a drop taken out gives a yollow pp. with Na,CO_a (Liebig, A. 85, 370). Assuming the compound CON.H.2HgO to be formed, 1 pt. urea should ppt. 7.2 pts. HgO, but in practice 7.72 pts. of the latter are required. A solution of 71:48 g. mercury in HNO, diluted to 1 litre is equivalent to 01 g. area per c.c. If the urine contains more than 2 p.c. urce the titration gives too_low results; in this case the urine must be diluted. When inercuric nitrate is added to a solution of urea nitric acid is set free. Labig recommended the addition of M.CO, from time to time to keep the liquid neutral. Pflüger (Fr. 19, 375) proceeds as follows: During the titration, after each addition of $Hg(NO_3)$ a drop is placed in contact with a little pasty NaHCO₂. Long before the titration is ended, a yellow colour is seen between the two drops, but disappears on mixing them together. When the yellow colour is permanent, the titration is near its end; at this point the solution is neutralised by Na₂CO₂, and the tilration continued till a permanent yellow colour is got on mixing the drops. Should the entire liquid become yellow on adding Na,CO, a fresh quantity of urea solution must be taken and the operation be repeated with greater speed. The presence of over 1 p.c. NaCl in urine inter-feres with the titration when Na₂CO₄ is used as indicator, the final reaction not being sharp. Since NaHCO, does not ppt. HgCl,, when the bi-carbonate is used as indicator the titration may proceed as if NaCl were absent, subtracting the amount of Hg(NO₃), that is converted into HgCl₂ by the chloride (Rautenburg, A. 133, 55; Pfeiffer, Pr. 24, 475; Pflüger, Fr. 27, 120). It is, however, better to ppt. the chlorides by AgNO, and titrate in the usual way.

Barium carbonate method. The solution is heated with BaCl, and NI,Aqin scaled tubes at \$20°-240° and the ppd. BaCO, weight (Bunsen, A. 65, 575). Before applying this method to urine other substances which might form BaCO, must be ppd. by phosphotungstic acid (Pflüger a. Bleibtreu, Fr. 28, 377).

acid (Pflüger a. Bleibtreu, Fr. 28, 377).

Kjeldahl's method. Nitrogen in urea may be estimated by Kjeldahl's method. 5 c.c. urine gre heated with H.SO, (10 c.c.), and Nordhausen H.SO, (10 c.c.) until no more water or gre comes off, and the liquid is clear yellow. After cooling, water (200 c.c.) and N.OH areadded and NH, distilled off. In the case of urine it must be remembered that about 13 p.c. of the nitrogen is, on an average, combined in substances other than urea (Pflüger, Pr. 35, 464, 40, 533; Camerer, Z. B. 24, 306).

Other methods. Urea may also be estimated by fermentation and determination of aminonia set free (Miquel, C. R. 111, 501).

Campani (G. 17, 187) proposes to decompose urea by nitrous acid, and pass the CO, into a solution of lime-water of known strength, and titrate with oxalic acid.

Cazeneuve and Hugouneng (Bl. [2] 48, 82) Pheat urea with a large excess of water and titrate the resulting ammonium carbonate.

Riegler (F. 83, 49) decomposes ures with Millon's reagent and measures the mixture of N and CO₂ evolved.

Möiner a. Sjögvist (Fr. 80, 888) add 5 c.c. Moiner a. Bjöqvist (Br. 30, 588) and 5 c.c. of a saturated solution of BaCl, containing 5 p.c. baryta to 5 c.c. urine and then add 100 c.c. of a mixture of 97 p.c. alcohol (2 pts.) and ether (1 pt.). After 24 hours the liquid is filtered, the pp. washed with 50 c.c. alcoholether, and the filtrate and washings evaporated at 50° to 25 c.c., MgO and some water added. and the evaporation continued as long as NH, comes off. The urea is then determined by Bunsen or Kjeldahl's method (Bödtker, H. 17, 140).

Salts .- B'HCl. Very deliquescent crystalline mass, formed com urea and dry HCl. De-At 140° composed by water into urea and HCl. it yields NH₄Cl and cyanurio acid.—B'HNO₄. Small plates, sl. sol. water and alcohol, v. sl. sol. HNO₄.—B'₂H₄Co₄. S. 4.4 at 15°. S. (alcohol of S.G. 833) 1-65. Monoolinic tables; (alcohol of S.G. 833) 1°05. Monooning tables, a:b:c=1::04::491; $a=82^\circ$ 10' (Loschmidt, Sitz. W. 51, ii. 7, 384). V. sol. hot water. Ppd. from its aqueous solution by oxalic acid.— -B'H₂CO₄aq (Lubavin, A. Suppl. 8, 83). -B'HAuCl₄aq: orange-red prisms or needles, v. sol. water, alcohol, and ether. B', HAuCl, : yellow needles, v. sol. hot water (Heintz, A. 202, 264).—B',H_PtCl_s2aq. Yellow, deliquescent tables, v. sol. water and alcohol, insol. ether (Heintz, A. 198, 91).—B'H,PO,. Large crystals, v. sol. water and alcohol, sl. sol. ether (Lehmann, Buchn. Rep. 15, 224; Schmeltzer a. Birnbaum, Z. [2] 5, 200). Its solution does not ppt. MgSO,

-B', 2H, PO, Its aqueous solution gives a crystalline pp. of cyanuric acid on heating.

Tri-chloro-acetate B'C, HCl, O, Plates (from gloohol) (De Clermont, J. 1873, 536) .trom siconoj (De Ciernont, J. 1873, 536).— The fumaratte B'.C.H.O., maleates B'C.H.O., and B.O.H.O., malate B'.C.H.O., gallate B'C.H.O., and succinate B'.C.H.O., [145°], all crystallise in monoclinic forms (Loschmidt, M. 1871). all crystallise in monoclinic forms (Loschmidt, Sitz. W. 52, ii. 238). The parabanate B'C,H,M,O, and tartrate B',C,H,O, are trimetric.—The citrate B',C,H,O, is 'triclinic (L.). An acid tartrate B',C,H,O, and an acid citrate B',C,H,O, have been prepared (Hlasiwetz, J. 1856, 698).—Cyanurate B',C,N,H,O, Monoclinic crystals.—Picrate B',C,N,H,O, (Smalle, H, 5,990). S. 1.9 B'C,H,N,O, [142°] (Smolka, M. 6, 920). S. 1'9 at 18:5°. S. (95 p.c. alcohol) 3 at 18°. Slender yellow needles (from alcohol). Tri-chloromethanu sulphinate B'CCl,SO,H. [96°– 100°]. Thin prisms (McGowan, J. pr. [2] 34,

Compounds with metallic oxides.— B'.8Ag.O. (Liebig). Formed by adding moist Ag.O to a solution of urea. Grey plwder com-Ag₂O to a solution of urea. Grey pluwder composed of slender needles. According to Mülder (B. 6, 1019), the yellow pp. got by adding NaOH to a solution of urea mixed with AgNO, is GON,H,Ag., It combines with iodine, forming CON,H,Ag.I., a greenish mass, darkened by light (Tafel a. Enoch, B. 23, 1554).—3°,HgO. Got by adding Hg(NO₂), to a solution of urea mixed with KOH. White pp.—B',3HgO. White mixed with KOH. White pp.—B',3HgO. White pp. formed by adding HgOl, to a solution of urea and HgOl, changes to a yellow granular powder on boiling with water.—B'HgO. Formed' by adding Hg(NO₂), to a warm solution of urea by adding Hg(NO₂), to a warm solution of urea (Dessaignes, A. 82, 232; Liebig, A. 85, 289).

Compounds with metallic salts.—B'AgNO₂ Prisms. Yields silver cyanate on acctamide at 50° (Schmidt, J. Or. [2] 5, 68).

NaCl. Deliquescent prisms. Alcohol extracts urea from the compound.—B'NaNO, aq. Prisms (from water).—B'NH,Cl. Deliquescent crystals. -B'₃(NH₄Cl)₂HCl. Formed by dissolving urea in bleaching-powder solution (Beckmann, A. 91, 367. Large plates, sol. alcohol mixed with ether.—B',Mg(NO,), (Werther, J. pr. 35, 5).—B',Ca(NO,),—B',ZnCl,—Very deliquescent crystals (Neubauer a. Kerner, A. 101, 337).—B'CaCl, Needles.—B',Hg(NO,),2HgO. Granu^a lar powder formed by mixing warm dilute solutions of urea and mercuric nitrate. At the moment of formation the pp. is flocculent.— B',Hg(NO₃),2HgO. • Formed by pouring mercuric nitrate into a solution of urea as long as a pp. is produced, and keeping the whole at 40° pp. is produced, and keeping the whole at 40° pp. is for some time (Liebig). Six-sided lamins.

—B'₂Hg(NO₃)₂HgO. Formed by adding an acid solution of mercuric nitrate to a solution of trea nitrate. Crusts of small tabular crystals (Liebig, A. 85, 296).—B'HgCl₂. Flat crystals, v. sl. sol. cold water (W.).—B'₁₂Cr₈O₂₁ 3aq. Formed by the action of water on the product of the action of CrO₂Cl₂ on urea (W. J. Sell, Pr. 33, 267; 45, 321). Olive-green needles (from hot water). PtCl, added to its solution in not water ppts. silky green needles of B', Cr, Cl, (PtOl,), 2aq. The chromate treated with PbCl, forms lead chromate and a liquid from which gaseous HCl ppts. green prisms of B'12Cr2O, 6aq, the aqueous solution of which heated with Ag₂SO₄ gives dark-green prisms of B'₁₂Cr₂(SO₄), 10aq. In a similar way green prisms of B'₁₂Cr₂(NO₄)₆ may be got.—B'₁₂Cr₆Cl₂O₁, 2aq. Green monoclinic crystals, got from the product of the action of Cro.Cl. on urea by crystallising from conc. HClAq (1 vol.) diluted with water (9 vols.). By treatment with water it is split up into B'₁₂Cr₂O₂₁ and B'₁₂Cr₂O₃. By treatment with conc. HClAq and B',Cr,Cl,s. By treatment with conc. HClAq (1 vol.) and water (6 vols.) it is converted into the salts B',Cr,Cl,Ql,1 3aq. — B',Cr,Ol,2 4aq. — B',2Cr,Cl,6 Gaq. — B',2Cr,Cl,6 GlgCl, — B',2Cr,(CO,),4 aq. — B',2Cr,Cl,1,a. — B',2Cr,(SO,),I, — B',2Cr,(CO,),I, — B',2Cr,(CO,),I, — B',2Cr,(CO,),I, — B',2Cr,(CO,),I, — B',2Cr,Cl, — B',2Cr,(CO,),I, — B',2Cr,Cl, — B',2Cr,Cl, — B',2Cr,Cl, — B',2Cr,Cl,1, — B',2Cr,Cl,2, & B',2Cr,Cl,2,

v. sol. water, being decomposed into urea and formic acid.

Attyl derivative C,H,N,O₂ i.e.

Altayl derivative C,H,N,O₂ i.e.

NH,CO.NHAc. Acetweide. Mol. w. 102.

[214]. H.F. -200 (M.). S. (alcohol) 1 in
the cold; 10 at 78°. Formed by boiling urea
with Accl or Ac₂O (Zinin, A. 92, 405'; G.;

Leftde, R. T. C. 8, 235). Got also by the action of KMnO, on methyl-uracil (Behrend, A. 229, 29). Four-sided needles (from alcohol). Slowly but completely usecomposed by pure HNO, with evolution of CO. (1 volward N.O (2 vols.) (Franchimout, R. T. C. 6, 215). It is not ppd. bas Ho(NO).

Formed also from mercuric fulminate and AcCl (Scholl, B. 23, 8515). Needles (from alcohol). sl. sol. cold water.

Chloro-acetyl derivative
NH_CO.NH.CO.CH.Cl. Formed from chloro-acetyl chloride and urea (Jazukovitch, Z. 1868, 284; Tomfnasi, C. R. 76, 640). Thin needles (from alcohol). Begins to melt at 160°.

Tri-chloro-acety derivative
NH_CO.NH.CO.CCI, [150]. Crystals (from alcohol) (De Clermont, J. 1874, 798; Meldola a. Tommasi, C. J. 1874, 404; Cloez, A. Ch. [6] 9, 219). Nearly insol. hot water.

Bromo-acetyl derivative
NH_CO.NH.CO.CH.Br. Needles (from dilute alcohol) (Baeyer, A. 130, 156). Pure HNO gives off CO, (1 vol.) and N₂O (2 vols.) (Franchismont, R. T. O. 6, 218).

Tri-bromo-acetyl derivative NH, CO.NH.CO.CBr, [148°]. Formed by the action of Bron an aqueous solution of di-bromobarbituric acid (Baeyer). Crystals, v. sol. hot alcohol. Yields crystalline B'₂Ba(OH), xaq, v. e. sol, water.

Cyano-acetyl derivative NH, CO.NH.CO.CH, Cy. [200°-210°] (Mulder,

B. 12, 466). Crystalline.
Butyryl derivative NH_CO.NHC,II,O.
[176°]. Formed from urea and butyryl chloride (Moldenhauer, A. 94, 101). Plates.

Isovaleryl . derivative $C_6H_{12}N_2O_2$

[1912]. Minute prisms, v. sl. sol. water.

Carbonyl derivative CO(NH.CO.NH.)₂,

Formed by heating urea with COCl₂ at 100°
(E. Schmidt, J. pr. [2] 5, 39; Emich, M. 10,

347). Powder composed of minute crystals, v.

sl. sol. cold water and alcohol. Decomposed by heat into NH, and cyanuric acid. Boiling KOH also produces cyanuric acid.—B'HgO; crystalline powder, insol. water.

Succinyl derivative
C.H.O.(NH.CO.NH.). Formed by heating urea
(2 mols.) with succinyl chloride (1 mol.) at 65°
(Conrad, J. pr. [2] 9, 301). Colourless powder,
v. sl. sol. hot water.

Vol. IV.

Methyl-malonyl derivative CHMe:C.O.:N.H.CO. [192°]. Formed by heating methyl-malonic acid with urea and POOl. (Franchimont a. Klobbie, R. T. C. 7, 22). Pointed plates, v. sol. water and alcohol.

Bensoyl derivative NH₂CO.NHBz.

200°]. S. (alcohol) 1 in the cold; 4 at 78°. Formed by heating urea with BzCl or Bz₂O at 150° (Zinin, A. 92, 404; Geuther, Z. [2]=4, 299). Four-sided plates (from alcohol), insol.

CO(NEBz)z Di-bensoyl derivative CO(NEB2)₂. [210°] (S.); [197°] (H.). A product of the action of COCl₂ on benzamide at 165° (E. Schmidt, J. prac[2] 5, 58). Formed also by heating guanidine carbonate with B2,0 at 100° (Creath, B. 7, 1739), and by treating mercuric fulminate with B2Cl (Hollemann, R. T. C. 10, 72; B. 23, 2998, 3742). Needles (from alcohol), al. sol. water. Aniline at 180° gives NT₁₂ benzamide, hearsanilide and adjumble vives. Di-bensoyl derivative

benzanilde, and s-dreahenyl-ures.

2.Di-benzoyl derivative NH_CO.NBz_

[c. 197°]. Formed by heating sodium benzoyl
eyanamide NaBzN.CN with BzCl, followed by boiling alcohol (Buddéus; J. pr. [2] 42, 97). White needles.

m-Nitro-bensoyl derivative NH₂CO.NH.CO.C₂H₄.NO; [1:3]. Plates (Griess. B. 8, 222).

m-Amido-bensoylderivative C₂H₂N₃O₂.

Formed by boiling the preceding body with aqueous aumonium sulphide (G₂). Needles (from water), decomposing at 200°. — B'HOl aq: needles.—B',H,PtCl₂.

(8)-Naphthoylderivative

NH.CO.NH.CO.C_{1e}H., [215°]. Formed from naphthoyl chloride and urea (Vieth, A. 180, 319). Minute needles, m. sol. alcohol, v. sl. sol.

benzene.

Di-(Brnaphthoyl urea [286] (Ekstrand, B. 20, 1853). Needles.

Lactyl derivg tive v. Lactyl-urka.

Glycollyl derivative v. Hydantoïn.

Reference. - Oxy-urea.

UREA CARBOXYLIC ACID v. ALLOPHANIC

UREA CHLORIDES. A name sometimes ed to denote alkyl-carbamic chlorides nsed X.NH.CO.CI.

URECAITIN C28 II 42O8. Occurs, together with urechitoxin, in the leaves of Urechites subcrecta, growing in Jamaica (Bowrey, C. J. 33, 252). Crystallises from alcohol in needles (containing xaq), tastes bitter. It is very poisonous (Pr. 27, 309). Nearly insol. water, m. sol. ether. Appears to be a glucoside. Conc. H.SO, forms a yellow liquid, turning red, and . finally purple, especially in presence of an oxidising agent.

• Urechitoxin C₁₃H₂₀O₃. Bitter poison, split up by acids into sugar and urechitoxetin.

UREIDES. Compounds obtained by climination of water between urea and an acid or an aldehyde. Many of them may be represented as amides in which NII2 is replaced by NH.CO.NH2.

BIURET v. vol. i. p. 517. URETHANE v. CARBAMIO ETHER. ISURETINE v. FORMAMIDOXIM. URIC'ACID C,H,N,O, i.e.

CO NH.CO.C.NH CO (Medicus, A. 175, 243; Fischer, B. 17, 329, 1776). Mol. w. 168. S.G. 187. H.C.p. 461,400 (Berthelot, G. R. 110, 887; Matignoff, C. R. 110, 1267); 462,500 (Stohmann, J. pr. [2] 44, 590). H.C.v. 462,700 (M.). H.F. 148,100 (M.). S. 002 at 0°; 006 at 20°; 062 at 100° (Blarez a. Denigès, C. R. 104, 1847; cf. Gerrod, Pr. 35, 63).

Occurrence.-In urine and in ufinary calculi (Schoele, a.D. 1776; Liebig a. Wöhler, A. 26; 241; Horbaczowski, M. 12, 221). About 5g. is daily excreted in human urine. Uric acid occurs in urine of carrivora, herbivora (Mittelbach, H. 12, 463), and of birds. Serpent's urine is chiefly composed of acid ammonium urate. A considerable quantity occurs in the blood of A considerable quantity occurs in the blood or gouty subjects, and solidin urate is deposited as 'chalk-stones.' Very small quantities are normally present in the liver, lungs, brain, and blood. It occurs in the green gland of the fresh-water crayfish (Griffiths, Pr. 38, 187). Urea, glycocoll, leucine, and aspartic acid given to lowls appear in the urine as uric acid (Jane a.

Meyer, B. 10, 1930; Knierim, B. 10, 1930).

Synthesis.—1. By rapidly heating glycocoll (1 pt.) with urea (10 pts.) to 230° (Horbaczewski, B. 15, 2678; M. 3, 796; 6, 356).—2. By heating

ures with tri-chloro-lactic acid or its amide (Horbaczewski, M. 8, 201, 584).—3. By preparing methyl-uracil from acetoacetic ether and urea; converting methyl-uracil into nitro-uracil carboxylic acid by treatment with fuming HNO;; boiling the carboxylic acid with water, and reducing the resulting nitro-uracil to amido-uracil, and finally to isobarbituric acid by means of tin and HClAq; oxidising the isobarbituric acid to isodialuric acid; and heating the isodialuric acid 1801 acid (1 pt.) with urea (1 pt.) and H₂SO₄ (6 pts.) (Behrend a. Roosen, A. 251, 235).—4. By fusing urea (4 g.) with cyano acetic acid (1 g.) (Formánek, B. 24, 3419).

Preparation .- 1. Serpent urine is dissolved in boiling KOHAq, filtered, and the uric acid and by HCl or dilute H₂SO₄. If the uric acid is much coloured a little KMnO, or K,Cr,O, (Gibbs, Am. S. [2] 48, 215) should be added to the boiling alkaline solution before ppn.—2. Guano is boiled with borax (1 pt.) and water (120 pts.), and the solution of sodium urate thus obtained pd. by HCl.--3. Guano is extracted with dilute HClAq, and the residue dissolved in conc. H2SO4

and ppd. by water.

Properties .- White anhydrous scales When slowly deposited from dilute solutions (e.g. urine) it separates as large crystals (containing 2aq). Nearly insol. water, insol. alcohol and ether. Sol. conc. H.SO, and reppd. by water. Its solution in hot H.SO, deposits on cooling a deliquescent compound of uric acid with H₂SO₄. Uric acid is m. sol. glycerin, hot NaOAc, and sodium phosphate. Lithium carbonate (1 pt.) dissolved in water (90 pts.) can dissolve uric acid (4 pts.). Aqueous

K.CO, also dissolves uric acid.

Reactions .- 1. Decomposed by heat, without fusion, yielding HCy and a sublimate of evanuric acid, ammonium cyanate, urea, and ammonium carbonate, and leaving a carbonaceous residue. 2. Water at 180° forms mycomelic acid (Hlasigetz, A. 103, 211).—3. Potash-fusien yields NH, and potassium oxalate, carbonate, and cyanate. - 4. Chlorine and bromine in presence of water yield alloxan, urea, and parabanic acid (Hardy, A. Ch. [4] 2, 372). Alloxan is also produced by iodine, by HNO, and by MnO, and H.SO,.—5. Boiling with water and PbO, yields allantoin. Allantoin is also produced by ozone (Gorup-Besanez, A. 110, 94), alkaline K,FeCy, KMnO, (Claus, B. 7, 226), and MnO, and water. 6. Pure HNO, decomposes uric acid in the cold, with evolution of CO₂(14 vols.), N₂O (24 vols.), and nitrogen (4 vals.) (Franchimont, R. T. C. 6, 222). 7. KNO; and HOAc yield urinilio acid (Sokoloff, Z. [2] 5, 78) and stryphnic acid (Gibbs, Am. 3. [2] 48, 215).—8. HIAq at 165° forms glycocoll, MH,I, and CO; (Strecker, Z. [2] 4, 215).—9. Exposed to the air in alkaline solutionary yields exonic and uroxanic acids.—10. A dilute solution of sodic trate absorbs oxygen from the sir at 85° or some trate absorbs oxygen from the six at \$5^{\circ} according to the equation $O_1HN_0O_2^*+O_1+O_2H_2O_3$ (uroxanicacid). Usic acid in dilutional matches acid in completely decomposed by 35 days, digestion at \$5^{\circ} (Nenoki a. Sleber, J. pr. [3] \cdot 5, 18). 5 g. uric acid dissolved in 200 c.a. water and 20 g. potash disappeared in 5 days. However, if no oxygen be present the uric acid is not affected.—11. In fermenting urine uric

acid is completely split up into CO, and NH.

(Sestini, G. 20, 188).

Detection.—Uric acid may be recognised by its insolubility in water and HClAq, by its crystalline character under the microscope, and especially by the murexide reaction. When evaporated with HNO, on a water-bath it leaves an orange residue, which is coloured violet-red by ammonia and violet blue by potash. A solu-tion of uric acid in aqueous Na₂CO₂ produces a dark-brown spot of reduced silver when added to paper moistened with AgNO, (Schiff, A. 109, 65). Uric acid (1 mol.) reduces boiling Fehling's solution, ferming a pp. of Cu₂O (1 mol.) (W: Müller, J. Th. 1881, 73). In presence of KOH uric acid dissolves CuO, forming a blue solution, which slowly deposits white cuprous urate. The compound $C_5H_4N_4G_5Cu_2O$ is ppd. when an alkaline solution of uric acid is treated with Fehling's line solution of uric acid is treated with remning solution and hydroxylamine hydrochloride (Balke, J. pr. [2] 47,546). Uric acid evaporated with a little dilute HNO₂ gives a blue colour on shaking with H₂SO₄ and benzene containing thiophene (Denigès, J. Ph. [5] 18, 161).

Estimation in urine.—1. Urine (500 c.c.) is

concentrated, HCl is added, and after twenty-four hours the pp. is collected and weighed. Uric acid may be separated from xanthine by ppn. with cone. H.SO₄ (Horbaczewski, H. 18, 341; cf. Wulff, H. 17, 934).—2. Uwne (200 c.e.) is mixed with cone. Na₂CO₃Aq (10 v.e.), and after an hour cone. NH₂ClAq (20 c.e.) added. After forty sight hours than vir sullected washed forty-eight hours the pp. is collected, washed with HCl (1 pt. of S.G. 1-123), diluted with water (10 pts.), the washings allowed six hours to deposit any dissolved uric acid, the combined pps. washed with alcohol and dried at 110° (Salkowski, Fr. 16, 373). Uric acid may also be ppd. as ammonium urate by saturating urine with solid NH₄Cl (30 g. to 100 c.c.) (Hopkins, Pr. 52, 93).—3. Fresh urine is mixed with very dilute (15 p.c.) NaOHAq, filtered from phosphates, and diluted to S.G. 1.010. To 300 c.c. of this solution is added 50 c.c. of magnesia mixture [MgSO, 7aq (1 pt.), NH Ol (2 pts.), NH,Aq (4 pts. of S.G. 924), and water (8 pts.)]. The pp. is filtered off, and 175 c.c. of the filtrate hixed with 5 g. CaCO, and 5 c.c. of a 8 p.c. solution of AgNO. The pp. is washed and dried, and a nitrogen estimation made by Kjeland a mittogen estimation made by Mjedahl's method (Camerer, Z. B. 26, 84; cf. Salkowski, Pf. 5, 319).—4. Urine (25 c.c.) is mixed with NaHOO₂(1g.), and NH₂Aq (2 to 3 c.c.), and ammoniacal AgNo₂ (1 to 2 c.c. of a solution of 5 g. AgNO₂ in 100 c.c. water, to which NH₂Aq is added till the ppd. Ag₂O is just re-dissolved.

The UP. is collected washed discolved in HNO. The (pp. is collected, washed, dissolved in HNO, and the silver determined volumetrically by the sulphocyanide method (Haycraft, Fr. 25, 167; 80, 648). This method is liable, according to Salkowski (H. 14, 31) and Gossage (Pr. 44, 884), to appear on the property of the same of the s is partly due to variations in composition of the silver urate, and partly to presence of bodies of the xanthine group (Deroide, Bl. [8] 7, 863)

V. also Herrmann, H. 12,496; Ozapek, H. 12

502), 7-5. In a solution containing not more than 0125 p.c. of uric acid 1 c.c. of decinorfia permanganate is reduced by 0074 g. uric acid (Blarez a. Denigès, C.-R. 104, 789).—6. By treat

ment with a standard iodine solution in presence

ment with a standard iodine solution in presence of alkali (Kreidl, M. 14, 109).

Salts.—(NH₀)HA". S. 06 at 15°. Slender needles.—(NH₀)₁HA".—(NH₀)₂H₂A". (Maly, J. 1865, 621).—K₁A". S. 8 at 16°. Small needles.—KHA". S. 18 at 20°. Amorphous.—Na,A" aq. S. 15. blackening in light.

UROBILIN.

Occurrence.--Often in urine (Jaffé; Disqué,

ppd. by lead acetate and sub-acetate until the absorption band at F is removed. The yp. is extracted with alcohol, acidified with HCl or H₂SO₄, filtered, diluted with water, and extracted with chloroform.

Properties.-A red amorphous, shiny substance. Prepared as above it contains HCl or H.SO., as the case may be. Its spectrum exhibits a dark band at F, destroyed by NH, but on adding NaOH another band near the red is formed (MaoMunn, Pr. 80, 250; 81, 26, 206; v. also Hydrobhithuric, this vol. p. 278.

e. also hypeoblimusis, this vol. p. 273.

e Detection and estimation in urine: Jolles, H. 18, 545; Studensky, C. C. 1892, ii. 668.

UROCANIMIC ACID C₁₂H₁₂N₄O₄. [213°]. Occurs in dog's urine (Jaffé, B. 7, 1669; 8, 811).

Prisms (containing 4aq), v. sol. hot water, insol. alcohol and ether. Decomposed by fusion into CO₂ and urocanine C₁H₁,N₂O, an amorphous base yielding B'H₂PtCl₂.—HA'2HCl: needles, v. e. sol. water.—HA'2HNO₂: crystalline pp. insol. dilute HNO₂, v. sol. water.—HA'H₂SO₂. Minute needles and plates.

UROCHLORALIC ACID C.H., Cl.O. (?) [142°]. S. (ether) 4. Found in the urine after administration of childral (Von Mering a. Musculus, B. 8, 662; H. 6, 483; Külz, C. C. 1881, 486). Silky needles, v. c. sol. water and alcohol. Decomposed by boiling dilute II.SO, into tri-chloro-ethyl alcohol and glycuronto acid C.H., O, — NaA'.—RA'.—Bah',: satiny plates (from etheralcohol).

UROFUSCOHÆMATIN v. this vol. p. 274.

UROLEUCIC ACID CuH, Os. [133.5°]. An acid occurring in human urine which darkens on addition of alkalis (Kirk, Brit. Med. Journ. [1888] 2, 232) Crystals. Its solution is ppd. by Pb(OAc), and gives a transient green colour with very dilute FeCl. FeCl, colours the crystals relayed. tals rod.

UROMELANIN C18H19N,O16. A black substance which separates on treating urine with 11_SO, or HClAq in presence in air (Thudichum, $J.\ pr.\ 104,\ 257;\ C.\ R.\ 106,\ 1803;\ Plosz,\ H.\ 8, 89;\ Udranski,\ H.\ 11,\ 537;\ 12,\ 32;\ this vol.\ p. 274). It yields <math>C_{18}H_{46}AgN_{1}O_{6}$ (Thudwiffum).

URONITROTOLUOLIC ACID C, H15NO,. Oc. curs in urine of dogs after a dose of o-nitro-toluene (Jaffé, H. 2, 47). Very deliquescent. Asbestos like mass, v. e. sol. water and alcohol. Decomposed by dilute H₂SO, into o-nitro-benzyl alcohol and a syrupy acid. Salts. — BaA'z: crystalline powder, v. e. sol. water, insol. alcohol. -CO(NH₂)₂HA' 2 aq. [149°]. Needles, v. e. sol.

water, sl. sol. cold alcohol.
UROROSEIN v. this vol. p. 274.
UROSULPHINIC ACID C.H.N.SO...* Formed by heating thio-uramido-barbituric acid (1 pt.) with H.SO. (2 pts.) at 160° (Nencki, B. 4, 724;

to stand for most HClAq). Its K sait crystallises in needles, m. sol. cold water.

UROXANIC ACID C.H.,N.O... Formed by leaving a solution of uric acid (5 g.) in water (200 c.c.) containing KOH (20 g.) to stand for 5 days at 35°, neutralising by HOAc, filtering, and evaporating (Nencki a. Sieher, J. pr. [2] 24, 504; cf. Städeler, A. 78, 286; 80, 119; Streeker, A. 155, 177; Mulder, B. 8, 1291). Tetrahedra, sl. sel. cold water, insol. alcohol. Decomposed st. sol. cold water, insol. alcohol. Decomposed by boiling water into CO₂, urea, and allanturic acid.—K,A'\$3aq. Four-sided pearly plates, v. spl. hot water.—CaA'' 4aq.—BaA'' 5aq.—PbA'' 4aq. Insol. water.—Ag,A'': flocculent pp., turned red by light.

turned red by light.

URSONEO._{3.H.4.O.} 2aq. [265°] (Gintl, M. 14.

255). Occurs in the leaves of the red bear-berry
(Arctostsphylos Uva-ursi) (Trommsdorff, Ar. Ph.

[2]:80, 273; Hlasiwetz, J. pr. 68, 123). Needles,
hsol. water, acids, and alkalis, sl. sol. alcohol
and ether. Conc. H.SO, added to its solution
in Ac,O gives a red colour, changing through
hlus to green. Does not react with hydroxylshine. blue to green. Does not react with hydroxylamine or phenyl-hydrazine. Reduced by HI and P at 860° to O₁₂H₂₁ (256°-267°).

**Acetyl derivative [264°].

Bensoyl derivative [2149].

URUSHIO ACID C14H18O2. S.G. 25 985. Occurs in urushi or Japanese lacquer (Yoshida, S.G. 25 -985. 1 C. J. 43, 472). Dark, pasty mass, v. sol. benzene and ether, insol. water. Br in CS, forms C₁,H₁₂Br₂O₂. HNO₂ forms C₁,H₁₆(NO₂)₂O₂, which forms FeA'₂. Chromic acid mixture forms oxyurushio acid C₁₄H₁₈O₂.—PbA', (dried at 100°). [110°-115°]. Flocculent pp.—FeH₂A'₁₂ 2aq.—

FeH, A', Deep-black pp.

USNETIC ACID C, H₁₀O₂. [172°]. Occurs in small quantity, together with usene acid, in the lichen Usnea barbata (Hesse, B. 10, 1326). Flat prisms (from alcohol), v. sol. ether. FeCl. colours its alcoholic solution bluish-violet. Bleaching-powder does not colour its alkaline solution. Is perhaps identical with decarb-

USNIC ACID C₁₈H₁₆O, (Salkowski; Paterno) or C₁₈H₁₆O₆ (Hesse), or C₁₆H₁₆O, (Stenhouse a. Groves, C.J. 39, 234). Carbusnic acid. [195·4° cor.]. S. (ether) 3 at 20°. Occurs in the lichens Usnea barbata, Usnea florida, Leora sordida (Knop, A. 49, 103; Rochleder a. Heldt, A. 48, 12; Thomson, A. 53, 252; Stenhouse, Pr. 18, 222; A. 68, 97, 114; 155, 51; Hesse, A. 117, 843; Paterno, G. 8, 225; Salkowski, B. 8, 1459). Sulphur-yellow monoclinic crystals, sl. sol. alcohol, v. sol. hot ether and benzene. Does not yield betorcin when heated. Conc. H2SO, forms usnolic acid C_2 , $H_{21}O_{10}$ [213°] crystallising in small \sqrt{c} wish prisms (Stenhouse a. Groves, °C. J. 39, 236). When it is heated with an alcoholic solution of aniline it yields the anilide C₁₈H₁₈O₄(NHPh), crystallising from alcohol in pale-yellow plates [171°], and forming in KOHAq a yellow solution from which HCl ppts. C2H23NO. [171°].

Salts.—NaC₁₈H₁₇O₈ 2aq (Spica, G. 12, 432). Pale-yellow, silky needles.— KC₁₈H₁₈O₈ 3aq or KC18H17O 3aq. Pale-yellow plates (from 50 p.c. KC₁₈H₁₇O₅ oaq. Pale-yellow plates (from 50 p.c. alcohol) (Hesse, B. 10, 1325).—KC₁₈H₁₇O₅ aq or KC₁₈H₁₇O₄ aq. Yellow prisms (from 93 p.c. alcohol).—CuA'₂: green pp.

*Decarbusnein C₁₇H₁₈O₄. [175]. Formed by heating usnic acid (1 pt.) with alcohol (3½ pts.) at 150° (Paterno, G. 12, 234). Yellow, silky

needles, sol. hot alcohol, sl. sol. water and ether. Not coloured by FeCl. Not attacked by AcCl. Reduces warm ammoniacal AgNO. Boiling KOHAq in absence of air splits it up into HOAc and decarbusnic acid $C_{ls}H_{ls}O_{s}$, which crystallises from alcohol in lemon-yellow prisms [199] and yields, when boiled with Ac,0, two acetyl derivatives $C_{15}H_{15}ACO_{5}$ [148°] (isomeric with decarbuspein) and $C_{15}H_{15}ACO_{5}$ [181°].

Pyrouanic seid $C_{12}H_{10}O_{5}$ (P.); $C_{2}H_{2}O_{4}$ (Salkowski, B. 8, 1461). [197°]. Formed, together with pyrousnetic acid, by boiling usnic acid (2, the bound water (5 th

pts.) with KOH (5 pts.) and water (5 pts.) in an atmosphere of hydrogen (Paterno, G.S., \$13; 12; OXYLIC ACID.

242). Shining scales (from ether), v. sol. alcohol, sl. sol. ether. Its alkaline solution absorbs oxygen from the air, turning green and ultimately brown. Reduces ammoniacal AgNO, readily. Ac O yields an acetyl derivative [205°]. Alcohol and HCl form an ether [147°]. Pyrousnic acid is split up on dry distillation in a current of H into CO₂ and usneels C₁₁H₁₂O₃, which crystallises from alcohol in yellow pris-matic tablets [176°] and is converted by AcCl into a di-acetyl derivative [142°].

Pyrousnetic acid C_{1,}H_{1,}O₄ i.e. C_{1,}H_{1,1}O₄ (CO,H). [186°]. Formed by boiling usnic acid, (10 pts.) with KOH (25 pts.) and water (25 pts.) for 15 minutes (Paterno, G. 12, 238). Colourless plates or needles (from alcohol). Ac₂O yields C₁₄H₁₃AcO₂ [168°]. When heated in a current of H, pyrousnetic acid is split up into CO₂ and us netole C₁₅H₁₄O₄, which crystallises from dilute alcohol in yellowish needles [179°].

(β)-Usnic acid v. Cladonic acid.
UVIC ACID v. Pyrotritaric acid.

UVINONE $C_{1i}H_{12}O_{4}$ i.e., O < CMe: C.CO.C:CMe > O (?) [247°]. to the extent of 2 p.c., by distilling pyrotritaric acid (Dietrich a. Paal, B. 20, 1086). Yellow needles (by sublimation), sol. HOAq, v. sl. sol. alcohol. Conc. Haso, forms a solution with green fluorescence. Br at 100° Yorms crystal-

green fluorescence. Br 2t 100° forms crystal-line C.H.Br.,O...
UVITIC AICD C.H.,O., i.e.
C.H.Me(CO.H.),[1:3:5]. Mesidic acid. Mol. w.
180. [288°]. H.C.v. and p. 928,900. H.F.
193,100 (Stohmann, J. pr. [2] 40, 128). Formed,
together with uvitonic acid, by boiling pyruvic
acid with baryta-water (Finck, A. 122, 184).
Formed also by oxidation of mesitylene or mesitylenic acid (Fittig a. Von Furtenbach, Z. [2]
4, 1; A. 147, 295), by oxidation of di-methylcthyl-bengen (Wroblewsky, A. 192, 217), and thyl-benzene (Wroblewsky, A. 192, 217), and by heating L.H.Me(SO,NH.)(CO,H), with conc. HClAq at 230° (Hall a. Remsen, Am. 2, 136). Slender needles (from water), v. sl. sol. hot water, m. sol. alcohol and ether. Yields toluene on heating with soda-lime (Baeyer, Z. [2] 4, 119). The Ca salt heated with lime yields mtoluic acid (Böttinger a. Ramsay, A. 168, 255). Chromic acid mixture oxidises it to trimesic acid.

Salts.—K.A": plates (from alcohol), v. sol. water.—BaA" aq.—CaA" aq.—Ag₂A". Nearly insel. cold water.

Ethyl ether Et.A". [35°]. 'Crystakine. References.—Amido-, Bromo-, Nitro-, and OXY-INVITIO ACID.

Isouvitic acid v. CARBOXY-PHENYL-ACETIC ACID. Uvitonic acid v. Methyl-pyridine-dicarb-

idene di-ACETONAMINE.

WELERAL v. Valeric aldehyde.

VALERAL-DI-ACETONAMINE

v. Pentyl
Mktz, A. 90, 109; Parkinson, A. 90, 119). Formed also from thiorisovaleric aldehyde and VALERALDINE C14HaNS, Thiovaleraldine. dry NH, (Schröder, B. 4, 468), Plates (from ether), with powerful smell, sol. alcohol, insol. water. B'HCl. Needles, sol. water.

VALERCREATININ v. METHYL-GUANIDO-VALERIC ACID.

VALERIAN OIL. An essential oil obtained from the root of Valeriana officinalis. It contains a terpene $C_{10}H_{10}$ (156°) $[\alpha]_{D} = -21^{\circ}$, a camphene, borneol $C_{10}H_{10}$, O, di-bornyl oxide $(C_{10}H_{11})_{0}O$ (285°-290°), formyl-, acetyl-, and valeryl-borneol, and a little valeric acid (fierhardt, A. Ch. [3] 7, 275; Pierlot, A. Ch. [3] 56, 291; Bruylants, J. Ph. [4] 27, 349; B. 11, 452; Haller, C. R. 103, 151; Oliviero, C. R. 117, 1096).

1090).

n-VALERIC ACID $C_3H_{10}O_2$ i.e. $CH_{2}.CH_{2}.CH_{2}.CH_{2}.CO_2H$. Mpl. w. 102. (186° cor.). S.G. $\frac{9}{6}$ 9562 (Zander, A. 224, 65); $\frac{15}{6}$ 9446; $\frac{25}{6}$ 9375 (Perkin); $\frac{20}{6}$ 9298 (Brühl). C.E. (0°-10°) 00098 (Z.). S. 3·5 at 16°. S.V. 130·0 (Z.). M.M. 5·513 at 13·6°. $\mu_{\theta} = 1$ ·4093. $R_{\infty} = 43\cdot16$ (Brühl). H.F. 137,800 (Stohmann, $\frac{1}{2}$ ar [2] 49. 99). Occurs in early a word virous control of the second virous co J. pr. [2] 49, 99). Occurs in crude wood vinegar (Grodzki a. Krämer, B. 11, 1358).

Formation.—1. By saponifying its nitrile (nbutyl cyanide) (Lieben a. Rossi, A. 159, 58; G. 1, 239).—2. By oxidation of n-amyl alcohol (L. a. R.).-8. By the action of metallic silver on a mixture of E41 and 3-iodopropionic acid (W. von Schneider, Z., 2] 5, 343).—4. By oxidising a-oxy-n-caproic acid (Erlenmeyer, B. 9, 1840).—5. By heating \$\beta\$-acetyl-propionic acid with HI and P at 200° (Kehrer a. Tollens, A. 206, 233).—6. By reducing Bacetyl-propionic acid with sodium-amalgam (Wolff, A. 208, 110).—7. By heating an-propyl-malonic acid at 180° (Juslin, B. 17, 2504; Furth, M. 9, 308).—8. By fernentation of calcium lactate (Fitz, B. 13, 1309; 14, 1094). 9. By heating the lactone of γ -oxy-n-valeric acid with HIAq and P at 240° (Fittig, A. 226, 346).—10. A product of exidation of easter oil by dilute HNO, (Wahlforss, B. 22 Ref., 438).

Properties .- Liquid, smelling like butyric acid.

Salts.-KA'. Plates (from alcohol). Salts.—KA: rintes (from account).—

V. sol. water, alcohol, and ether.

Nitrile C.H. CN. n-Butyl cyanide. (140°). S.G. ² 816 (Lieben a. Rossi, A. 158, 171). Formed, together with amylamine, by allowing a mixture of hexoic amide (1 mol.) and bromine (2 mors.) to run into a 10 p.c. solution of NaOH

(Hofmann, B. 17, 1410).

Isovaleric acid. (CH₂), CH.CH₂, CO₂H. Isopropyl-acetic acid. (176° cor.). S.G. § 9386; § 93261 (Perkin); § 931 (E. a. H.). M.M. 5-635 at 16°. S. 4.24 at 20°.

Vapour tension: Richardson, C. J. 49, 767. Heat of neutralisation : Gal a. Werner, Bl. [2] 46, 801.

Occurs in the fat of Delphinum Phocana (Chevroul [1817], Corps gras, pp. 99, 209), in valerian cot (Grote B. J. 11, 225; Trommedorff a. Ettling, A. 4, 229; 6, 176), in the root of Angelica Archangelica (Moyer a. Zenner, A. 55, 828), in the root of Athamanta Oreoselinum, in the bark of the alder tree, in the herries and bark of the Guelder rose (Viburnum Opulus) (Moro, A.

55, 330), in the root of Viburnum prunifolium (Allen, Ph. [3] 11, 413), and in oil of geranium (O. Jacobsen, A. 157, 232). A valeric acid occurs in rosin cil (Lwoff, B. 20, 1017) and in yolk

of wool (suint) (Buisine, Bl. [2] 48, 639). Formation. -1. By exidation of inactive fermentation amyl alcohol (Dumas a. Stas, A. 38, 156; 35, 143; Erlenmeyer a. Helf, A. 100, 257; Pedler, C. J. 21, 74).—2. By boiling its nitrile with alcoholic potash (E. a. H.; Schmidt a. Sachtleben, A. 193, 87).—3. Together with the active acid by oxidation of leucine (amido-hexolo acid) (E. a. H., cf. Neubauer, A. 106, 50).—4. By heating sisopropyl-malonic acid at 180° (B. 11, 596).-5. By oxidising di-methyl-allyl-carbinol, treating the resulting CMe2(OH).CH2CO2H with HI, and reducing the β-iodo-valeric acid so formed by means of 3 p.c. sodium-amalgam applied in an acid solution (Schirokoff, J. pr. [2] 23, 286).—6. By the action of KOH or HClAq on Athamantin (Schnedermann a. Winckler, A. 51, 324) 47. By putrefactive fermentation of pro-terids (Hjenko, A. 63, 269).—8. By the action of CrO, on gelatin and albumen (Schlieper, A. 59, 7; Guckelberger, A. 64, 71). - 9. From isopropylaceto-acetic ether (Frankland a. Duppa, A. 145. 84).—10. By distilling isopropyl-malonic acid Conrad a. Bischoff, A. 204, 151).—11. A product of distillation of colophony (Renard, A. Ch.

[6] 1, 253). Preparation.-1. Isoamyl alcohol is oxidised by less than the calculated quantity of KMnO, in the cold. Some acetic acid is formed, but this can be got rid of by distribing a dilute solu-tion of the acids, for valeric acid passes over in the first quarter of the distillate, the acetic acid remaining behind (Duclaux, C. R. 105, 171).—2. By oxidising isoamyl alcohol (1,000 c.c.) with K₂Cr₂O₂ (1000 g.) dissolved in water (8,500 c.c.) by adding in the cold H₂SO₄ (1,400 g.) mixed with water (800 g.). The resulting isoamyl isovalerate is saponified by potash (Pierre a. Puchot, A. Ch. [4] 29, 229).—8. By

distilling valerian root with dilute phosphoric acid, neutralising the distillate with Na₂CO₂, and, decomposing the resulting Na salt by H₂SO₂. In purifying valeric acid use may be made of the fact that the acid forms crystalline acid salts with K and Na (Lesceut, Bl. [2] 27,

Properties .- Liquid, inactive to light. Its smell is powerful and unpleasant. «Sl. sol. water. Separated from aqueous solution by CaCl... Volatile with steam. Mixes with alcohol and ether. It is set free from its salts by mineral soids, by HOAc, by oxalic, tartaric, citric, and malic acids, but not by buttric acid. conc. valeric acid is added to a solution of cupric acetate, anhydrous cupric val rate separates in oily drops, which soon change to a greenish-blue crystalline powder of the hydrated salt; butyric scid would at once give a crystalline pp. (Larocque a. Huraut, J. Ph. [3] 9, 430).

Reactions.—1. Oxidised by thromic acid mixture at 20° to acetic acid and CO.—2. Boiling dilute HNO, forms nitro-valence acid, methyl-malic acid, and a little di-nitro-propane methyl-malic acid, and a little di-nitro-propane (when prepared from valerian) or di-nitro-butane (when prepared from isoamyl alcohol) (Bredt, B. 14, 1782; 15, 2319; cf. Dessaignes, A. 79, 874).—\$. Dilute alkaline KMnO, forms CMe₂(OH).CH₂.CO₂H.—4. Electrolysis of the K salt in 50nc. solution yields octane C₂H₄Pr₂ (Kolbe, A. 69, 259).—5. Passed through a red-hot tube it yields ethylene, propylene, butylene, and other hydrocarbons (Hofmann. C. J. 3. 121). and other hydrocarbons (Hofmann, C. J. 3, 121). 6. The Ca salt yields di-isobutyl ketone on distillation by itself, valeric aldehyde on distillation with calcium formate, and methyl isobutyl ketone on distillation with calcium acotate.

ketone on distillation with calcium acctate.

Aceto-valeric anhydride (C.H.O).OAc.

(147°-160°) (Autenrieth, B. 20, 3187).

Amide C.H., CONH., [128°] (Letts, B. 5, 669; Hofmann, B. 15, 982); [135°] (Schmidt a. Sachtleben, A. 193, 102). (231°). Silky plates, v. sol. water and alcohol.

Anilide C.H., CO.NHPh. [115°] (Chiozza, A. Gl. [3] 39, 201; Kelbe, B. 16, 1200; cf. Dumas, C. R. 25, 475, 658; Dessaignes, A. 68. 333). Sl. sol. hot water, v. sol. alcohol and ether.

Fr.CH.CN. Isobutyl cyanide. (129°) (R. Schiff, B. 19; 587). V.D. 289. Formed by hard Nitrile Mol. w. 83. S.G. 9 823. Pr.CH2.CN. ammonium valerate or valeramide with P.O. ammonum valerare or valeraming with P₂O₃ (Dumas, Malaguti a. Leblanc, C. R. 25, 358). Occurs among the products of oxidation of gelatin and case by chromic acid mixture (Schlieper, A. 59, 15; Guckelberger, A. 64, 72), of the action of chlorine on leucine (Schwanert, A. 102, 228), and of the action of conc. HNO, on castor oil (Hell a. Kitrosky, B. 24, 980). Formed also, together with valeramide, by heating valeric also, together with valeramue, by heating valera-toid with potassium sulphoryanide (Letts, B. 6, 669). It is also got by the action of cold Ac.0 on the oxim of valeric aldebyde (Dollfus, B. 25, 1915). Prepared by digesting isobutyl iodide with KCy and alcohol (Erlenmeyer a. Hell, 4. 160, 266). Liquid, smelling like almonds, dissolving in about four times its volume of water Sodium converts it, on heating, into cyanbutine C₁₂H₂₇N₃, crystallising in stellate groups of needles, which yield B'HCl and B'₂H₂PtCl₃, and is converted by nitrous acid into C18H2 (OH)N. [89°] (E. von Meyer, J. pr. [2] 37, 407).

Active valeric acid CHMeEt.CO,H. Methylethyl-acetic acid. Hydrotiglic acid. (177° i.V.). S.G. $\frac{34}{178}$ 938 (Saur). S.V. 129 1 (Lossen, A. 254, 60). Occurs in the essential oil from the fruit Angelica Archangelica (R. Müller, B. 14,

Formation.-1. By oxidation of isoamyl · alcohol .- 2. By reducing tiglic acid with HI and P (Schmidt a. Berendes, A. 191, 117).—8. By heating methyl-ethyl-malonic acid (Bischoff a. Conrad, A. 204, 151).—4. From methyl-ethylacetoacetic ether (Saur, A. 188, 257).—5. By feducing angelic acid (Schmidt, A. 208, 261).-6. By reducing bromo-hydro-tiglic acid (Pagen-Steeher, A. 195, 121).—7. By the action of NaOEt and Et on propionyl-propionic acid (Israel, A. 231, 219).—8. By oxidation of the corresponding aldehyde (Lieben a. Zeisel, M.

Properties .- The acid obtained by synthetic methods is inactive, but when obtained by oxidation of active amyl alcohol it is dextrorotatory, but is mixed with inactive isovaleric acid. By oxidation of an amyl alcohol [a] == acid. By oxightion or an amplification $|a_1\rangle = -4.4^\circ$ Guyes and Chavanne (C. R. 116, 1454) obtained a valeric acid (174°), $[a]_D = +13.6^\circ$, S.G. $\frac{23}{2}$ 938. By oxidation of an amplialcohol $[a]_D = -5.2^\circ$ at 22° Rogers (C. J. 63, 1130) got a valeric acid (175°), S.G. $\frac{23}{2}$ 936, $[a]_D = +13.9^\circ$ at 22°. Methyl-ethyl-acotic acid can be separated acting a solid through this rated from isopropyl-acetic acid through the greater solubility of its silver salt. Dilute KMnO, oxidises methyl-ethyl-acetic acid to CMeEt(OH).CO.H.

Salts.—CaA'₂5aq: needles. S. (of CaA'₂) l.—*BaA'₂: gummy mass.—ZnA'₂. Needles, ore sol. cold than hot water.—CuA'₂: bluish-'een, crystalline pp.—AgA': groups of needles. 1.13 at 20° (C. a. B.); 1.11 at 1° (Sedlitzky, r. 8, 568).

Ethyl ether EtA'. (133 5° i.V.). S.G.

Nitrile C.H., N. (125°). S.G. 2 8061. ormed by adding Na and EtI to a solution of cetonitrile in benzene (Hanriot a. Bouveault,

valerie in oeuzene arianriot a. Bouveault, l. [2] 51, 173). Liquid. Valerie acid CMe, CO.H. Tri-methyl-acetic cid, [35°]. (163.5° i.V.). S.G. 22 005. S. 2.2; 20°. Heat of neutralisation: Gala. Werner, l. 1914. 12, (2) 46, 801. Formed by heating its nitrile ith alcoholic potash or conc. HGlAq at 10° (Butleroff, A. 165, 322; 170, 151; 173, 355; 1. 5, 478). Formed also by action of CrO, on inacolin (Friedel a. Silva, B. 6, 146, 826) and n wi-methyl-pyruvic acid (Glücksmann, M. 10, 77). Monometric crystals. Does not yield a romo-derivative on heating with Br, either lone or in presence of P (Reformatzky, B. 23,

D90).
Salts.—NaA'&aq. Prisms, v. sol. water.—

with a solid salt, which dissolves up again on cooling.—PbA',--PbHA's: needles.—CuA'aq: greenish pp.—AgA'. S. 1·1 at 1°; 1·27 at 27°

(Stiasny, M. 12, 599).

Methylether MeA'. (101°) (Butleroff).

Ethylether Eth'. (118.5° i,V.). 9 .875.

Test-butyl ether C.H.A'. (135° i.V.).

Amyl ether CMe, CH.A'. (165°) (Tissier,
Bl. [2] 24, 589).

Chloride CMe, COCl. (106°).

Anhydride (CMe, CO).O. (190°).

Anide CMe, CO.NH₂. [154°]. (212°).

Formed by heating the aumonium salt in sealed tubes & 230° (Famchimont a. Klolbie, B. T. C. tubes at 230° (Franchimont a. Klobbie, R. T. C. 6, 238). Long needles. Decomposed by pure HNO, (S.G. 1-53) with evolution of N.O.

Methylamide CMe, CO.NHMe. 191°1. (204°).

Dimethylamide CMe_xCO.NMe_x. (186°). Ethylamide CMe_xCO.NHEt. [49°]. (204°). Diethylamide CMeg.CO.NEt_x. (203°). S.G. 15 ·891.

Nitrile CMesCN. Tert-butyl cyanide. [16°]. (106°). Formed, together with a polymeride (160°), by the action of tert-butyl iodide on dry potassio-mercuric cyanide below 5° (Butleroff, A. 170, 151; Freund a. Lenze, B. 23, 2806; 24, 2161). Crystalline mass with pungent smell. On heating with aniline hydrochloride it yields phenyl-valeramiame, which forms an oxalate [192°]. Hydroxylamine forms the amidoxim CMe, C(NH.): NOH [116°].

CH. CH. CH. CH. CHO. (103°) S.G. 11 819. Formed by distilling calcium n-valerate with calcium formate (Lieben a. Rossi, A. 159, 70; Zander, A. 224, 81).

Zanner, A. 224, 51).

Isovaleric aldehyde (CH₂),CH.CH₂.CHO.

Valeral. Mol. w. 86. (92·5°). S.G. 18 8041;
25 7921 (Perkin, C. J. 45, 477). µ_B 1·3934,

R. 40·66 (Brühl). V.D. 43·08 (calc. 43)
(Schröder, B. 4, 400, 468). S.V. 118·5. Formed by oxidation of isoamyl alcohol (Dumas a. Stas, A. Ch. [2] 73, 145; Parkinson, A. 90, 114; Kolbe a. Guthrie, A. 109, 296). Formed also by distilling calcium iso-valerate with calcium formate (Limpricht, A. 97, 370), by the distillanormate (LIMPPICEN, A. VI, 570), by the distillation of isovalerates (Chancel, A. 60, 318; Ebersbach, A. 106, 262; Schmidt, B. 5, 600), by oxidation of gluten (Keller, A. 72, 84) and castor oil (Arzbächer, A. 73, 202), and by the action of

SO, on leucine (Schwanert, A. 102, 226).

Properties.—Neutral oil, with pungent fruity odour. Polymerises on keeping. Mixes with alcohol and ether. On heating with ammonium sulphocyanide it yields a dark-red liquid, sol. alcohol ether, and HOAc (Brodsky, M. 8, 87). Alkaline sodium nitroprusside gives a violet-red colour, destroyed by HOAc (Von Petto, A. 267, 876). Combines with sodium bisulphite, form-

ing (O,H,₀O)NaHSO,
Reactions.—1. Readily oxidised to valerio
Reactions of the forms mono and dischloroacid.—2. Chlorine forms mono- and di-chloro-valeric aldehydes, and, at 140°, oily C.H., Cl.O. (204°), which is converted by alcoholic soda into C_1H_1 , C_1 , C_2 , C_3 , C_4 , C_5

valerate and other bodies (Fittig, A. 117, 68) .-6. Sodium-amalgam and water slowly form isoamyl alcohol (Wurtz, A. 134, 201).—7. Sodium isoamyl alcohol (Wurtz, A. 134, 201).—7. Sodium forms isoamyl alcohol, sodium valerate, decyl alcohol $C_{16}H_{12}O$ (203°), an oil $(C_{16}H_{13}O)_a$ (250°–290°), the compound $C_{16}H_{19}O_{1a}$, cand the acid $C_{16}H_{19}O_{2}$ (Borodin, Z. 1864, 553; E. 5, 480).—8. KOH at 0° produces an oily polymeride, lighter than water, not capable of combining with NaHSO, and yielding isovalgric aldehyde and the compounds $C_{16}H_{16}O$ and $C_{26}H_{26}O$, on distillation (Borodin, B. 6, 982). This polymeride, left in contact with Na₂CO₃Aq, 57ten forms needles of C₂₆H₁₆O, [70°2,—9. Heating forms needles of C₂₀H₁₂O₃ [70°] —9. Heating with KOH forms the aldehyda C₁₀H₁₈O and a compound C₂₀H₁₈O₃ (260°-290°). S.G. '90.— 10. Heating with sinc at 1806 forms decenoic aldehyde $C_{10}H_{11}O$ (190°), S.G. 2 862 (Riban, C. R. 75, 96; Kekulé, A. 162, 77) and other products.—I1. ZnEt, produces the oil $(C_{10}H_{11}O)$, in large quantity (Beilstein a. Rieth, A. 126, 242). ZnMe2 followed by water, forms methyl-isobutylcarbinol (Kuvsinoff, J. R. 1887, 204).—12. Dry carbinol (Kuvsinoii, J. H. 1881, 2041,—12. Dry K₂CO₂ at 50° forms an oily polymeride, which is reconverted at 180° into the aldehyde. Bodling with K₂CO₃ yields C₁₀H₁₀O (v. supra), C₂₀H₃₀O₂ (265°-270°), and C₁₃H₂₀O₂ (235°-240°) (Gass a. Hell, B. 8, 369).—13. Dry K₂CO₃ added to moist incovaluric additional forms efter some days isovaleric aldelyde forms, after some days, crystals of a polymeride [84°], which is reconverted at 108° into the original aldehyde. Converted 105° into the original aldenyde, (Bruylants, B. 8, 414).—14. PH, I forms a compound (C₂H₁₀O),PH₄I, crystallising from ether in plates [119°], converted by cold potash into (C₂H₁₀O),PH₂OH, crystallising in prisms [125°], insol. water (De Girard, A. Ch. [6] 2, 33; C. R. 94, 215).-15. On heating with hypophosphorous acid in an atmosphere of hydrogen the compound (C₂H₁₀O₃H₂PO₂ [160°] is formed. It yields BaA'₂aq (Ville, C. R. 109, 71).—16. AcCl at 100° combines, forming chloro-amyl acetate C,He.CHCl,OAc (Maxwell Simpson, Pr. 27, 120). 17. m.-mido-benzoic acid forms C₁₁H₁,NO₂ c. 430°].—18. Dry HCl forms (C₁H₁,CHCl)₂O (180°) (Bruylants, B. 8, 414).—19. Conc. NH₂Aq forms isovaleric aldehyde - ammonia C₂H₂.CH(NH₂)OH 7aq [58°] (Erdmann, A. 130, 211; Petersen, A. 132, 158; Ljubavin, B. 6, 1460). 1460), which yields, on allowing its alcoholic solution to stand, or on boiling with potash, the solution to stand, or on boiling with potash, the oily 'throxyamylamine' C₁H₃₃NO₃, fortaing B'HCl [113°] and B'₂H₄PtCl₃. AgNO₃ seacts with isovaleric aldehyde-ammonia, forming (C₂H₁₁N)₂AgNO₃ and (C₂H₁₁N)₃AgNO₃ (Goldschmidt, B. 11, 1200; Mixter, J. 1878, 438).—20. Alcoholic NH, at 150° forms valeritrine, hydrovaleritrine, and other bodies. Valeritrine, C. H. N. is a very notable liquid (250°. nydrovalentrine, and other bodies. Valeritrine C₁₂H₂₁N is a very unstable liquid (250°–260°), yielding B'HHgCl₂ [88°], B'₂H₄PtCl₄, and B'C₁H₂N or C₁H₃N is a liquid, yielding crystaline B'HCli₄, B. 2-87 at 22°, not melted at 180° (Ljubavin, B. 6, 565).—21. H₂S passed into an aqueous solution forms thiovaleric aldehyde CHS (69°) An isomerica (115°) is get to C.H., S [69°]. An isomeride (115°) is got, to-gether with a polymeride [94.5°], by heating gener with a polymeride [947], by heating isovalegit aldehyde with sulphur at 250° (Barbaglis, B. 18, 1574; 17, 2654; G. 11, 95; 16, 426).—22. CS, and NH_AAq form carbovaleraldine C, H_m, N_S, (Schröder, B. 4, 469; Mulder, A. 168, 237), which melts at 109°

(Guareschi, A. 222, 811).—28. NH_BGS.OEt and HCl form C₂H₁₆(NH.CS.OEt), [108°] (Bischoff, B. 7, 1078).—24. H₂Se passed into an agneous solution of valeric aldehyde forms C₄H₁₆Se [56:5°].—25. Acetons and dilute NaOH yield Pr.CH₂CH:CH:CC.CH₄ (180°) (Barbier a. Bou-

veaut, C. R. 118, 198).

O x im C.H., CH:NOH. Mol. w. 101. (163°).
S.G. ³⁰ *8934 (in vacuo): μ_D 1 *437 (Petraczek, B. 15, 829; Trapesonzánz, B. 26, 1428). It is a syn. oxim, because it yields valeronitrile when mixed with Ac,O and ether (Dollfus, B. 25, 1915).

Isovaleric orthaldehyde. Amylidene glycol. Acetyl derivative C, H, CH(OAc)2. (195°). Formed by heating isovaleric aldehyde with Ac.O at 200%

Bensoyl derivative C₄H₂.CH(OBz)₂. [111°]. (264°). Formed by heating the aldehyde with Bz₂O at 260° (Guthrie a. Kolbe, A. 109, 298).

Di-methyl ether C,H, CH(OMe), (124°). S.G. 10 .852. Formed from isovaleric aldehyde S.G. 12 852. Formed from isovaleric aldehyde (2 vols.), MeOH (5 vols.), and HOAc (1 vol.) (Alsberg, J. 1864, 486).

Di-ethyl ether C₄H_n.CH(OEt). (168°).

S.G. 12 835. Formed in like manner.

Di isoamyl ether C₄H₉CH(OC₅H₁₁)₂ (c. 248°). S.G. ² ·849. Ethyl isoamyl ether

C.H. CH(OEt)(OC, H.1). (c. 205°). S.G. 12 ·875. Formed by the action of Na on an ethereal solution of isovaleric ether (Greiner, Z. 1866,

Valeric aldehyde CHMeEt.CHO. Formed by reducing tiglic aldehyde with iron and HOAc (Herzig, M. 3, 123; Lieben a. Zeisel, M. 7, 56), and by warming CH.:CH.CHEt.OH with dilute (1 p.c.) H₂SO₄ (Kondakoff, J. R. 20,

154).
Valeric aldehyde CMe, CHO. [3°]. (75°).

sparks, v. Thalen (A. Ch. [4] 18, 243)

Historical.—In 1801 Del Rio announced the discovery of a new metal in a lead ore from Zimapan in Mexico (G. A. 71, 7); to this metal he gave the name erythronium, but at a later time he thought the metal was only impure chromium. In 1830 Sefström found a new element in the bar-iron and refinery slags where iron-ore from Taberg in Sweden was smelled (P. 21, 43); this element he called vanadium (from a Scandinavian deity Vanadis). In the same year (P. 21, 49) Wöhler found that the lead ore examined in 1801 by Del Rio contained lead vanadate; and he showed that the metal which Del Rio had called erythronium, and had then supposed to be impure chromium, was really wanadium. In 1831 Berzelius supposed he had prepared vanadium by heating an oxychloride in NH, and also by heating the highest oxide with K (P. 22, 1); but in 1867 Rescoe (T. 1863, 1; 1869, 879; v. also 1870, 317) showed that one of the substances which until then had been taken to be the element V was a nitride, and that another substance, taken to be V, was an orgice of this element. Roscoe obtained pure V by heating VCl₂ to redness for many hours in dry H. Roscoe was led to doubt the accuracy of the statement of the properties and at. w. of V that had been accepted on the authority of Berzelius, because he found that several compounds of V and Pb were isomorphous, but that, it was impossible to assign comparable formulato these compounds if the at. w. given by Berzelius for V were accepted (v. T. 1868. 1 et seq.).
Berzelius gave the value 68.5 to the at. w. of
V; he assigned the formula VO, VO, and VO,
(O, 8) to the three offles, and classed V with
Cr. Mo, and W. Roscoe's researches showed
that the at. w. of the metal is 51.2, that the
sxides are best represented as V,O, V,O, and
V,O, that the substance thought to be V,was it was impossible to assign comparable formula

really chiefly V₂O₂, that the compound supposed by Berzelius to be VCl₂ was VOCl₂ and that V must be classed with P and As.

Occurrence.—Small quantities of compounds of V are found fairly widely distributed; the element does not occur uncombined. The chief minerals that contain V compounds are mottramite (Cu-Pb vanadate), descloisite (Pb-Zn vanadate), dechenite (Pb-Zn-Cu vanadate), roscocite (Al vanadate with K silicate), vanadinite (vanadate of land with lead chloride), and some other minerals, which generally contain vanadates of Cu, Pb, Zn, or Ca, Small quantities of compounds of V are found in all pisolitic limonites (Böttger, C. C. 1873. 514), in some pitchblendes, clays, and basalts, and in a few other rocks. Compounds of V have also been found, in small quantities, in the slag from copworks (Karsten, P. 52, 629; Witz a. Osmond, Bl. [2] 88, 49); in many specimens of pig-iron (v. Riley, C. J. 17, 21; cf. Hodges, C. N. 26, 238; Walz, Am. Ch. 6, 453; in some meteorites (v. Apjohn, C. J. 27, 104); in contributed with a state of the contributed o in caustic soda and sedium phosphate (Schöne a. Rahmelsberg, B. B. 1864. 681; Donath, D. P. J. 240, 318); and according to Lockyer (Pr. 27, 279), probably in the sun.

Preparation.—1. From the refinery slag of the Taberg iron-ore. The finely-pow-dered slag is heated with KNO, and Na.CO, the fused substance is digested with boiling water, and solution of a salt of Ba or Pb is added to the filtered liquid; the ppd. Ba or Pb vanadate is decomposed by boiling with a slight excess of H2SO, Aq, and the solution is filtered from BaSO. or PbSO,; the filtrate is neutralised by NH,Aq and concentrated, and pieces of NH Cl are placed in the liquid until some NH Cl remains undissolved; the NH, VO, which is thus ppd. as a white crystalline powder is washed with conc. NH,ClAq, and then with alcohol, and is then decomposed by heating strongly in an open vessel, whereby V₂O₅ is produced (Berzelius, P. 22, 1). Wöhler (A. 78, 125) employed a very similar process for preparing V₂O₅ from timonite.—2. From vanadinite. L'Hôte (C. R. 101, 1151) recommends to mix finely-powdered vanadinite (approximately 3Pb, V₂O, PbCl₂) vanadinite (approximately 3Pb,V₂O₃.PbCl₂) with four times its weight of lampblack and a with four times its weight of imposes and a little oil, to heat strongly in a closed vessel, and then to heat to 300° in a stream of dry Cl, whereby VOCl, is formed, and distilled over into a cooled U-tube; other compounds of V are readily prepared from VOCl,—3. From the cobalt-ore of Mottram in Cheshire. This source of V compounds was discovered by Poscoe (v. C. J. [2], 6, 326). The Cheshire Keuper sandstone contains carbonates of Cu, carbonate of Pb and galena, black cobalt-ochre, fron oxides, and salts of As, Ag, Ma, and Ba. The compound of V was probably vanadinite.
The sandstone was crushed, and the metallic compounds were dissolved by HClAq; bleaching powder and milk of lime were added till the reaction was alkaline; and it was from the pp. thus obtained that Roscoe prapared a and its compounds. The lime pp. con-tained chiefly As, Cu, Fe, Pb, V, and Ca in combination with SO, and PO,; it was heated in a furnace with ground coal to remove As, then roasted with a quarter its weight of Na, CO,

and lixiviated with water; the solution was saturated with H.S and filtered, and H.S was boiled off; crude oxide of V was then ppd. by NH_Aq; the oxide was dried and heated with cone. HNO_Aq to oxidise it to vanadic acid, which was then boiled with saturated (NH_)_CO_Aq, and the somewliat soluble NH_ vanadate was crystallised from water, and then strongly heated in an open vessel; the V_O, thus obtained was suspended in water, into which NH, was passed; the solution of NH_ vanadate was filtered from silica, phosphates, &c__evaporated to dryness, and heated in an open vessel until V_O, remained.

The metal vanadium is paspared by reducing VCl₂ in H (for preparation of VCl₂ v. Vanadium disciplinations, p. 844). The process is conducted in perfectly pure and dry H; every trace of moisture and air must be excluded. The pure and dry H is passed for 12 hours through a porcelain tube, connected (by specially arranged paraffin-joints) by a glass tube, to the H apparatus; the VOl₂ is then placed in the porcelain tube (a special arrangement for loing this is desgribed by Roscoe), and H is passed through the apparatus for 6 hours. The porcelain tube is then gradually heated to full redness, and the passage of H is continued so long as HCl is given off, after which the tube is allowed to cool for several hours in the stream of H. The process occupies from 40 to 80 hours according as from 1 to 4 g. of VCl₂ are used. The V thus obtained contains traces of H and O. Reduction proceeds more quickly at a white heat, but the product is not so pure; it generally contains c. 95 to 96 p.c. V. (For details, and figures of the apparatus, v. Roscoe, T. 1869. 679; 1870. 317; or C. J. [2] 8, 344; 9, 23.)

Moissan (C. R. 116, 1225) obtained V containing from 17.5 to 25.7 p.c. C. by heating a minute of the contains trace of the contains trace of the contains trace of the contains trace.

a. Moissan (C. R. 116, 1226) obtained V containing from 17.5 to 25.7 p.c. C, by heating a mixture of C and one of the oxides of V in an electric furnace, using a current of 70 volts and 1,000 ampères; with a current of 70 volts and 850 ampères reduction proceeded very slowly.

Sio ampères reduction proceeded very slowly.

Vanadium, mixed with V₂O₃, was obtained by Roscoe (l.c.) by strongly heating a mixture of one of the chlorides of V with Na in an atmosphere of H, and lixiviating with water; the admixed black, powdery V₂O₃ can be removed from the heavier, grey, lustrous, metallic powder, by repeated washings with water, and a substance containing c. 91 p.c. V can be obtained.

The substance supposed by Berzelius (P. 22, 1) to be V, and obtained by heating V₂O₃ with K, was shown by Roscoe to consist chiefly of V₂O₄. The black powder which Uhrlaub (F. 108, 134) prepared by heating V oxychloride in NH₂, ar I which he supposed to be V, was found by Schafarik (W. A. B. 38, 5) to be VN₂ (cf. Roscoe, l.c.). Properties.—A light-grey, lustrous powder; under the microscope at 3 seen to be composed

Properties.—A light-grey, lustrous powder; under the microscope at 3 seen to be composed of crystalline, silver-white particles. Does not become coherent and dense when strongly compressed. S.G. 5.5 at 15°. Not magnetic. Is not oxidised in, air at the ordinary temperature, nor by moistening and then drying in vacuo. Has not been melted, except perhaps when reduced from the oxides by C in an electric furnace (v. Moissan, C. R. 116, 1225). When powdered V is thrown into a Bunsen flams it burns brilliantly; when strongly heated in O it forms

V₂O₂; and when slowly heated in air it perhaps forms V₂O, then V₂O₂, V₂O₄, and finally V₂O₂. Burns in Cl., forming VCl.; combines with N to form VN; also combines with N V is insoluble in HClAq; it dissolves in hot conc. H₂SO₄ and in HNO₂Aq. V dissolves in molten NaOH, giving off H, and forming st vanadate. V acts on glass vessels in which it is heated, forming a compound with Si; it also alloys with Ph(R₁, L₂C₄).

forming a compound with St.; it also alloys with Pt (R., I.c.).

The at. w. of V has been determined (1) by reducing V₂O₂ to V₂O₃ by heating in H (Berzelius, P. 22, 15 [1831]; Rossoe, T. 1868, 8); (2) by oxidising, V₂O₃ to V₂O₃ by HNO₃ (B., I.c. [1831]); (3) by analysing (V₂O₃)(SO₃)₂4H₂O (B., I.c., p. 18 [1831]); (4) by ppg. VOCl₃ by AgNO₂Aq, removing excess of Ag from the filtrate, evaporating to dryness, heating, affil weighing the V₂O₃ produced (B., I.c. [1831]); (5) by determining the weight of Ag required to ppt. the Cl from VOCl₃; also by weighing the AgCl ppd.; also by filtering from AgCl, evaporating, and weighing the V₂O₃ obtained (Roscoe, T. 1868, 23); (6) by determining V.D.s of, and analysing, VCl₄ and VOCl₃ (g. v.). The results obtained by Berzelius (with the necessary corrections on account of the wrong formulæ used by him; v. Roscoe, I.c.) gave values for at. w. of V varying from 49·3 to 52·5; Roscoe's values from the reduction of V₂O₃ to V₂O₃ varied from '51·13 to 51·55, and from the analyses of VOCl₃ from 50·32 to 51·877. The S.H. of V has not been determined.

S.H. of V has not been determined.

Vanadium is both metallic and non-metallic in its reactions. V₂O₄ interacts with attong acids to form divanadyl salts, V₂O₄(SO₄), &c.; hypovanadates V₂O₄(DM), are also derived from a hydrate of V₂O₄; V₂O₅ interacts with conc.

H.SO₄ to form V₂O₄, SSO₅ and V₂O₅2SO₂, xH₂O;

V₂O₅ also forms V₂O₅, H₂O (=HVO₂) and V₂O₅, 2H₂O (=HV₂O₂), which react as acids, and salts of the acid H₂VO₄ are also known;

V₂O₅ also combines with various acidic oxides (P₂O₅, MO₅, &c.) and basic oxides, to form complex, salt-like compounds. The sulphides of V dissolve in alkali sulphide solutions; several thiovanadates have been isolated, e.g. (NH₄)₄VS₄; and also thio-oxyvanadates, e.g. Na₄VS₂O. The haloid compounds of V are generally decomposed by water to oxyhaloid compounds.

Vanadium is placed in Group V., with N, P, As, Nb, Sb, Di, Er, Ta and Bi. V is the second member of the even series family of this group, the family consisting of N, V, Nb, Ta and an unknown element with an at. w. between those of Th (-232) and U (-239). Group V does not show a marked division into families; the gradation of properties from N to Bi is fairly regular, nevertheless the families (1) N and P, (2) W, Nb and Ta, (3) As, Sb and Bi are distinctly indicated. No hydrides of members of the vanadium family have been isolated with exptainty. The highest oxides, M₂O₃ are salforming; all of them interact with alkalis to form salts containing the elements M in the acidic radicles; V₂O₃ also forms basic salts (VO)₂R_p, with strong soids; normal salts have not been obtained by the reactions of M₁O₃ with acids. Oxyacids of V, viz. H7O₃ and H₁V₂O₃, have been isolated, but definite oxyacids of Nb and Ta are unknown. Both Nb and Ta form chlorides, corresponding with their highest

oxides M.O.; but the highest haloid compound ornose myo, we are migress matter compounds of V is VX, corresponding with V₂O, coxysholid compounds of V of the form of VX, exist (VOCl₂, VOBr₂) (v. Nitreger Group of Elements, vol. iii. p. 571).

In cognidering the relations between vanations of the constant of

dium and the elements of Group V., the position of V in series 4 must be taken into account: as compared with the elements that form series 3, in which series P is placed, the elements, of the vanadium series are metallic (V is preceded by Ti, Sc. Ca and K, and is followed by Cr. Mn. and the iron elements); the elements of the vanadium series are nearly as metaltic, and also as non-metallic, as Rb, Sr, Y, Nb, Mo, -, and the Ru metals, which elements form series 6, i.e. the niobium series. Hence V would be expected to be distinctly more like a metal, in its chemical relations, than P, and about equal to Nb in its metallic and non-metallic tendencies. As V is the second member of the even series family of Group V., it might be expected to resemble N, which is the first of the even series elements of this group; but it is to be remembered that the differences between the first and second even series members of the groups (i.e. the differences between Li and K, Be and Ca, B and Sc, C and Ti, N and V, O and Cr, F and Mn), become more marked in passing from Group I. to Group VII., and it is also to be remembered that the resemblances between the first even series members and the succeeding odd series members, become more marked as the atomic weights increase; F is more like Cl and Br than O is like S, Se, . and Te; but O resembles S, Se, and Te more than N resembles P, As, Sb, &c.; and C is more like Si, Ge, Sn; &c., than B is like Al, Ga, In, &c.; but C less resembles Si, &c., than N resembles P, &c.

Reactions and Combinations .- (Roscoe, T. 1869. 679; 1870. 317.) 1. Heated in air, V burns to V₂O₄; lower oxides are first formed if the temperature is low. - 2. Does not decompose water at 100° .- 3. Heated to redness in chlorine water at 100°.—8. Heated to redness in chloring burns to VCI,; heated in bromine produces VBr,; does not combine with iodine.—4. Heated with excess of sulphur, V forms V,S, (v. Kay, C. J. 37, 728).—5. Heating in a stream of pure nitrogen produces VN.—6. V combines directly with stition and also with flatinum.—7. Molten polash or sola dissolves V, forming an alkali vanadate and giving off H.—8. V dissolves in combination of the conc. sulphuric acid (? forming a vanadyl salt); also in nitric acid, probably forming a basic nitrate; also, slowly, in hydrofluoric acid (? forming VF.).

Detection and Estimation .- Small quantities of compounds of V give a colorrless borax of microcosmic salt bead in the outer flame, becoming green in the reducing flame; if much, V compound is present the bead is yellow in the blue; after reduction the solution bleaches indigo very rapidly, and soon absorbs O. Solutions of vanadates, either neutral or acidified by acetic acid, give finely-divided black pps. with tincture of calls, and the liquids appear like ink.

When an acidified solution of a vanadate is shaken with an ethereal solution of H₂O₂, the latter solution becomes dark red (Werther, J. pr. 88, 195).

Vanadium is generally estimated by convertvandum is generally estimated by converting it into an ammonium salt, strongly heating this in air, and either weighing the V₂O, thus produced or heating in H and weighing the V₂O₃ that remains. For a volumetric method of estimating V²v. Gerlach (B. 10, 1216).

Vanadium, acidə of, v. Vanadium oxfacids, and

SALTS AND DERIVATIVES THEREOF, p. 851.
Vanadium, bromides of. Only one bromide of V has been obtained.

VANADUM TIBERONIDE VBr., Mol. w. not known; from analogy of PBr., AsBr., &c., the formula VBr., is probably molecular. Formed by heating Vor-VN to redness in vapour of Br. Also by passing Br vapour over a mixture of Also by pussing Br vapour over a mixture of v_{2} 0, and C kept at a red heat; VOBr, is formed, then VOBr, and then VBr, sublimes (Roscoe, T. 1870. 317). Usocoe (L.c.) recommends to prepare VBr, by placing pure VN in a porcelain boat in a tube of hard glass, driving out all air by dry CO., then passing vapour of Br through the tube while that part where the boat is placed is heated to redness, when brown vapours are given off and condense on the cooler parts of the tube, and finally driving out all traces of Br by a stream of dry CO₂. VBr, is a greyish black, opaque, amorphous, very deliquescent solid; loses Br even in a sealed tube; heated gently for air gives V2O2, and at a higher temperature V2O3. Dissolves in water, without giving off any Br, forming a brown liquid which goes green on addition of a few drops of HClAq; this reaction is said by R. to be characteristic of a salt of V₂O₂.

Vanadium, chlorides of. Three chlorides have been isolated: VCl₂, VCl₃, and VCl₄, V burns when heated in Cl, forming VCl₄, and the other chlorides are formed by reducing VCl, by The V.D. of VCl, has been determined, and the formula VCl, is molecular; the formula VCl, is probably molecular, from the analogy of AsCl., PCl., BiCl., &c.; VCl., AsI., Pl. and BiCl. are the only haloid compounds of the form MX. that have been isolated in Group V.; the mol. w.s of these compounds have not been deter-

mined.

VANADIUM TETRACULORIDE VCI. 192'08. Prepared by Rosco (7. 1869. 601).

Formation.—1. V or VN is heated in Cl.—

The vapour of VOCl₁, mixed with excess of

Cl, is passed slowly over a long layer of sugar-

charcoal heated to redness.

Preparation.—VN is heated to redness in a tube of hard glass, in a current of pure, dry Cl, which must be free from air. The first few drops of distillate are rejected, as they contain traces of VOCl, formed from traces of oxide in the nitride used. Elife dark-red liquid that is formed is saturated with dry Cl, then heated for some hours in a current of elry CO, in a vessel to the containing the property of the proper connected with an upright condenser, and then

fractionated.

Properties and Reactions.—A thick, dark, brownish red liquid; boils at 154° under 760 mm. pressure. •S.G. 18584 at 0°, 18868 at 8°, 18159 at 30°. V.D. 98°1 at c. 200°. Does not solidify at any temperature above -- 18°. Slowly decomposes to VCl, and Cl at ordinary tempera-

tures, more quickly when exposed to light, and rapidly when heated. Gives off white fumes in the air. Dissolves in water, forming a blue solution, which does not bleach; this solution is oxidised by KMnO,Aq to HClAq and V,O,Aq. 2VCl, taking up O. Reacts violently with alsohol and ether, torming deep-boloured liquids. When heated with Br in a sealed tube, VCl, is formed. VCl, does not combine with Cl to form a higher chloride. H2S reacts with VGI, to form

a higher chloride. H₂S reacts with VGl₄ to form VCl₂, HCl, and S (Kay, C. J. 38, 736).
VANDIUM TRICHLORIDE VCl₂. Mol. 4v. not determined, but formula is probably molecular from analogy of PCl₃. AsCl₃. &t. Prepared by heating VCl₄ in a retort as leng as Cl is given off, and heating the residual solid to 160° in a stream of dry CO₂ (Roscoe, T. 1869, 691). Also by heating pure V₂s, in a stream of dry, air-free Cl, separating S₂Cl₂ by repeatedly distilling the liquid product, and heating the residue at 140° in dry CO₂ to remove the last traces of S Cl. in dry CO₂ to remove the last traces of S₂Cl₂ (Halberstadt, B. fo, 1619). Lustrous, peach-blossom coloured tablets, resembling CrCl₂; S.G. 8.0 at 18°. Deliquesces very rapidly in air to a brown liquid, which goes green on addition of a drop or two of HClAq; this solution is oxidised by KMO,Aq, 2VCl, taking up 2O, to HClAq and V₂O₂Aq. Soluble in alcohol and in ether. Heated in air forms V₂O₃. Heated in H is re-

duced to YCl, and then, gradually, to V.

VANADIUM DICHLORIDE VCl.. Mol. w. not known. Formula possibly V.Cl.. Prepared by passing vapour of VCl., mixed with a large excess of pure, dry H, through a glass tube heated to dull redness. The distillation of VCl. should be slow, and the mixture of vapour of VCl4 and H should be brought at once into the heated part of the tube. Forms applie-green, micaceous, hexagonal plates; S.G. 3·23 at 18° ; very hygroscopic. Dissolves in water, forming a violet solution, which bleaches indigo and litmus, and reacts as a solution of a salt of V_2O_2 . Dissolves in alcohol and in ether. The solution in water is oxidised by KMnO₄Aq to HClAq and V₂O₄Aq, 2VCl₄ taking up 30. Heated in H, is slowly reduced to V; heating to whiteness in

NH, produces VN (Roscoe, l.c.).

Vanadium, ferrocyanide of, v. vol. ii. p. 837. Vanadium, fluorides of. Only one fluoride, VF, has been isolated; there are indications of the existence of a higher fluoride in solutions in conc. HFAq.

VANADIUM TRIFLUORIDE VF. 3H2O. Mol. w. not known; formula probably molecular, from analogy of tritalides of other elements of Group V. Prepared by evaporating a solution of V₂O₂ in HFAQ at 100°, and crystallising from water containing a little HFAQ. A white cryswater containing a name rinay. A wince cays-talline crust, consisting of rhombohedra. Easily soluble in water; solution reacts acid. Insoluble in cone alouhol. Efforesces in air; loses some water at 100°, and all at 130°, with absorption of O; V₂O₃ is formed on heating to redness in air. An aqueous solution reduces Ag salts to Ag, Hg and Cu selts to mercurous and cuprous Ag, Hg and Cu sens to mercurous and cuprous salts; alralis or alkali carbonates ppt. V₂O₂xH₂O from VF₂Aq (E. Petersen, J. pr. [2] 40, 44).

Vanadofluorides. (Fluovariadites.) A number of compounds of the forms VF₂xM²F.

and VF₂.xM¹¹F₂ were obtained by Petersen (l.c.) by adding various fluorides to solutions of V₂O₂.

in HFAq, and crystallising. These salts are generally greenish coloured, and crystalline; most of them are soluble in water, but not in KFAq; they lose water of crystallisation from 100° to 200°. The vanadofluorides may be regarded as salts of hypothetical acids HVF., regarded as saits of hypothetical adus 1.74., H₁VF₈, and H₂VF₈; they may also be formulated as double saits (g. supra). The following saits are described by Fetersen (l.c.):
. Commonium canadoftuorides NH₄VF₄.2aq,

(NH₁)₂VF₃. aq, and (NH₁)₂VF₃.

Cadmium vanadofiuoride CdVF. 7aq (Piccini a. Giorgis, G. 22 [1] 55).

Cobalt vanadofluoride CoVF , 7aq. Nickel vanadoftuoride NiVF, 7aq.

Potassium vanadoftuoride K,VF, aq

Sodium vanadoftuoride Na,V,F,1, aq

2VF,5NaF, aq (7 Na,VF, aq).

Zino vanadoftuoride ZnVF, 7aq (P. a. G.,

l.c.).
Vanadoxyfluorides. (Fluoxyvanadates.) These salts are generally produced by dissolving V₂O₂ in HFAq, adding metallic fluorides, and crystallising; also by dissolving V₂O₃ in solutions of metallic fluorides, and crystallising; some of them are obtained by treating solutions of V2Os in metallic fluoride solutions with reducing agents, and then crystallising. vanadoxyfluorides have been examined by Baker (C. J. 33, 388 [1878]), Ditte (C. R. 105, 1067; 106, 270 [1888]), Piccini a. Giorgis (G. 18, 186 [1889]; G. 22 [1] 55 [1892]), and Petersen (B. 21, 3257 [1888]; more fully in J. pr. [2] 40, 193, 271 [1890]). There are still considerable discrepancies between the results obtained by the different observers. For a criticism of Baker's results v. Petersen (J. pr. [2] 40, 289-92). The vanadoxyfluorides belong to two main classes: (1) those obtained by dissolving Voo, in HFAq, adding a fluoride (or carbonate), and crystaldissolving V_2O_3 in solutions of fluorides, and crystallising; (2) those obtained by partially reducing solutions of V_2O_3 in HFAq, then adding fluorides, and crystallising. The first class of salts may be divided into (i.) those wherein one atom of O in V2Os is substituted by 2F, and which, therefore, are represented as xMF.yVO.F $(V_2O_3, gives \ V_2O_4F_2=2VO_2F)$; and (ii.) those wherein 30 in V_2O_3 is substituted by 6F, and which, therefore, are represented as xMF,yVOF, (V₂O₃ gives V₂O₂F₅=2VOF₃). Salts of the second class are regarded as compounds of MF with VOF2, and VOF2 is looked on as obtained vor, and vor, is looked on as obtained by substituting 20 in V₂O₄ by 4F (V₂O₄ gives V₂O₅F₄=2VOF₂). The salts derived from V₂O₄ i.e. xMF.yVO₅F and xMF.yVOF₈, are often called fluorythroadates, and those derived from V₂O₄ and xMF.yVOF₈ are often called fluorythroadates. V₂O₄, i.e. cMF₂VOF₂, are often called fluory hypovanadates; the former class of salts will here be called vanadoxyfluorides, and the latter hyprbanadoxyfluorides.

Ammonium vanadoxyfluorides. Three salts are described by Baker (C. J. 38, 388 [1878]), and also by Piccini a. Giorgis (G. 22 [1] 55, [1892]; the formulæ given by the different experimenters do not agree.

Lamellar summonium vanadoxystuoride.

This salt was obtained by Baker by dissolving V₂O₂ in NH₄HF₂Aq, and then odding more NH₄HF₂; it separates in small yellow, pearly.

hexagonal plates. P. a. G. obtained the sait by dissolving V₂O₂ in a slight excess of HFAq, adding NH₂F in the ratio 3NH₂F:2V₂O₃, and evaporating. B. gives the formula 6NH₂F.V₂O₄F. If both formula are expressed as 3NH₂F:2VO₂F, then x=13 in Baker's formula and =2 in the formula of P. a. G. A sait obtained by Petersen (J. pr. [2] 40, 193, 271 [1890]), by a similar process to those used by B. and by P. a. G., was formulated by him as 7NH₂F.4VO₂F.HF.

Pyramidal ammontum vanadoxyfluoride. Obtained by Baker by adding NH, HF, to a solution of the lamellar salt; P. a. G. prapared the salt by dissolving V₂O₅ in excess of HFAq, and exactly neutralising the hot solution by NH₂Aq. This salt crystallises in yellow, simple pyramids (Baker). The formula assigned by B. is 12NH,F.V.O.,EVOF., while that given by P. a. G. is 3NH,E.VO.F.; Petersen gives the same formula as P. a. G. If Baker's formula is expressed as 3NH,F.VO.F., x must be put = 13,

and $y = 1\frac{1}{2}$.

Acicular ammoniumvanadoxyfluoride. Baker obtained this salt by dissolving the pyramidal salt in warm HFAq and allowing to cool; P. a. G. prepared it by a similar reaction. This salt crystallises in pale-yellow acicular prisms; when dry it has the odour of HF; it acts on glass. The formula given by P. a. G. is SNH, F.2VOF, ad; Baker assigned to this salt the formula SNH, HF, 2VOF, but his analyses were, admittedly, not very trustworthy.

Adopting the formulæ given by P. a. G. for

the three ammonium vanadoxyfluorides, these salts are represented as

(1) 3NH₄F.2VO₄F = (NH₄)₃V₂O₄F₅ (2) 3NH₄F.VO₂F = (NH₄)₃V₂O₄F₄ (3) 3NH₄F.2VOF₅ = (NH₄)₃V₂O₄F₉.

A few of the other vanadoxytluorides seem to belong to one or other of these types; P.a.G. and also Petersen, describe a potassium vanadoxy-fluoride $8KF.2VO_aF = K_aV_aO_aF$, belonging to the same form as the lamellar ammonium salt. But most of the vanadoxyfluorides described belong to forms which are not represented by the ammonium salts. The following are the principal salts :-

Ammonium salts. 9NH,F.5VOF,3HF; 7NH,F.4VOF,HF (Petersen).

**NH. A. VOT., HF (received).

**Potassium salts 2RF.VO,F; 2RF.VOF;

8KF.2VOF, HF; 4KF.VF, VOF, (P.).

**Sodium salt 3NaF.VOF, VOF, a.] (P.).

Zinc salts. ZnF2.VO,F. 7aq (P. a. G.);

ZnF₂.ZnO.2VOF₃. 14aq (B.). In none of these compounds does the atomic ratio of V to O exceed 1:2. According to Ditte (C. R. 105, 1067; 106, 270 [1889]), many compounds of alkali fluorides with V₂O₃ are formed by heating the constituents together, digesting by heating the constituents together, digesting with water, and crystallising; the atomic fatio of V to O in these compounds, as given by Ditte, is 2:5. The formulæ assigned to the compounds may be generalised & xV₀, yMF; M = K or N₀, x=1,3, and 4, and y + 1,2,4, and 8. Ditte (l.c.) says that crystals of V₀,4NH,F.4aq are obtained by dissolving V₀, in hot cone. NH, Maq, and that this compound is formed, along with V₀O,8NH,F.4aq, when V₂O, is dissolved in cold

cone. NH,FAq; but the experiments of Baker, Piccini a. Giorgis, and Petersen, all agree in assigning to the compounds formed in these reactions, formulæ wherein the atomic ratio of V to O does not exceed 1:2.

Hypovanadoxyfiuorides. (Fluoxyhypovanadates.) These compounds are formed by partially reducing mixtures of V₂O₂ and fluorides, or carbonates, dissolved in HFAq. If sufficient the F is assigned to the metal present to form the normal fluoride, then the atomic ratio of V to the remaining F in these compounds is 1:2, and

the remaining F in these compounds is 1:2, and that of V to O is 1:1; the formulæ are written xMF.yVoF.

All the salts described by Baker and Piccini a. Giorgis, except one, belong to the form 2MF.VOF.

The salt of the formulæ may evidently be yritten M. (orM!)VOF.

Ammonium hipporanadoxy/tuoride

2NH.F.VOF., aq(*= (NH.).2VOF., aq) was propared by Baker (C. J. 33, 395) by passing H.S into a solution of V.O.; in HFAq. concentrating, filtering, and adding NH.F. The same salt was prepared by Piccini a. Giorgis (C. 22 | 1) 55) by electrolytically reducing a solution of NH.YO, in HFAq, after adding NH.F.; also by reducing NH.YO, in HFAq, after adding NH.F.; also by reducing NH.YO, in HFAq, and HFAq, and cutralising by NH.Aq, and HFAq by SO₂Aq, neutralising by NH₂Aq, and adding NH₃F; and in each case dissolving the crystals that were formed (said by P. a. G. to be 3NH,F.VOF2) in hot HFAq, and crystallising. Petersen (J. pr. [2] 40, 196) also obtained this salt. The salt crystallises in clear blue monoclinic forms; a:b = 9653:1 (Baker, l.c.).

Petersen (J. pr. [2] 40, 197) described two other ammonium hypovanadoxyfluorides,

7NH,F.4VOF, 5aq and 3NH,F.VOF '7NH_kF.4VOF_x-faq and 3NH_kF.VOF_x.

The other hypovanudoxyfluorides described by P. a. G. (i.c.) are 2KF.VOF_x and MF_x-VOF_x 2aq where M = Cd, Co, Ni and Zn. The K salt was prepared by reducing V₂O_s in HFAq by SO_xAq and adding KF; the other salts by dissolving MO, or MCO_s, along with V₂O_s in HFAq, and reducing electrolytically. According to Petersen (i.c. pp. 199, 200), the salts 7KF.3VOF_x and SNaF.3VOF_x 2aq also exist.

P. a. G. (i.c.) remark that the tendency to form highly fluorinated compounds increases in

form highly fluorinated compounds increases in the family V, Nb, Ta as the atomic weight inthe tanniy V, No, Ia as the atomic weight increases; thus, VO₂F is not affected by a little HFAq, while Nb₂OF forms NbOF₃, and TaOF₄ is converted into TaF₅. They also point out that the three compounds, ZnF₂,VO₂F. 7aq, and ZnF₂,VF₃, 7aq, all crystallise with the same number of molecules of water, all contain the same number of atoms, have the same crystalline form, and are geometrically iso-

morphous.

VANADUM PENTAPLUONDE VF. According to
Petersen (J. pr. (2) 40, 271), this compound
exists in a solution of V.O. in conc. HFAq. No compound was isolated, nor is any trustworthy evidence given of the existence of VF, in solution.

Vanadium, haloid compounds of. When V is heated in excess of Cl the tetrachloride VCl. is produced; heating in Br produces the trifromide VBr., V does not sombine with I. The haloid compounds of V belong to the forms VX., VX., and VX.; X = Cl in each case, X = Br or F in the one case of VX. The formula VX. is molecular; the other formulæ are probably molecular. VCl. BiCl., AsI, and PI, are the

only dihalides known of members of Group V. Attempts to prepare halides higher than VX, have failed. Solutions in water of the haloid compounds of V behave like solutions of the corresponding oxides in haloid acods; VCl.Aq like corresponding oxides in hatch away vol. Aq like a solution of v.O. in HClAq, VX.Aq like a solution of v.O. in HXAq, and VOL.Aq like a solution of v.O. in HClAq. VCl. is decomposed by heat to VCl. and Cl. and heating VOl. with H produces VCl. VF. combines with metallic fluorides to form vanadofluorides, man v of which fluorides to form vanadoftuorides, finany of which belong to the form Mr₂VF₂ or. Mr¹VF₃ (v. p. 844). Several oxychlorides and oxybromides of V have been isolated: VOX₃ and VOX₂, where X = Cl or Br; also VOCl, Vo₂U₁, and VO₂Cl; the existence of other oxybromides also is probable. No oxyfluoride has been isolated with certainty. But many compounds exist which may be regarded as containing the oxyfluorides VO₂F, VOF₃, and VOF₂ respectively; the compounds VO₂F.xMF and VOF₃.xMF are obtained by dissolving V₂O₂ and fluorides in HFAq and crystallising; they are described as vanadoxyfluorides (p. 844); the compounds VOF₂xMF are obtained by partially reducing solutions of V₂O₃ and fluorides in HFAq, they are described as hypovanadoxyfluorides (p. 845).

Vanadium, iodides of. No iodide of V has been isolated. No reaction occurs when vapour of I is passed over VN heated to redness, nor do I and $V_{\bullet}O_{\bullet}$, react at any temperature (Roscoe, C. J. [2] 9, 28). I does not react with $V_{\bullet}O_{\bullet}$ when digested therewith for a long time in presence of water or alcohol (Guyard, Bl. [2] 25,

Vanadium, nitrides of. V and N combine directly. Two nitrides are known.

Vanadium mononitride VN. Mol. w. not

known. Obtained by heating V in a stream of pure N; also by saturating VOCl, with dry NH., and heating to full whiteness in a stream of white heat in a stream of NH_s. Better prepared by heating NH_qVO_s in the air, and then heating the residue to a full white heat in a stream of dry NH_q (Roscoe, C. J. [2] 8, 844). VN may also be prepared by heating V_qO_s to whiteness in NH_s (R., l.c.). VN is a greyish-brown, metal-like powder; heated in

a greysan-prown, metal-like powder; heated in air it is oxidised to V₂O₂ and then to V₂O₂; heated with soda-lime it gives off NII,.

VANADIUM DINTIRIDE VN... A black powder; exposed to air gives off NII, and is oxidised. Prepared by saturating VOCl₂ with dry NII, heating the solid so obtained in a glass tube distribution. long as NH₂G sublimes, washing the residue with water containing a little NH₃, and drying in vacuo over H₂SO₂ (Roscoe, C. J. [2] 6, 349); examined by Unrlaub, who did not succeed in

examined by Unriaub, who did not succeed in determining its composition (P. 103, 184; cf. Schafarik, W. A. B. 33, 5).

Vanadium, oxides and hydrated pages of. By gently heating V in air the oxide V₂O₂ is possibly farmed, and, off continued heating, oxidation proceeds to V₂O₃, V₂O₃, V₂O₄, and finally V₂O₅. The oxides V₂O₄, V₂O₅, and V₂O₂ are also formed by reducing V₂O₄ by heating with Hor K. Saverel oxides intermediate held. with H or K. Several oxides intermediate between, F.O. and V.O. seem also to exist. The oxides V.O., V.O., V.O., and V.O. are feebly basic; V.O. and V.O. are also be dide. The oxides of V correspond in composition with the oxides of N; corresponding oxides of Bi

are known. The names generally given to the oxides of V do not, unfortunately, tally with the oxides of v do not, unto tamasely, sany wan the names given to the corresponding oxides of N; thus, V₂O₂ is generally called hypovanadous oxide, while NO is called nitric oxide; V₂O₃ is called variadic oxide, while the name nitrogen peroxide is often quite wrongly applied to NO.

The mol. w. of none of the oxides of V is known.

? Vanadium monoxide (? V₂O). When the
powdered metal is ... slowly heated in a powdered metal is ... slowly heated in a current of air it glows brightly, with absorption of oxygen, forming in the first place a brown oxide (V₂O or V₂O₂); and on further heating this oxide again glows, and passes through the black trioxide and blue tetroxide to pentoxide' (Roscoe, C. J. [2] 8, 357). This statement seems to contain all that is known of an oxide lower than V.O.

than V_2O_2 .

VANADIUM DIOXIDE V_2O_2 . (Hypovanadous oxide.) This substance was supposed by Berzelius (P. 22, 1) to be V; Roscoe (T. 1868. 1) proved it to be an oxide with the atomic ratio V:O=1:1. The mol. w. is not known; the formula is generally written V_1O_2 rather than V_2O_3 at the double formula is on the whole VO, as the double formula is, on the whole, more in keeping with the reactions of the compound.

Formation.—1. By heating one of the higher oxides with K (Berzelius, l.c.).—2. By passing vapour of VOCl₃, mixed with much dry H, over red-hot charcoal (Schafarik, A. 109, 85).—3. By strongly heating V₂O₃, and V₂O₄, mixed in the ratio V₂O₄:V₂O₅, out of contact with air (Petersen, J. pr. [2] 40, 193).

Preparation.—A mixture of much dry H and vapour of VOCl. (a. p. 854) is passed through

vapour of VOCl₃ (q. v. p. 854) is passed through

a hard glass tube containing powdered charcoal and kept red hot. Some solid oxychlorides are deposited on the cooler parts of the tube, while the V₂O₂ remains mixed with the C. The contents of the tube are then strongly heated in a current of dry H to remove traces of Cl comrated from the C (Roscoe, C. J. [2] 6, 334). When Zn, Cd, or Na-amalgam is added to a solution of V2O, in H2SO, Aq (prepared by dissolving the oxide in hot conc. acid and diluting with 50 pts. water), the liquid becomes blue, green, and finally lavender. The lavender solution absorbs O very rapidly; exposure to the air for a few seconds causes the colour to change to deep chocolate-brown. By determining the quantity of standardised KMnO, Aq decolourised by the lavender solution, Roscoe (C. J. [2] 6, 834 proved that this solution contained V.O. probably combined with SO. After passing air into the lavender solution until it becomes air into the lavender solution until it necomes permshently blue, the solution contains V_{\bullet} ; if the free acid in the lavender solution is neutralised by zino, and the liquid is then exposed to the air until permanently brown, and slittle acid is then added, a green solution is forthed which contains V_{\bullet} (R. 1.c.).

December and Reactions.—A light-grey.

rommed which contains v_*O_* (K., i.e.).

Properties and Reactions. — A light-grey, lustrous powder; or a lustrous, metal-like, crystalline crust, S.c. 8:64; very brittle; fuses at a very high temperature. eHeated to redness in sir, V₂O₂ burns to V₂O₂; heated in O, burns to V₂O₂. Insoluble in water; disolves in dilute acids, giving a lavender solution, which bleaches strongly: from these solutions KOHAs at strongly; from these solutions KOHAq of

NH,Aq ppts, a brown ayarared oxide, which rapidly oxidises (Brierley, C. J. 49, 824). According to Petersen (J. pr. [2] 40, 194), V,O, dissolves in HFAq, and on evaporation, solution of the residue in water, and evaporation over the ThSO, blue, microscopic crystals are ebtained, which are perhaps, VOF, zaq; no analyses were made. Addition of alkali fluorides to V,O, in HFAq produces various compounds of the form xVOF ... WHY (v. HYPOYANADOXYFLUORIDES, p.

845).

HYDBATE OF VANADIUM DIOXIDE. By adding NH,Aq to a lavender-colbured solution of V,O, φ in H,SO,Aq), Brierley (C. J. 49, 824) obtained a deep-purple gelatinous pp. which he said was hydrated V₂O₂; the pp. rapidly oxidised in the

Vanadium trioxide V_2O_3 . (Vanadous oxides Vanadium sesquioxide.) Mol. w. not known. This compound was represented by Berzelius as

 $\nabla O \ (\nabla - 68.5, O - 8)$

VO (V=68°5, O=8).

Formation.—1. By heating V₂O₃ to redness in H (Schafarik, A. 109, 85). The presence of traces of P₂O₃ prevents reduction (Roscoe, C. J. [2] 6, 331).—2. By heating V₂O₃ in a carbon crucible (Berzelius, P. 22, 1).

Preparation.—Pure V₂O₃ is heated in perfectly pure and dry H until the substance ceases to lose weight: the tube is allowed to coal com-

to lose weight; the tube is allowed to cool completely in H, and then a stream of dry air is passed through it (Roscoe, C. J. [2] 6, 331). When a solution of V_2O_3 in cone. H_2SO_4 is much diluted, and then treated with Mg until the liquid is green, this solution contains V,O,, combined with SO, (v. Vanadous salts, infra). A similar solution is obtained from the lavender solution of V_2O_2 in H_2SO_4Aq (prepared from V_2O_3 in H_2SO_4 , v. supra) by neutralising free acid by zinc, exposing to the air, and adding a little

acid (Roscoe, C. J. [2] 6, 337).

Properties and Reactions.—V₂O₃ is a black powder, resembling graphite; or, formed by reducing VOCl, by H, it is a black, lustrous, crys-illine crust. S.G. 4.72 at 16°. Does not fuse the blowpipe flame. When warm V_2O_3 is exosed to the air it glows and oxidises to V_2O_3 ; and even at the ordinary temperature it takes up the strong of th ',O. (Sabatier a. Sendereus, C. R. 115, 236). leating to redness in H.S produces V,S. (Kay, I. J. 87, 728). V₂O₃ dissolves in hot conc. L₃O₄, forming V₂O₃.∞SO₃ (v. Vanadeus Saltes, Myab, V₃O₂ dissolves in HFAq, and VF₃.№I₂O as been isolated from this solution (v. Vanadum). RIFLUORIDE, p. 844).

HYDRATE OF VANADIUM TRIOXIDE. By adding

Hybrate of vandoum trioxide. By adding (OHAq, or NH₂Aq, to an aqueous solution of 1,0,480,9H₂O (n. infra) Brierley (C. J. 49,824), bitained a dirty green, gelatinous fp., which ridited rapidly in air. According to B., this p. was hydrated V₂O₂.

VANADOUS SALTS V₂O₂.xX (X = acidic raids) or V₃R₂ (Ru = acidic raids). Only one lait derived from an oxyscid fits been certainly solated; it has the composition V₂O₂.4SO₂.xH₂O₃. The formula may be written V₂H₂(SO₂).yH₂O₃. Vanadous thrasulphate, or acid vanadous supplements, or acid vanadous supplements, v₂O₂.4SO₂.xH₂O or V₃H₂(SO₂).yH₂O₃.

A hydrate with x = 3 or y = 2 was obtained

by Gerland (B. 10, 2111 [1877]) by heating a solution of V₂O₄ in a large excess of conc. H₂SO₄ for a long time at 120°, and treating the blue crystalline crust-thus formed (consisting chiefly of V₂O₄.3SO₂.xaq, v. Hypovanadus saltes, p. 848) with boiling water, when V₂O₄.4SO₂.8H₂O remained. G. sppposed that reduction of V₂O₄

remained. G., supposed that reduction of V₂O₄ was effected by dust in the air.

Brierley (C. J. 49, 822 [1886]) prepared
V₂O₃.4SO₄.9H₂O(=V₂H₄(SO₄), 8H₂O) by electrolysing a solution of V₂O₄ in H₂SO₄. The solution was prepared by reducing V₂O₄ in concl.
H₂SO₄. Agater dilution, by SO₂. The deep-blue solution was placed in a Pt digh which formed the negative electrode, and a porous pot containing dilute H.SO.As was arranged so that it just touched the surface of the liquid in the Pt dish; a plate of Pt immersed in the H.SO.As formed the positive electrode. The Pt dish was warmed during the process, so that electrolysis and evaporation proceeded together. Blectrolysis was continued until the liquid was deep green, and a drop placed in a little water showed no trace of blue colour. Conc. H₂SO₄, equal to twice the bulk of the green liquid, was added; after 24 hours the green, sandy pp. was collected, with the green sandy pp. was collected. washed with conc. alcohol, and dried over H₂SO₄ in coal-gas. The salt dissolved in water, and alkali ppd from this solution a dirty-green gelatinous substance, said by B. to be $V_{Q,p,xH,Q}$. This pp dissolved in an aqueous solution of $V_{xQ,p}ASO_{x}9H_{yQ}$, forming a chocolatebrown solution, giving a lustrous green solid or evaporation, which dissolved in water to form a brown solution. B. concluded that the brown solution contained a compound of V₂O₂ and SO₂

solution contained a compound of V₂O₂ and SO₂ more basic than V₂O₂ASO₃.

Gerland (B. 11, 106 [1878]) 4uentions the normal winadous sulphate V₃(SO₂), (-V₂O₂ASO₃) as if he had prepared it; no details are given.

VANADIUM TETROKIDE V₂O₄. (Hypovanadio oxida.) Mol. w. not known. Represented by Berzelius as VO₂(V = 63:5, O = 8).

Fornation.—1. By allowing V₂O₃ to absorb of from the air (cf. Hypovanado-vanado oxida.), 851).—2. By strongly heating a mixture of

O from the air (cf. HYPOVANADO OXIDES, p. 851).—2. By strongly heating a mixture of 5 pts. V₂O₃ and 6 pts. V₂O₃, in absence of air.—3. By the electrolysis of molten V₂O₄ (Buff avoided in a stream of CO₂ (Crow, C. J. [2] 15, 453).

Preparation.—A solution of V₂O₄ in H₂SO₄ obtained by reducing V₂O₅ in conc. H₂SO₄ by SO₂, is ppd. by Na₂CO₂A₃, and the pp. is washed and dried by heating in vacue (Barzallus P. 22.

and dried by heating in vacuo (Barzelius, P. 22, and dried by heating in vacuo (Barzelius, P. 22, 1).—2. V₃O₄ is exposed to the air for some months, until the colour has changed to blue (Roscoe, G. J. [2] 6, 338].—3. V₂O₄ is dissolved in hot cone. HClAq; when Cl ceases to be given off the liquid is saturated with H₂S, filtered from S, evaporated to dryness at 100° and the V₂O₄CD, 22q thus formed is heated to redness in a stream of dry CO₂ (Ctow, l.e. pp. 457, 458).

Properties and Reactions.—A blue, lustrous, crystalline nowder: nemared w heating VO Cl.

Properties and Reactions.—A blue, lustrous, crystalline powder; prepared by heating V₂O₂Cl₃ in CO₂ it forms a dark-green, amorphous powder (Grow, Lc.). Infusible at a high temperature. Insoluble in water. When kept in a loosely-stoppered bottle V₂O₃ gradually absorbs O, forming V₂O₃ (Crow, l.c.). Dissolves easily in acids, forming bright-brue liquids; the same solutions are obtained by the action of moderate

reducers, such as SO,Aq, H,SAq, or H,C,O,Aq, on solutions of V,O, in acids, also by passing air into V,O, in H,SO,Aq until the liquid becomes permanently blue (Roscoe, I.c.; v. infra, HPPO-VANADIC SALTS). Petersen (J. pr. [2] 40, 194) supposed that the blue microscopic crystals he obtained by dissolving V₂O₄ in excess of HFAq and evaporating were VOF₂. xaq, but he did not obtain enough to make an analysis. V₂O₄ dissolves readily in alkali solutions, forming hypo-vanadates, M₂V₄O₅ (q. v. under Vanadotte ox-acids, and salts and derivatives thereof, p. 858)

HYDRATES OF CHYPOVANADIC OXIDE. By adding Na₂CO₂Aq, drop by drop, to₅ a colution of V₂U₄ in HClAq or H₂SO₄Aq, till the supernatant liquid was colourless, filtering rapidly in CO₂, and drying on a porous tile over H₂SO₄ in vacuo, Crow (l.c.) obtained the black, amorphous heptahydrate V₂O₄, 7aq; and on heating this in CO₂ for some hours at 100° he obtained the trihydrate

V₂O₄, Saq.

HYPOVANADIC (or variedyl) SALTS
V₂O₄, xX (X = acidic oxide). Only a few compounds of V₂O₄ with acidic oxides have been studied more isolated. The sulphates have been studied more represented as V₂O₄.2SO₃.yH₂O. The compound V₂O₄.2SO₃ may be called the normal sulphate; V₂O₂,2SO₃ may be called the normal sulphate; the formula may be expressed as V₂O₂,(SO₄), or VO.SO₁,... The compound V₂O₄.3SO₅.6H₄O may be called acid sulphate; the formula may be expressed as V₂O₂,SO₄(SO₄H)₂.5H₂O or (V₂O₂)H₂(SO₄),5H₂O₅, or it may be written V₂O₄.2SO₂,H₂SO₄.5H₂O; When the formulæ of the compounds of V₂O₄ with acidio oxides are written V₂O₄.X the compounds of a compound of the compounds of V₂O₄ with acidio oxides are written V₂O₄.X the compounds of a compound of the compounds of V₂O₄. pounds are generally called hypovanadic salts; when the formulæ are written V₂O₂·xR (R= acidic radicle) the name divanadyl salts is usually given to the compounds; and when these compounds are regarded as VO.xR, it is customary to call them vanadyl salts. Hypovanadic sulphates are obtained (1) by dissolv-

H2SO, and heating to the boiling-point of the liquid for a long time. The salt separated as a green-blue powder; insoluble in water, cold or het; insoluble HClAq and H₂SO₄. (G. does not say how the salt was obtained pure for analysis; no analyses are given of the salt prepared exactly as described above.) Various hydrates are described by G. obtained by different processes. Crow (C. J. [2] 15, 456 [1876]), obtained he heptahydrate by repeatedly treating hexalty fracted trisulphate (v. infra) with absolute alcohol.

Hypovanadic trisulphate, or acid divanadyl Hypovaniaci trisuipnate, or acta avamacy sulphate, V_*O_* 380, xH_*O or $(V_*O_*)H_*(SO_*)_*, yH_*O$ [y=x-1]. (Acta vanadyl sulphate $(VO.SO_4)_*, H_*SO_*, yH_*O.)$ Hydrates with x=4 and 3 (or y=3 and 2) were prepared by Gerland (B. 10, 2, 109); and a hydrate with x=6 (or y=5) by Crow (C. J. [2] 15. 455).

By dissolving V₂O₄ in a large excess of conc. H₂SO₄, heating for a long time at c. 120°, and drying the small, blue, transparent crystals that formed on a porous tile over H₂SO₄, Gerland obtained a substance which gave analytical results approaching those required by the formula V₂O₄.3SO₃.4H₂O. The salt was not obtained quite free from admixed V₂O₃.4SO₃.xH₂O. This tetrahydrate was partially decomposed by cold ing with alcohol and other and drying over H_2SO_4 , had the composition of a trihydrate, V_2O_4 3SO₃3H₂O₄.

Crow obtained a hexahydrate V₂O₄, 3SO₄, 6H₂O₅, by reducing by SO₄ a solution of V₂O₅ in conc. H₂SO₄, heating at 100° for some time, drying the light-blue crystals that separated on a tile, removing acid by washing with ether, and drying by pressure between paper. The crystals deliquesced in air to a blue syrup; they were insoluble in ether, and scarcely soluble in absolute alcohol.

The formulæ of the various hydrated hypovanadic sulphates are as follows :-

Vanadyl sulphates. Hypovanadic sulphates; Divanadyl sulphates; V₂O₂·(SO₄)₂ V₂O₂·(SO₄)₂·3H₂O V₂O₂·(SO₄)₂·4H₂O VO.SO, (Gerland). 2(VO.SO,).3H₂O (G.) VO.SO,.2H₂O (Crow, confirming V₂O₄·2SO₃·3H₂O V₂O₄·2SO₃·4H₂O Berzelius). Berzeitus).
2(VO,SO₄).7H₂O (G., also C.)
VO.SO₄.5H₂O (G.)
2(VO.SO₄).18H₂O (G.)
2(VO.SO₄).H₂SO₄.2H₂O (G.)
2(VO.SO₄).H₂SO₄.3H₂O (G.)
2(VO.SO₄).H₂SO₄.5H₂O (C.) V2O (SO)2.7H2O V2O4.2SO4.7H2O V₂O₂(SO₄)₂,10H₂O V₂O₂(SO₄)₂,10H₂O V₂O₂(SO₄)₂,18H₂O (V₂O₂)H₂(SO₄)₃,2H₂O (V₂O₂)H₂(SO₄)₃,3H₂O ₄(V₂O₂)H₂(SO₄)₅,5H₂O V₂O₄.2SO₃.1H₂O V₂O₄.2SO₃.10H₂O V₂O₄.2SO₃.13H₂O V₂O₄.3SO₃.4H₂O V₂O₄.8SO₃.6H₂O

ing V₁O₄ in hot cone. H₂SO₄ and boiling; (2) by dissolving V₂O₄ in cone. H₂SO₄ reducing by SO₂ dithionate by adding BaS₂O₄Aq to V₂O₂(SO₂)Aq, or H₂CO₄, and evaporating; (3) by dissolving V₂O₄ and evaporating; (3) by dissolving v₂O₄ filtering, and evaporating in vacue: the salt was V₂O₄ in cone. H₂SO₅ and beliling in the air for some time. In reaction (5) V₂O₅, xSO₅ seems to be formed and then partially reduced, by dust or products of combustion of coal-gas, to V₂O₄, xSO₅; the products are mixtures or V₂O₄, xSO₅; the products are mixtures of V₂O₅, xSO₅ and V₂O₄, xSO₅ (Gerland, B. 11, 98).

Hypovanadic disulphate, v₂O₄, xSO₅ or v₂O₇ (SO₂).

(Vanadyl sulphate, V₂O₄, xSO₅ or v₂O₇ (SO₂).

(Vanadyl sulphate, V₂O₄, xSO₅ or v₂O₇ (SO₂).

(Vanadyl sulphate, V₂O₅, xSO₅ or v₂O₇ (SO₂).

(Vanadyl sulphate, V₂O₅, xSO₅ or v₃O₇ (SO₂).

(Vanadyl sulphate, v₄O₅, xSO₅ or v₅O₇ (SO₂).

(Vanadyl sulphate, v₅O₅ or v₅O₇ (SO₂).

(Vanadyl sulphate, v

pounds of V₂O₄ with As₂O₃, B₂O₃, CrO₃, MoO₃, and a few other acidio oxides (#. Lehrbuch [5th ed.] 3, 1053).

VANADUM PENTOXIDE V₃O₄, (Vanadic oxide. Vanadic anhydride.) Mol. w. not knewn. Represented by Berzelius as VO₃ (V=68*5, 0=8).

**Example from -1. By strongly heating any of the company of th

Formation .- 1. By strongly heating any of the lower oxides in air or O .- 2. By heating NH. VO. in air to dull redness.—3. By decomposing VOCl, by water.—4. By heading V₂O₂.4SO₃. 9aq to bright redness (Brierley, C. J.

Preparation .- Pure VOCl, is decomposed by water, and the ppd. V₂O₄ is washed till the washings are free from acid (HClAq is produced) and heated until dry (Schafarik, J. pr. 76, 142). For the preparation of V₂O₃ from vanadinite and other sources of V compounds, v. Vanadium, Pre-

paration of (p. 841).

Properties.—A pale-yellow powder, with a reddish tinge. When heated to full redness out of contact with any reducing agents, V2O3 melts, and solidifies on cooling to a mass of yellow-red, crystalline needles, appearing ruby-red by transmitted light; should the V_2O_3 used contain V_2O_4 , which is often the case when the V_2O_3 is prepared by heating NH4.VO3, the solid obtained by fusion and cooling appears violet to nearly black, and does not seem to be crystalline (Berzelius, P. 22, 1). As molten V₂O₃ cools nearly to its solidifying-point much heat is given out, and the mass glows until solidification is complete (B., l.c.). V2Os is said not to be changed at a white heat, provided no trace of a reducing agent is present (B., l.c.); but according to Read (C. J. 65, 313 [1894]) molten V₂O₃ gives off O, producing V₂O₃, which on cooling in air takes up O, forming steel-blue crystals of V₂O₄. The crystals of V₂O₄ are rhombic (c. Nordenskjold, P. 112, 160). S.C. (crystalling) 25 5 4 00 (Cal-Agerit I. 17, 160). (crystalline) 3.5 at 20° (Schafarik, J. pr. 76, 142). V₂O₃ is odourless and tasteless; it reddens moist V₂O₂ is odouriess and sateless; it reduces most litmus paper; 1,000 pts. boiling water dissolve scarcely 1 pt. V₂O₃ (B., l.c.). With molten alkalis or alkali carbonates V₂O₃ produces vanadates (q.v. p. 851). V₂O₃ dissolves in conc. H₂SO₄, HClAq, HNO₂Aq, or HFAq (cf. Vanadic surrs, p. 850).

According to Ditte (C. R. 101, 698), V₂O₃ exists in three forms; (1) red, obtained by heat-

ing NH, VO, in a closed crucible, treating with HNO, and repeatedly heating to redness; (2) yellow, obtained by heating NH, VO, to 440° in a stream of air; and (3) crystalline, obtained by treating the yellow form with HNO,, and then fusing. D. says that the red form is somewhat soluble in water, 1,000 c.c. dissolving 8 g. at 20°; that the yellow form is very slightly soluble, and the crystalline form is insoluble, in water. He also says that the red form absorbs water from the air, producing hydrates with 2H,0 and 5H,0; and that addition of NHCl, KCl (and other salts). to an aqueous solution of the red variety causes so an aqueous solution of the red variety obtains ppn. of a hydrate of the yellow form of V_2^{20} , which hydrate, when dry, is a dark-red powder o having the composition $V_2O_1.2H_2O_2O_3$ and is almost insoluble in water. (No analyses

are given by D.)

Reactions.—1. When heated and kept molten, V₂O₂ is formed, and this absorbs Q as it cools in air and forms V₂O₂ (Read, C. J. 65, 313 [1894]).

Heated to reduces in hydrogen till it ceases to lose weight, V₂O₃ is reduced to V₂O₃ (Schafarik,

A. 109, 85); traces of P₂O₃ prevent the reduction (Roscoe, C. J. [2] 6, 831).—8. Heating with potassium produces V₂O₃ (Berzelius, P. 22, 1).—4. V₂O₃ is produced by heating V₂O₃ in a carbon expedible (B., l.c.). For action of Mg, Zn, &c. on solutions of V₂O₃, v. Vanadic satus, (p. 850).—5. When mixed with carbon and heated in chlorine, V₂O₃ yields VOCl₃ (Roscoe, C. J. [2] 6, 342).—6. Electrolysis of molten V₂O₃ produces V₂O₄ (Buff a. Wöhler, A. 110, 277).—7. According to Ditte (C. R. 103, 55), f-kion with potassium cyanide produces 110, 277).—7. According to Ditte (C. R. 108, 55), frion with potassium cyanide produces V_QO₂ (N, K_QO, and OQ, being also formed). Carnot (S. R. 104, 1803, 1850; 105, 119) says that a boiling solution of potassium cyanide produces KVO₃ (CO₂ and N being given off); and that by dropping V_QO, into excess of boiling KONAq there is formed K₂V₁O, (with evolution of N and CO₂). No analyses are given either by D. or C.—8. Ditte (C. R. 103, 55) asserts that the products of the interaction of V₂O₃ and potassium iodice or bromide are K₂V₂O₄, KVO₄, and I or Br. The reactions are said to occur and I or Br. The reactions are said to occur between V_2O_3 and molten KI or KBr; and KIAq is said to react in the same way as the molten salt.—9. When V₂O₅ is heated with molten boron triaxide, a pale-yellow glass is formed, which is said by Guyard (Bl. [2] 40, 354) to be a vanadio borate; no analyses, composition, or methods of borate; no analyses, composition, or memors of purification are given.—10. V₂O₃ dissolves in hot cone. sulphuric acid, forming V₂O₅.xSO₃, genearally along with more or less V_QO₄.xSO₄ (v. Vanabos acids, p. 850).—11. V₂O₃ dissolves in cone. hydrochloric acid; Cl is given off on heating; after the passage of H2S followed by evaporation at 100° the oxychloride VO, Cl. rag is obtained (Crow, C. J. 30, 457; cf. Vanadium dioxymono-chloride, p. 854).—12. By dissolving V₂O₈ in conc. hydrochloric acid in presence of platinis chloride, Brauner (M. 3, 58) obtained large tablets having the composition 2(VOCl, PtCl,). 21aq.-13. An oxylodide 2VOI, 9aq is obtained, according to Ditte (C. R. 102, 1310), by adding excess of hydriodic acid to a warm aqueous solution of red V₂O₃, removing free I by shaking with silver powder, filtering, and evaporating in vacuo. (No analyses are given.) -14. V₂O₃ dissolves in hydroftuoric acid, forming a pale-yellow solution, the colour of which becomes deeper on dilution (Piccini a. Giorgis, G. 22 [1] 55). Petersea (J. pr. [2] 40, 271) supposed that a solution in cone. HFAq contained VF₃; but he did not separate this compound, nor does he give any direct evidence in favour of its existtence beyond the preparation from the solution tence beyond the preparation from the solution of V₂O₃ in HFAq of a compound which may be represented as **XF.VF*, VOF*, and other compounds of the forms **xMF.yVOF*, and **xMF.yVOF*, and **xMF.yVOF*, and adding metallic fluorides to colutions of V₂O₃ in HFAq, and crystallising, vanadoxyfluorides are formed; these cympounds are of the forms **xMF.yVOF*, and **xMF.yVOF*. are of the forms xMF.yVOF, and xMF.yVO,F (v. WANADOXYFLUORIDES, P. 844). 15. Vanadoxyfluorides are also formed by dissolving V2O, in alkali fluoride solutions, and drystallising (of infra, Combinations, No. 5).-16. It a solution of V.O. in hydrofluoric acid is partially reduced, and then evaporated with metallic fluorides. hypovanadoxyftuorides (q. v. p. 845) are formed; these salts are of the form xMF.yVOF, -17. By boiling V.O. with hydrogen peroxide solution, a

black liquid was obtained that deposited a blackbrown crust of indefinite composition (Cammerer,

Chem. Zeit. 19, 957).—18. By fusion with alkali or alkali carbonates vanadates are formed (v. Vanadates, p. 851).

Combinations.—1. With water, but not directly, to form V₂Q.H₂O and V₂O₂2H₂O (v. Metavanadic acid and Pyrovanadic acid, under VANDIUM OXYACIDS, AND SALTS AND DÉMIVATIVES THEREOF, p. 851).—2. With various acidic oxides: (1) With SO, to form V₂O, xSO, formed oxides: (1) With SO, to form V₂O_xxSO₃, formed by dissolving V₂O₃ in hot conc. H₂SQ₄; (2) with As₂O₃ to form V₂O₃xAs₂O₅; (3) with P₂O₅ to form V₂O₃xP₂O₅; (4) with I₂O₆ to form V₂O₃xAs₂O₅; (5) with MoO₃ to form V₂O₃xMoO₃; (7) with P₂O₃ and SiO₄ to form V₂O₃xWO₂; (7) with P₂O₃ and SiO₄ to form V₂O₃xP₂O₃ySiO₂. Most of these compounds combine with the stronger leaves M O₃ and O₃ of the form at this compounds. bases M2O and MO to form salt-like compounds. The compounds of V₂O₃ with SO₃ are described as vanadic sulphates under Vanance sates (infra); the compounds with other acidic oxides are described respectively as arseno-vanadic acids and salts, iodo-vanadic acids, molybdo-vanadic acids and salts, phospho-vanadic acids and salts, phospho-silico-vanadic acid, and tungsto-vanadic acids and salts, under VANADIUM OXYACIDS, AND BALTS AND DERENATIVES THEREOF (v. pp. 853-4).—

8. With vanadium tetroxide to form oxides intermediate between V₂O₄ and V₂O₅ (v. Hyro-yanado-yanado-vanadic oxides, p. 851).—4. With vanadium trioxide to form V₂O₄; produced by heating equivalent weights of the two oxides out of ontact with air (Berzelius, P. 22, 1; Petersen; J. pr. [2] 40, 193).—5. With alkali fluorides. According to Ditte (C. R. 105, 1067; 106, 270), several compounds of the form xV.Q., yMf are formed by fusing V.Q., with alkali fluorides, extracting with rate of all awarellicing. tracting with water, and crystallising; D. gives formulæ where x = 1, 3 and 4, y = 1, 2, 4 and 8, and M = K and Na; but he does not give analyses of the salts (v. Vanadoxyfluorides, p. 844).

Hyprates of vanadic oxide. The hydrates $V_2O_s.H_2O=HVO_s$ and $V_2O_s.2H_2O=H_4V_2O_r$ have been isolated; these compounds are acids (v,Vanadic acids, p. 851). Ditte (C. R. 101, 698) asserts, without giving analyses, that a penta-hydrate V₂O₅.5H₂O is formed by absorption of water from the air by the red form of V.O. (v.

VANADIUM PERTOXIDE, Properties, p. 640),
VANADIO SALTS V₂O₂cX (X = acida.)
oxide). A few compounds of this form have been isolated. The sulphates have been better studied than the other salts. Two sulphates, $V_2O_3.2SO_3.xH_2O$ and $V_4O_3.8SO_3.xH_2O$, have been If x is taken to be 2 in the first sal. isolated. If x is taken to be x in the nrss sat, and 3 in the second, then the formulæ may be written as (VO),2SO,H,SO,H,GO and (VO),SO,2H,SO,H,O expectively; ((VO),SO,2H,SO,H,O = V,O),2SO,2H,O; (VO),SO,2H,SO,H,O = V,O,3SO,3H,O]. If the salts are anhydrous, as seems most probable from the analyses, then the formulæ may be written (VO),SO,2SO, respectively. (VO₂)₂SO₄·SO₅ and (VO₂)₂SO₄·2SO₅ respectively. Neither of the salts can be regarded as the nor-

98), and Münzig (C. C. 1889 (ii.) 908). The salt seems to be without water of crystallisation; Fe (l.c.) says it crystallises with H2O. V2O, is dissolved in hot conc. H₂SO₄, and the solution is boiled for a considerable time, when small crystals separate, some of which are brown and some ruby-red, lustrous, and transparent. The crystals are heated in a bath of molten lead until SO, ceases to be given off (G., Lc.). According to Münzig (l.c.), the orange-coloured crystalline powder that separates when V_2O_3 is added to boiling conc. H.SO, until the acid is saturated is V₂O₂.2SO₂. By keeping a solution of V₂O₃ in a large excess of conc. H₂SO₄ at 130°-150° for a long time, Gerland (l.c.) obtained a hard, opaque, sealing-wax red, crystalline crust composed of

Y₂O₂, and SO₃ in approximately the ratio V₂O₃:2SO₄.
Y₂O₄:2SO₅ [= (VO₂)₂SO₄.SO₃] is described by G. (i.e.) as a clear red, crystalline, deliquescent solid; addition of a drop or two of water ppts.

 $V_2O_3xH_2O_5$ Vanadic trisulphate $V_2O_3.3SO_3(?xH_2O)$. This salt seems to have been of tained by Berzelius (Lc.). Ditte (C.R. 102, 757) gave x the value 3; Gerland's analyses (Lc.) were inconclusive the percentage of water found varying from 3 to 73. G. (Lc.) prepared this salt by long-continued boiling of a solution of V₂O₂ in a large excess of conc. H₂SO₄; small crystals separated, some of them brown and some ruby-red and transparent (probably regular octahedra). When the boiling was not continued for so long a time, G. noticed that fine, golden-yellow, lustrous needles separated. The composition of the crystals in each case was very nearly that required by the formula V₂O₄.3SO₃. More or less V₂O₄.2SO₃ was always formed; G. found that addition of a little HClO, prevented the formation of much V₂O₄.2SO₃. V₂O₅.3SO₃ is very deliquescent; soluble in

cold water or alcohol; a slight rise of temperature suffices to ppt. V₂O₂.xH₂O. By adding to a solution of this salt in cold water the proper quantity of K₂SO₄, G. (l.c.) obtained small, amber-yellow crystals, which, after a few washings with cold water, pressure between paper, and drying over H₂SO, had the composition of the double salt V₂O, 2SO₃K₂O. 6aq. The same crystals were obtained by using the tion of the double salt V_2O_s , $2SO_s$, k_2O , 6ag. The same crystals were obtained by using the disulphate V_2O_s , $2SO_s$. Replacement of K_sSO_s by $(NH_s)_2SO_s$ produced the double salt V_2O_s , $2SO_s$, $(NH_s)_2O_s$, Aa_sSO_s or $MgSO_s$, by the trisulphate $(V_sO_s, 3SO_s)$ crystallised unchanged. Gerland (B, 11, 102) found that when a solution of V_sO_s in both cone. H. SO_s we leavely

tion of V₂O₅ in hot. conc. H₂SO₄ was largely diluted and dialysed, H₂SO₄Aq passed rapidly through the dialyser, along with small quantities of V compounds, until the liquid in the dialyser contained V.O. and SO. in the ratio V.O. 3SO. after which SO. Aq passed very slowly through, and the composition of the substance in the dialyser gradually approached V₂O₂.2SO₄. By dialysing a diluted solution of V₂O₅ in cold conc. H2SO, the conditions being the same as in The sulphates are obtained by distifue V_1 , V_2 and V_3 are obtained by distifue V_4 , V_4 and V_5 , V_6 and V_7 , V_8 , V_8 and V_8 , $V_$ H.SO, contains loose, easily decomposed compounds of V_2O_5 and H_2SO_4 , but that a solution of V_2O_5 in hot H.SO, contains V_2O_4 .3SO,, which gradually loses SO, until V_2O_5 .2SO, is formed. Solutions of V_2O_4 in cone. H.SO, may be reduced to sulphates of lower oxides (Roscoe, C. J.

2] 6, 3344 Rammelsberg, B. B. 1880. 787) :—Zn, Cd, or Na-amalgam causes reduction to lavender solutions of $\nabla_2 O_2 x S O_3$; Mg effects reduction to green solutions of $\nabla_2 O_3 x S O_3$; and $H_2 S$, $S O_{21} O_2 x S O_3$; and $G O_3 x S O_3$; and

V₂O₄.xSO₅. By fusing V₂O₅ with B₂O₅ (Guyard, Bl. [2] 25, 354) obtained a green glass, which he took to be a vanadic borate; no analyses or descrip-

tions are given.

The compounds of V2Os with As2Os, I2Os, P2Os MoO₃, and WO₃ respectively—or some of these compounds—may perhaps be regarded as vanadic arsenates, iodates, &c.; v. Arseno-vanadic acids AND SALTS, IODO-VANADIC ACIDS, &c., p. 853.

HYPOVANADO-VANADIC OXIDES. Several oxides seem to exist intermediate between V2O4 and V₂O₄. Roscoe noticed that V₂O₄ gradually absorbed O and H₂O from the air, forming a greenish solid; Brierley (C. J. 49, 30) found that a pale grass-green substance was formed after some months, having the composition V₂O₄.2V₂O₅.8aq = V₂O₇.4aq. By dissolving this solid in dilute H₂SO₄Aq, and neutralising by KHOAq, B. obtained 2V₂O₄.4V₂O₅.5K₂O. aq. By gently heating the compound

2V₂O₄,3V₂O₅,3(NH)₂O. faq (v. Hypovanadovamdates, p. 853), B. (i.c.) obtained a darkgreen solid that absorbed water from the air, and then had the composition $3(V_2O_1, V_2O_2)$. 8aq = $3V_4O_8$. 8aq (cf. Ditte, C. lt. 101, 151; also Manasse, A. 240, 23).

Compounds of SO, with oxides intermediate between V_2O_4 and V_2O_5 are formed by the reducing action of zinc on solutions of V_2O_5 in H₂SO₄ (v. Rammelsberg, B. B. 1880. 787).

Vanadium oxyacids, and salts and deriva-tives thereof. Two oxyacids have been isolated, HVO, and H₄V₂O, corresponding with HPO, and H.P.O.; salts of these, also salts of the tribasic acid H₂VO, and several more complex salts, are known. Salts derived from the hypothetical hypovanadic acid V₂O₁(OH)₂ (=2V₂O₁H₂O) have also been prepared; and several compounds are known which are most eimply regarded as xV₂O₄.yV₂O₅.2MO, and which may be called hypovanado-vanadates. V₂O₅ also combines with several acidic and basic oxides simultaneously to form compounds of the general form. $x\nabla_{z}O_{z}yX:xMO$; these compounds are generally described as arseno-vanadates, phospho-wana-

described as arseno-vanadates, phospho-wanadates &c.

VANADIC ACIDS. Two vanadic acids,
HVO, and H,V,O,, have been isolated; esalts of
the third acid, H,VO, are known, but the acid
itself has not certainly been prepared.

Metavanadic acid. Monohydrate of vanadic oxide
vanadic acid. Monohydrate of vanadic oxide
V,O,H,O.) Gerland (B. 9, 872 [8876]) prepared
this acid by adding an excess of NH,ClAq to
cold CaSO,Aq, then adding NH,VO,Aq sill a
permanent pp. formed, heating to 75°, washing
the lustrous yellow scales that slowly separated
with dilute H,SO,Aq and SO,Aq (to remove
V,O.), then washing with water, and drying at

100° until the smell of NH, ceased. Manasse (A. 240, 52) obtained HVO, by decomposing cone. solutions of the Ca, Mg, or Sr salt by a little HNO₂Aq, and washing the pp. with dilute HNO₃Aq, and then with hot water. Metavanadic acid forms golden-yellow crystalline scales; it is unchanged in air; dissolves very slightly in water; insoluble in absolute alcohol; soluble in NH,Aq, KOHAq, or NaOHAq. By adding NH,VO,Aq, to CuSO,Aq, filtering from the pp. that formed, and dialysing for several days, By adding Gerland (I.c. p. 874) obtained a solution in the dialyser of vanadic acid, which remained clear when heated, and on continued evaporation gave a pp. of red amorphous V_QO_x. Metavanadic acid forms a series of salts (v. Metavanapares, infra).

This compounds is used as a colour in place of gold bronze, under the name of vanadium bronze. According to Guyard (Bl. [2] 25, 856), the substance commonly known as vanadium

bronze is really an ammonium vanadate.

Pyrovanadic acid H₁V₂O₂. (Tetrabasio vanadic acid. Dihydrate of vanadic oxids vanadic acid. Dihydrate of vanance oxuse V₂O₂,2H₂O₃) This acid is obtained by decomposing a fairly cone, solution of an alkali vanadate of the form M₂V₂O₁₁ or M₂V₂O₁₆ (v. Tethavanamers and Hexavanamers, p. 852) by HNO₃Aq, washing with cold water, and drying in the air (von Hauer, J. pr. 80, 321). According to Ditte (C. R. 101, 698), the red form of V₂O₅ (v. p. 849) absorbs H₂O from the air, forming V₂O₂,2H₂O, and also V₂O₅SH₂O. Pyrovanadic acid is described as a brown, amorphous powder. acid is described as a brown, amorphous powder, resembling FeO,H,; dried over H,SO,, it is said to lose half its water. Very slightly soluble in water; the solution is clear yellow; it reddens ntmus. H₄V₂O₇ is insol. in absolute alcohol; it dissolves readily in NII₃Aq. For salts of this acid v. Pyrovanadates (p. 852).

VANADATES. The greater number of the vanadates belong to the series (1) MVO₃, (2) M,VO₃, (3) M,VO₄, (4) M,VO₃, or (5) M,VO₃, (8). Series (1), (2), and (3) may be called normal salts; the formule may be written as (1) M₂O₄VO₅, (2) 2 M₂O₄VO₆, and (3) 3M₂O₄VO₅. Series (4) and (5) may be called acid salts; the formule may be written as (4) M₂O₄VO₅, and (5) M₂O₃VO₄. Acid salts are also known intermediate between sories (1) and (4); the chief of these are (6) 3M₂O₄VO₅ = M₂V₂O₅, (M₂O₄VO₆ = 1:1; 1, (7) 3M₂O₄VVO₅ = M₂V₃O₄(M₂O₄VO₅ = 1:1; 1, (1). A few salts of the form 4M₂O₄VO₅ = M₃V₃O₅(M₂O₄VO₅ = 1:1; 1, (1) may be called basic salts. Some salts, especially those of Sie and Tl, belong to more complex fogurs. VANADATES. The greater number of the

forms. Roscoe (C. J. [2] 9, 28) has shown that the alkali orthovanadates, M,VO, or 3M,O.V.O, are asily decomposed in aqueous solution at the ordinary temperature to pyrovanachtes M.V.O., and MOHAq; but that orthovanachtes are formed, rather than meta- or pyso-vanadates, by fusing V₂O₂ with alkali carbonates; further, that aqueous solutions of alkali pyroganadates are readily decomposed by CO, to alkali carbonates

and metavanadates.

METAVANADATES MIVO, or M.O.V.O. Ammonium metavanadate NH.VO. with dilute H.SO,Aq and SO,Aq (to remove tained by dissolving V2O,EH.O in excess of V2O,), then washing with water, and drying at NH,Aq, warming, and allowing to evaporate Forms a white, crystalline crust. Dissolves slowly in cold water, quickly in boiling water. Dissolves Decomposed by heat, giving V_2O_s when air is present. According to Berzelius (P. 22, 1), when a solution of $V_2O_sxH_2O$ in excess of when a solution of V₂U₃xH₂U in excess of NH₂Ag is allowed to evaporate without having been heated, NH₄VO, separates in lemon-yellow crystals (v. B., l.c.; Roscoe, C. J. [2] 6, 322; Ditte, C. R. 102, 918; Norblad, B. 8, 126; Wagner, D. P. J. 223, 633; Böttger, C. C. 1873

Barium metavanadate Ba(VO_s), aq. A yellowish-white, pp.; obtained, along with red crystals, by ppg. (Manasse, A. 240, 23). Sl. sql. in water. Loses H₂O when heated to c. 200° (Berzelius; Norblad,

Potassium metavanadate KVO₁, xaq. Formed by dissolving V₂O₂ in KOHAq in the ratio V₂O₃:KOH. Various hydrates have been obv₂0₅:ROEE. various nyurates have been obtained as white crystalline solids, melting to a clear yellow liquid, which solidifies to white, lustrous KVO₆ (v. Berzelius, Lc.; Ditte, C. R. 104, 902, 1061, 1168).

104, 902, 1001, 1108).
Sodium metavanadate NaVO₃. Obtained by,
Roscoe (C. J. [2] 9, 31) by fusing V₂O₃ and Na₂CO₃,
in the ratio V₂O₃:2Na₂CO₃, dissolving in water,
crystallising Na₄V₂O₇. 18aq, and passing CO₂
into an aqueous solution of this salt, when NaVO₃ crystallised out and Na CO, remained in solution. Small yellowish-white crystals, probably monoclinic prisms, melting readily and solidifying to a yellow crystalline mass (cf. Norblad, l.c.). Hydrates with 2, 4, and 5 H.O have been ob; tained (cf. Ditte, l.c.).

tained (cf. Ditte, l.c.).

The other metavanadates that have been prepared are Cd(VO₃)₂ (Ditte, C. R. 104, 1705) (Ca(VO₃)₂ 4aq (von Hauer, J. pr. 69, 385; 80, 324; Manasse, A. 240, 23; cf. Roscoe, C. J. [2] 9, 32); Co(VO₃)₂, 3aq (D., l.c.; Radau, A. 251, 114), forms double salts with KVO₃ (R., l.c.); Pb(VO₃)₂ (R., l.c.; D., l.c.); LiVO₃ 2aq (Ditte, C. R. 104, 1168); Mg(VO₃)₂ 4aq (Radau, l.c.); Manasse, l.c.); Mn(VO₃)₂ 4aq (Radau, l.c.); AgVO₂4NH, 2aq (D., l.c.); Sr(VO₃)₂, 4aq (Norblad, l.c.; Manasse, l.c.); Zn(VO₃)₂, 2aq (D., l.c.).

Onyhoyandates M₃VO₄ or 3M₂O. V₂O₃.

Potassium orthoyanadate K, VO₄. Obtained

Potassium orthovanadate K₂VO₄. Obtained by fusing V₂O₄ with K₂CO₅; decomposed by water, giving KOHAq and K₄V₂O₇ (Rammelsberg, B. B. 1883, 8).

perg, B. B. 1853. 3).
Sodium orthovanadate Na, VO, xH,O! Roscoe
(C. J. [2] 9,39) obtained the salt with 16H,O
by fusing V,O, and Na,CO, in the ratio
V,O, 3Na,CO, allowing to cool, dissolving in as
little colic water as rossible, quickly adding excess of conc. alcohol, allowing to stand for some
hours, washing the crystals that formed with small
quantities of alcohol, and drving on a rorons nours, washing the crystals that formed with small quantities of alcohol, and drying on a porous plate over H₂SO₄ in vacuo (cf. Czučnowicz, R 120, 34; Rammelsberg, B. B. 1885, 3). Baker (C. J. 47, 853) obtained Na₂VO₄mH₂O with c=8(?), 10, and,12; he also obtained the double satt Na₂VO₄NaF19H₂O. The crystalline forms are given by B and the various hydrates of are given by B, and the various hydrates, of Na, VO, are shown to be isomorphous with cor-Na, VO, are shown to be isomorphous with corresponding arsenates and phosphates. Na, VO, Aç changes to Na, V,O,Aq and NaOHAq; the change occurs slowly at 'ordinary temperatures, and rapidly at higher temperatures (R., l.c.).

The other orthovanadates that have been pre-

pared are Ca₁(VO₄)₂. CaCl₂(Hautefeuille, U. R. 103, 600; 104, 501); Pb₄(VO₄)₂ and 3Pb₄(VO₄)₂ PbCl₂(R., l.c.); Ag₃VO₄ (R., l.c.); Tl₃VO₄ (Carnelley, C. J. 26, 323).

C. J. 20, 523).

PYROYANDATES M¹₄V₂O₇ or 2M₂O.V₂O₄.

Barium pyrovanadate Ba₂V₂O₇. Obtained, as a white amorphous powder, by adding BaCl₂A₀ to freshly-prepared Na₂VO₄A₁, washing, and drying at 100°. The salt is slightly soluble in water (Roscoe, C. J. [2] 9, 83).

Potassium pyrovanadate K₁V₂O₇. Hard, deliquesgent monnellinic prisms. formed by adding

liquescent monoclinic prisms, formed by adding KOHAq to KVO,Aq, rapidly evaporating to a syrup, and placing over H₂SO₄ (Norblad, B. & 126).

Na, V20,.16H2O. Sodium pyrovanadate Formed by fusing V₂O₅ and Na₂CO₅ in the ratio V₂O₅:2Na₂CO₂, disso ving, and orystallising; also v₂V₅:2Na₂V₉, anserving, and orystalising; also by exposing Na₃VO₄Aq to air free from CO₂ until addition of alcohol ppts. silky scales (Na₄V₂O₂) (Roscoe, *l.c.*, p. 31). White six-sided tables; e. sol. water, insol. alcohol. Na₄V₂O₄Aq is decomposed by CO, to Na, CO, Aq and NaVO, Aq

(R., l.c.).
The other pyrovanadates that have been pre-The other pyrovanatates that have been prepared are 2Ca,V2O,. 5aq (Roscoe, l.c.; cf. Ditte, C. R. 104, 1705); Cu,V2O,. 3aq (von Hauer, l.c.); Pb,V2O, (Ditte, l.c.); 2Pb,V2O,. PbO (Roscoe, l.c.); Li,V,O,. 6aq (von H., l.c.); Mn,2V,2O, (Ditte, l.c.); Ag,V2O, (Roscoe, l.c.; Ditte, l.c.); Tl,V2O, (Carnelley, C. J. 26, 323); Zn,V2O, (D., l.c.).

TETRAVANADATES M,2V4O,1 or M,2O.2V4O, (also called diagnadates).

called divanadates).

Ammonium tetravanadate (NH₄). V_4O_{11} , raq; x=3 or 4. Formed by adding a little acetic acid to boiling NH₄VO₄Aq and evaporating in vacuo; also by saturating NH₂Aq with V_2O_3 in a closed, warmed flask, and allowing to evaporate; red prismatic crystals with a goldenyellow sheen (Berzelius, P. 22, 1; Rammelsberg, B. B. 1883. 3; von Hauer, l.c.; Ditte, C. R. 102,

918). Potassium tetravanadate = 3, 4, 7, and 10. Obtained by saturating K₂CO₃Aq at 80° with excess of V₂O₃ and allowing to cool; also by adding acetic acid to V₂O₅ in KOHAq, concentrating at 80°, and letting cool. (Ditte, C. R. 104, 902, 1061, 1168; cf. Norblad, B. 8, 126). Orange-coloured tablets (v. also Gibbons, C. N. 80, 267).

Chip ons, C. N. 80, 207).

The other tetravanadates are CaV₁O₁₁, 9aq (Manasse, A. 240, 23); PbV₂O₁₁ (Ditte, l.c.); Li₂V₂O₁₁, 9aq (Norblad, l.c.); MgV₂O₁₁, 9aq. (B., l.c.; vop. Hauer, l.c.); NiV₂O₁₁, 3aq (Radau, A. 251, 114); Na₂V₂O₁₁, 9aq (Berzelius, P. 22, C; von Hauer, l.c.; Norblad, l.c.); SrV₄O₁₁, 9aq (B., l.c.; vop. V. l.c.) von II., l.c.).

HEXAVANADATES M, IV, O16. xH, O or M.O.3V.O., $2H_2O$ (also called trivanadates). These salts have been described by Norblad (B. 8, 126) and Ditte (C. R. 104, 90% 1061, 1168). The chief are those where $M_2 = (NH_4)_2$

Cd, Ca, K₂ and Na₂.

The principal vanadates belonging to other

The principal vanadates belonging to other The principal vanadates belonging to other series than those already mentioned are the following:—(1) $3M_{\star}O_{\star}AV_{\star}O_{\star}$ (= $M_{\star}\Pi V_{\star}O_{\star}$), M = Ca and Sz (v. Manasse, Lc.); (2) $3MO_{\star}OV_{\star}O_{\star}$ (= $M_{\star}\Pi V_{\star}O_{\star}$), M = Ba, Mg, K_{\star} (d. Manasse, Lc.; Radau, A. -251, 114); (3) $2MO_{\star}SV_{\star}O_{\star}$ (= $M_{\star}\Pi V_{\star}O_{\star}$), M = (NH_s)_p, Ba, Li_s, Mg, K_s, Na_s (v. Ditte, Lc. p also C. R. 96,

l.c. ; 1048 ; Manasse, Norblad, l.c.) ; (4) 4M₂O.V₂O₃(=M¹,V₂O₃), M=Li and Na (v. Ditte, i.e.).

Several other vanadates not belonging to any of these series have also been described; for Ca

of these series nave also open described; for Ca and Sr satts (and double satts). v. Manasse (Lc.); and for Tl salts v. Carnelley (C. J. 26, 323).

HYPOVANADATES, Salts of hypothetical hypovanadic acid V.O.(OH). (=2V_2O., H_O). These salts belong to the form M.V.O., xH_O (= M_O.2V_2O_xH_O). The formation of the NH, when the salts was described by Regrating a garden. and K salts was described by Berzelius; a series of salts was prepared and examined by Crow (C. J. [2] 15, 458). The alkali salts are obtained by treating fairly conc. VO₂ClAq (v. HYDRATED VANADIUM DIOXYMONOCHLORIDE, p. 854) with excess of caustic alkalis, allowing the pps. to settle in closed vessels, washing with alkali solution, then with dilute alcohol containing a little acetic acid, and finally with alcohol alone, and drying between paper. The salts of Pb and Ag are obtained by ppn. from a solution of the K salt. The salts form brown to black crystalline powders; the alkali salts dissolve in water. Crow prepared salts with M2 = (NH4)2, Ba, Pb, K2, Ag2,

and Na... HYPOVANADO-VANADATES. Salts of the form $nV_2O_1 mV_2O_2 pM_2O_2 H_2O$. Alkali salts of this series were obtained by Brierley (C. J. 49, 32) by reducing $V_2O_2A_2$ by SO_2 , adding V_2O_3 in alkali, then a slight excess of alkali, and then acetic acid; pouring into alkali acetate solution, washing the pps. with alcohol, and drying over The salts crystallise in greenish-black,

CaCl₁. The saits crystallise in greenish-black, or black, prisms. The following were prepared: (1) 2V₂O₄,V₂O₂,2Na₅O.13H₂O; (2) 2V₂O₄,V₂O₂,2K₂O.6H₂O; (3) 2V₂O₄,V₂O₂,(NH₃).O.14H₂O; these salts are soluble in water: (4) 2V₂O₄4V₂O₅5K₂O.H₂O; (5) 2V₂O₄4V₂O₅3(NH₃)₂O.6H₂O; these are insoluble in water. soluble in water.

COMPLEX VANADIC ACIDS AND SALTS. Vanadio oxide V₂O₃ combines with several an-hydrides, such as As₂O₃, I₂O₃, P₂O₃, &c., and many of the compounds thus produced combine with basic oxides. The compounds of V₂O₃ with certain anhydrides are generally regarded as acidic; and the compounds formed of V₂O₅, anhydrides, and bases are usually classed as salt-like substances. It is quite likely that many of the compounds of V₂O₃ with anhydrides, such as As₂O₄, F₂O₃, &c., would be better classed as salts, just as the compounds of V₂O₃ with SO₃ are classed as salts.

ARSENO-VANADIC ACIDS AND SALTS. By boiling ARSENO-VANDIC ACIDS AND SAITS. By BOILING V₂O₃ with excess of H₂ASO₄Aq, and concentrating the solution, Fernandez (B. 17, 1632) obtained lustrous, golden-yellow crystals of V₂O₂As₂O₃, 11aq (cf. Friedheim a. Schmitz-Dumpnt, B. 23, 2600). Gibbs (P. Am. A. 2%, 50) obtained xV₂O₄.yAs₂O₅, saq (x and y probably either 5 and 8, or 7 and 6), by decomposing a privature of Na vanuadate and arsenate by mixture of Na vanadate and arsenate by a mixture of Na vanadate and arsenate by HNO, Aq. For various compounds of the form mV_*O_*, mA_*, O_*, pMO , where m and n are 1 and n, 2 and 3, 1 and 2, 2 and 1, &c., and p varies from P to 5, v. F. a. S. D. (l.c.):

1000-variant across. Ditte (Q. R. 102, 357) says that compounds of V_*O_* and I_*O_* are formed by heating V_*O_* with conc. HIO, Aq; he gives formulæ, but no analyses.

MOLYBDO-VANADIC ACIDS AND SALTS. For descriptions of numerous compounds of the forms also $xV_2O_*yM_0O_*$, eaq, $xV_2O_*yM_0O_*pMO_*$ eaq, and also $xV_2O_*yM_0O_*pMO_*$, $xpMO_*pMO_*$, $xpMO_*pMO_*$. Gibbs $(P. \Delta m. A. 18, 232)$.

PHOSPHO-VANDIC ACIDS AND SALTS. Various compounds of V₂O₃, P₂O₃, and H₂O are described by Gibbs (P. Am. A. 21, 50); Ditte (C. R. 102, 757) also assigned formulæ to substances ob-

of the form $\mathbf{z}V_{s}Q_{s}, \mathbf{y}P_{s}O_{s}$, neMO. zaq, v. Gibbs (l.c.); and cf. Friedheim (l.c.).

F. divides the compounds formed by reacting with V2O, on alka I phosphates into two classes, which he calls · luteo- and purpurco- compounds.

Luteo- compounds are formed by (1) the interactions of phosphoric and vanadio acids in solution; (2) the interactions of solutions of phosphates and vanadates in presence of small quantities of acids; (3) the interactions of solutions of phosphates and vanadic acid; (4) the interactions of vanadates and phosphoric acid, by heating solutions nearly to beiling and eva-porating. These compounds are yellow, granu-lar, and indistinctly crystalline; the alkali compounds are very slightly soluble in water, solution being accompanied by decomposition. The following luteo- compounds are described by F.:

V₂O₃,P₂O₃2H O. 9nq. V₂O₃,P₂O₃(Nif₁)₂O.H O. 2aq, 2V₂O₃,P₄O₃(Nif₄)₂O. 7aq, V₂O₃,P₂O₃K₂O.H₂O. 2aq, and 2V₂O₃P₂O₄K₂O. 7aq.

Purpureo compounds are formed by dissolving vanadic acid in conc. solutions of alkali phosphates, and by adding phosphoric acid to cone solutions of alkali vanadates; in each case the solutions should be strongly heated. The purpurco- compounds described by F. belong . to the form 12V2O3.P2O6.7M2O. 26aq; they are dark-red crystalline substances, sol. in water.

F. regards the luteo- compound of the form V_{2.0}, P_{2.0}, 2H_{2.0}, 9aq as acid phosphate of the radicle VO, thus (VO₂)H₂PO, 9aq; he compares this with the acid orthophosphates MH_PO₁. The compounds of the form MH.PO. The compounds of the form V.O. P.O. M.O.H.O. xaq are looked on as double heid phosphates of alkali metal and VO, thus NH₄(VO₂)HPO. The luter-compounds 2V₂O₃P₂O₃M₂O₄xaq are formulated by F. as double compounds of alkali metavanadates and double compounds of alkali mets-angdates and (VO.)H.PO.; thus 2VO.,P.2O.,K.Q.2H.Q. 5ac = 2(KVO.,(VO.)H.PO., 2½aq). The purpureo-compounds which belong to the form 12V.Q.P.O.,7M.Q. xaq are looked on by F. as double compounds of scil vanadates and acid phosphates; this view of their constitution is expressed by the statement 12V.Q.,P.O.,7M.Q. xH.O = P.Q.,2M.Q.H.Q. + 12V.Q.,5M.O + (x-1)H.O. These views of F. are considerably modified in a

These views of F. are considerably modified in a later paper (Zeit. f. anorg. Chemie, 5, 437) where the purpureo- compounds are looked on as divanadates with some V₂O isomorphously replaced by P₂O. According to F., many of the substances described by Gibbs and by Ditte do not exist. Berzelius (P. 22, 1) described a compound of V2O2, P2O2, and SiO2 with H2O, which may be

named phospho-silico-vanadic acid.

TUNGSTO-VANADIC ACIDS AND SALTS. pounds of V₂O₅ with WO₅ and bases that have been described are very numerous, and the formula, given are generally excremely complex (v. Gibbs, P. Am. A. 18, 232; Rosenheim, A. 251, 197, 234; and especially Friedheim, B. 17, 1505; 23, 1505; 24, 1173).

Vanadium, oxybromides of. Two compounds of V with O and Br have been isolated; and VOBr, corresponding with two of the five oxychlorides. According to Schafarik (W. A. B. 33, 14; 47 [11] \$\theta 51\$), other exybromides also

VANADIUM OXYDIBROMIDE VOBr2. (Vanadyl vanadion oxyddromide vodr. (*Anadio dibromide.) A brown, def quescent powder. Prepared by heating VOBr. (*). infra); decomposition to VOBr. and Broccurs slowly at temperatures below 180°, and suddenly at 180°. Heated in air forms V.O.; dissolves in water, forming a blue solution (Roscoc, U. J. [2] 9, 26). forming a blue solution (Aloscov, O. 1.12) of 1.27. Ditte (C. R. 102, 1310) says that a compound VOBr₂.4H₂O is formed, as dark-gleen deliquescent crystals, by treating red V₂O, with HBr. D. writes the formula V₂O, Br₂.2HBr.7H₂O.

VANADIUM OXYTRIBONIDE VOBr₃. (Vanady)

tribromide.) Prepared by passing vapour of pure Br over V₂O₂ heated to redness, condensing the yellowish white vapours that are formed, removing excess of Br from the red liquid by heating to 40°-50° at c. 100 mm. pressure in a current of perfectly dry air, and then distilling in vacuo (Roscoe, C. J. [2] 9, 24). VOBr₃ is s red, very hygroscopic liquid that boils, at 1300-136° at 100 mm. pressure; S.G. 2.9673 at 0°, 2.9325 at 11.5°; decomposes slowly at the ordinary temperature, and suddenly Lt 180°, to VOBr. and Br (R., l.c.).

Vanadium, oxychlorides of. Five compounds of V with O and Cl have been isolated: VOCl, VOCl₂, VOCl₃, V₂O₂Cl, and VO₂Cl. xaq.

VANADIUM OXYMONOCHLORIDE VOCI. (Vanadyl monochloride.) Obtained by the regulated reduction of VOCl, by H. The mixed vapours are passed through a red-hot tube; VOCl is deposited near the end whereat the vapours enter the tube. A brown, light, flocculent powder; insol. in water; easily dissolved by HNO, Aq

(Roscoe, C. J. [2] 6, 347).

VANADUM OXYDICHLORIDE VOCI2. dichloride.) Prepared by heating a slight excers of VOCI, with zinc for some days in a sealed tube, at 400°, cutting off the part of the tube on which the sublimate of VOCL, has formed (V2O4 and ZnCl, are the other products), quickly placing it in a wider tube, and removing VOC, by heating in a stream of dry CO, at 130°. Also obtained by passing vapour of VOCla and H through a red-hot tube; VCCla is deposited part the end of the tube whereat the gases enter, and V.O.Cl at the further end of the tube (Moscoe, Lc., p. 348). Luctrous, grass-green, deliquescent tablets; S.G. 288 at 13°; clowly decomposed by water; soluble in dilute HNO, Aq. A compounds with PtCl₄, having the composition 2(VOCl₂.PtCl₄). 21aq, is said by Brauner (M. 3, 58) to be formed by dissolving V₂O₃ in conc. HClAq in presence of PtCl,Aq.

VANADIUM OXYTRICHLORIDE VOCl₂. *(Vanadyl

trichloride.) Mol. w. 173.27.

Formation.—1. By heating V₂O₂ gently in a stream of Cl (Berzelius, P. 22, 1).—2. By heat. ing a mixture of V2O, and C in Cl.

Preparation .- A mixture of V2O, and sugarcharcoal is heated to redness in a stream of dry H, and allowed to cool in that gas; a stream of dry Cl is then passed over the mixture, which is heated to redness, and the product is condensed; the liquid thus obtained is heated for some boars in a flask with an inverted condenser, in a current of dry CO₂, and then rectified over Na (Roscoe, C. J. [2] 6, 342).

Properties and Reactions .- A clear, mobile, lemon-yellow liquid (Berzelius, l.c.; Roscoe, l.c.; Schafarik, A. 109, 85). S.G. 1.836 at 17.5°, 1.828 at 24° (R., l.c.); 1.86534 at 0°, 1.63073 at b.p. (Thorpe, C. J. 37, 348). B.P. 127·19° (T., Lc.). S.V. 106·25. Does not solidify above -15° (B., Lc.). V.D. 88·38 at 186° (R., Lc.; cf. T., C. N. 24, 827; Schafarik, Lc.). Gives off thick, yellowish-red fumes in the air. Dissolves in a little water, forming a thick, red liquid; dissolves in much water, forming a clear yellow liquid; dissolves in absolute alcohol with a red colour, but the solution soon becomes blue, owing to reduction. Heated to 60°-70° in a closed tube with ether forms needles of the composition VOCl, Et,O (Bedson, C. J. 29, 309).

V2O2Cl. DIVANADIUM DIOXYMONOCHLORIDE (Divanadul monochloride.) Yellow-bronze, microscopic crystals, resembling mosaic gold; formed by passing VOCl, and H through a red-The crystals are deposited on the hot tube. part of the tube farthest from the end whereat the gases enter (Roscoe, C. J. [2] 6, 348). Insoluble in water; soluble in HNO₃Aq. This compound was thought by Schafarik (A. 109,

85) to be V.

HYDRATED VANADIUM DIOXYMONOCHLORIDE VO.Cl. raq. (Hypovanadic chloride V.O.Cl. raq.) Formed, as a brown, deliquescent solid, by passing H.S into a solution of V.O. in hot HClAq, filtering from S, and evaporating (Crow, C. J. 30, 457). Heated in a stream of dry CO, gives off HCl and H2O, and leaves V2O4-40 C: (l.c.) gives the hydration as V₂O₄Cl₂. 5aq.

Vanadium, oxyfluorides of. No compound of Vewith O and F has been isolated with certainty. V2O2 dissolves in excess of HFAq; on evaporation, solution in water, and evaporation over H.SO., Petersen (J. pr. [2] 40, 194) obtained blue, microscopic crystals which he supposed might be VOF, xaq, inasmuch as a solution of these crystals in HFAq treated with fluorides yielded salts of the form xMF.yVOF, (v. Hypo-VANADOXYFLUCRIDES, p. 845). P. did not obtain enough of the blue crystals for analysis.

Vanacium, oxyiodides of. According to Ditte (C. R. 102, 1310), an oxylodide 2VOL-9K₂O is formed, as a black, deliquescent mass, by adding formed, as a black, deliquescent mass, by adding excess of HIAq to a warm solution of red V₂O₃, removing free I by shaking with finely-divided Ag, filtering, and evaporating in vacuo. The compound is said to react with NH₂Aq, civing (NH₄)₂V₂O₃. D. writes the formula as V₂O₁I₂.2HI.8H₂O; but no analyses are given.

No reaction occurs when I is heated with V₂O₄ (Roscoe, C. J. [2] 9, 28); nor when V₃O₅ is digerted with water, or alcohol, and I (Guyard,

Bl. [2] 25, 351). V.O. and I.O. probably combine (v. Ditte, C. R. 102, 757, 1019).

Vanadium, exysulphides of. None of these compounds has been certainly isolated. Ozysulphides may perhaps be formed by decomposing alkali thiovanadates in solution by dilute

and airdit into sandages in solution by different acids (o. Kay, C. J. 87, 728).

Vanddum, salts of. Compounds of the oxides V₂O₃, V₂O₄, and V₂O₅ with acidic oxides have been isolated; the formula of one or two of the compounds may be written as desired. from oxyacids by replacing H by V, but it is simpler, and more in keeping with the facts that eare known, to represent all the compounds by the general formula $V_2O_x.yX$, where X is an acidic oxide. The best-studied compounds of acidio oxide. V₂O₄ with acidic oxides may be represented as salts of the radicle V2O2 (divanadyl), or of the radicle VO (vanadyl); and the compounds of V2Os with acidic oxides as acid salts of the radicle VO₂. The sulphates have been better studied than the other salts; the following table presents the compositions of the sul-

I. Vanadous sulphates (v. p. 847): $V_2O_1.48O_3.xaq = V_1.H_2(SO_4)_4.yaq (y=x-1)$; ?? $V_2O_2.8SO_3 = V_2(SO_4)_3$. II. Hypovanadio sulphates (v. p. 848):

V₂0₄.2SO₄ = V₂O₂(SO₄)₂ = (VO)SO₄; V₂O₄.3SO₃, xx_0 = V₂O₂. H_2 (SO₄)₃, yx_1 (y = x - 1) = (VO.SO₄)₂. H_2 SO₄ yx_0 . III. Vanadic sulphates (v. p. 850):

Y₂0.2SO₂ = (YO₂)₂SO₃O₃ for if the salt contains xaq then Y₂O₃2SO₃, xaq = (YO₂)₂SO₃.H₂SO₄, yaq (y=x-1); Y₂O₃SO₂ = (YO₂)₂SO₃; or if the salt contains xaq, then $V_2O_4.3SO_3$. $xaq = (VO_2)_2SO_4.2H_2SO_4$. yH_2O

(y=x-2).

Alkalis probably ppt. V2O3. xaq from solutions of vanadous sulphates (v. p. 847); from solutions of hypovanadic sulphates alkalis ppt. V₂O₄. xaq (v. p. 848). V₂O₂ dissolves in oxyacids, forming lavender

olutions which probably contain V2O2. xX, where

\(\) is an acidic oxide (v. p. 846).

Various salts of V₂O₃, V₂O₄, and V₂O₃ besides he sulphates probably exist, but they have not

\[
\] been thoroughly examined (v. Hyrovanadic latts, p. 848; Vanadic salts, p. 850; Aiseno-/Anadic acids and salts, p. 853; Iodo-vanadic icids, p. 853; Molysdo-vanadic acids and salts, p. 853; Foreign salts, p. 2.853; PHOSPHO-VANADIC ACIDS AND SALTS, p. 853; and TUNGSTO-VANADIC ACIDS AND SALTS, p. 854).

Tanadium, silicide of. Roscoe (C. J. 23 8,

358) says that V acts on glass or porceann vessels when strongly heated therein, forming a compound with Si; tubes in which Vchlorides are reduced by heating in H get coated with a grey lustrous mirror of this compound. No details or

analyses are given.

Yanadium, silicofluoride of. By boiling

Y.O. with H.SiF.Aq and alcohol, Guyard (Bt.

[2] 40, 352) obtained a greyish, uncrystallisable

[2] 40, 552) obtained a greyish, uncrystallisable mass which he took to be a silicofluoride of V; no analyses or details of preparation are given.

Vanadium, sulmides of. Berzelius (P. 22, 1) described two compounds of V and 8, one often a solution of an alkali shiovanadate by dilute acid, and the other by heating VO on HS R wave the formula VS and ing V.O. in H.S. B. gave the formula VS, and Na, VOS, 5aq. Obtained by saturating 80 e.e

VS, to the compounds he described. The sul-phides of V were re-examined by Kay in 1880 C. J. 37, 728), who found that the pp. obtained (C. J. 37, 728), who found that the pp. obtained by adding dilute HClAq or H_SO_Aq to a solution of sodium ganadate saturated with H_S, or to solution of V_O, in an alkali hydrosulphide, contained O, but probably had not a sedinite composition; and that the product of heating V_O, in H_S is the trisulphide V_S, Kay prepared three sulphides, V_S, V,S, and V,S, corresponding to three of the four oxides; the sulphide discolve in solutions of bled including sulphides dissolve in solutions of alkalisulphides.

probably forming thioranadates (q. v. infra).

Vandium disurrence V.S., (Hypovanadous sulphids.) Propaged by heating V₂S, to full redness, for a long time, in H quite free from O. Forms black lustrous plates, or a brownish-black powder; S.G. 4-2 to 4-1. Absorbs O very quickly when heated in air, giving V_2O_3 , V_2O_4 , and then V_2O_5 , with evolution of SO_4 . Not acted on by boiling HClAq, dilute or conc., nor by boiling dilute H.SO.Aq, or cold conc. H.SO. Dissolves in hot conc. H.SO.; dissolves in HNO.Aq. Slowly acted on by NaOHAq or KOHAq, hot or cold: dissolves in (NH₄)₂SAq or KHSAq, forming purple to reddish-brown solutions (Kay, Le. 775)

(Vanadous VANADIUM TRISULPHIDE V2S2. sulphide.) Formed by strongly heating V.O. in a stream of H.S. (Berzelius, Le.; Kay, Lo. p. a stream of H.S (Berzelius, Lc.; Kay, Lc. p. 736); also by heating any chloride of V, or VOCl., to redness in H.S (K., Lc.); and by strongly heating VO. ing V2O, in a stream of vapour of CS2 so long ing V₂O₂ in a stream of vapour of CS₂ so only as any reaction occurs (K. Lc.). Forms dark, lustrous plates, or a black amorphous powder; S.G. 37 to 40. Oxidised by heating in air, finally to V₂O₂, giving off SO₂. Scarcely acted on by dilute HClAq or H₂SO₂A₃, and or cold, nor by cone. HClAq; readily oxidised by HNO, Aq. Soluble in (NH,) 2SAq or KHSAq, forming purplered to golden-red solutions; also somewhat soluble in KOHAq, NaOHAq or NH, OHAq (Kay, l.c.).

VARADIUM PENTASULPHIDE V₂S₃. (Vanadia sulphide.) Prepared by mixing V₂S₃ with \$\frac{1}{3}\$ its weight of pure powdered S, heating to fusion (c. 400°) in a narrow tube quite filled with CO, and scaled, cooling, and dissolving out excess of S with CS. A black powder; S.G. 30. Heated in a gas that does not react with it, V2S, gives in a gas that does not react with 13, v₃S₃ gives off S and leaves V₂S₃; heated in air gives off SO₂, forming V₂O₃ and finally V₂O₃. Behaves towards bacids similarly to V₂S₃. Dissolves in hot NaOHAq; also in (NH₄). SAq or KHSAq, forming

yellow to red solutions (Kay, I.c. p. 738). Vanadium thio acids, and selts thereof. compound of V with H and S has been isolated, but some thiovanadates, and also some oxythiovanadates, have been prepared by Krüss a.

throwandates, have been prepared by Kuss.
Ohmanis (B. 23, 2547).
Athinonium bito-orthovanadate (NH.), VS.,
Obtained, in pusple crystals, resembling
KMfO., S.G. 1-62, by passing H.S into a solution of NH, VO, in NH, AQ 23G. 898; the solution is saturated in the cold, and is kept cold while H.S is passed in. A brown pp. is formed, and this dissolves after passing in more H.S to a dark-violet liquid, from which the salt crystal lises after some time.

Sodium monoxy-thio-orthovanadate

NaOHAq S.G. 1.122, with H.S, adding a solution of 8 g. Na, V,O, in 6 c.c. water, cooling the liquid by ice, and passing in H,S for 4 hours. The salt was also obtained without water of crystallisation by Krüss (Zeit. f. anorg. Chemie, 3, 264) by fusing a mixture of V₂O₃, Na₂CO₃, and S, until excess of S was removed. Small crystals, that melt at the ordinary temperature to a red, oily liquid (K. a. O., *l.c.*).

Sodium trioxy-thio-orthovanadats

Na, VO, S. 10aq. Obtained by heating Na, V2O, Aq to boiling, adding freshly prepared NaSHAq, cooling by ice, and adding alcohol. A red oil, that solidifies to a crystalline mass which melts at 18° (K. a. O., l.c.).

Ammonium monoxy-thio-p rovanadate (NH₄)₄V₂OS₅. Formed by passing H₂S into a cooled solution of NH₄VO₅vin NH₃Aq S.G. greater than '898, and allowing the liquid to stand for some months, when crystals separate having S.G. 1.715 (K. a. O., l.c.).

Potassium monoxy-thio pyrovanadate

K.V.OS. 3aq. Obtained by passing H.S into KVO, in KOHAq S.G. 1.472, air being excluded and the liquid cooled by icer Crystals resemble KMnO₄; S.G. 2·144; loses all water slowly at 150°. By evaporating the mother-liquor from this salt in vacuo, large crystals of the salt 2K₄V₂OS₄. 3aq are obtained (K. a. O., l.c.) M. M. P. M.

VERATRUM ALKALOIDS

Veratrine U₁₂H₁₈NO, & Cevadine. [205°]. 8. 12 at 16° Occurs in the seeds of Veratrum Sabadilla (Meissmer, N. J. T. 5, 3; Pelletier a. Caventou, A. Ch. [2] 14, 69; Ccuerbe, A. Ch. [2] Carenton, A. Ch. [2] 14, 05; Ottoroe, A. Ch. [2] 52, 352; Merck, ch. 95, 200; Ar. Ph. 231, 135; Delondre J. Ph. [3] 27, 417; Weigelin, C. C. 1872, 259; Schmidt, Ar. Ph. [3] 10, 511; B. 9, 1115; A. 185, 224). Occurs also in the root of Sarracenia purpurea (St. Martin, Z. [2] 2, 442;, Hétet, C. R. 88, 185). Prepared by extracting

the seeds with boiling alcohol containing a little tartario acid, concentrating the extract, adding water, filtering from resin, adding Na,CO,, and shaking with ether. The ethereal solution is shaken with dilute tartaric acid solution, and the acid solution mixed with Na,CO, and extracted with ether. The ethereal extract is mixed with ligroin and allowed to evaporate spontaneously, when a viscid mass first separates, followed by crystals which are recrystallised from alcohol (Wright s. Luff, C. J. 83, 888). If commercial veratrine [144°] be dissolved in alcohol at 70°, water added till turbidity ensues, and the solution evaporated at 50° to 60°, crystalline veratrine separates first, then a resinous mixture of veratrine and veratridine, while the mother-liquor contains veratridine and veratroin

veratrate (Rosetti, Ar. Ph. [3] 21, 81).

Properties.—Needles (from alcohol),
ether, insol. water. Inactive to light. poisonous, a small quantity producing vomiting and purging. Introduced into the nose it produces sneezing. Alkaline to test papers. Conc. H₂SO₄ forms a yellow colour changing to crimson, 1 pt. colouring 3,000 pts. H₄SO₄ (Vasmer, Ar. Ph. 2, 74). Conc. HClAq forms a yellot solutions. violet solution on warming. HNO, forms a red solution, becoming yellow. Veratrine mixed with sugar (3 pts.) is coloured by H₂SO₄ dark green and finally deep blue (Weppen, Fr. 13, 454). A solution of ammonium selenite (1 g.) in H₂SO₄ (20 c.c.) gives a yellow colour at 30°; in 3 hours a red pp. is formed, the liquid remaining yellow (Da Silva, C. R. 112, 1267). On heating with alcoholic potash or baryta it yields angelic acid and cevine (W. a. L.; Rosetti; "Stransky, M. 11, 482). ICl forms a yellow flooculent pp., sol. hot HClAq (Dittmar, B. 18, 1612). Conc. HClAq yields tiglic acid. Veratrine yields tiglic acid and (8) methyl-pyridine on distillation. On distilling veratrine with lime the products are (8) methyl-pyridine and its hexahydride and isobutyric acid (Ahrens, B. 23, 2705). Veratrine is not affected by bolling dilute H₂SO, Salts.—B'HCl. Amorphous.—B'₂H₂PtCl₄:

amorphous.—B'HAuCl, Yellow needles (from alcohol).—B'HAuCl, 2aq (Rosetti, J. 1883, 1351). -R'HHgCl₃. Crystalline pp., v. sol. alcohol.-B'₂H₂SO₄ (dried at 100°).—B'H₄. Reddisl Reddishbrown amorphous solid (Bauer, J. 1874, 861).

Benzoyl derivative C₂₂H₄₈BzNO₂. [170°—180°]. Brown crystals (containing 1½ aq) (from

ether).—B'HAuCl.

Dibroride C. H. Br. NO. Formed by allowing the tetrabromide to stand in contact with dilute KOHAq. Light-yellow amorphous

Tetrabromids C_{zt}H₁₈Br₄NO₂. Formed by whaking veratifihe with bromine-water. Yellow amorphous powder, insol. water, v. sol. alcohol and ether (Ahrens_{*}B. 23, 2701).

Cevine C_{zt}H₁₈NO₂ (W. a. L.); C_{zt}H₁₈NO₂ (Rogstit). Cevedine. [145°] (W. a. L.); [182°-185°] (R.). Formed by boiling veratrine with alcoholic NaOH (W. a. L.). Yellow resin, v. col. alcohol of sof ether. Exampons solution sol, alcohol, sl. soff ether. Ks aqueous solution becomes turbid on warming. Does not attack the mucdus membrane, gives a crimson colour with H₂SO, and a brown colour with cane-sugar and H₂SO. Its salts are amorphous.—B'HHgI₄ (dried at 100°). Precipitate. Veratridine C₂, H₂₂NO₁₁ (W. a. L.); C₂, H₂, NO₂ (Rosetti). Veratrine. [180° c (W. a. L.); [160°-155°] (R.). S. 3 at 15°. [180° cor.] the viscid mass which separates before veratrine when a solution of the crude base in alcohol-ligroin is evaporated be shaken with ether, cevadilline remains undissolved, while veratridine dissolves in the ether (Wright a. Luff). Amorphous resin, sl. sollether. Decomposed by alcoholic potash into versiric acid and verine C₂₂H₁₅NO₅ [c. 95°] (W. a. L.) or versiring C₃₅H₂₅NO₅ [143°-148°], (R.), an amorphous base, solether. Verstriding dissolves in boiling water, being converted into veratroin veratrate $C_{ab}H_{ab}N_{a}O_{1}C_{a}H_{10}O_{1}$ 2aq (Rosetti), which melts, when anhydrous, at 165°-170°. H₂SO₁ forms a yellow solution which turns crimson.—Salts.—B'HAuCl. Amorphous.—BH,SO, 10aq, crystal-

Cevadilline C₁H₂₃NO₅. Obtained as above (W. a. L.). Amorphous, sl. sol. ether, m. sol. benzene. Decomposed by alcoholic potash.

Salts.—B'HAuCl,—B'HHgI₂. Gelatinous.
Cevadilline is perhaps identical with the sa badilline C₄H₅₆N₂O₁*of Wiegelin (C. C. 1872, 229), to which Hesse (A. 192, 186) assigns the formula CH₅NO₅ while sabatrine C. H₅NO₅ (W.) C₁₁H₃₅NO₇; while sabatrine C₃₁H₃₆N₂O₁, (W.) or C₃₂H₄₅NO₉ (H.) was probably a mixture of decomposition-products (Wright a. Luff).

Veratrum about. The alkaloids in the root

of this plant, and in that of V. viride, are described under JERVINE

VERATRUMIC ACID is VERATRIC ACID.

(Trifolium pratense), in pumpkin seeds, in ergot, and in the blossom of Corylus avellana and Pinus sylvestris (E. Schulze, J. pr. [2] 32, 447; H. 10, 80, 326). Separated from asparagin by crystallisation from hot water. Minute silky prisms, v. sol. hot water, insol. alcohol. Its aqueous solution is neutral, gives no pp. with Pb(OAc), but is ppd. by AgNO, by pieric acid, and by phosphotungstic acid in presence of

HCl. Boiling hydrochloric acid forms guanine.—
Ag.C., H., N.O.. Gelatinous pp.
YERNONIN C., H., O.. Occurs in the root of
Vernonia nigritiana, used on the west coast of Africa as a febrifuge (Heckela. Schlagdenhauffen, C. R. 106, 1446). White powder, sl. sol. ether and chloroform, sol. alcohol. Conc. H2SO, gives a brown colour, changing to purple. Cardiac poison, 80 pts. being required to produce the effect of 1 pt. of digitalin. Decomposed by boiling dilute HCl into glucose and a resin

the seeds of Vicia sativa, V. Faba, and V. Faba minor (Ritthausen, J. pr. [2] 2, 3359.

Seeds with cold dilute H.SO. (1:50), neutralising with lime, filtering from CaSO., evaporating to dryness and crystallising from 86 p.c. alcohol.

The yield is 25 p.c.

Properties.—Tuffs of small needles, nearly
insol. alcohol. Loses 2H₂O at 160°. Sol.

alkalis and allaline earths, reppd. on newtralisation. Not affected by boiling baryta-water. Sol. dilute HCl and H.SO., but after boiling the colution gives a deep-blue colour with FeQ, and needles.

NH₂, and a violet pp. with baryta. Boiling KOHAq (S.G. 1·1) also forms divioin. When evaporated with HNO, (S.G. 1.2) the residue is edged with deep violet. Potash-fusion forms KCy.

Salts. - B'44H2SO. - B',11HCl. Slender needles.

Divicin C₃,H₃₆N₃₆O₁₆. By boiling vicin with water (5 pts.) containing H₃SO₄ (1 pt.) at 0° shere is formed crystalline (C₃,H₂,N₃,O₆)2§SO₄, which yields divicin on treatment with exactly the calculated quantity of KOHAq. Flat prisms (from water). Reduces AgNO, at once. Not pod by baryta. A little FeCl. followed by NH, gives a splendfil bac colour. B'SHNO, Whetstone-shaped crystals, got by adding HNO, to a

convicin C₂₀1²₁₂₈N₀O₁₁ 2aq. Obtained from powdered vetch seeds by extracting with alcohol, allowing vicin to crystallise from the extract, ppg, the mother-liquor with HgCl, and potash, decomposing the pp. with enqueous H.S, and evaporating. The mixture of vicin and convicin dissolves the vicin only. Thin plates (from water), often resembling leucine. Hardly sol. water), often resembling leucine. Hardly sol. cold water, sl. sol. alcohol. Not decomposed by boiling KOHAq (S.G. 1-1). Potash-fusion gives off NH, but forms no KCy. I sol. cold dilute HCl and H.SO. Its aqueous solution gives a flocculent pp. with Hg(NO₃)... VINACONIC ACID v. TRI-METHYLENE D

CARBOXYLIC ACID.

VERINE v. VERATRUM ALKALOIDS.

VERNÍN O₁₆H₂₈N₂O₈ 384. Occurs in young extended by milk of lime from powdered vetch plants (Vicia sativa), in young red clover a asclepids root (Tauret, C. R. 100, 277; Rl. [2] 43, 620. Occurs in two forms, sue soluble and one insoluble in water. Both forms are laworotatory, amorphous, sl. alcohol, insol. ether. Boiling dilute HCl yields an amorphous, inactive sugar, which does not ferment with yeast.

VINYL ALCOHOL CH.: CH.OH. This substance might be expected to be identical with aldehyde CH, CHO, but Poleck a. Thumsel (B. 22, 2863) suppose it to be present in ether that has been exposed to air and sunlight, and that its presence is indicated by the formation of a pp. C.H.OHgOHg.Cl. when a solution of mercury oxychloride in Na, CO, Aq is added to commercial ether. This pp. is white, and is converted by boiling potash into explosive greenish black acctylene mercury C.H.O.Hg. and by adding nitrio acid to its alkaline solu-tion into C₂HHg₂OCl₂, which is not explosive. H.S passed into water containing the compound C.H.O.H.O.Cl. yields (γ)-tri-thio-acetic aldehyde

VINYL-DIACETONAMINE v. ACETONAMINES. vinyL-Minus CH₂:CH.NH₂. Formed by the action of moist Ag₂O or of KOHAq on bromo-ethylamine hydrobromideat 48° (Gabriel, B. 21, 1049, 2665). Known only 2n squeous solution. Volatile with steam. Decomposes in aqueous solution gven in the cold. SO, converts it into taurine.

Salts.—*B'HCl. Poisonous. Its aqueous solution is decomposed by heat.—B',B,PtCl., Crystals, v. sol. water.—B',2BiI, Minute scarlet hexagonal leaves.—B'HAUCl., Golden crystals. B'C.H.N.O. [142°]. Slender yellow

–Di-iodovinylamine. VINYL BROMIDE v. BROMO-ETHYLENS. Vinyl tribromide of. TRI-BROMO-ETHANE. VINYL CHLORIDE v. CHLORO-ETHYLENE. VINYL ETHANE v. BUTYLEZE. VINYL-ETHYL-CARBINOL, v. PENTENYL

VINYL-ETHYLETE v. BUTINENE

VINYL ETHYL OXIDE CH. CH.OEt. (35.5° i.V.). S.G. $\frac{14.5}{17.5}$ 7625. Formed by heat-ing chloro-acetal CH₂Cl.CH(OEt)₂ with sodium at 140° (Wislicenus, A. 192, 106). Liquid, smelling like ether mixed with allyl compounds. Combines with Cl and Br. forming di-chloro, and di-bromo-di-ethyl oxide. A small quantity (1 g.) of iodine converts large quantities of the oxide (200 g.) into a viscid liquid. Dilute (1:4) H2SO4 forms aldehyde and EtHSO. .

Reference.—Chloro-vinyl-ethyl oxide. VINYL-ETHYL-PYRIDINE

C.H.NEt.CH:CH. (98°-102° at 21 mm.). Formed by heating C.H.NEt.CH. CH. OH, with conc. HCl at 170° (Prausnitz, B. 25, 2394). Oil, v. sol. ether.—B'₂H₂Hg,Cl₁₂. Neefles, sl. sol. hot water. VINYL IODIDE v. IODO-ETHYLENE.

VINYL-MALONIC ACID v. TRIMETHYLENE

DIGARBOXYLIC ACID.

VINYL OXIDE (C2H3)2O. (39°). Formed by the action of dry Ag₂O on vinyl sulphide (Semmler, A₂, 241, 90).

Reference.—HEXA-CHLORO-DI-VINYL OXIDE.

o.VINYL-PHENOL CH₂:CH.C₄H.,OH. Methyl ether CH₂:CH.C₄H.,OMe. o-Vinyl-anisole. (c. 198°). S.G. 16 10005, 30 10005. Formed from either of the methyl derivatives of o-oxy-phenyl-acrylic acid by successive treatment with HI and Na₂CO₂Aq (Perkin, C. J. 83, 211; 39, 429). Oil. Polymerises readily (at 150°), forming a glassy mass, which, however, on distillation, regenerates the original oil. It smells like high-boiling coal-tar naphtha. It forms a colourless compound with bromine.

p-Vinyl-phenol. Methyl ether
CH₂:CH.C.H.OMe. [3°]. (205°). S.G. ½5
1-0029; ½5 9956. Formed by distilling methoxyphenyl-acrylic acid (q. v.) and from the same acid by successive treatment with conc. HI (S.G. 194) and Na.CO.

Reference.-BROMOand NITRO-

PHENOL. VINYL-PIPERIDINE C,H10(C,H3)N (?) (147°). Formed by dehydration of oxy-ethyl-piperidine [32°] (Ladenburg, B. 22, 2587). Liquid, smelling like tropidine and conjine, v. sol.

YINYL-

Reference .- BROMO-VINTI - PIPERIDINE.

p. VINYL-ISOPROPYL-BENZENE O₁₁H₁₄ i.e. C.H.Pr.CH:CH₂ (204°). S.G. 14 p. 8902. Formed by distilling purels arylic acid at 21°0 r by boiling a-bromo-β-tumyl-propionic acid with Na₂CO₂Aq (Perkin, C. J. 1877, ii. 660). Oil, smelling like cuminic aldehyde. Partially polymerises on boiling, and also on keeping, forming a glassy mass, reconverted into the original hydrogarbon by heat. Yields C₁₁H₁₁Br, [71°]. .VINYL-PYRIDINE C,H,N i.c.

N < C(C,H_):OH > CH: (159°). S.G. 2 9985, Formed by passing a mixture of pyridine and Reducing agents form uranil (amido barbituric

ethylene through a red-hot tube (Ladenburg, B, 20, 1643). Formed also by distilling oxy-ethylpyridine under high pressure or in presence of KOH (Ladenburg, B. 22, 2585), and by the action of NaOHAq on β-bromo-β-pyridyl-propionic acid (Einhorn, A. 265, 229). Liquid smelling like conyrine, m. sol. water, v. sol. alcohol. De composed by distillation under atmospheric pressure, but boils at 81° under 29 mm. Oxidised by KMnO, to picolinic acid, and reduced in alcohone solution by Na to ethyl-pyridine.—Salts:
B'H.PtCl. [174°]. Crystals, m. sol. water.—
B'HAuCl. [144°]. Yellow needles.
Tetra-vinyl-pyridine C,H(C,H,),N. (277°).
S.G. 2 1°0515. Formed in the preparation of

γ-ethyl-pyridine by heating pyridine ethylo-igdide in sealed tubes at 320° (Karan, B. 25, 2776). Sl. sol. wakr.—B'.H.PtCl, [175°].— B'HAuCl, [148°].—B'HHgCl, [146°]. Needles.

VINYL-QUINOLINE v. QUINOLYL-ETHYLENE. VINYL SULPHIDE C.H.S i.e. S(CH:CH2)2. (101°). S.G. 913. Constitutes the chief part of the essential oil of Allium ursinum (Semmler,

A. 241, 90). Liquid, smelling like allyl sulphide. Reactions.—1. Dry Ag.O forms vinyl oxide.— 2. Moist Ag₂O gives aldehyde.—3. Alcoholic HgCl₂ forms crystals of C₈H₁₂Cl₄Hg₂S₂, which, when heated with potassium sulphocyanide, yields vinyl sulphocyanide.—4. PtCl, added to its alcoholic solution ppts. (C₂H₃) Cl₃Pt₂S₃, which is decomposed by animonium sulphide into vinyl chloride and dark-brown (C,H,),PtS,... 5. AgNO₃ forms (C,H,),2AgNO₃...6. Br gives (C,H,)tz),SBr. [295°]...7. Oxidising agents yield CO₂, oxalic acid, and H₂SO₃ only.

VINYL-TOLUIDINE so called is DI-p-TOLYL-DI-ETHYLENE-DIAMINE.

VIOLAQUERCITRIN v. this vol. p. 373. VIOLANTIN C.H.N.O. 4aq. Formed by mixing hot conc. solutions of nitroso- and nitrobarbituric acids (violuric and dilituric acids). Formed also by warming hydurilic acid with dilute HNO₂ (Baeyer, A. 127, 223). Yellowishwhite, crystalline powder, decomposed by water into its two component acids, but may be recrystallised from HOAc or 50 p.c. alcohol. It is also split up into its components by salts of the stronger acids.

VIOLURIC ACID C.H.N.O. i.e.

C₂O₂<NH C:NOH. Nitroso-barbituric acid. Mgl. w. 157.

Formation.—1. From hydurilic acid by the action of nitric acid (S.G. 1.2) or nitrout acid (Baeyer, A. 127, 200).—2. By heating dilituric (nitro-larbituric) acid with glycerin.—3. By warming ferçous diliturate with KCy.—4. By boiling an aqueous solution of alloxantin with hydroxylamine hydrochloride (Pellizzari, G. 17, 258).—5. Byadding hydroxylamine to an aqueous solution of alloxan (Ceresole, B. 16, 1133).— 6. By adding KNO, to barbituric soid (Baeyer, A. 130, 140).

Properties.—Trimetrio crystals (containing as); a:b:c = 83:1:1.92. M. sol. cold water, sl. sol. alcohol. Its aqueous solution is ppd. by scobol. FeSO gives a deep indigo-blue colour. HNO, forms ritro-barbituric seid. Br forms di-bromo-barbituric acid and nitrous fumes.

acid). Conc. HClAq forms hydroxylamine on heating.

Salts .- NH,A'. Dark-blue prisms .- KA'2aq. Balts.—NH,A'. Dark blue prisms.—KA'2aq.
Deep-blue crystals, v. sol. water, forming a blue solution; turned red by excess of KOH. A solution of the K salt in conc. HClAq deposits (KA'),HCl), 6aq in colourless efflorescent prisms.—BaA', 4aq. Red dimetric tables, nearly insol. cold water.—MgA', 6aq. Purple-red crystals.—PbA', 4aq. Small red crystals.—AgA'. •

Bensyl ether CONH.CONC.H.

[226°]. Formed by the action of benzyl chloride on silver violurate (Conrad a. Guthzeit, B. 15, 2849). Silvery scales, sol. hot water and alcohol. VIRIDIC ACID v. CAFFETANNIC ACID.

VIRIDINE C₁₂H₁₈N. (251°). S.G. 1024. A homologue of pyridine occurring in coal-tar (Thenius, C. C. 1862, 53). Yellowish oil, with slight greenish fluorescence, sl. sol, water, v. sol, alcohol and ether. — B'2H2PtCla. Greenish brown, insol. water, alcohol, and ether. The mercuric chloride double salt melts at 85° and crystallises from water.

Isomeride C12H16N. (230°-235°). Obtained, with other bases, by heating methyl-ethyl-acrolein with alcoholic ammonia (Hoppe-Seyler, M.

9, 651).—B'HAuCl., [93°].—B'HA!YCl., [135°].
VISCIN C_{[0}II.,O₀, (?). The glutinous constituent of the stalk, leaves, and berries of the mistletoe (Viscum album). Extracted from the bark by kneading with water, washing the sticky mass with 90 p.c. alcohol, and extracting the viscin with cold ether. The residue consists of viscaoutchin and woody-fibre (Reinsch, C. C. 1861, 145). Colourless, tasteless, semi-flaid mass, S.G. 10, decomposed by distillation, yielding oily viscene (226°) S.G. 85, which forms a crystalline Na salt with conc. NaOHAq. Viscaoutchin is very glutinous. Its S.G. is

978, and it is insol, alcohol and ether, sol, oil of turpentine.
VISCOSE is DEXTRIVE (q. v.).

VITELLIN v. PROTEÏDS. VITELLOSE v. PROTEÏDS.

VOLUMES, SPECIFIC: v. SPECIFIC VOLUMES.

VULPIC ACID C, HP,O, i.e. Methyl pulvate. [148°]. Occurs in Cetraria vulpina, a lichen growing in Norway, and used there, mixed with nux. vomica, as poison for wolves (Bebert, A. 2, 342; Strecker a. Möller, A. 113, 56; Spiegel, B. 13, 1629; 14, 1686; A. 219, 15). The lichen contains 2) to 4 p.c. of the acid, which may be extracted by warm milk of lime. Vulpic acid is also formed by dissolving pulvic anhydride in a solution of KOH in McOH. It appears to occur in the lichen Parmelia parieting (Berzelius; Stein, J. 1864, 553).

Properties.-Yellow plates or needles, sol. alcohol and ether, v. e. sol. chloroform, nearly insol. boiling water. Decomposed above 200° ind McOH and pulvic anhydride. Boiling milk of lime converts it into pulvic acid. Boiling

KOHAq forms di-benzyl-glycollio acid and CO₂.

Salts.—NH,A'. Yellow crystals, sol. water.

-BaA', 2aq. Yellow needlos (from water).

BaA', 2aq.—KA'aq. Light-yellow needlos sl. sol. water.

-AgA'. Pp. Blackens 2t 130°. Acetyl derivative C₁₈H₁₃AcO₄. [156°]. Colourless needles, insol. NaOHAq.

Methyl ether v. Di-methyl ether of Pulvio

Isovulpic acid C₁₈II₁₁McO. [124°]. Formed, in small quantity, together with pulvic anhydride, by heating vulpic acid at 200° (Spiegel). Thin golden plates (from alcohol). Forms orange

solutions in alkalis.

w

WACKENRODER'S SOLUTION. The soluion obtained by passing H2S for a long time nto nearly saturated SO₂Aq. The solution conains H₂S₂O₆, much H₂S₂O₆, H₂S₂O₆, and propably H₂S₂O₆, along with H₂SO₄, dissolved olloidal S, and a little S in suspension; v.

CHONGE CAUSE, P. 618: S IN SUSPENSION, F. C. (1908). Cause P. 638. WALDIVIN C₁₀H₂₁O₁₀. [230°]. S.G., 1:46. J. 17 at 15°; 3 at 100°. S. (alcohol) :33. Exracted by dilute alcohol from the powdered fruit of Simaba waldivia (Tanret, Bl. [2] 35, 104; 7. R. 91, 886). Hexagonal pisms (containing faq), v. sol. chloroform, insol. ether. Neutral to famus. Inactive to light. Tastes bitter. WATER. H.O. (Hydrogen monoxide.) Mol. w. 17.96. (For physical data v. Properties.). Occurrence.—Pure water is never found in

nature. The properties of different specimens of naturally occurring waters depend on the im-purities they contain, and these impurities are derived from the substances with which the water has come into contact; hence it is customary to classify natural waters in accordance with their origin, as rain-water, surface-water,

well-water, mineral spring-water, and sea-water. The composition of the substances found in these waters, and the properties of the waters themselves -that is, of the various more or less dilute aqueous solutions - are discussed in pp. 989-960 of vol. iv. of the DICTIONARY OF APPLIED CHEMISTRY. Solid water, more or less pure, is found as ice and snow. Water vapour is a constant constituent of the atmosphere. Agreat many minerals, and also many organic substances, contain water combined with other compounds.

Historical .- In 1781 Cavendish showed exnatoricat.—In 1781 Cavendins snowed ex-permentally that water was the only product of burning H and O mixed in certain proportions, and that almost the whole of the H and O dis-appeared. The account of the experiments made by Cavendish was published in 1784 (T. 1784. 116).

'When a mixture of inflammable and dephlogisticated air [i.e. in modern language, hydrogen and Gygen] is exploided in guch proportions that the burnt air is not much ploigisticated, the condensal liquor contains a little soid, which is always of the nitrous kind . . ; but if the proportions be such that the burnt air is almost entirely phlogisticated, the condensed liquor is not at all soid, but

eems pure water, without any addition whatever; and as, when thay are mixed in that proportion, very little sir emains after the explosion, sluost the whole being con-lemed, it follows that almost the whole of the inflammable and dephlogisticated air is converted into pure water '(i.e.

Translated into modern language, this statenent would be taken as asserting that water is lormed by exploding a mixture of H and O in croper proportions. It is, however, worthy of note that Cavendish did not himself ipterpret his experimental results as we interpret them to-day. He regarded 'dephlogisticated air' oxygen] as 'nothing but dephlogisticated water, or water deprived of its phlogiston. He said: We must allow . . . that inflammable air [hydro-He said: gen] is either pure phlogiston... or else water united to phlogiston' (l.c. pp. 187, 140).

The formation of water by burning H and O was thought of by Cavendish as the restoration of phlogistone to water that had been deprived of this principle. 'Water,' he said, 'consists of dephlogisticated airs' united to fhlogiston.' Cavendish evidently thought of H and O as what we might now call forms of water; one or these was water with too little phlogiston, and the other was water with too much phlogiston; the explosion restored the phlogistic balance, and the properties of water were apparent. When Lavoisier had interpreted Cavendish's results, Cavendish spoke of Lavoisier's explanation as an hypothesis: 'According to this hypothesis we must suppose that water consists of inflammable air united to dephlogisticated air (l.o. p. 150). Cavendish established the fact that water is the product of burning a mixture of H and O in the ratio (approximately) of 2 vols. H to 1 vols?); but he stated this fact, in language that no longer carries a definite-meaning with it. Lavoisier added to the experimental basis whereon the fact rested, and he expressed the fact in language that still is clear, definite. and descriptive.

Formation .- 1. By the direct union of H and & by igniting a mixture of these elements. 2. By deoxidising metallic oxides, and many other compounds that contain O, by heating with H.-3. By the decomposition of many compounds containing H and O, by heat, or by reactions with other substances.

According to Freyer a. V. Meyer (B. 25, 622), a mixture of H and O in the ratio 2H:O does not explode when slowly passed through a giass tube at 606°, and the temperature of ignition of the wet, gaseous mixture is between 650° and 730°. Askenasya V. Meyer (A. 269, 49) found that when pure, dry electrolytic gas was passed at a moderate rate through a class tube heated to 518°, only o. 7 to 1.7 mgms. of water were produced in ten hours; and that a little more water, but still only a very small quantif, in proportion to the total quartity of H and O, was formed at 606°. Experiments made to determine the relation between the quantity of water formed and the time of the experiment showed that no constant relation could be arrived at, even when every precaution was taken to insure equality of conditions; the irregular action of the surfaces of the vessels was probably the cause of the irregularities in the results.

Davy (T. 1817) found that electrolytic gas did not explode when the pressure was so reduced

that the gas was rarefied to $\frac{1}{15}$ of its ordinary density. Thomas (C. J. 85, 215) found that the gas exploded at 168 mm. pressure. L. Meyer a. Seubert (C. J. 45, 586) found that the sparks from a Ruhmkorff coil caused the combination of c. 2 of a quantity of electrolytic gas at c. 70 mm. pressure, and that the remainder combined when the pressure was increased until it became the same as before the first explosion; this result is in keeping with Bunsen's determinations of the quantity of oxygen needed to prevent the explosion of CH+O (v. M. a. S., l.c. p. 588). Dixon (T. 1884. 634) noticed that electrolytic gas did not explode at a pressure under 70 mm., but that explosion occurred under 75 mm. pressure (cf. D., l.c. p. 642).

According to the experiments of Dixon (l.c.), the union of oxygen and hydrogen is not affected by the presence or absence of water'; dry electrolytic gas exploded by the spark at a pressure between 70 mm. and 75 mm., and the wet gas exploded at the same pressure.

The velocity of explosion of electrolytic gas was found by Berthelot and Vieille (C. R. 95, 151) to be 2,810 metres per second (cf. Explosion, vol. ii. p. 530).

Preparation.—Stas (Chem. Proport. 110) prepared pure water as follows. When large quantities were required, spring-water was very slowly distilled through a long copper tube, bent into zigzag form, completely filled with pure copper turnings that had been oxidised by strongly heating in O, the copper tube being surrounded by alumina and sand, and beated to full redness; the distillate was then distilled in an apparatus of platinum.

The second method recommended by Stas, especially when comparatively small quantities of pure water are required, is based upon destroying the organic matter in distilled water by the action of K manganate and permanganate. The process is described by Stas as follows :-

The process is described by Stas as follows:—

I preparel potassium manganate by reacting on manganese oxide with caustio potash and potassium chlorate. I shook up the powdered product with water, just sufficient to dissolve the manganate that had been formed, and allowed the mixture to settle in a closed vessel. I then added, 4 or 5 p.o. of the clear, dark-green solution to the spring water which was to be distilled, and allowed the components of this mixture to react for 24 hours. I then poured into the distillation, vessel one or two litres of the cone. solution of potassium manganate that had been mixed with an equal volume of cone. caustic potash solution; while the distillation was sufficiently cone. to make the salt as stable that its dilute solution could be beated for a long time without decomposition. I then filled the distillation vessel to a fa, with the water which had been in contact with the potassium manganate, and distilled in the ordinary way. When boiling began I moderated the heat, in order to prevent the liquid, which frothed much for ome minutes, from passing over. When the frothing has stepped, the water shay be boiled rapidly without the least inconvenience. When to the water has distilled over, that which they distill its completely free from orgatic substances, and also from mineral substances, if the upper parts of the distillation vessel is furnished with disphragmes to hold back the extremely small drops that are always carried over the water has prepared is perfectly.

Stassays that water thus prepared is perfectly free from organic matter. When he wished to obtree from organic master. What he whater absolutely free from any form of solid nfuter, Star re-distilled the water that had been purified as described above, using as condenser a long tube of platinum soldered, with gold. It is advisable to distil the water just before it is to be used.

On one occasion Stas used rain-water instead of well-water, and he found distinct quantities of ammonia in the distilled water thus prepared. To remove this he recommends to re-distil with 1.1 part of NaHSO, or KHSO.

To remove this he recommends to re-distil with roos part of NaHSO, or KHSO.

Composition of water.—The gravemetric composition of water was determined by Berzelius a. Dulong (A. Ch. [2] 15, 86) and by Dumas (A. Ch. [3] 8, 189) by passing pure H over a weighed quantity of red-hot CuO, and weighing the water produced and the copper which remained. The results gave the ratio H:O = 1:8 (B. a. D.) and 1:7-98 (D.). An extended series of measurements by the same method, with many precautions, by Dittmar a. Henderson (C. N. Cl. 127, 139, 151, 164 [1898]) gave the ratio H:O = 1:7-9827.

Several measurements have been made of the proportion by volume in which H and O combine to form water. Gay-Lussae in 1805, and Humboldt in 1805 (A. Ch. 53, 239), found the volumetric ratio of H:O to be 2:1. Morley, in 1891 (Am. S. [3] 41, 220, 276), determined the ratio of H:O to be 2:00023:1 by directly measuring the volumes of the gases. In 1892 Ledue (C. R. 116, 1248) found the ratio H:O = 2.0037:1, from determinations of the relative densities of H, O, and electrolytic gas. In 1893 Scott (T. 184, 543) completed a most carefully performed series of syntheses of water by sparking mixtures of H-and O, and determined the most probable value of the volumetric ratio H:O to be 2.00245:1.

Properties.—Water is a clear, transparent, almost colourless, tasteless, odourless liquid. A column of water appears slightly blue when looked at lengthwise. Bunsen (A. 72, 44) pointed out that the slight blue colour of water may be observed by looking at a shining white object through a column of water 2 metres long, contained in a tube brackened inside. V. Meyer (B. 15, 297) recommends to join five wide, thinwalled glass tubes, c. 40 mm. internal diameter, and each c. 14 metres long, by wide caoutchouc tubing, and thus to form a tube c. 7½ metres long; to lay the tube perfectly horizontal, and colose the end by smooth glass plates held in position by metallic clasps; then to cover the tube with black cloth. On looking through the tube the field of view appears quite colourless, but on now filling the tube with pure water (by means of brass tubes passing through the metallic clasps) a deep-blue colour is seen on looking through the colourn is seen on looking through the colourn is seen on looking

The boking-point of water is 100° under the pressure of 760 mm. Zeuner (Grundzigs der mechanischen Wärmetheorie, Tab. 19 [1877]) gives the following table, showing the increase of boiling-point with increase of pressure:—•

Pressure In atmos.	Boiling- point.	Pressure in atmos.	Boiling- point.
1 2	. 100 . 120·6 . 138·91 . 144 . 152·32 . 159·22	9 10 41 12	. 179.81 . 175.77 . 180.31 . 184.50 . 188.41
7	. 165.84	14 · ·	. 195 ;53 Frosh <i>(Trat</i>

An elaborate table is given by Broch (Trav. Mem. des Bureau internat. des Poids et Mes.,

1, 46 [1881]) based on Regnault's determinations; the table gives the b.p. of water for each '1 mm. from 680 to 800 mm. pressure. (The table is given in Landolt a. Börnstein's Physikalisch-Chemische Tabellen [Berlin, 1883], pp. 47-49.)

given in Landoit a. Börnatein's Physikalisch-Chemische Tabellen [Berlin, 1883], pp. 47-49.)

The melling-point of ice is slightly lowered by pressure. J. Thomson (T. E. 16) calculated that the m.p. would be lowered by n '0075° for an increase of n atmospheres; W. Thomson (P. M. [3] 37, 123) confirmed this calculation by determining the m.p. of ice at 81 and 16 8 atmos. Mousson (A. Ch. [3] 56, 252) kept water liquid. at _3.5° by greatly increasing pressure, and he found that at c. 13,000 atmos pressure ice melted at -3.5°.

The specific gravity of water is greater at 4° than at any other temperature. Exner gives the temperature of maximum density as 3°945° (older determinations are tabulated by Exner, W. A. B. 68 (ii.), 463 [1873]). The following table, showing the density and volume of water from 0° to 100°, is given by Volkmann (W. 14, 260 [1881]): it is based on the determinations of Hagen, Matthiessen, Pierre, Kopp, and Jolly:

Rossetti (P. Ergänsbd. 5, 268 [1871]) gives he densities and volumes of water for each legree from -10° to 100°, referred both to water it 0° and to water at 4° as unity. The S.G. of ce is c. 916 at 0° (water at 0°=1); according o recent determinations by Zakrzevski (W. 47, 155 [1895]) the value is .916660.

The expansion of water for various intervals of temperature has been measured by various between the base has been measured by various observers; putting $V_i = V_0$ (1 + at + $b_0^{i2} + c_0^{i2}$), the ollowing values are given by Kopp (F. 72, 1 1847); cf. Pierre, P. 86, 461; Weidner, P. 123, 300; Matthiessen, P. M. [4] 31, 149; Rosgetti, P. Ergänzbd. 5, 256; Hirn, A. Ch. [4] 10, 32):

Temp. - 000061045 0° to 25° 25° to 50° -:000065415 -:00005916 50° to 75° 75° to 100° - 00008645

For the expansion of water above 100° v.

Mendeléeff (A. 119, 1).

As water freezes it expands by c. ¹/₁₇ of its volume; one volume of water at 0° becoming 1.09082 volumes of ice at 0°. "It expands when heated at temperatures below 0°; Zakrzevski (W. 47, 155) gives the co-efficient of expansion 000077 (v. also Brunner, P. 64, 116; Struve, P.

66, 298; Marchand, J. pr. 35, 254).

The compressibility of water is small.

Röntgen a. Schneider (W. 33, 644) give the absolute compressibility at 17.95° as 0000462 per atmosphere of pressure (v. also Ramsay a. Young, T. 1892; and cf. Grassi, A. Ch. [3] 31, 437; and Rankine, P. M. [4] 1, 548; also Amaury Descamps, C. R. 68, 1564; and Calletet, C. R. 75, 77).

A table showing the volume of 1 kilo... of

saturated water vapour and the weight (in kilos.) of 1 c. metre of the vapour, at tempera-tures from 0° to 200°, is given by Zeuner (v. Lancolt a. Börnstein's Physikalisch-chemische Tabellen [Berlin, 1883], p. 53; cf. Dieterici, W. 38, 1). "According to Dieterici (l.c.) water vapour saturated at 0° behaves like apperfect

The vapour pressure of water varies from 1:0288 mm. at -19° to 20926.4 mm. at 230°; for complite tables calculated from Regnault's determinations v. Landolt a. Börnstein's Physikalischchemische Tabellen [Berlin, 1883] pp. 40-46 (the vapour pressure is given for each 1° from -19°

0000077183 -- 00000003734 ·0000077587 -- 000000035408 .0000000072848 ·0000031892 ·0000000024487

to 101°, and for each 1° from 101° to 230°). Ramsay a. Young (T. 1892) give a table of the vapour pressures of water up to 270°. In connection with the vapour pressures of water and ice, v. R. a. Y. (2. 1884. 470). For an expression representing the vapour pressure of water at any temperature up to 325°, v. Antoine (C. R_c 113,

The spec. heat of water increases as temperature rises; the quantity of heat required to raise 1 g. of water from t to to +1 is taken as unity in determinations of the spec. heats of other substances. The following table presents the data for S.H. of water at intervals of 10° from 0° to 230° (the memoits by the different observers are: Regnault, Acad. 21, 729, [1847]; Jamin a. Amaury, C. R. 70, 661 [1870]; Bostcha, P. Jubelbd. 549 [1874]; von Münchhausen, W. 1,

The S.H. of ice is considerably less than that of waters Regnault's determinations gave 474 be-

quantity of heat required to convert 1 g. of water at 100° into steam at 100°—is 585.77

gram-units, according to Favre a. Silbermann (A. Oh [3] 87, 461). The following values are given for the heat required to convert 1 g. of water at t° completely into water vapour; 606.5 when $t=0^{\circ}$, 637 when $t=100^{\circ}$, 676.6 when $t=230^{\circ}$ (Regnault, Acad. 21, 635); Dieteriei (W. 38, 1) gives 596.8 when $t=0^{\circ}$; Regnault (Le.) gives the formula $\lambda = A + Bt$ for the total heat of vaporisation of water at different temperatures, and gives the values A = 606.5. B =

According to Sakhrai (C. J. 61, 495 [1892]), the temperature of the steam escaping from a beiling salt solution is exactly the same as that of the solution."

The heat of fusion of ice, i.e. the quantity of heat required to convert 1 g. of ice at to into 1 g. of water at to is given as follows by different observers (the values are in gram-units different observers that values are in grant-state of heat):--79:24 and 79:06 when $t^2 = 0$; (Regnallt, A. Ch. [3] 8, 19); 79:25 when $t = 0^\circ$, 74:2 when $t = -10^\circ$, 80:22 when t varies from -2° to -21° Te = -10°, 80°22 when t varies from = 2° to = 21° (Person, A. Che [3] 21, 295; 30, 73); 77°85 at = 2°8°, 76°75 at = 4°935°, 76°11 at = 6°28°, 76°0 at = 6°6° (Petterson, J. pr. [2] 24, 129).

The thermal conductivity of water, from 10° to 18°, was determined by Winkelmann (P. 153, 481) to be 154; Bottomley (Pr.31,300) obtained nearly the same value; this figure means that heat sufficient to raise 154 mgm, water from 0° to 1° passes per second through a layer of water 1 mm. thick and 1 sq. mm. area, when the difference between the temperatures of the two surfaces of the layer is maintained at 1°. For electrical conductivity of water v. Reactions, No. 2.

The refractive indices of water at different temperatures, and for different lights of determinate wave-lengths, have been measured by many observers. The following values have been found for μ_{He} : 133120 at 19.9°, 133091 a. Börnstein's Physikalisch-Chemische Tubellen [Berlin, 1883] 205; cf. also Perkin (C. J. 61, 293), who gives values for μ for the lines A C D and F, at 15° and 83.7°.

Observations have been made on the absorption spectrum of water and water-gas, but the matter has not been thoroughly investigated (v.

Yogel, P. 156, 326; Jansen, B. A. 1866, 11).
Water crystallises, as ice, in rhombohedral forms; snow is generally found crystallised in

water, Regnance tween -75° and 0°; the determinance tween -75° and 0°; the determinance tween -75° and 0°; the determinance tween -20° and 0°; Ramsay a. Young (T. 1884, 475) give the value 5 as the mean of various experiments. Sh. of water gas at 100° is given by Strecker (W. 7, 85) as 37 referred to an equal weight of water -1, and 1·36 referred to an equal volume of air -1; the ratio S.H.p. given by S. is 1.4, Jaeger (W. 36, 165 [1889] gave the value 1·33 to this ratio, and Cohen (W. 37, 628 [1889]) gave that the mol. w. of liquid water is probably 36, and this conclusion was strengthened by Walker's experiments on the connection between heats of 1 columbility (Z. P. C. 5, 194). From six-sided stars derived from six-sided prisms.

Molecular weight of liquid water. Several observations have been made which tend to measurements of the surface tension of water Ramsay and Shields (C. J. 68, 1069 [1893]) conclude that the mol. w. of liquid water is pro-

bably 72 at the ordinary temperature.

Reactions.—1. In 1847 Grove (T. 1847. 1)
showed that water was decomposed into H and O by heat. Grove formed a little ball on the end of a Pt wire, by fusing the Pt, heated the globule of Pt to whiteness by an electric current, and plunged it into alittle air-free water, nearly and plunged is into sentile air-free water, nearly boiling, in a small basin, with a test tube full of air-free water arranged to collect any gas that might come off. Deville (C. R. 56, 195, 322 [1863]) found that H and O were given off in considerable quantities when molter ePt was plunged under water. D. noticed no decompcstition when steam was passed through t. Pt tube heated to bright redness, but by passing a cur-rent of an indifferent gas, such as CO₂, through the hot tube, and thus sweeping away the products of decomposition, H and O were obtained .-2. Water is scarcely decomposed by an electric current. Kohlrausch found the electrical conductivity of the purest water he could obtain by distillation in vacuo to be 2.5 x 10-8 in C.G.S. units, or c. 72 billionths of the conductivity of Hg (P. M. [5] 18, 542). By calculations based on this result, Ostwald concluded that in a litre of pure water the weight of water dissociated into H and OH ions, expressed in gram-molecules, is $\cdot 6 \times 10^{-6}$ (Z. F. C. 11, 521). By other methods of calculation, based on other data, Ostwald arrived at the Value 2 to 9 x 10-6 for what has been called the dissociation constant of water (Z. P. C. 11, 521); Wijs, by calculations based on the hydrolysis of methyl acctate, obtained the values 1×10^{-7} (Z. P. C. 11, 492), and 14×10^{-6} (bid. 12, 514); Arrhenius obtained the value '1125 × 10⁻⁶ (bid. 11, 827); and Bredig, the value '6 × 10⁻⁶ (bid. 11, 829). Later experiments on the conductivity of water by Kohlrausch a. Heydweiller (Z. P. C. 14, 316 [1894]) with water that had been distilled in vacuo ten years ago, had then stood in a vessel filled with water, and been again distilled in vacuo, gave the following results:—conductivity (Hg = 1) 014 at 0°, 04 at 18°, 058 at 25°, 089 at 34°, 170; all these to be multiplied by 10 10. K. a. H. say that 1 mm. of this water at 0° had a resistance = that of 40 million kilometres of Cu wire of the same area. K. a. H. calculate that in 1 litre of the purest water at 18° there is 00008 mgm. H as free ions, and 000105 mgm. at 25°.—8. Steam is decomposed by stectric sparks; for condition, and details of results v. Thomson (Pr. 53, 90).

The reactions of water are so many that an approximate classification of them into groups is all that come be attempted here. - 1. Many metals react with water, at temperatures varying from the ordinary to a full red heat, forming oxides or hydroxides and giving off H. The following metals decompose cold water : Bay & , Ca, (Ce?), (La?), Li K, Rb, Na St. Al, Fe, Pb, Mg, (? Mn), Mo, Hi react at c. 100°; and most of the other metals at temperatures from c. 100° to a full red heat .- 5. Many non-metals react, generally slowly, with water, forming acids and giving. nary ter herature; Cl reacts slowly at the ordinary temperature, and somewhat more rapidly at a red heat; Br resuts more slowly than Cl; I has probably a very slight (?any) action. S' and P react slowly at 100°; Se is said not to

decompose water at 160°. Carbon gives off H at a red heat. Boron acts like a metal, giving off Hat a red heat .- 6. Many haloid compounds react with water, giving oxyhaloid compounds or oxides, and haloid soids.—7. Some metallic sul. phides react with steam to form oxides and H.S. 8. A few of the lower oxides decompose water; e.g. CrO.xH2O at the ordinary temperature, and CO at c. 600° .- 9. Water reacts with many oxides to form hydroxides which are either basic acidic: in some cases hydrates are formed. Hydrates of various salts are also produced by combining the salts with water (v. HYDRATES, vol. ii. p. 703; cf. Hydroxides, vol. ii. p. 783) .-10. Water dissolves very many compounds of the most different properties (v. Solutions, vol. iv. p. 484).

Small quantities of water often bring about chemical changes that do not occur when the substances are perfectly dry; for instance, a mixture of dry CO and O is not exploded by sparks, but a trace of water suffices to start the change (v. Baker, C. J. 65, 611 [1894]).

The acidic and basic characters of water are so nearly balanced that the compound cannot be classed among either acids or basic bodies. The chemical relations of water to the compounds formed by reactions between it and other substances are determined chiefly by the chemical characters of the substances that react with it; thus the relations of HOH to $M_x(OH)_y$, formed by the interaction of water and metals, are those of an acid to its salts, whereas the relations of HOH to HX, formed by the interactions of water and non-metals, are those of a basic hydroxide to salts derived therefrom. The relations between both classes of derivatives of water and the parent compound are sometimes expressed by saying that the compounds belong to the water

type (v. Types, vol. iv. p. 811). M. M. P. M. WAX. A term applied to various natural solids more or less resembling bees'-wax. They are compound ethers, but differ from fats in yielding monovalent alcohols and not glycerin on saponification. They melt below 100°, are insol. water, sl. sol. or insol. alcohol, and sol. ether. They are not volatile.

Bees'-wax. [64°]. S.G. 965. Consists of a portion (about 5 p.c.) soluble in alcohol (cerin) and as portion insoluble in alcohol (myricin). Myrion is myrioyl palmitate (Brodie, A. 87, 180; 71, 144). Cerin is chiefly composed of cercticacid; but it contains small quantities of meliusic acid C₂₀H₈₀O₂ [90°], and an acid melting at 73° (Schalfejeff, B. 9, 278, 1688; Natzger, A. 224, 246). There is also present one or more acids whose lead salts dissolve in ether and whose less sales dissolve in easer and which therefore probably belong to the cleic series. Myricin may be saponified by alcoholic pot.sh, and the myricyl alcohol separated from potassium palmitate by extraction with ligroin. Crude myricin yields CCl, and C.Cl, when heated with I and excess of SbCl, at 400° (Hartmann, B. 24, 1022). Bees'-we contains two hydrocarbons, one of which [60°] (c. 275° at 11 mm.) is probably n-beptaicosane C_s.H_{set}, and the other [68°] (c. 360° at 11 mm.) n-hentriacontaine C_s.H_{set} (Schwalb, A. 235, 106). According to Schwalb, the myricyl alcohol of bees'-wax has the formula C_{st}H_{st}Q [85°], and is converted by heating with

soda-lime into an acid CalHatO, [89°], which forms a methyl ether [71°] and an ethyl ether [70]. Among the products of saponification of bees'-wax, ceryl alcohol C₂,H₂₀O or C₂,H₃₀O or C₂,H₃₀O. The lastmentioned alcohol when heated with soda-lime gives an acid C₂₅H₃₆O₂ or C₂₄H₄₈O₂ [75.5°].

Carnaüba wax v. vol. i. p. 710. Chinese wax, which is produced by an insect, is almost entirely composed of ceryl carquates (C₂, H₃₅)C₂, H₃₅O₂ (Brodie, A. 67, 199). Cork wax v. Cerin.,

Pine wax v. CEROPIC ACID.

Sugar-cane wax v. CERQSIN.

Japan wax. [42°-55°]. Obtained in the East from Rhus succedanea. It appears to be really a fat, since palmitin is its chief com-It also contains the ether of a fatty acid of higher melting-point than stearic acid (Sthamer, A. 43, 343; Buri, Ar. Ph. [3] 14,

(Sthamer, A. 45, 545; Buri, A. 403).

Wax of Ficus gummiflua of Java contains an alcohol C₁H₂₀O [73°], v. sol. ether, and a small quantity (5 p.c.) of isoceryl alcohol C₂H₂₀O, sl. sol. ether (Kessel, B. 11, 2112).

Myrtle wax. [49°]. Got by boiling the berries of Myrica cerifera of North America with water (Moore, J. 1862, 506). Consists of palmitic and some lauric acid and (20 p.c. of) ralmitin. palmitin.

Opium wax. Contains ceryl cerotate and ceryl palmitate (Hosse, B. 3, 637).

Tobacco wax. Contains $C_{10}H_{140}O_{2}$ [63°], insol. cold alcohol, sol. ether and a small quantity of $C_{40}H_{120}O_{2}$ [64·5°], rd. sol. cold ether (Kissling, B_{1} , 16, 2433).

Coca leaf wax (Hesse, A. 271, 214). The wax from Trujillo coca is palmityl-(β)-amyrin wax from Trullio coca is paintivy. (6)-ally in $C_0H_{\infty}O_2$ (75°) [α]_p = 54.5°. On saponification it yields palmitic acid and (β)-amyrin $C_0H_{\infty}O$ [196°] [α]_p = 94.2°, which yields an acetyl derivative [286°] and a benzoyl derivative [228°]. The wax from the broad-leaved coca of Peru and Bolivia melts at 70°; contains palmityl-(8)-amyrin and a ketone, (8)-cerotinone C₃H₁₀₀O [66°], m. sol. alcohol, ether, and ligroïn. The wax from Java coca contains the same substances, and also some ceryl cerotate and ethers of myristic acid and of ovycerotic acid G,H,4O, [82°], which is v. e. sol. hot alcohol and ligroin, v. sl. sol. ether, and is converted by Ac₂O at 100° into cerotolic acid C₂H₃₂O₂ [70°].

WHEY PROTEID v. MLE.
WINE CIL. Light oil of wine. An oil obtained in the preparation of ether by distilling alcohol with H.SO.. The ether is shaken with a contract of the con milk of lime and fractionally distilled, the successive fractions being ether, alcohol, and wet cessive fractions being ether, absonot, and well alcohol. Light oil of wine (25 to 5 p.c. of the alcohol etherified) rises to the surface when the last fraction (90°-120°) is allowed to stand. When dried over CaCl, it has S.G. 17.5 903, Water. Wrightin It contains O₁₈H₂₈ (157°), EtOC₂H₁₁ (112°), conessine (g.v.).

Et.CO.C,H,1 (1549), and CH,.CO.C,H,2 (1649)

(Hartwig, J. pr. [2] 23, 449).

Heavy oil of wine, which passes over when the temperature is raised after the preparation of ether, consists of Et.SO, mixed with olefines (Claesson, J. pr. [2] 19, 259; Serullas, 4. Ch. [2]

WINTERGREEN OIB contains methyl o oxy-

benzoate. winterene C₁H₁, (260°-265°) S.G. 1934. [a], 11·2° at 16°. A destrorotatory sesquiterpene obtained by distilling winterbark (from Dryskis Winter-Forster) with water (Arata a. Canzoneri, G. 18, 527). Coloured green by Br in CHCl.. in CHCl.. WOOD v. LIGNONE.

WOOD GUM v. XYLAN.
WOOD NAPHIHA v. METHYL ALCOHOL.

WOOD OIL. Gurjun Balsam. Flows from incisions in the stem of Dipterocarpus costatus. It contains an essential oil, which gives a splendid violet coloff when its solftion in CS, (20 pts.) is treated with a drop of a cold mixture of HNO. and H.SO.. The same reaction is exhibited by the balsam itself, and also, in a more transient manner, by cod-liver oil and copaïba balsam (Flückiger, Ph. [3] 7, 2). The essential oil con-(Guibourt, J. 1876, 907). The essential of consists chiefly of a terpene (255°) (Werner, J. 1862, 461), which composes 65 h.o. of the balsam (Guibourt, J. 1876, 907). The resin contains a neutral substance, C₂₁II₄₀O₂, which brystalliase from light petroleum in triclinic prisms [1296–1200]. 130°]; it dissolves in conc. H, SO,, and is reppd. from the resulting reddish solution by adding water, It is not affected by potasil-fusion (Flückiger, Ar. Ph. [3] 12, 58). A substance $C_{20}H_{20}O_2$ [129°] is described by siding (M. 2, 510)as ppd. by adding water to an alcoholic extract of wood oil. It is neutral and insol. alkalis, and yields a diacetyl derivative [75°]. It is perhaps identical with the compound C. H. O. Wood oil also contains gurjunic acid C. H. O. [220°]. which crystallises from alcohol, distils with decomposition at 260°, and forms Ag,A".

WOOD SPIRIT v. METHYL ALCOHOL. WORMSEED OIL. Oleum Cina Oleum Cina. tained by steam-distillation from wormseed, the flower-buds of Artemisia Vahliana, A. Sieberi, and A. incalla (Trommsdorff, Tr. N. J. 8, 812; and A. incatta (Frommasorii, 17. 18. 3., 32.) Võickel, A. 38, 110; 87, 312; Hirzel, J. 1854, 591; 1855, 655; Kraut a. Wahlforss, A. 128, 293; Faust a. Homeyer, B. 7, 1429; Hell a. Ritter, B. 17, 2609; Wallach c. Brass, A. 220, 291). It consists chiefly of cincol C. H. O.

291). It consists chiefly of cineol C₁₈H₁₀O. Wormseed (A. Gallica) also co-tains betaine and choline (Jahns, B. 26, 1493).

WRIGHTINE C₁, H₁₈N. [1222]. Occurs in the juice of Wrightia antidysenterica (Stenhouse, Ph. [2] 5, 493; Warnecke, B. 19, 60). Needed with bitter taste, sl. sol. water, v. sol. alcohol and ether. Cohd. H₂SO, at 100° givgs a dark-green colour, turned dark blue by adding water. Wrightine, is probably identical with consessing (g. 2).

XARTHALINE C.,H.,N.O. [506°]. Occurs in opium (T. a. H. Smith, Ph. [8] 23, 793). White crystalline powder, insol. water and alkalis, sl. sol. hot alcohol, m. sol. benzete, v. e. sol. chloroform. Weak base, forming yellow salts from which it is, ppd. by hot water. Conc. H.SO, forms a deep-orange solution, from which water pots. the sulphate as yellow needles. Hot reduce it to hydroxanthaline O.,H.,N.O., which forms white crystals [137°], nearly insol. water, w. sol. alcohol and benzene, and forms easily soluble crystalline salts. Hydroxanthaline is coloured deep-violet by H_sSO₄ (even free from HNO,), the colour being destroyed by water, but reproduced by H₂SO₄.—B'H₂Cl₂4aq : yellow needles. Gives off all its acid at 150°.

XANTHAMIDE v. Ethyl ether of (β)-Thio-

CARBAMIC ACID.

XANTHATES. The salts RS.CS.OEt where R is a metal; v. ETHYL DITHIOCARBONATE.

XANTHIC ACID v. ETHYL DITHIOCARBONATE.

XANTHINE C.H.N.O. i.e.

NH.CH: C.NH
CO.NH. CHN
CO. Xanthic oxide. Mol. w.
152. S. 007 in the cold; 08 at 100°. Occasionally found in urinary calculi (Marcet, Essay on Calculi, London, 1819; Liebig a. Wöhler, A. 26, 840; Lebon, C. R. 73, 47) and in urinary deposits (Bence Jones, C. J. 15, 78). Occurs in small quantity in the urine of man, in the pancreas, sples, and liver of oxen, in the thymus gland of the calf, in muscle of mammalia and fishes (Scherer, A. 107, 314; 112, 257; Städeler, A. 111, 28; 116, 102; Dürr, A. 184, 45; Kossel, H. 6, 422), in some kinds of guano (Ungor a. Phipson, C. N. 6, 16), and in guano (Ungar a. Phipson, C. N. o., 10), and in yeast (Schindler, H. 18, 432). Occurs a'so in lupith seeds (Salomon, J. 1881, 1012; Schulze a. Barbieri, J. pr. [2] 27, 358), in pumpkin-seeds (E. Schulze, J. pr. [2] 32, 457), and in tea (Baginsky, H. 8, 996).

Formation.—1. By the action of nitrous acid

on guanine (Strecker, A. 108, 141; 118, 151; 181, 121; Balke, J. pr. [2] 47, 542).—2. In small

181, 121; Balke, J. pr. [2] 47, 542].—2. In small quantity by, heating a mixture of HOAc and aqueous HCy (Gautier, Bl. [2] 42, 141).

Preparation.—1. Separates as a crystalline powder when NaNO, (8 g.) is added slowly to a solution of guantine (10 g.) in H₂SO, (20 g.) and water (150 g.) at 75° (Fischer, A. 215):309).—

3. The aqueous extract of sprouting lupin seeds is evaporated, the residue treated with alcohol, and the alcoholi, filtrate avanorated. The and the alcoholic filtrate evaporated. The residue is dissolved in water and AgNO and NH, added. The gelatinous pp. is dissolved in hot HNO, (S.G. 1-1), which yields on cooling a crystalline compound of hypoxanthine and silver nitrate, and on adding NH, to the filtrate silvermanthine is ppd. (S. a. B.).—8. Urine is ppd. with bary'a-water; the filtrate is evaporated to a small bulk and boiled with cupric acetate. as small's bulk and boiled with cupric acetate.

The pp. is dissolved in warm nitric acid and spd. with AgNO; the pp. is crystallised from the diluted HNO, treated with ammeniacal in AgNO, elecomposed by H₂S, and the solution

HNO; it leaves a residue coloured orange by

evaporated.-4. A solution containing ranthine is treated with Fehling's solution and hydroxylamine hydrochloride, and the ppd. copper com-pound decomposed by H.S. The xanthine may the further purified by preparing its lead salt and decomposing this with H₂S (Balke, J. pr. [2] 47,

Properties.—Small scales (by evaporation) or powder composed of minute globules, nearly insol. cold water, insol. alcohol and ether. V. e. sol. KOHAq and reppd. by CO₂ and other acids. Weak base. Does not form an acetate. A cold saturated aqueous solution of xanthine gives white pps. with HgCl₂ and AgNO₃, and a yellowish-green, floculent pp. with hot cupric acetate. An a numerical solution of xanthine is ppd. by HgCl₂, ZnCl₂, CdCl₂, and AgNO₃. Xanthine HgCl₂, ZnCl₂, CdCl₂, and AgNO₃. Xanthine reduces ammoniacal cupric chloride (Drechsel. B. 25, 2454). Xanthine evaporated with nitrie acid leaves a yellow residue turned orange by KOH (but not by NH₃), the colour becoming violet-red on warming. Solid xanthine added to a mixture of bleaching-powder and NaOHAq on a watch-glass forms a dark-green spot, chan-ging to brown and finally disappearing. Xanthine warmed with chlorine-water and a trace of HNO, as long as gases escape, and then evapo-

HNO, as long as gases escape, and then evaporated to dryness, yields a residue which is soloured rose-red by gaseous NH₂ (Weidel, A. 158, 365; Kossel, H. 6, 420).

**Reactions.—1. Decomposed above 150°, giving off HCy, NH₂, cyanogen, and CO₂—2. KClO₂ and HClAq at 60° form urea and alloxan.—3. Conc. HClAq at 230° forms glycocoll, formic acid, NH₂, and CO₂ (E. Schmidt, A. 217, 311).—4. NaOH (2 mols.) and Pb(OAc), form a lead salt which, if dried and heated with MeI at 130°, yields theolyromine (Fischer).—5. Slowly

salt which, if dried and heated with MeI at 130°, yields theobromine (Fischer).—5. Slowly attacked by pure HNO₂, the gas evolved consisting of nitrogen (1 vol.), CO₂ (4 vols.), and N₂O (11 vols.) (Franchimont, R. T. C. 6, 223). Salts.—B'H.Cl. Nodular groups of silky needles.—B'H.SO₄ aq. Scales, decomposed by water.—B'BaH₂O₂. Sl. sol. water.—B'₂Cu₂O₃. Formed by the action of Fehling's solution and hydroxylamine hydroelfloride (Balke).—B'Ag₂O. Vallowish white flocculent pp., got by adding Yellowish-white flocculent pp., got by adding AgNO, to ar ammoniacal solution of xanthine. Blackens on boiling.—NaC.H.N.O.ag. Migute needles.

Brome-zanthine C.H.BrN.O. Formed by heating xanthine with bromine at 100°, and slso by the action of nitrous seid on bromeguanine (Fischer a. Reese, A. 221, 349). Crystalline powder, sol. conc. HClAq and H₂SO₄, but reppd. by water; sl. sol. hot water and flot alcohol; sol. alkalis.

Isoxanthine C.H.N.O. i.e.

NH.CO.C.NH N. Formed by reducing diazo-

KOHAq. Yields C,H,BrN,O, aq, crystallising from water in six-sided tables.

Pseudo-xanthine C₂H₁N₄O₂. A product of the action of H₂SO₄ (2 pts.) on uric soid (1 pt.) at 120° (Schultzen a. Filehne, B. 1, 150). Formed also by the action of nitrous soid on adenius (Kossel, H. 10, 258). Powder, al. sol. water? HClAq, and NH, Aq, v. sol. KOHAq. Its aqueous solution is acid in reaction, and on evaporation with HNO leaves a lemon-vellow residue, which is turned orange on warming with KOHAq.

The name pseudo-xanthine is also given by Gautier (Bi. [2] 48, 19) to a substance C,H,N,O occurring in muscular tissue. This is a yellow powder, which forms a very soluble hydro-chloride. Its aqueous solution is ppd. by HgCl₂, AgNO,, and ammoniacar Pb(OAc), but not by Pb(OAc). This pseudo-xanthine also gives an orange colour when the residue, after evaporation with HNO, is treated with potash.

Parazanthine O,H,N,O, [0.284°]. Occurs in human urine (Salomon, B. 16, 195; 18, 3406; H. 13, 187; Thydichum, H. 11, 415; Kosšel, H. 13, 302). Silky needles or monoclinic tables. insol. alcohol and ether, sl. sol. cold water, v. sol. hot water. Sol. NH, Aq and HClAq. Poisonous, acting like caffeine and theobromine. AgNO, added to its solution in HNO, or NH, Aq gives a gelatinous or flocoulent pp. Picric acid forms a yellow crystalline pp. when added to its solution in HCIAq. Gives a red colour (like xanthine) when the residue after evaporation with children water in exposed to gaseous NH. Does not, give an orange colour when KOHAq is added to the residue after evaporation with HNO. Cond. NaOHAq forms a crystalline salt. KOHAq does the same. A solution of paraxanthine is ppd. by Cu(OAc), phosphotungstic acid, HgCl, and ammoniacal lead subacetate, but not by mercuric nitrate.

Heteroxanthine C.H.N.O. Occurs in urine of men and dogs (Salomon, B. 18, 3407; H. 11, 412). Amorphous powder, v. sl. sol. cold water, sol. NH,Aq, insol. alcohol and ether. Its solution in HClAq is not ppd. by picric acid. AgNO, HgCl₂, Cu(OAc)₂, and ammoniacal lead sub-acetate give pps. When evaporated with chlorineacetate give pps. When evaporated with chlorine-water and HNO, it leaves a residue which is coloured red by gaseous NH, the colour changing to blue on addition of NaOHAq. NaOHAq forms a salt crystallising in tables, v. sol. water, al. sol. NaOHAq. The hydrochloride forms sparingly soluble crystalline aggregates, which lose HCl on treatment with water.

Hyperanthine v. vol. ii. p. 745.

Experanthine v. vol. ii. p. 745.

Example v. vol. ii. p. 745.

Exampl Get also by heating pseudo-uric acid with H.SC. st 150° (Grimaux, Bl. [2] 81, 535). White powder, nearly insol. water, sol. NH, Aq, forming solution with blue fluorescence. Its sorution a solution with blue fluorescence. Its sorution gives a white pp. with HgCl, and a yellow pp. with AgNO, Not attacked by HNO, Sol. KOHAq and reppd by CO, Sol. conc. H.SO., torming a laminar sulphate, decomposed by water with separation of xanthinine.—I'Ag.O. Bulky yellow pp., got by pouring an ammonifacal solution of xanthinine into excess of aqueous AgNO.

AENO_

XANTHOCHELIDONIC ACID & CHRESTONIO

MANTHOCREATININE of CREATININE and LEUCOMAÏNES

XANTHOGALLOL C., H.Br., O. i.e.

C₆H₂Br₄O < O₀C₆HBr₂O > O (?). [122°]. Formed by adding pyrogallol (1 st.) to bromine (10 pts.), leaving the mixture to stand for two hours, and then shaking with water and heating (Stenhouse a. Groves, C. J. 28, 1; A. 177, 191; 179, 287; Theurer, A. 245, 334). Tri-bromo-pyrogallol is an intermediate body in its preparation. Yellow blaming (Fram CS and lignoid) and the conditions of the conditions lamins (from CS, and ligroin), v. sol. ether and *slamins (from CS, and hgroif), v. sol. ether and CS, m. sol. *ligroin. Decomposed by boiling with water or alcohol. Very stable towards oxidising agents, eyen crystallising unaltered from conc. HNO.. Not reduced by sodium-amagam or by sine and dilute H,SO. Aniline in HOAo yields an anilide [205°], to which Theurer assigns the impossible formula C,H,Br,(NHPh),O, Toluiding forms a concasponding activities. p-Toluiding forms a corresponding p-toluide. Reacts with phenyl-hydrazine acetate.

Reactions .- 1. NaOHAq forms hexa-bromobenzene dihydride C.H.Br. [189°], sl. sol. alcohol, which crystallises in prisms, while the mother-liquor contains a sodium salt of an acid C₃H₁Br₂O₂ [124°], which forms BaA", crystallis-ing from dilute alcohol in large white plates (Theurer). By the action of dilute NaOHAq on xanthogallol, Hantzsch a schmiter (B. 20, 2033) obtained O₁H₂Br₁,(OH)₂O₂, which yields Ba₂(C₁H₃Br₁,O₂)₂ and crystalline C₁H₃Br₁Ac₂O₂ 2. Na₂CO₂Aq converts xanthogallol in the cold into G₁H₃Br₁O₂, crystallising from benzene in needles [72°] and prisms [131°], yielding the crystalline derivatives C₁H₃R₁CO₂RPhH₃ and C₁H₃Br₁O₃RNI₂CH₃Me.—3. HBr passed into a cooled solution of xanthogallol in MeOH forms C₁H₃Br₁O₃(OMe), crystallising from MeOH in prisms [113°], and converted by boiling dilute NaOHAq into an acid O₂H₁Br₁O₃(OMe), which crystallises in prisms, while the motherdilute NaOHAq into an acid C.H.Br.O.(OMe), [105°], and by MeOH and hydrochloris acid into C.H.Br.O.(OMe), [77°]. The brominated acid C.H.Br.O.(OMe), reacts with aniline, forming crystalline C.H.Br.O.(OMe), the Conc. H.Br.O.(OMe), the C.H.Br.O.(OMe), the Conc. H.Br.O.(OMe), the C.H.Br.O.(OMe), the C.H.Br.O [65°].—4. Hydrochloric acid gas passed into a cooled solution of xanthogallol in MeOH forms C₁₈H₄Br₁₁Cl₂O₂(OMe)₄[86°], which is insol. water, v. tol. alcohol, does not react with aniline, and is decomposed by dilute alkalis. -5. HCl passed into an alcoholic solution of xanthogallol forms The an account solution of Espinosistic terms of the Heri, Cl.O. (OE), crystallising from alcohol in colourless prisms [75], canyetted by NaOHAq into a product [92]. Cl. H.Br. 1, 2,9 [104] is bye-product in the action of alcohol and HO] on xanthogaliol. 'It forms large yellow crystals,

v. sol. alcohol.

PANTHOGENIC ACID v. ETHYL DITHIOGRA-

XANTHOWETHYLIC ACID v. LISTERL TRIO-

XANTHONE is DIPHENTIANE ERTONE OXIDE. KANTHOPURPURIN is m-DI-OXY-ARTERA-QUINONE.

KANTHOQUINIC ACID e. Ozy-burnouma

CARBOXYLIQ ACID.

XANTHORNAMMIN.C., H., O., (?). Obtained from Persian barries (the fruit of Rhammus factoria) by extracting with three times their

weight of 85 p.e. alcohol; the yield being 12 p.e. (Liebermann a. Hörmann, B. 11, 952, 1618; A. 196, 807; cf. Kane, P. M. [3] 28, 8; Gellatly, N. E. P. J. 7, 252; C. N. 3, 196; Hasiwetz, A. 111, 108; Bolley, A. 115, 55; Ü. J. 13, 328; Stein, Z. [2] 5, 183, 568; Behrends R. 11, 1353). Yellow heedles (containing 2aq), v. sol. water and alcohol, insed, ether. Hes little timetoxial Yellow heedles (containing 2aq), v. sol. water and alcohol, insol. ether. Has little tinctorial power. Reduces Fehling's solution and ammoniacal AgNO₃, forming a mirror. Feell, gives a dark-brown pp. Ppd: by ammoniacal lead acctate. Boiling dilute H₂SO₄ splits it up into rhamnetin (2 mols.) and isodulcite (4 mols.). Salts.—C₄₈H_{ex}K_{O20}. Yellow powder, v. e. tol. water.—PbA. v. Yellow pp.

**Acetyl derivatives C₄₈H_{ex}A<sub>C₁O₂₀.

**Cohistonerous X [SI] A 669. CH HAC.O.</sub>

Acetyl derivatives C₄₈H₄₄Ac₁₇O₂₈ (Schützenberger, Z. [2] 4, 668), C₄₄H₄₄Ac₁₇O₂₈. Powder, v. e. sol. alcohol (Liebermann a. Bergami, B. 20, 2245)

XANTHOBOCCELIN v. PICRO-ROCCELIN.

XANTHORRHEA RESIN is ACAROID RESIN. **EANTHOXYLIN** C₁₀H₁₂O₄. [80⁴]. Occurs, together with zenthoxylene C₁₀H₁₆ (162°) in the essential oil from japan-peaper (Xanthoxylon piperitum) (Stenhouse, Ph. [2] 13, 423; 17, 19; 4104, 297). Silly menopolity and the control of the co 4. 104, 237). Silky monoclinic crystals, insol. water, v. sol. alcohol and ether. Its alcoholic solution is not ppd. by AgNO₃ or lead acetate, even on addition of NH,Aq.

XENYLAMINE v. p-Amido-diphenyl. XENYBENE-DIAMINE v. p-p-Di-amido-di-

XERONIC ACID v. DI-ETHYL-MALEÏC ACID.

XYLAN C.H., O. Tree gum. Wood gum. S. 2 at 100°. [a]_D = 69°6° (Tollens); —84° (Thomsen). Obtained from the bark of trees (T. Thomsen, J., Tr. [2] 19, 146; Poumarède a. Figuier, A. 64, 388). Obtained to the crient of 1.78 p.c., by extracting jute with dilute (5 p.c.) NaCHAq; and got also by extracting beechwood or pine-wood sawdust with 5 p.c. NaOHAq (Tollens, A., 254, 307, 320, 324, 326; Bl. [3] 1, 1102; Winterstein, H. 17, 381). Obtained also be extracting wheat straw first with 2 p.e. by extracting wheat-straw, first with 2 p.c. NH,Aq, and then with 5 p.c. NaOHAq (Tollens, A. 260, 291). The alkaline extract is ppd. with alcohol and HCl.

Properties. - Porous mass, insol. cold, sol. hot, water; sol. NaOHAq. The hot agreeus solu-tion becomes opalescent on cooling. Insol. alcohol, but the aqueous solution is not ppds by alcohol unless an acid or the salt of an alkali is

alcohol unless an acid or the salt of an alkli is added. Insol. NH,Aq, lime and baryta-water. Its aqueous solution is levorotatory. Gives furfuraldehyde when boiled with H,SO, or HCl, and xylose when boiled with dilute H,SO, Gives no colour with ioding. HNO, oxidises aylan to saccharic acid, but gives no mucic acid. c-XYLENE C₂H, i.e. C₄H,Me,[1:2]. Dimethyl-bensene. Mol. w. 106, [-28°] (Verson, A. Ch. [6] 6, 128). (1182)* S.G.* 8932 (Pinette, A. 243, 50); 13° 865 (Gladstone, C. J. 300). Mal 14928, Mal 15328. C.E. (0°-10°) 100968. S.V. 1839 (Schiff); 137°6 (Pinette). McL. 1,084,274 [(1,0,=94,000; H,0=69,000] (Stohmann, J. pr. [2] 35, 41). M.M. 18-31 (Schönföck, Z. P. C. 11, 758). Critical temperature: 846° (A.). Occurs in coal-tar. The S.G.*of crude xylene varies in coal-tar. The S.G.*of orude xylene varies between 857 and 866; it contains 70 to 87 p.c. the syllane, 9 to 10 p.c. p-xylene, 2 to 15 p.c.

orylene, and 8 to 10 p.e. fatty hydrocarbons (Levinstein, B. 17, 444; of. Fittig, A. 148, 10). If 100 c.e. of the mixture are boiled for 45 minutes with 40 c.c. of HNO, (S.G. 1-42) diluted with 60 c.q. of water, the p- and o-xylene are oxidised, leaving the m-xylene and fatty hydrocarbons. If the residual hydrocarbons, after washing with NaOHAq followed by steam distillation, be shaken for 80 minutes with 11 volumes of H.SO, the m-xylene will be sul-phonated and dissolved, while the fatty hydro-carbons remain. If 100,c.c. of crude xylene be shaken with 120 c.c. of H2SO4, the o- and mxylene dissolve, leaving the p-xylene and fatty hydrocarbons. On crystallising the sodium salts of the dissolved sulphonic acids, sodium o-rylene sulphonate separates first, and may be converted into o-rylene by heating in a sealed tube with HClAq at 190° (Jacobsen, B. 10, 1009), or by heating with diluted sulphuric acid. Nölting, Witt, and Forel (B. 18, 2668) found 25 p.c. of p-xylene in commercial xylene. According to Nölting and Palmer (B. 24, 1955), crude xylene may contain 10 p.c. of ethyl-benzene. When a mixture of o-xylene and ethyl-benzene. is treated with Br (20 pts.) and I, tetra-bromoxylene is formed, together with a less highly brominated ethyl-benzene (Crafts, C. R. 114, 1110).

Formation.—1. By distilling its carboxylic acids with lime.—2. From o-bromo-toluene, MeI, and Na (Jannasch a. Hübner, A. 170, 117; Reymann, Bl. [2] 26, 532).—3. By heating cantharidin with P₂S₅ (Piccard, B. 12, 580).—4. By passing MeI through a mixture of toluene and AlCl, at 85° (Jacobsen, B. 14, 2628).

Properties.—Oil, solidifying in a freezing-mixture at -28°. Unlike m- and p- xylene it does not yield a solid nitro- derivative with a cold mixture of H.SO, and HNO. It is com-

Becommission of H₂SU₂ and finU₃. It is completely oxidised by chronic said mixture.

Reactions.—1. Dilute HNO₂ forms o-toluic soid.—2. Boiling squeous KMnO₄ oxidises it to phthalic scid.—3. PCl₁ at 200° reacts, forming O₂H₁(CCl₂), CHCl₂ (Colson s. Gautier, Bl. [2] 45, 507) .- 4. Bromine in the dark forms bromo-oxylene C.H.Me.Br [1:2:4]. In direct sunshine the products are C.H.Me.CH.Br and C.H.(CH.Br), (Schramm, B. 18, 1278).—5. AlCl, and gaseous HCl at*100° yield behizene, m. and a little p. xylene, ψ -cumene and mesitylene (Hesse a. Töhl, A. 270, 168).

Properties.—Liquid. Not attacked by dilute INO. Conc. HNO, on warming forms tri-

HNO. Conc. HNO. on warming forms trinitro-xylene [176°], sl. sol. alcohol.

Reactions.—1. Oxidised by chromic acid
micture to isophthalic acid.—2. ECl., at 200°
forms a hexachloride (Colson a. Gautier, Bl. [2]
45, 566).—3. Bromine in the dark forms
C.H.Me.Br [1:3:4], while in direct sunshine
C.H.Me(OH.Br) and C.H.(CH.Br), are produced
(Sohramm, B. 18, 1277°, M. 8, 305).—4. AlCl.e
and gaseous HCl at 100° form became, mestyleng. and some p.xylene and becamene (Heise a and gaseous prevene and ψ -cumene (Heise a. Töhl, A. 270, 168). On boiling with AlCl, the products are benzene, toluene, a little p-xylene, v-cumene, mesitylene, and durene (Anschütz, A. ψ-cumene, mesitylene, and durene (Ahschütz, A. 235, 182).—5. On heating with Mel and I at 250° it yields ψ-cumene, mesitylene, and C₁₈H₁₄ (Rayman a. Preis, A. 223, 320).—6. Ethyl-malonyl chloride at 60° in presence of AlCl₂ forms the ketone C₁₈H₁₄O₂ [63°] (Béhal a. Auger, Bl. [3] 3, 122).—7. Benzoyl peroxide forms dixylylene C₁₈H₁₈ (265°), S.G. 21° 9984 (Lippmann, M. 7, 528).—8. CrO₂Cl₂ added to its solution in CS₂ ppts. chocolate brown C.H.Mc.2CrO.Cl.. which is ppts. chocolate brown C,H,Me,2CrO,Cl, which is converted by water into m-toluic aldehyde and converted by water into m-toluic aldehyde and at 200° yields C₂H₄Me.CH(GrO₂Cl)₂(Étard, A. Ch. [5] 22, 244).—9. CH₂Cl₂ and AlCl₄ form tetramethyl-anthracene [163°] (Friedel a. Crafts, A. Ch. [6] 11, 268).—10. PHJ forms C₂H₄, on heating (Bayer, Z₂ [2] \(\frac{2}{4}, 455 \)). HIAq and P at 280° form m-xylene hexahydride.

at 280° 10rm m-xylene hexahydride.
p-Xylene C.H.Me. [1:4]. [13°] (Reissert, B.
23, 2242); [15°] (Jannasch). (138°). S.G. §
8801 (R); 27 860 (Gladstone, C. J. 59, 290).
C.E. (0°-10°) 00098 (Pinette, A. 243, 51).
p. 14864. \(\mu_1 \cdot \cdot 2525 \). S.V. 140 (Schiff). H.G.
1,084,274 (Stohmann, J. pr. [2] 35, 41). M.M.
12·79 at 20°-30° (Schönrock, Z. P. C. 11, 753).
Critical temperature: 344°. Occurs in coal-tar Critical temperature: 344°. Occurs in coal-tar (v. supra) and in Galician petroleum (Pawlewski, B. 18, 1915). Formed by the action of MeI and sodium on p-bromo-toluene (Fittig, A. 136, 303; Jannasch, A. 171, 73) and on p-di-bromo-benzene (V. Meyer, B. 3, 753). Monoclinic prisms; a:b:c=2'32:1:2'34; β=69'5° (Baeyer, A. 245,

Reactions .- 1. Dilute HNO, forms p-toluic acid.—2. Chromic acid mixture yields 'terephthalic acid.—3. PCl, at 190° gives C,H,(CH₂Cl)₂ and at 200° C,H,(CCl₃)₂ (Colson a. Gathier, Bl. [2] 45, 6, 507).—4. Bromine in the dark forms C.H.BrMe, while in direct sunshine the products are C.H.Mc.OH.Br and C.H.(OH.Br). (Schramm, B. 18, 1276).—5. AlCl, and HCl at 100°cact in the same way as with o-xylene.

References .- Bromo-, Bromo-nitro-, Chloro-, DICHLOBO-NITBO, DI-10DO-, NITBO-, and OXY,

BENZOIC ACID and MESITYLENIC ACID.

M-XYLENE DICARBOXYLIC ACID C.H.Q 6.e. C,H,Me,(CO,H), [1:8:4:6]. Dimethyl-iso phthalic acid.

thalic acid.
(a).Cumidic acid. Mol. w. 194. [above \$20°]. (a) Cumide acts. Mol. w. 193. [2009 220].
Formed by heating di-bromo-m-xylens dissolved in ether under pressure with ClCO_Et and Equium-amalgam. Formed also, together with (8)-cumidic acid, by oxidation of durene with dilute HNO_s or of durglic acid with KMnO_s (Schnapauff,

B. 19, 2508). Minute prisms (from water) or plates (by sublimation).—BaA" 1 aq : crystals, v. sol. water. Yields m-xylene on distilling with lime.

Methylether Me.A". [76°]. Crystals. m-Xylene dicarboxylic acid

C.H.Me.(CO.H), [1:3:4:5]. Dimethyl phthalic acid. Isocumidic acid. [280°]. Formed by oxidaacia. isocumiate acia. [250-]. Formed by Orlaction of ω(β)- and (γ)-isodurylic acid (Jacobsen, B. 15, 1857). «Small crystals. May be sublimed. Yields m-xylene on distillation with lime. The Ca salt crystallises in small plates. The Ba salt & amorphous.

p Xylene dicapoxylic acid C_aH₁Me₄(Co₂H)g[1:4:2:5]. Di-methyl-terephthalic acid. (β)-Cumidic acid. Formed, together with (a)-cumidic acid, by oxidation of s-durene with dilute HNO, or, of durylic acid with KMnO, (S.). dilute HNO, or of duryne acid with Minute six-sided prisms (from alcohol). Sublimes in small plates without melting. Nearly insol. hot water. Yields p-xylene on distilling with lime. **BaA" 2 aq. tables, v. sol. water. Methyl ether McA". [114°]. (c. 297° cor.).

Kylone diesebasylic soid
C_sH₂Me(CO,H)CH,CO_sH[3:2:1]. [178°]. Formed
by oxidation of C_sH₃Me(CO,Et)CH,CO_sH [Béhal a. Auger, C. R. 109, 972). Gives off CO, on fusion.

Xylene di-ω-carboxylic ackl v. Phenylene-DIACETIC ACID.

Reference.—Oxy-xylene carboxymo acm. XYLENE GLYCOL v. Di-oxy-xylene.

O-XYLENE DIHYDRIDE v. CANTHARENE. m. Xylene dihydride C₁H₁₂. (133°). S.G. 22 ·828. V.D. 3·74 (calc. 3·88). μ₁ 1·4675. Formed, together with a polymeride C₁₆H₁₄. (280°–285°) S.G. 22 ·832, by heating the ketone C.H. O with ZnCl., a The ketone itself is obtained by distilling the school of the control tilling the anhydride C10H14O, which is got by the action of Ac.O on cineolic acid, formed by oxidation of eucalyptol (Wallach, A. 258, 827).

Liquid, smelling like xylene. Yields on nitration $C_0H_2Me_2(NO_2)$ [1:3:4].

p-Xylene dihydride CMe<CH..CH>CMe. (134°) at 720 mm. Formed by heating di-methylquinite dibromide C.H.,Br, with quinoline (Baeyer, B. 25, 2122). Smells like turpentine. Forms a crystalline compound with HBr.

m-Xylene tetrahydride C.H.Me.. S.O. 2 814; 14 794.

Formation .- 1. By heating oxycamphoric anhydride C, H, O, with waten at 180° or with IPI at 150° (Wreden, A. 163, 386).—2. By heating camphoric acid with sympy phosphoric acid at 200%—3. By distilling camphoric acid with 210%, [Ballo, A. 197, 322].—4 By heating camphoric acid with 211Aq at 200° (Wreden, A. 187,

171), Properties — Oil. Oxidised by chromic said mixture to accide fiscoluic, isophthalic, and terophthalic acids. HNO, forms tri-nitro-m-

xylene. xylene.

Zylene tettahydride C.H.; (181°). S.G.
22 816. Occurs among the products of the distillation of colophony (Renard, A. Oh. [6] 1,
236). Slightly dextrorotatory liquid. Yields oily di- and tri- bronno- derivatives. Sulphurie acid forms an oily polymeride O.H., which is oxidised by fuming HNO, to succinic and oxalic Absorbs oxygen. Does not reduce

ammoniacal Agillo. In ethereal solution it combines with Br, forming Q,H,Br.,
m-Xylene tetrahydride (?) C,H,e. (120°).
Octomaphthylene. Formed by the action of moist Ag,0 on C,H,e,I, which is got by the action of Cal, at 60° on Q,H,C (175°), a product of the shlorination of octonaphthene (Jskowkin, J. R. 16, ii. 294). Oil, smelling like turpentine. Combines with Br (2 atoms). An isomeric ootenaphines with Br (2 atoms). 10, ii. 294). Oil, smelling like turpentine. Combines with Br (2 atoms). An isomeric octonaphthylene (123–129°) is got by distilling $\mathcal{O}_{i}H_{i,j}$ Obtained by chlorination of iso-octonaphthene (Putochin, J. R. 16, ii. 295).

m. Xylene hexabydride C.H., i.e.
C.H., Me, [1:3]. Octonaphthene. (118°). S.G.
2 7814 (Lossen, A. 225, 110); 2 7706 (A.).
C.E. (0° 26°) 001072. V.D. 3-87. S.V. 164 8. $\mu_{\rm b}=1^{\circ}419$ at 22° (Wallach, B. 25, 923). Occurs in Baku petroleum (Beilstein a. Kurbatoff, B. 13, 1820; Markownikoff a. Spady, B. 20, 1850), and among the products of the distillation of colophony (Renard, A. Ch. [6] 1, 229). Formed by heating heptang hthene carboxylic acid with HIAq and P (Aschan, B. 24, 2718). Prepared by heating camphorie acid or mexylene with HIAq at 200° (Wreden, A. 187, 757). Liquid. Not oxidised by aqueous KMnO., H.SO, and HNO, form tri-nitro-m-xylene. Sulphur at 220° forms m-xylene.

Isomeride C, His. Iso-octonaphthene. (122°). S.G. 3 .7767 17 .7637. Occurs in Caucasian petroleum (Putochin, J. R. 16, ii. 295). Liquid.

p-Kylene hexahydride C_sH₁₀Me₂[1:4]. (138° cor.), V.D. 4·01 (obs.). S.G. ‡ ·7956. Formed by heating bromo-camphor with ZnCl₂(R. Schiff, B. 18, 1407; G. 10, 320). Liquid, yielding tribits, and the complex control of the contr nitro-p-xylene [127°] on nitration.

m-XYLENE PHOSPHINIC ACID

Chloride C,H,Me,PCl, [1:3:4]. (257°).

Goffrom mercuric dixylyl Hg(C,H,Me, [4:1:3]), and PCl, at 235° (Weller, B. 20, 1720). Liquid, converted by water into the acid C, H, Me, P(OH).

Chlorine forms the compound C, H, Me, P(OH),

which is converted by water into C, H, Me, P(OH),

which is converted by water into C_sH₃Me_sPO(OH)₂ [194°].

m.Xylene-phosphinic acid C_sH₃Me_sPO(OH)₂ [98°] (Michaelis, A. 212, 237). Formed by the action of water on the chloride. Needles (from alcohol). Probably a mixture.

Chloride C_sH₃Me_sPOl₂ (256°). S.G. ¹²
1.24. Formed from m.Yclene, PCl₃ and AcCl₄ (Weller, B. 20, 1720). It is a mixture of the receding bedy and the 1.2 Siconomical Readily. preceding body and the 1,3,5 isomeride. Readily

preceding body and the 1,5,5 shorted. Evently absorbs chlorine, forming C₂H₂Me₂PCl₄, whence SO₂ forms C₂H₂Me₂PCl₄ (280°–300°).

p. Xylene phosphinous acid. Formed by treating the chloride with hot water. (Weller, B. 21,

1694). Crystallises with difficulty.

Chloride C₄H₄Me₂PCl₄. [-30°]. (254°).

S.G. 11 1.25. Formed by beating p-xylene (159g) with falCl₄ (30 g.) and PCl₄ (200 g.) for 36 hours with inverted condenser (Michaelis a. Paneck, A. 212, 286). Strongly refracting

18° 1760).

An ide C.H.Me., SO.NH.. Granules.

m'Eylene c. sulphonic acid. C.H.Me. (SO.H.)
[1:3:2]. m-Eylene (B) sulphonic acid. Formed, together with a larger quantity of the (1,3,4)-isomeride, by dissolving m'Eylene in fuming K.SO. (Jacobsen, A. 184, 188; B. 11, 18). It remains in the said liquor after prgs. the (1,3,4)-isomeride by the proper quantity of water. Potash-fusion yields p-zylenol [74:5°] (Jacobsen, B. 21, 3828). Its K salt heated with sodium

formate forms an soid C.H.O. [99°].-KA'. BaA's: minute needles.—CuA'saq.

Ghloride C.H.Me. SO.Cl. Oil. Amide C.H.Me. SO.NH. [96°]. Needles. Manae U. 12 mer. SU. Mar. [10°]. Needles. m. Xylene sulphonic acid. C.H. Me. (SO.H.) [1:3:4]. m. Xylene (a) sulphonic acid. Formed as abore. Long flat prisms (containing 2aq). Its Ke salt heated with sodium formate yields xylylic acid.—NaA.'—BaA'. Small plates.—"nA'. 9aq.—CuA'. 6aq. Chloride C.H.Me. SO.Cl. [34°]. *A mide [137°]. Needles (from water). 3zCl at 160° forms C.H.Me. SO.MHBz [151°] Mahon, Am. 4. 194). which yields crystalline

Mahon, Am. 4, 194), which yields crystalline la(C₁₈H₁₄NSO₃)₂aq and BaA'₂, sl. sol. water.

p-Xylene sulphonic acid C_eH₃Me₂(SO₂H)
[1:4:2]. Formed by sulphonating n-volume [1:4:2]. Formed by sulphonating p-xylene (Beilstein a. Wahlforss, A. 133, 38; Fittig a. Glinzer, A. 136, 305; Jacobsen, B. 10, 1009; 11,22; Remsen a. Emerson, Am. 8, 265). Plates or prisms (containing 2aq). Oxidised by alkaline KMnO, to sulpho-terephthalic and two sulpho-panilo, w supino-terepititate and two supino-p-toluic acids.—NaA'aq. [148°]. Trimetric plates; a:b:c=1.077:1:1:498 (Moody a. Nicholson, C. J. 57, 978).—KA'aq.—BaA'₂. S. 2·27 at 0°; 5·53 at 100°.—CuA'₂8aq. Light - blue triclinio

prisms.—ZnA'₂10aq.

Chloride C.H₁Me₂SO₂Cl. [26°]. Prisms. Amide [148°]. Needles, m. sol. hot water. o-Xyleng disulphonic acid C,H,Me,(SO,H), o-Ayien, alkalpaonie acia U.H.Me.(SU.H.).
Formed by hesting (1,2,4)-xylene sulphonie acid
with CISO.3H at 150° (Pfannenstill, J. pr. [2] 46,
155).—K.A"aq.—BaA"3aq.—PbA"3aq. Prisms.
Chloride C.H.Me.(SOCI). (79°). Prisms.
Amide C.H.Me.(SO,NH.). [230°].

m-Xylene disulphonic acid C.H.Mc.(SO.H) [1:3:4:2]. Formed by heating m-xylene with fuming H₂SO₄ at 150° (Wischin, B. 23, 2113), and by heating (1,3,4)-xylene sulphonic acid with SO, at 1500 (P.). Deliquescent needles, with SU, at 100° (r.). Designescent seedies, converted by potash-fusion into C,H,Me.(OH), [146°].— (NH,),2A".—NaHA" 3aq.—K,A" 2aq.—BaA" 3aq. Needles, v. sol. water.—PbA" 3aq.—CuA". Gummy mass.

Ethyl ether Et,A". Plates. Chtoride C,H,Me,(SO,Cl), [129°]. Converted by PCl, at 180° (2,4,1,3)-di-chloro-xylene

Needles. [249°]. Amide CaH N2S2O4 Amide C, H, 2N, 2S, V, CO NH) [225°].
Oxidised by KMnO, to C, H, (CO NH) [225°].

Ethylamide C.H.Me.(SO., HHEt). [135]. m.Xylene disulphonic acid C.X.Me.(SO.H). [1:8:2:6?]. Formed in small quantity, together [1:8:2:67]. Formed in small quantry, together with the preceding isomeride, by heating (1.3,2). The sulphonic acid with CISO, H at 150 (Pfannenstill, J. pr. [2] 46, 154). Needles. Chloride C.H.Me₂(SO₂Cl)₂. Oil. A mids. [210°]. More sol. water than its

isomeride.

isomeride.

p-Xylene disulphonic acid C,H,Me,(SC,H),
[1:4:2:6?]. Formed by heating (1,4.2).
C,H,Me,(SO,Ci) with fuming H,SO, (Holmes,
Am. 18, 372; Piannenstill, J. pr. [2] 46, 156).
Needles, v. e. sol. water.—BaA" 38q.—CaA" 48q.
—MgA" 78q.—PbA" 38q.—AgA" 48q.
C & Lorent e C,H,Me,(SC,Ci), [75°].
A mide C,H,Me,(SO,NH), [295°].

Frepared from owhene by nitration and reduction (Jacobsen, B. 17, 159). Got also by heating m-toluidine hydrochloride with MeOH at 300° (Limpach, B. 21, 643). Monoclinic crystals, not coloured by exposure to light and air. Gives no colour with bleaching powder. Its solutions colour pinewood yellow. On nitration it yields (6,1,2,4)nitro-xylidine [137°] and an isomeride [80°] (N. a. S.). Yields a saffranine on oxidation together

a. S.). Yields a saffranine on oxidation together with di-amido-di-phenyl-amine (Nietzki, B. 19, 3163).—Salt: B'HClaq. Prisms, v. sol. water. Yields \(\psi \)-cumidine when heated with MeOH at 310° (N. a. F.).

Acetyl derivative C.H.,Mc.(NHAc). [99°].

c.m. Xylidine C.H.,Mc.(NH₂) [1.3:2]. (\$).

Xylidine (214° 1.7) at 739 mm. (N. a. F.).

S.G., 22, 9942 (W.). Formed by distilling pamidognesity.enic acid with lime (Schmitz, A. 193. 179) and by reducing c-nitc-m-xylene. 193, 179) and by reducing c-nitro-m-xylene (Grevingk, B. 17, 2430). Obtained from commercial sylidine by crystallisation of the sulphate; the last mother-liquor depositing cryst tals which are converted into the acetyl derivative by distillation with HOAc. The acetyl derivative is saponified by treatment with diluse dertyative is saponified by treatment with diluge (25 p.c.) H₂SO₄ (Nölting a. Pick, B. 21, 3150; cf. Wróblewsky, B. 12, 1226). Gives m-xyloquinone (73°) on oxidation (Nölting a. Forel, B. 18, 2676). Yields (4,1,8,2)-nitro-xylidine [83°] on nitration (Nölting a. Stoecklin, Bl. [3] 5₄ 381).—Salts: B'HCl.—B'HCl aq. S. 9.7 at 18° a. Monoclinto plates. Yields mesidine on heating with MeOH at 310°.—B'HNO. S. 9.2. Needles.—B'_HRO. Very soluble needles.—B'H₁SO₄, 2½ aq. S. 60. Acetyl derivative [1740] (G.); [176-5]

(N. a. F.). Needles.

Bensoyl derivative [140°]. Needles. Yields benzoyl-nitro-xylidine [178°] on nitration

Helds benzoyi-into-xyndine [176] on nitration (Hühner, 4. 208, 318).

s.m-Xylidine C,H.Me.(NH.) [1:3:5]. (222°
I.V.). \$\frac{3}{2}\$. If 972. Formed by reduction of s-nitre-m-xylene [710] (Thöl. \$\frac{1}{2}\$. R5 (362; Nöltting a. Forel, \$\frac{1}{2}\$. 18, 2678). On exidation by ting a. Forel, B. 18, 2678). On oxidation by K₂Cr₂O, and H₂SO, it gives m-xyloquinone [73°], By boiling the diazo-compound with water xylonol [68°] is formed. ClCO_Et forms C₆H₂Me₂NH.CO₂Et [77·5°] (Frentzel, C. C. 1883, 1361).—B'HCl. MeOH at 250°-300° yields iso-cumidine C₆H₂Me₂(NH₂) [54:3:1] (Lhapach, B. 21, 643).—B'H₂SO₄ aq.—B'HNO₂. S. 4·66 at 13°. Acetyl derivdtive [140·5°] (N. a. E.); [138°] (T.); [144·5°] (W.). Colourless plates (from alcohol or ether).

i-m-Xylidine C₆H₃Me₂(NH₂) [1:3:4]. (a)-Xylidine. (215°) at 745 mm. (G.). S.G. 12° 9184 (H.). S.V. 148·3.

Formation.—1. By reducing i-nitro-m-

Formation.—1. By reducing i-nitro-m-xylene (Deumelandt, A. 144, 273; Tavildaroff, B. 2, 553; Wroblewsky, A. 192, 215; 207, 91; Grevingk, B. 17, 2430; Wallach, A. 258, 331). It may be isolated from commercial xylidine by conversion into hydrochloride and several crystallisations from water; the yield being about 40 p.o. (Nölting a Forel, B. 18, 2677).—2. By heating o and p-toluidine hydrochloride with MeOH at 300° (Hofmann, B. 9, 1295; Limpach, B. 21, 640). -3. By distilling (4,3,1,5)-amidomesitylepic acid with lime. (Schmitz, A. 193, 177).—4. By heating i-m-xylenol with anmonium-zinc bromide and NH, Br (Müller, B. 20,

Reactions.—1. When dissolved in H₂SO₄ (10 pts.) it yields C₆H₂Me₂(NH₂)(NO₂) [1:3:4:6] [123°] on nitration (Nölting a. Collin, B. 17, 265).-2. The hydrochloride heated with MeOH at 310° yields mesidine.—3. ClCO_Et forms C₄H_Me_NH.CO_Et [57°] (Frentzel, C. C. 1888, 1361).—4. When mixed with di-amido-di-phenylamine it yields a saffranine on oxidation (Nietzki, amine it yields a sairrainie on oxidation (Netzer, B. 19, 3163).—5. When m-xylidine (4 pts.) is heated with S (1 pt.) at 190° it gives off H₂S and forms a base C_xH_xN_xS [107°] (285° at 14 mm.) which crystallises from alcohol in yellowish white prisms and yields C₁₄H_xAcN_xS [227°] (Anschütz a. Scaultz, B. 22, 582). By further heating with sulphur a homologue of

turther heating with sulphur a homologue of primuline is formed.—6. **CEnanthol forms, oily C.,H.,NO (Leeds, B. 16, 288).—7. **Erolein-yields C.,H.,NO (Leeds, B. 16, 288).—8. **Erolein-yields cryptidine O.,H.,IN (270°) (Leeds, A. C. J. 5, 1).

**Eromo-acetyl derivative oxidine in benseen (Abenius, J. pr. [2] 49, 435). Needles (from broan-acetyl bromde and p-xylidine in benseen (Abenius, J. pr. [2] 49, 435). Needles (from dilute alcohol). Boiling alcoholic potash converts it into an azine and the compound oxidine prisms.—B'HCl., Oxidine potash converts it into an azine and the compound oxidine prisms.—B'HCl., Oxidine potash converts it into an azine and the compound oxidine potash converts it into an azine and the compound oxidine prisms.—B'HCl., Oxidine

B. 21, 2549). Crystals (from water). Converted by P.S. at 100° into the thioformyl derivative [105].

Mono-acetyl derivative

C_sH₃Me_s(NHAcf). (129°]. Needles or plates (from dilute alcohol). P_sS, forms the compound C_sH₃Me_sNH.CSMe [95°] (Jacobsen a. Ney, B. 22,

Diacetyl derivative C.H.Me.NAc. [60]. Formed, together with the mono-acetyl derivative, by boiling the base with Ac.O (Wallach, A. 258, 801).

Benzoyl derivative C.H.Me.NHBs.

**COUNTY OF THE PROPERTY O

[192°]. Needles (Hübner, A. 208, 818). Converted by HNO, into the hitro-benzoyi derivative [184°] which is reduced by tin and HOAo to C_eH₂Me₂ NH CPh [195°].

Phthalyl derivative [158°].

Prisms (from alcohol).

p. Kylidine C.H.Me.(NH.) [1:4:2]. [15:5°] (Michael, D. 26, 39). (215° i.V.) at 789 mm. (N. a. F.); (213:5° uncor.) (M.); (220°) (S.). S.G. 18 1980. 4btained from m-xylene by nitration and reduction (Schaumann, B. 11, 1537; Nölting a. Forel, B. 18, 2664; 19, 2680). Occurs to the extent of about 25 p.c. in commercial xylidine, from which it may be isolated by dissolving in warm H.SO, and pouring inter hot water. sparingly soluble m-xylidine sulphonic acid crystallises out, and the mother-lauor, after successive treatment with CaCO, and Na,CO,, yields on evaporation sparingly soluble, pearly

yields on evaporation sparingly soluble, pearly plates of sodium p-xylidine sulphonate, which on distillation with lime give p-xylidine almost without loss. May also be got from crude xylidine by means of its benzylidine derivative. Teagtions.—1. Oxidised by K.Cr.O. and H.2SO. to p-xyloquinone [123°], the yield being 70 p.c.—2. Converted by the diazo-reaction into p-xylenol [75°] (210°).—8. On heating with sulphur it yields C_{1s}H_{1s}N₂S [144°], which crystallises from alcohol in yellowish needles, and vields an acetyl derivative [212°] (Anschütz &. yields an acetyl derivative [212°] (Anschütz a. Schultz, B. 22, 585).—4. The hydrochloride heated with MeOH at 290° under pressure forms ψ-cumidine (Limpach, B. 21, 646).—5. Bensoic aldehyde forms C,H,Mc,N:CHPh [1027] (Pflug, A. 255, 16%). The same body [96°] is got by adding benzoic aldehyde to an alcoholic solution

of thionyl-p-xylidine (Michaelis, A. 274, 287).

Balts.—B'HCl aq. Leaflets, subliming at 125-130° in needles.—B'HNO, Needles.—B'H₂SO₄. Plates, 8l. sol. water.—B'₂H_CCo₄.

Bensoul derivative C.H.Me.NHBz. [140°]. Needles.

References .- BROMO , CHLORO , and Nyrro ETLIDINE.

XYLIDINE SULPHONIC AUD v. AMIDO-EYLENE SULPHONIC ACID and BROMO- and NITRO-XYLIDINE SULPHONIC ACIDS.

XYLIDINIC ACID &. TOLUENE DICARBOXYLIC

XYLINDEIN. C, 65.5 p.c.; H, 4.7 p.c.; N, 1.0 p.c. A green colouring matter in green decayed wood (Rommier, C. R. 66, 103; Liebermann, B. 7, 1102). Extracted by phenoi and ppd. by alcohol or other. Four-sided blue plates, with coppery lustre. H.SO, forms a green solu-tion. Rideal (C. N. 53, 277) finds that the blue substance in decayed birch-wood is soluble in chloroform, while the blue resin obtained from coniferin by successive treatment with H2SO,

Edinterin by successive treatment with H₂SO₄ and water is insol. chloroform. **XYLITONE** C₁₂H₁₀O. Xylite oil. (252°) (Pinner, B. 15, 589; 16, 1729) (c. 240°) (Claisen a. Ehrhardt, B. 22, 1013). S.G. 935. A product of the action of HCl en acetoce (P.). Formed also by the action of NaOEt on mesityl oxide in ether, and in the preparation of acetylacetone by the action of boiling EtOAc and NaOAc on acetone (C. a. E.). Oil, easily resini-

fied by strong acit's.

Dixylitone C₁₂H₂₀O₂. (310°-320°). A pr duct of the action of HCl on acetone (Pinner). ·XYLOHYDROQUINONE HYDROXYLO-

XYLOYC ACID v. DI-METHYL-BENZOIC ACID.

XYLONIC ACID $C_3H_{10}O_6$. $[a]_D=17\cdot48^\circ$. Formed by oxidising xylose with bromine (Tollens, A. 260, 367). Dextrorotatory. Its . Ca. Zn, and Ag salts are amorphous.—SrA',.

[a]n = +12·14°.

XYLONITRILE v. Nitrile of DI-METHYL-

BENZOIC ACID.

BENZOIG ACID.

6. XYLOQUINONE C.H.O., i.e.

6. H.Me.O. (1:2:3:6). [55"]. Formed by oxidation of c-o-xylidine by K.Cr.O., and H.SO., the yield being about 10 p.c. (Nölting a. Forel, B. 18, 2678). Yellow needles (by sublimation), v. sl. sol. water, m. sol. alcohol and ether.

7. Xyloquinone C.H.Me. (2:1:3:2:5).

m. X loquinone C₀H₂Me₂C₂ [1:3:2:5]. [78°]. Formed by oxidation either of c-m- or s-m-xylidine with K₂Cr₂O, and H₂SO₄ (Nölsing a. Forel, B. 18, 2679). Got also by oxidation of mesidine (Nölting a. Baumann, B. 18, 1151). Yellow needles.

p-Xyloquinone (1.H.Me.O. [1:4:2:5]. Phlorone. Metaph profile. Mol. w. 136. [124].

Formation.—1. Occurs, together with toluquinone and other bodies, alrang the products. of the action of MnO, and H.SO, on coal-tar of the action of MnU₂ and H₂SU₄ on coal-tar and beechwood-tar (Rommier a. Bouilhor, \$U. R. \$5, 214; Gorup Besanez a. von Rad. Z. [2] 4, 560; Carstarjen, J. pr. [2] 23, 425).—2. cBy oxidation of p. xylylene-diamine (Nietzki, B. 13, 472; A. 215, 168).—5. By oxidation of ψ-cumenol (Carstanjen, J. pr. [2] 23, 430?.—4. By oxidation of ψ-cumidine by CrO, (Nölting a. Th. Baumana B. 18, 1151; Sutkowski, B. 20, 977). S. By distilling xylidine (2182) with H 50 card. Bathanagy B. 10, 1101; Suksowsai, D. 20, 311). 5. By distilling xylidine (218°) with H.SO, and MnO₃; the yield being 5 p.o. (C.).—6. By oxida-tion of p-xylidine with K.Cr.O, and H.SO, the yield being over 70 p.c. (Nölting, Witt, a. Forel,

H. 18, 2667).—7. By heating diacetyl with dilute NaOHAq (Van Pechmann, B. 21, 1420).

Preparation.—1. Commercial xylene (130°—140°) is heated with H.SO, at 100° for six days; the product poured into water; neutralised by CaCO,; treated with K.CO,; and the K salts of the sulphonic acids fused with potass. The product is dissolved in water, acidified, and extracted with ether; and the mixture of xylenois 450 obtained is dissolved in warm H.SO., and rso obtained is dissolved in warm H₂80, and then diluted with water and distilled with MnO. Crystals of p-xyloquinone appear in the conorystats of p-xyloquinous appear in the condenser and receiver (Carstanjen, J. pr. [2] 23, 427).—2. 'Yellow carbolic acid' or 'creosote,' the mothef-liquor from which phenol has crystallised, is dissolved in H.SO, diluted with water, and then distilled with MnO. The solid found in the receiver is crystallised from alcohol when the first crop of crystals is xyloquinone (E. Carstanjen, J. pr. [2] 23, 423).

Properties.—Long yellow needles (from benzene), sl. sol. water and cold alcohol, v. sol. ether.

May be sublimed. Volatile with steam.

**Reactions.—1. Distilled with zinc-dust gives a hydrocarbon that oxidises to terephthalic acid.—2. Reduced by aqueous SO, to hydroxyloquinone.—3. Conc. HCl converts it into a mix-

quinone.—3. Cone. HCl converts it into a mixture of mono- and di-chloro-hydro-xyloquinones, C₂HClMe₂(OH)₂ [147°] and C₂ClMe₂(OH)₂ [175°].

Mono-oxim C₂R₂Me₂Q(NOH), Nitroso-p-xylonol. [168°]. Formed by heating p-xyloquinone (2 pts.) with an alcoholic solution of hydroxylamine hydrochloride (1 pt.) (Gold-schmidt a. Schmidt B. 18, 568; Sutkewski, B. 20, 978). Obtained also by adding KNO₂ and excess of HOAo to an alkaline solution of \$\beta\$-xylonol (Oliveri, G. 12, 162). Yellowish needles (from alcohol). v. sol. alcohol. ether. and henzene. (from alcohol), v. sol. alcohol, ether, and benzene. insol. cold water. Alkalis form a deep orangered solution. Reduced by SnCl, to amido-p-xylenol. Oxidised by alkaline K₃FeCy₆ to nitrop-xylenol.

Di-oxim C_eH₂Me₂(NOH)₂. [272°]. Formed by boiling the quinone (1 mol.) with an alcoholic solution of hydroxylamine hydrochloride (2 mols.) (Sutkowski, B. 20, 977). V. sl. sol. alcohol, acetic acid, and benzene, insol. water. Dissolves in alkalis with a yellow colour. By tin and HCl it is reduced to xylylene-p-diamine. Its di-acetyl derivative C₄H₂Me₄(NOAe), crystallises from acetic acide in small yellow prisms,

[170°], v. sol. alcohol and benzene.

References .- DI-BROMO- and CHLORO-TYLO-QUINOFE.

EYLORCIN v. DI-OXY-XYLENE. XYLQSE v. p. 538.

XYLOSTEIN, A glucoside in the berries of Bonicera Xylosleum (Hübschmann, J. 1856, 691; Enz. C. C. 1856, 393). Crystalline, insol. water, sol alcohol and ether.

"MYLOYL-BENZOIC ACID v. PHENYL XYLYL KETOME CARBOXYLIC ACID.

XYLOYL-FORMIC ACID v. XYLYL-GLYOXYLIG

ACID.

#p-DIXYLYL C. H. s.e.

[4:1:3] C.H.Me., C.H.Me., [3:4:1]. [125°]. Prepared by distilling mercury di-p-xyyl (Jacobsen, B. 14°21:2). Loug needles (from alcohol).

Dixylyl. (290°-295°). Formed from brome-m (?)-xylane and Na (Fittig, 4. 147, 38). Liquid.

Di-xylyl (so-called). (295°) (Oliveri, G. 12, 153). Is got by warming commercial xylene with H₂SO₄, but never from xylene which has been made from xylene sulphonic acid. Hence it is probably not a benzene derivative Armstrong, C. J. 45, 150). It is a colourless, fluorescent liquid, smelling like copaiba balsam.

XYLYL-ACETAMINE v. Acetyl derivative of

XYLIDINE and Amide of XYLYL-ACETIC ACID.

RYLYL-ACETIC ACED [102°]. Formed from its amide, which is got by the action of yellow ammonium sulphide on xylyl methyl ketone (Willgerodt, B. 21, 534). Slender needles. XYLYL-ACETIC ACID

Reference.— OXYXXIVILACETIC ACID.

XYLYL ALGOHOL is TOLYL-CABBINOL.

XYLYL-AMIDO-ACETIC ACID C₁₀H₁₈NO₂i.e.

[1:8:4] O₂H₂Me₂NH.CH₂CO₂H. [134*]. Formed by boiling m-xylidine (2 mols.) with water and the state of chloro-acetic acid (1 mol.) (Ehrlich, B. 16, 205). Prisms (from dilute alcohol). Insol. water, v. sol. acids.

Xylide C.H., NH.CH., CO.NHC, H., [128]. Formed by boiling xylidine (2 mols.) with chlory-acetic ether (1 mol.). Thick needles (from alcohol), insol. water and HClAq.

KYLYL-AMIDO-CROTONIC ETHER

[1:3:4] C₆H₂M₉₂.NH.CMe:CH.CO₂Et. from m-xylidine and acetoacetic ether (Conrad a. Limpach, B. 21, 526). Decomposed on heating into (Py. 1, 8; B. 2, 4)-oxy-tri-methyl-quinoline, di-xylyl-urea, and alcohol.

XYL7L-AMIDO-ETHYL-PHTHALIMIDE [1:3:4] C.H.Me., N.H.C.H., N.C., H.O. [123°], Formed by heating brome-ethyl-phthalimids with m-xylidine at 140° (Newman, B. 21, 2197). Small needles, v. e. sol. benzene, al. sol. cold

DI-m-XYLYL-DI-AMIDO-OIAZTHIOLE

C₁₈H₂₈N₄S i.e. S<C(NHC₈H₄):N. [79°]. Formed V₁₈H₂₈N₄S v.e. S C(NHC, H₂); N· Iro J. Former by oxidising (1,3,4)·xylyl-thio-urea with aqueous H₂O₄ (Hector, B. 23, 368). Insol. water. Forms a very soluble hydrochloride.—B'₂H₂PtCl₂. Decomposes at 214°-217°.—B'₂AgNO₃. Explodes on heating. Blackened by sunlight.—B'₂C₄H₃N₄O₅ (218°). Yellow crystals, v. sol. alcohol. Cyanogen passed into its alcoholic solutions forms C₁₈H₃N₄SCy₂ [103°].

Acetyl derivative C₁₈H₁₈AcN₄S. Needles, Bensoyl derivative C₁₈H₁₈AcN₄S. [212°].

Nitrosamine C₁₈H₁₉(NO)N₃S. [246°].

YYLYLMENIE v. XYLDINE and METYYL-

TYLYLAMINE v. XYLIDINE and METHYL-Benzyl-Amine.

Dio-xylyl-amine (C₁H₂)₂NH. (330°-345°). Formed, together with xylidine, by heating (1,2,4)-xylenol with ammonic-zipe bromide and NH, Br at 300° (Müller, B. 20, 1039). Liquid.

NIS, BY at 800° (Müller, B. 20, 1039). Liquid, solidified at a very low temperature.

10.m.xylyl-amine. "(305°-810°). Formed in like manner from m.xylidine. Oil.

10.xylyl-amine. [162°]. Formed, together with a liquid isomeride, by seating xylidine with its hydrochloride (Girard a. Vogt).

TRITYL-BENEYIL-AMINE C₁₁H₁₁N. 6.6.

C.H.Me. NH. CH.Ph. (c. 205° at 15 'gmm.).

Formed by hasting m-xylicine with benzyl elderide at 160° (Joblin-Gonnet, Bl. [8] 6, 21).

Tellowish cil, agl. alcohol and bensens.

p-Xylyl-bensyl-amine [1:4:2]C.H.Me. NH.CH.Ph. (822°) (Pflug. 4. 255 A168

255 A168).

C.-XYLYL BENZYL KETONE C., H., O i.e.

C.H., Me., CO.CH.Ph. [95°]. (210°-220° at 25° mm.). Found from o-xylene, phenyl-acetic chloride, and AlCl. (Wege, B. 24, 8540). Plates, sol. alcohol, v. sol. ether. Yields a crystalline acime. N.O.C. and honoryl chloride, xield will oxim. • NaOEt and benzyl chloride yield C.H.Me. COCH(CH.Ph)Ph [75°].

C.H., Ma. COCCH(CH., Ph)Ph [75°].

n. Xylyl bensyl ketone
[1:3:4] C., H., Ma., CO.CH., Ph. (350°). Formed, together with a smaller quantity of an isomeride
[93°], by the action of A.Cl., on a mixture of n. xylene and phenyl-acetic chloride (Süllscher, B. 15, 1681). Yields C., H., Mc(CO., H.), [3:4:1] on oxidation. NaQEt and benzyl chloride form oily C., H., CO.CH., Ph. (305°–375°).

p. Xylyl benzyl ketone C., H., CO.CH., Ph. (2010°–378°) at 26 mm. Econed in like manner

(220°-230° at 26 mm.). Formed in like manner from p-xylene (Wege). Yields an oxim [99°] and a phenyl-hydrazide [96°]. NaOEt and benzyl chloride yield C.H.,CO.CHPh.CH,Ph [60·5°].

2. XYLYL-BEIZYL-THIO-UREA C.H.,NH.CS.NHCH,Ph. [85°]. Formed from benzyl-thiocarbimide and m-xylidine in alcohol (Dixon, C. J. 59, 558). Monoclinic prisms, v. sol, boiling alcohol and chloroform.

XYLYL BROMIDE v. BROMO-XYLENE.

XYLYL-tert-BUTANE C.H.Me. OMe. (201°) Formed from m-xylene, isobutyl bromide, and AlCl₄ (Baur, B. 24, 2840). Got also from isobutyl alcohol, m-xylene, and H₂SO, or ZnCl₂ (Nölting, B. 25, 791). Oil, yields mesitylenic and trimesic acids on oxidation.

XYLYL.BUTYL ALCOHOL... [2:3:1] C.H.Me.CHPr.OII. (above 270°). Got by reducing xylyl propyl ketone with zinc-dust

by reducing xyly propyr account with 2m-account and KOHAq, or with sodium-amalgam (Chaus, J. pr. [2] 46,474). Oil, v. sol. alcohol and ether. Tri.xylyl-butyl alcohol (C.H., C.CMe, OH. (aboye 300"). Formed from xylene, tri-chlorotert-butyl alcohol, and AlCl. (Willgereat a. Genieser, J. pr. [2] 37, 361). Oil, smelling like mushrooms.

m-XYLYL-n-BUTYRIC ACID

[1:3:4]C,H,Mo,CH,CH,CH,CO,H. [70°]. Formed by saponifying the amide (Claus, J. pr. [2] 46, 476). Needles, v. sol. hot water. May be subtimed.—BaA', 4nq.—CaA', 4nq. Prisma, v. sol. water and alcohol.

water and alcohol. Amids C,H,Mer,C,H,CO,NH, [124°]. Got by heating xylyl propyl ketone with S and ammonium sulphide in world tubes at 250°. Flat siky needles. May be subfined. p-xylyl.n-butylic field [1:4:2]C,H,Mer,CH,CH,CH,CO,H. [70°]. Needles, sl. sol. cold water.— BaA', 4aq.— CAA', 2aq. Needles, sol. water and alcohol. Amids C,H,CH,CO,NH, (125°]. Formed from p-xylyl propyl ketone (C.). Fat needles, v. sol. hot water.

sol, hot water.

m.-Kylyl.isohutyric acid
m.-Kylyl.isohutyric acid
[1:8:4] C.H.Me.,CH.,CHMe.,CO.,H. [70°]. Flat
pearly needles, sol. hot water, alcohol, and ether.
May be sublimed.

Amide C.H., C.H., CO.NH. [120°]. Got by heating xylyl isopropel ketone with 8 and ammogium sulphide at 235° (Claus, J. pr. [2] 46. 483). Needles, sol. hot water.

XYLYL-CARBAMIC ACID

[1:8:4] C.H.Me.NH.CO.H. Ethyl ether EtA'. [58°]. Formed from m-xylidine and chlorotormic ether (Hofmann, B. 3, 657; Frentzel, C. C. 1888, 1861). Needles.

Xylyl-carbamic acid [1:8:5]C,H,Me,NH.CO,H. Ethyl ether EtA'. [77-5] (Frentzel).

DI-p-XYLYL-CARBINOL ([2:5:1] C.H.Me2),CH.OH. [131°]. Formed by KOH (Elbs. J. pr. [2] 35, 484; B. 19, 408). White needles (from alcohol), nearly insol. Aq.

XYLYL CYANATE [1:3:4] C.H.Me. N:CO. (205°) (Frentzel, C. C. 1888, 1361).

Xylyl cyanate [1:3:5] C_eH₂Me₂.N:CO. (208·5°). XYLYL CYANURATE

[1:3:4] (C₆H₂Me₂)₂N₂C₃O₃. [162°] (Frentzel, C. C. 1888, 1861).

XYLYLENE ALCOHOL v. DI-OXY-XYLENE.

XYLYLENE-DI-LLLYL-DI-THIO-DI-UREA (CH₃)₂C₆H₂(NH.CS.NH.C₂H₃)₂(1:4²:6]. [112:5³.] Made from p-xylylone diamine and allyl thiocarbimide (Lellmann, A. 228, 252). Needles Needles (from alcohol). Not decomposed on melting.

m-XYLYLENE-m-DIAMINE

C.H. (CH.), (NH.), [1:3:4:6]. m. Di-amido-m-xylene [105°]. Formed by reduction of nitro-xylidine [123°] or of dicatro-xylene [93°] (Fittig, A. 147, 18; Grevingk, B. 17, 2426; Witt, B. 21, 2419). white crystals. Sublimable. Does not yield a curhodine on boiling with nitroso-dimethylaniline, NaOAc, and HOAc. — B"2HCl. — B"H_SO_C. Crystalline, v. sql. Aq.

m. Nyllene-o-diamine

C_sH_sMe_s(NH_s)_s[L-9:5:6] [78:5°]. Formed by reduction of [2:4:1] C_sH_sMe_sN_sC_sH_sMe_sNH_s(1:3:5:6] (Nölting a. Forel, B. 18, 26:3) and also by the action of tin and HClAq on di-bromo-di-nitro-mxylene [191°] (Jacobsen, B. 21, 2821), and on (5,1,3,6)-nitro-xylidine (Hofmann, B. 9, 1298). Plates (from water), sl. sol. cold benzen, sol. ether.

m-Xylylene-m-diamine

C.H.Me.(NH.)₂[1:3:4:2]. [64°]. Formed by reduction of nitro-xylidine [78°] or of di-nitro-m-xylene [82°] (Grevingk, B. 17, 2426). White needles. Gives a Bismarck brown with nitrous acid and a chrysoïdine with diazobenzene.

p-Xylylene-o-diamine

C.H.Me₄(NH₂), [1:4:2:3]. [75°]. Formed by reduction of c-di-nitro-p-xylene (Lellmann, A. 228, 251; Nölting, B. 19, 145). White needles (by sublimation). Eves a deep-red colour with

FeU1, p-Xylylene-m-diamine C.H.Me₁(NH₂), [1:4:2:6]. [102°]. Formed by reducing (2,6,1,4)-di-nitro-xylene (L.; N.). Needles (by sublimation), Behaves like a m.

diamine.

p. Xylylefte-p-diamine
C.H.Me.(NH.), [142°] (S.); [147°]
(N. a. F.); [150°] (N.). Formation.—1. By reduction of xylene-azoxylidine (amido-azo-xylene)
[2:5:1] C.H.Me., N.C.H.Me., N.H. [12:5:4] by zine and HCRA (Nietzki, B. 18, 471; Nölting a. Forel, B. 18, 2685).—2. By reduction of nitro-pxylidine [142°] (Nölting, Witt, a. Forel, B. 18, 2685).—2. By reduction of nitro-pxylidine [142°] (Nölting, Witt, a. Forel, B. 18, 2685).—3. By reduction of the di-oxim of DixYLYL-ETHYLENE C. 12. 4. 2866; yon Kostanecki, B. 19, 2818; Margkwald, B. 28, 1021).—3. By reduction of the di-oxim of [106°]. c (325°—340°). Formed by distilling

p-xyloquinone C.H.Me.(NOH), with tin and HCl (Sutkowski, B. 20, 979).

*Properties. — Colourless needles, sol. hot

water and alcohol, m. sol. benzene and ether.
Yields xylequinone [123°] on oxidation. Not
oxidised by exposure to air. May be sublimed.
Salts.—B°2HCl. Colourless leaflets.—

Salve.—B'zhci. Colouriess leaness.—
B'H₂SO₄. Crystalline meal.
o-Xylylene exo-diamine
[1:?]_to_cH₄(CH₂NH₂)₂. Formed by heating the phthalimide C_cH₄(CH₂N:C₂O₂:C_cH₄)₂ with conc.
HClaq at 200° (Strassmann, B. 21, 579). Alkaline liquid, smelling strongly like ammonia.

Absorbs CO₂. Gives with FeCl, a pp. of yellowish-red needles.—B"2HCl.—B"2HAuCl₄. Yellow plates.—B"2C,H₂N₂O₂. Yellow needles, decomposing above 170° without melting.

Acetyl derivative C₈H₁₀Bc₂N₂. [146°], Bensoyl derivative C₆H₁₀Bz₂N₂. [168°], m-Xylylene-exo-diamine

[1:3] C,H,(CH,NH,),. (247°). Formed by the action of conc. hydrochloric acid at 220° on the C₁H₁(CH₂N:C₂H₁O₂)₂ [237°], which is got by heating potassium phthalimide with di-ω-bromo-*t-xylene (Brömme, B. 21, 2705). Liquid, sol. water, miscible with alcohol and ether. Absorbs CO₂. — B"2HCl. Needles (from water). — B"2H_PtCl₀.—B"C₆H₃N₃O₇. Yellow spangles, decomposing at 187

A cetyl derivative C,H,(CH,NHAc). [119°]. Crystalline mass, v. sol. hot water.

Reference.—NITRO-XYLYLENE-DIAMINE.

XYLYLENE-BENZENYL-AMIDINE v. Benz-Enyl-xylylene-dialine.

XYLYLENE BROMIDE v. DI-BROMO-XYLENE. XYLYLENE-CHLORO-MALONIC ETHER v. CHLORO-XYLYLENE-MALONIC ETHER.

Xylylene-exo-di-chloro-malonic ether v. Dr-CHLORO-PHENYLENE-DI-METHYL-DI-MALONIC ETHER. XYLYLENE-ETHENYL-AMIDINE C10H12N2

i.e. CMe $\langle NH \rangle C_sH_2Me_2$. Formed by reducing C,H,Me,(NO,)(NHAc) [1:3:5:4] with tin and HOI (Hobrecker, B. 5, 922). Resinous mass.— B'HCl. Large needles.—B'₂H₂PtCl₂.—B'HNO₂ Long needles.

XYLYLENE IODIDE v. DI-IODO-XYLENE. XYLYLENE-DI-MALONIC ACID v. PHENYL-ENE-DI-METHYL-DI-MALONIC ACID.

o-XYLYLENE SULPHIDE C.H.S &c.

 $C_0H_4 < CH_2 > S$. [c. 0°]. Formed by heating dies brome zylene with KS (Leser, B. 17, 1824; Hjelt, B. 22, 2904). Oil, smelling like mercaptan. Very unstable, quickly furning into a black fesin.—B', HgCl. Long needles.

Metaylo-iodide B'Mel. [1555].

Di-xylylene disulphide Pormed by cheating xylylene-diazosulphide at 200°-250° (Jacobsen a. Ney, B. 22, 911). Conc. H₂SQ₂ forms a blue liquid, remaining blue on diazosulphide.

O.H.Me, CH, CH, Cl, which is got from di-chlord wald, B. 25, 2368). Sl. sol. water, -Aurodi-ethyl oxide, m-xylene, and H.SO, (Hepp. B. 7, 1416). Spangles (from alcohol), sol. ether and CS. Unites with bromine. Oxidised by dilute HNO, to (1,3,4)-di-methyl-benzoic acid

Di-xylyl-ethylene C,H,Me,CH;CH,C,H,Me, [157°]. Formed in like manner from p-xylene. Plates (from alcohol). Less soluble than the preceding isomeride.

Tetra-xylyl-ethylene (C₆H₄Me₂)₂C:C(C₆H₃Me₂)₄. [245°]. Formed from xylene, CHCl₂, and AlCl₂ (Schwarz, B. 14, 1528).

xylene, CHCl., and AlCl. (Schwarz, B. 14, 1528). Yellow plates.

m.XYLYL.ETHYLENE.DIAMIND

C.H.Me.NH.C.H.NH... (274°). Formed from

m.xylyl.amido-ethyl-phthalimide and HCl (Newman, B. 24, 2197).—B'HCl. [173°].—B',H.PtCl...

—B'C.H.N.O... [141°]. Reddish-yellow needles,
v. e. sol. alcohol.

DI.-m.XYLYL.ETHYLENE DIKETONE DI-m-XYLYL-ETHYLENE DIKETONE

C.H. (CO.C. H.Me. [4:3:1]). [129°]. Formed from m.xylene, succinyl chloride, AlCl, and CS. (Claus, B. 20, 1375). Needles, insol. water, v. sol. alcohol and ether. Dilute HNO, oxidises is to (1,3,4)-di-methyl-benzoic acid. Oxim C,H,(C(NOH).C,H,)2. [140°].

C.L., (C(A)CH). (LACH). [140].

Phenyl-hydrazide

C.H., (C(N, LPh). C, H₂). [189]. Crystals.

Di-p-xylyl thylene diketone

C.H., (CO.C, H, Me., [2:4:1]). [123]. Formed from p-xylene, succinyl chloride, AlCl., and CS., (Clays). Moddler.

(Claus). Needles.

m-XYLYL ETHYL KETONE

[1:3:4] C.H.Me.CO.C.H., (239°). Light oil, with aromatic ododr, not solid at -10° (Claus, 140°).

[1:3:4] C.H.Me.CO.C.H., Violag (1:3:4).di-methyl. J. pr. [2] 43, 140). Yie benzoic acid on oxidation. Yields (1,3,4)-di-methyl.

Phenyl-hydrazide [126°]. Plates, v. sol. hot water, alcohol, and ether.

hot water, alcohol, and enter.

p.Xylyl ethyl ketone

[4:1:2] O₂H₂Mo₂CO.O₂H₃. (238° uncor.). Formed
from p-xylene, AlCl₁, and propionyl chloride
(Claus a. Fickert, B. 19, 3182). Oil. Oxidised
by KMnO, to C₂H₂Mo₂CO.CH₂CO₂H [132°] and
some (4,1,2)-di-methyl-benzoic acid.

mxylyl ETHYL KETONE CARBOXYLIC

ACRE (4,2)1.C H Mc CO CH CH-CO H.

ACID [4:2:1] C.H.Me, CO.CH, CH, CO, H.

Di-methyl-benzoyl-propienic acid. [108°].

Formed from m-xylene, succinyl chloride, Formed from m-xylene, succinyl chloride, AlCl., and CS. (Claus, B. 20, 1376). Needles, v. sol. hot water, insol. cold.—NH, A'.—KA' 4aq. V. sol. water.—NaA' 4aq. Needles.—BaA', 3aq. Needles.—BaA'; white pp.—AgA': Thite crystalline pp.
p-Xylyl ethyl ketone carboxylic acid
[4:1:2] C,H,Me,CO.CH,CH,CO.H. (84°).
Formed from p-xylene in like manner (C.),
Colourless needles.

ZYLYL-DI-ETHYL-PHOSPHINE OH, Me.PEt. (260°). Formed by the action of ZnEt on O.H.Me.PCl. (Czimatis, B. 15, 2016). Thick colourless oil. Yields B'Mef [90°], B', Me, PtCl, [202°], and B'EtI [186°]. me,rtol, [202], and 2 Hit [104], CH;CH;m-XYLYL-GLEOXALINZ C,H,N CH;CH

,[32°]. (279°). Formed by the action of HNQs on C,H,N<0H= CH [192°], which is get by the action of HCl on the product of the action (N. amido-actal on m-zylyl-thio-urea Marck-hol.

wald, B. 25, 2368). Bl. sol. water,—Aurochloride [165°].—Picrate. [159°]. Yellow
needles, m. sol. chloroform.

-XYLYL-GLYOXYLIC ACID
[4:3:1] C.H.Me., CO:OO, H. [92°]. Formed by
oxidising o-xylyl methyl ketone with alkaline
K.FeCy. (Buckka a. Irish, B. 20, 1766).—BaA'.

K₁FeCy₄ (Buchka a. Irish, B. 20, 1766).—BaA'₂—

"Xylyl-glyoxylic acid

[4:2:1] S₆H₂Me₂CO.CO₂H. [54°]. Formed by
oxidising m²xlyl methyl ketone with KMnO₄
(Claus, B. 19, 231; J. pr. [2] 43, 142). Flat
prisms, Yields (4,2,1) di-methyl-benzole acid
on böling with dilute HNQ₃. Gives rise to
C₆H₄,CH(OH).CO₂H. [119°] on reduction.—
CaA'₂Zaq. Needles.—BaA'₂Zaq.—AgA'. Needles,
sol, hot water. sol. hot water.

p-Xylyl-glyogylic acid [5:2:1] C.H.Me. CO.CO.H. [70°-80°]. Formed by oxidation of p-xylyl methyl ketone by aqueous KMnO, (Claus a. Wollner, B. 18, 1859). Crystalline, v. sol. alcohol, ether, and HOAc, v. sl. sol. water. Splits up above 200° into CO, and di methyl-benzoic aldehyde. Oxidised by HNO, to C.H.Me, CO. H. Ac,O and NaOAc yield dimethyl-cinnamic acid.—BaA', 6aq: small felted needles. - CaA', 3aq. - AgA': crystalline pp. Ethyl ether EtA'. Oil.

XYLYL GLYOXYLIC ALDEHYDE

[1:3:4] C. H., Mc., CO. CHO. Oxim [95°]. Formed from xylyl methyl ketone, NaOEls, and C. H., NO. (Söderbaum, B. 25, 3463). Needles (from benz-ene-ligroin). Acetic anhydride gives the acetyl derivatives of the syn-oxim C.H., CO.CH:NOAc C,H,.CO.CH(OH).CO.CO.C,H, [155°].

DI XYLYL GUANIDINE HN:C(NH.C.H. [1:2:4])₂. [158°]. Formed by the action of PbO and alcoholic ammonia on dixylyl-thio-urea (Hofmann, B. 9, 1295). Needles,

(from alcohol). XYLYL-HYDRAZINE [4:2:1] C₆H₁Me₂NH₁NH₂ [85°]. Formed from xylidine by diazotisation followed by reduction with Na SO,, the resulting C,H, N,H, SO,Na laq

with Na, No., the resulting U, H, N, H, SO, Na § adbeirg then treated with zinc-dust and HOAc (Klasber, M. 11, 282). Pale-yellow needles, v. sl. sol. water, v. sol. slcohol. Reduces Fehling's solution on warming. On heating with acctosic ether it yields a crystalline body [208°] reduced in alcoholic solution by Na to oxyvivlmethyllmyracols § xylyl-methyl-pyrazole. Salt:—C'HCleiq. [[183°]. Small needles.

Salt.—C'HCl&zq. [185']. Small necess. Di.o.zylyl-hydrazine, [3:2:T-C.H.Me.,NH.NHC.H.,Me., [1:2:3]. [141']. b. Hydrazo o.zyleke. Got by heating nitro-cylene (20 g.) with NaOH (20 g.), sloohol (100 c.o.) and zinc-dust (25 g.) and reducing the product with alcoholic ammonium sulphide (Nölting a. Stricker, Bl. [2] 50, 618). White needles, sol. alcohol and ther. Easily oxidised by air.

u-Di-o-xylyl-hydrazine N.H.(C.H.Me.[1:3:4]). [107°]. Formed by reducing hitro-o-xylene with sodium-amalgam ducing hitro-o-xylene with southern sol. also (N. a. S.). Yellowish white needles, sol. also

Di-m-xylyl-hydrasine . N₂H₂(C₆H₂Me₂ [1:3:5])₂. [125°]. Obtained from s-nitro-m-xylene (N. a. S.). Needles, easily oxi-

dised by air.

u-Di-m-xylyl-hydrasine u-Di-m-xylyl-hydrasine
N₂H₂(C₂H₂Me₂[1:2:4]), [122°], (Gpt by warming nitro-m-xylene (30 g.) with MaOH (30 g.), zinc-dust (40 g.), and alcohol (250 c.c.) and treating the xylene-azo-xylene so obtained with the challenge of the control of alcoholic ammonia and H2S (N. a. S.). White needles, sol. alcohol and ether.

Di.p. zylyl. hydrasine N.H. (C.N.Me. [1:2:5]). [145°]. Formed from nitro-p-xylene (N. a. S.). Needles, not affected by air.

XYLYLIC ACID v. DI-METHYL-BENZOIC ACID. a-Xylylic acid v. TOLYL-ACETIC ACID.

p-XYLYLIDENE DI-IMINI

o.H.(CH:NH)₂[1:4]. Formed by the action of alcoholic NH, or dry NH, gas upon terephthalic aldehyde (Oppenheimer, B. 19, 576). Glassy brittle crystals. V. Sl. sol. alcohol and ether.

DI-XYLYL-KETONE CO(CoH, Me.)2. (c. 340°) Obtained from (m?)-xylene, GOCl₂, and AlCl₃ (Ador a. Rilliet, B. 11, 399). Liquid, not solid at -60°. Split up by long boiling into H₂O and

C,,H,,.

U1-p-xylyl ketone [2:5:1] C₆H₁Me₂(2).C₆H₁Me₂ [1:2:5]. (327° uncor.). Formed from p-xylene, CS₂, and COCl₂ in closed vessels; the yield being 55 p.c. (Elbs, J-pr. [2] 35, 481). Oil. Quickly decomposed by distillation into H₂O and (B. 2, 1',4')-trimethyl-anthracene [227°]. Reduced by zincdust and alcoholic KOH to di-p-xylyl-carbinol [131°].

Di-xylyl-tat-a-batca-Di-p-xylyl ketone

Di-xylyl-tetasketone
C₂H₂.CO.CO.CO.CO.CO.H₂Me₂[4:3:1]. [180°].
Formed by the action of cold HNO₃ (S.G. 1·4)
on C₁H₂.CO.CH(OH).CO.CO.C.H₂.(Söderbaum, B. 25, 3475). Scarlet needles (from CS2). On dissolving in HOAc and ppg. by water it yields a dihydrate [100°] C.H...O.

**YYLYL MERCAPTAN C.H.Me.SH. (214°).

TRI. p. XYLYL-METHANE CH{C,H,Me₂}; [188°]. (above 360°). From di-p-xylyl-carbinol, p-xylene, and P₂O₅ by boiling for four hours (Eibs, J. pr. [2] 35, 484). Crystalline grains (from alcohol), v. bl-ether and benzene. o.XYLYL METHYL RETONE
[4:3:1] C₆H₈Me₂CO.CH. (2460)

o-XYLYA METHYL KETONE

(3:1] C.H.Me., CO.CH., (246°). Formed from
o-xylene, AcCl, and AlCl, (Ukus, B. 18, 1856;
19, 232; J. pr. 1890, 410). Oil, smelling like
commarin (Armstrong a. Kipping, C. J. Ch. 81).
Yields (4,3,1)-di-methyl-benzolo acid on oxida:
tion. Conce CllAq forms C.H., O[114°]. P.O.
gives a body melting av 165°. Zino-dust reduces.
the ketone to C.H., CH(OH), CH. (257°).

Oxim C.H., C(NOH), CH., [85°]. Prisms
(from. dilute alcohol), converted by AcCl into
C.H., C(NOA), CH., [72°].

(from dilute alconol), converted by Acc. Into C.H., C(N.O.A.), C.H., [72°].

Phenyl-hydrasids. Colourless prisms.

m-Xylyl methyl ketene
[4:2:1] C.H.Me., CO.C.H., (228°). Formed from m-xylene, AcCl, and AlCl, (Claus, B. 19, 280).

Obtained also by boiling m-xylene with HOAL ZuCl_m and POCl_a (Frey, J. pr. [2] 48, 120). Oi smelling like peppermint. Not condensed b HClAq. Yields C_{1.}H₂Br₂O [69°]. Reduction b HI yields C_{2.}H₃Me_{2.}OH₂OH₃OH₄ (184°) (Claus, J. pr. [2] 45, 830). HNO, gives C_{2.}H₁₂N₂O₄ [108° (Claus, J. pr. [2] 41, 492).

p-xylyl methyl ketone
[5:2:1] C_{4.}H₂Me_{2.}CO.OH₂. (225° uncor.). S.C
12° 9962. V.D. 4°93. Formed from p-xylene AcCl, and AlCl₃ (Claus a. Wollner, B. 18, 1856;
Oil, v. sol. alcohol and gther. Oxidised by 801 aqueous KMnO, to p-xylyl-glyoxylio acid. Dilut

aqueous KMnO, to p-xylyl-glyoxyliz acid. Dilut HNO, forms di-methyl-benzoic and methyl phthalic suids.

Oxim C.H. C(NOH) .CH. [58°]. AYLYL METHYL KETONE CARBOXYLICACID.

ACID v. METHYL-BENZOYL-ACETIC ACID.

XYLYL-DI-METHYL-PHOSPHINE C.H.Me., PMe. (230). Formed from ZnMe and C.H.Me., PCl. (Czimatis, B. 15, 2016). Oil Unites with CS., forming a compound [115°].

. XYLYL-METHYL-THIOHYDANTOÏN

[1:3:4] C₄H₂Me₂.N<CO.CH₂. [165°]. Formed from xylyl-thiocarbimide and alanine (Marckwald, B. 24, 3282). Needles, v. sol. alcohol.

XYLYL PENTADECYL KETONE C_oH₃Me_xCO.C₁₃H₃₁, [87°]. (269° at 15 mm.). Formed from m-xylene, pulmityl thloride, and AlCl₃ (Krafft, B. 21, 2269). Small plates, yielding di-methyl-benzoic acid [126°] on oxidation.

XYLYL PHENYLAMYL KETONE C.H.Me. CO.CHPh.C.H. [91.5°]. Formed by Friedel and Craft's method (Wege, B. 24, 3541). XYLYL-PHENYL- v. PHENYL-XYLYL

TRI-XYLYL PHOSPHATE PO(OC,H,Me,),. The o- and p- compounds are formed by heating o- and p-xylenol with POCl, (Kreysler, B. 18, 1702). They are oils, v. sol. ether, alcohol, and

m-XYLYL-PHTHALIDE

 $C_eH_4 < CO \xrightarrow{CH(C_eH_sMe_s)} O$. [84°]. Got by heating C₆H₂Me₂.CO.C₆H₄.CO₂H with zine and HCl (Gresly, A. 234, 237). Needles (from alcohol), sl. stl. benzene.

XYLYL-PROPIONIC ACID

XXIXI.-PROPIONIC ACID

[1:3:4] 6.4 Me., CH., CH., CO., H. [105°]. Formed by saponifying the amide. Silky needles, v. sol. hot water.—BaA', 6aq. Plates, m. sol. water.—CaA', 4aq.—AgA'. White powder.

Agnide & H., Me., C.H., CO.NH., [107°]. Got by heating the oxim of m. xylyl ethyr zetone with yellow ammonium sulphide under pressure (Claus, V. pr. [2] 46, 477). Needles, sol. hot water. water.

m-XYLYL PROPYL KETONE C12H10O i.e. [4:2:1]C.H.Me.CO.Pr. (251°). Formed from m*xylene, butyryl chloride and AlCl, (Class, (J. pr. [2] 46, 474). Oil, v. sol. alcohol and ether? Yields mxylyl-glyoxylic acid [54°] on Saldation with YM-2. Exidation with KMnO.

exication with KMnO_s.

Oxim. Crystal₁, v. e. sol. alcohol.

b-Xylyl propyl ketone [5:3:1] O_sH₁Me₂CO.Pr.

(240). Formed in like mather from p-xylene.

Lightwil.

Oxim (47°]. • Colourless needles.

o-Xylyl isopropyl ketone

[4:3:1] Q_sH₁Me₂CO.Pr. (258°). Oil, melling like

tarpentine (Claus, J. pr. [2] 45, 484). Y di-methyl-benkoic acid [163°] on oxidation. Oxim [68°]. Large prisms. Yield

m. Tylyl isopropyl ketone
[4:2:1] C.H.Me. CO.Fr. (245°). Oil yielding
m-tylyl-glyoxylic acid on oxidation by KMnO.
Osim [97°]. Prisms (from sicohol).

Phinyl-hydraside [129°]. Crystals. p-Xylyl isopropyl ketone

[5:2:1] C.H.Me. CO.Fr. (240°). Formed from p-xylene, isobutyryl chloride, and AlCl. (Claus, J. pr. [2] 46, 484). Oil, smelling like mush-

Oxim [76°]. Plates and prisms...
TETRA-0-XYLYL SILICATE Si(OC,H,Me.),. (c. 460°). Formed by heating o-xylenol with SiCl, the yield being 85 p.c. of the theoretical amount (Hertkorn, B. 18, 1691). Large prisms. Tetra-m-xylyl silicate Si(OC₂H₃Me₂). (453°-

457°). Formed, in like manner, from m-xylenol.

Oil.

77. XYLYL THIOCARBIMIDE C,H,NS i.e. [4:2:1] C,H,Me,,N:CS. Formed from di-xylyl-thio-urea and P,Q, (Hofmann, B. 9, 1295). Crystals. Converted by PhOEt and AlCl, into C.H.NH.CS.C.H.OEt [140°] (Gattermann, B. 25, 8530). XYLYL ETHYL DITHIOCARBONATE

CS(OEt).SC:H.Me. Formed from potassium

xanthate and m-diazo-xylene chloride (Leuckart, J. pr. [2] 41, 192). Oil, converted by heating with alcoholic potash into xylyl mercaptan

DI-XYLYL-THIO URBA

CS(NH.C.H.Me.[1:2:4]),. [158°]. Formed by digesting xylichine with CS, as long as H.S escapes (Hofmann, B. 9, 7295). Crystals (from

[186°]. Formed from crude xylidine sulphate and potassium cyanate (Genz, B. 8, 226). Needles (from alcohol).

receies (from alcohol).

s.Xylyl ures NH, CO,NH,O,H,Me,[1:3:5].
[162°] (Frontzel, C. C. 1888, 1361).
Di-s.xylyl-ures CO(NHC,H,Me,[1:3:5]),
[275°] (F.); [251°] (G. a. C.). Formed from s.xylidine and GOCl, (F.). Formed also from m.xylyl cyanate and xylidine (Gattermann a. Cantzler, B. 25, 1089). Needles

m-xylyl cyanate and xylotine (caterman a: Cantzler, B. 25, 1089). Needles.

Di.m.xylyl-area CO(NH.C₃H₃Me₂(1:2:4)).

[263°]: A product of the distillation of m-xylylamido-crotonic acid (Conrad a. Limpach, B. 21, .

527). Sublimes when mereng.
Di-xylyl-urea CO(NHC, H, Me.). Formed by heating urea (1 pt.) with crude xylidine (8 pts.). Felted needles (from hot alcohol), not melted at 250° (Genz, B. 3, 226).

Reference. - METHYL-BENZYLAIREA.

YTTERBIUM. Yb. At. w. c. 173. This name is given to the metal, not yet isolated, of an earth separated by Marignac, in 1878, from crude erbia obtained from gadolinite or euxenite. The claim of ytterbia to rank as a definite homogeneous compound is not yet satisfactorily established.

The discovery of a new earth in a mineral from Ytterby in Sweden was announced in 1788 by Gadolin; in 1797 Eckeberg confirmed the disthe mineral from which it was obtained was called gadolinite. Researches into the nature of called gadolinite. Researches into the nature of yttria were conducted by Berzelius in 1819 (v. Lehrbuch [5th ed.] 2), Mosander in 1839 and KHSO, fused over a powerful burner, pulverised 1848 (J. pr. 30, 27), Scheerer in 1849, Cleve and others. In 1879 Marignao made 4 careful examination of erbia (M. Ch. [5] 14, 247); he fractionally decomposed erbium nitrate by heat fractionally decomposed erbium nitrate by heat, and obtained an earth which he called ytterbia. The erbia used by Marignac was fink, and gave, rne erous used by marigina was plus, and gave, in solution, an absorption spectrum; the new earth was white and showed no absorption spectrum. Nilson (B. 12, 554; 13, 1439 [1879-89]) prepared ytterbia, but found a reacting weight for the earth different from that assigned to it by for the earth different from that assigned to it by Marignac. By repeated fractional decomposition by heat of the gitrate of ytterbium, Nilson separated another aerth which he called scandia (cf. Scandium, this, vol., p. 431). Nilson 45: 13, 1430) in 1873 made a fuller examination of ytterbia, and defermined the at. w. of the metal of this earth, and the properties of several salts of the metal. In this memoir Nilson asserted

that erbia was separable into seven distinct earths: erbia proper, scandia, terbia, thulia, ytterbia, yttria, and Soret's X (afterwards called holmia). (cf. Erbium, vol. ii. p. 456; and Metals, RARE, vol. iii. p. 245).

Ocquirence. - Along with orbia, scandia, yttria, &c., in very small quantities in a few rare Scandingvian minerals, chiefly in gadolinite and euxenite. Nilson (l.c.) obtained c. 20 g. ytterbia from 6-7 kilos, of the crude earths prepared from c. 15 kilos. gadolinite.

the fused mass, and thoroughly exhausted with cold water; he ppd. the aqueous solution by ammonia, washed the ppd. in the solution for some time, and filtering, he ppd. by oxalic acid, washed the pp. dried it, and heated strongly until it was decomposed. The crude garths thus obtained were freed from K.CO. by boiling with water, and were than dissolved in HNO,Aq; the solution was evaporited to dry-ness, and the residue was lused until red vapours began to come off. The reddish-yellow, opaque solid was then treated with boiling water, wheresond was then treased with boung water, where by a reddish-yellow pp. was formed, which was filtered off by means of a suction-pump! (This pp. contained oxide of Th, along with oxides of Ce, Fe, and U.) The reddish filtrate was evaporated to dryness, and the solid nitrates thus obtained In this memoir Nilson asserted were partly decomposed by heating, the soluble

(undecomposed) portion removed by solution in water, the residue dissolved in HNO2Aq, the solution evaporated to dryness, the residue partly decomposed by heating, the unde-composed nitrates were removed, by washing with water, the residue was dissolved in HNO, Aq, and so on. After thirty repetitions of this process a solution was obtained that showed merely a trace of red colour after thirty-five repetitions the solution was quite colourless, and showed only two faint absorption bands, one in the green and the other in the red; after forty repetitions a solution was obtained which gave only the red band; and when the process of partial decomposi-tion by heat had been repeated skity-eight times a solution in HNO.Aq was obtained which showed no trace of an absorption spectrum. This solution was saturated with H,S, the small yellowish-brown pp. of PtS, was filtered off, the filtrate was ppd. by oure exalic acid, the pp. was washed, dried, and decomposed by heating strongly, and pure ytterbia was thus obtained. For a modification of this method of separating ytterbia from accompanying earths v. Auer ven Welsbach (M. **4,** 630).

Atomic weight of ytterbium.—The metal has not been isolated; the at. w. was determined by Nilson (B. 13, 1433) by dissolving pure Yb,O₃ (v. supra) in HNO₃Aq, adding a suitable quantity of H.SO, Aq, exaporating on a water-bath to drive off HNO, then on a sand-bath, and finally over as flame until all free H.SO, was removed, weighing the Yb,(SO), thus obtained, and analysing it. Nilson dissolved pure Yb,O, in HNO,Aq, evaporated to dryness, partially decomposed the nitrate by heat, treated with water, co., as described supra, and in this way obtained seven fractions, each of which was converted into sulphate. The results are presented in the following table :-

Weight of	Weight of sulphate	Pctge. composition of sulphate		Atomic W.
taken	formed	Yb,O,	80,	bf Yb.
1.0063	1.6186	62-171	37.829	173-21

Chemical relations of ytterbium.—If Yb is really a homogeneous substance, it must be placed in Series 10 of Group III. in the periodic classification of the elements. This group contains the following elements:

ought to be decidedly more metallic than B, and somewhat more metallic than Al, Ga, or In; the data, however, are too meagre to allow a detailed comparison to be made. Little is known of the properties, of compounds of Yb; but what is known broadly confirms the conclusions drawn from the position of the element in the periodic scheme of classification (cf. Easths, METALS OF

THE, vol. ii. p. 424).

Ytterblum oxide Yb₂O₂. (Ytterbia.) A very heavy, white, infusible powder; slowly acted on by acids when cold or gently warmed, but resdily dissolved by dilute acid solutions when boiling. Solutions in acids are colourless, and show no absorption spectra. The emission spectrum of as solution in HClAq, obtained by help of the spark, shows several lines, the most conspicuous of which have the wave-lengths 6221, 5556, 5476, 5352, and 5334 (v. Lecog de Boisbaudran, TR, 5352, and 5334 (v. Lecog de Boisbaudran, CR, 5352, and 5354, and 53 C. R. 88, 1342). S.G. 9.175. S.H. (0°-100°)

·0646 (Nilson, I.c.).

Hydrated ytterbium oxide. A white, gelatinous, but heavy pp. obtained by adding NH,Aq to a solution of a salt of Yb; shrinks much when dried, and absorbs CO₂ from the air.

Easily soluble in acids (Nilson, l.c.).
Ytterbium salts. Nilson (l.c.) prepared an oxalate, an acid selenite, and a sulphate; and

oxalate, an acid sciente, and a suppate; and Marignac (C. R. 87, 578) prepared a formate. Ytterbium ozalate Yb_(\(\infty\)_0\), \(\bar{1}\), \(\bar{ changed in air; gives up part of its water at 100°. Prepared by adding oxalic acid to a warm solution of the sulphate.

Ytterbium selenite Yb, 0,4SeO, 5aq.

tained by adding Na₂SeO₃Aq to a solution of Yb₂(SO₄)₃, washing the ppd normal selenite, dissolving in water containing a large excess of H2SeO2, evaporating nearly to dryness, and washing the residue with water. A white crystalline

salt, insoluble in water. Loses 4H₂O at 100°.

Ytterbium sulphate Yb₁(SO₁), Prepared by dissolving Yb₂O₂ in HNO₂Aq, adding H₂SO₂Aq, evaporating on a water-bath to drive off HNO₂, then on a sand-bath, and finally over a flame at low redness till all H₂SO₄ is removed. An opaque, white solid. Dissolves in water when a large quantity is added at once; if a little is added much heat is produced, the salt combines with the water, and then dissolves very slowly when more water is added. Decomposed at a red heat, fully et a white heat. S.G. 8.793. S.H. 1039 at 0° to 100°.

A hydrated sulphate Wb, (SO,). Saq was obtained by Nilson in large, white, lustrous prisms by evaporating a solution of Yb. (SO.), in water at a gentle heat. M. M. P. M.

at a gentle heat. M. M. P. M. YTTRIUM: Y. At. w. c. 89 6. The name of trium is given to the metal of an earth-obtained from a few fare Swedish minerals. The tains the following elements:

Even series—

2 4 6 2 10

B (11) So (14) Y (89) La (139) Yb (173)

Odd series—

3 5 7 9 11

Al (27) Ga (70) In (114) — T1 (204)

A comparison of the position of Yb with the positions of elements placed in Series 10 (c. that is a position of the positions of positions of positions of elements placed in Series 10 (c. that is a position of the position of Yb with the position of you have that Yb oxides 4cf. Erroum, vol. ii. p. 456; Scampton, vol. i wars von p. 879; and

infrq, Homogeneity of Yttria).

Occurrence.—About 30 to 35 p.c. of yttria, in combination with SiO2, is found in the exceedingly rare Swedish mineral gadobnite; some specimens of orthite also contain yttria, and the earth has also been found, in combination with Nb₂O, and Ta₂O₅, in specimens of curenite. The exides that generally accompany yttria in these rare minerals are ceria, didymia, erbia, lantana

lime, magnesia, soda, and oxide of iron.

Preparation of yttria.—The crude oxides of yttrium, erbium, &c., are separated from gadolinite by the method of Bahr, a. Bunsen described under Erbuum (vol. ii. p. 457). Madistrial of the contract of the oxides of the contract of the critical of the crit rignac (A. Ch. [5] 14, 247) converted the oxides into nitrates, heated the nitrates in a Pt basin until red fumes came off freely; treated the residue with water, and separated the solution, which contained much Yt nitrate, from insoluble basic nitrates of Er, &c. He then evaporated the solution to dryness, heated again until partial decomposition was effected, again treated with water, poured off the solution, evaporated it to dryness, partially decomposed the solid nitrates by heat, and so on. After some hundred repetitions of these processes, approximately pure yttria was obtained. Auer von Welsbach (M.4, 630) sengrated approximately pure yttria from the crude earths obtained from gadolinite by a long-continued series of operations based on the facts (1) that yttrium nitrate is less readily decomposed to basic salts than erbium sitrate when a fairly conc. solution of these nitrates is beated with the oxides of the metals finade into a paste with water, and (2) that basic yttrium nitrates dissolve in a solution of the normal nitrates of Y and Er more readily than basic erbium nitrates.

porated, separated and dried the double chloride of yttrium and ammonium thus formed, mixed this with Na, the double salt and the Na being arranged in alternate layers, heated the mixture in selected except the salt and the Na being arranged arraphit till extinct heated the mixture arranged in accrume inyers, nearest the introduction of closed crucible till action began and ther allowed the reaction to proceed; washed the fused mass with water, separated unreduced yttria by levigation, washed the dark grey powden that remained with water and then with alcohol. yttria by levigation, washed the dark-grey powden that remained with water, and then with alcohol, and dried it over H.SO. In 1890 Winbler (B. 23, 787) obtained a black powder that decomposed water by heating utria and finely divided Mg in the ratio Y.O.; 3Mg (cf. Yagara, p. 882). Popp describes yttriam as a dark-grey powder resembling ferrum reductum, decomposing cold-water slowly and hot water rapidly, Yoz. IV.

easily dissolved by dilute acids, including acetic acid, decomposing boiling KOHAq, and NH, ClAq at the ordinary temperature, with evolution of H and NH₁; we metal burns brilliantly when heated on Pt foil; when heated in O it burns with a very dazzling light.

with a very dazzing igut.

An examination of the emission spectrum of yttrium was made by Thalén: the most prominent lines observed had the wave-lengths 6191, 6331, 5387, 5971, 5662, 5496, 5402, 5205, 5202, 5203, 5203, 53030, 53030, 5303, 5303, 5303, 5303, 5303, 5303, 5303, 5303, 5303, 5303, 5 5200, 5088, 4900, 4881, 4854, 4874, and 4809

(Kongl. Sie. Vetens. Acad. Hundl. 12).

The atomic weight of attrium was determined by Berzelius, Delafontaine, Popp, Bunsen a. Bahr (v. supra, References) by analyses of the sulphate, or by transforming yttria into the sulphate; the values varied from 92.2 to 102.3. În 1873 Cleve a. Höglund (v. B. 6, 1467) made more accurate determinations by analysing purer specimens of Yt2(SO4)3, and obtained the value

Chemical relations of yttrium. - Assuming yttrium to be a homogeneous element with at w. c. 89, it must be placed in Series 6 of Group III. in the periodic arrangement of the elements. This group contains the earth metals; yttrium is preceded in the even series family by B and Sc, and as succeeded by La and Yb. A consideration of the position given to Y in the periodic classification shows that the element bught to dosely resemble the other metals of the earths. little is known of the properties of many of the earth metals to allow of a detailed comparison of them one with another. A general account of the relations of these metals will be found in Electrical Metals of the (vol. ii. p. 424).

The homogeneity of uttrice. The properties

described as belonging to yttria before 1885 were the properties of a mixture of at least five, and perhaps six, different bodies, according to Crookes (C. N. 54, 13, 155). Crookes subjected 'yttria' to a prolonged process of fractionation by ammonist for a description of this method v. EARTHS. vol. ii. p. 423), and he then examined the phosphorescence spectra of various fractions. Crookes concludes that yttrium is a compound, or perhaps a very intimate mixture, of simpler bodies. For details of the phosphorescence spectra of the substances obtained by fractionating 'yttria' v. METALS, RARE (vol. iii. p. 248). By thirty-two fractionations of 'yttria' by ppn. with NH,Aq, Preparation of yttrium.—The metal has not preparation of yttrium.—The metal has not been obtained pure. Wöhler in 1828 (P. 13, followed by twenty-six fractionations by ppn. with NH, Aq. been obtained impure yttrium by reducing the chloside by sodium. In 1864 Popp (A. 131, 179) dissolved yttria in HCfAq, added NH, ClAq, evaluation of the chloside sense and add dried the double abloride with propared. Sense and which when mixed with line and which when compared with line and which when line and when mixed with lime, and which, when converted into chlorida, gave a spark spectrum,

Schowing only the lines of yttrium.

Yttrium, bromide of, YBr, 19H₂O. Colourless, gery deliquescent tablets; obtained by dissolving Y₂O₂ in HBrAq and concentrating (Cleve, Bl. 2] 18, 193). The anhydrous salvis obtained by Duboin (C. R. 107, 99, 248) by heating Y₂O₃ to redness on a sapport of gas-carben in a current of CO and Br vapour. Very soluble in water or alcohol; insoluble in ether.

Yttrium, chloride of, YCl, 6H_O. Obtained by dissolving yttria in HClAq, evaporating to dryness on a water-bath, dissolving in alcohol, and evalurating over H.SO. (Cleve, I.c.). Crystallises in large, colourless, very deliquescent,

rhombis prisms (C., I.c.). The anhydrous com-pound is formed by heating yttria to redness on a support of gas-carbon in a slow stream of CO and Cl (Duboin, l.c.). By evaporating a solution of yttria in HolAq with addition of NH₂Ol a double compound of YCl₂ and NH₄Ol is obtained; double compounds with KCl and NaOl are formed by fusing the constituent chlorides together. Popp (4.131, 179) described the double compound YOl, 3HgCl, 9H,O. Cleve (Bl. [2] \$1, 195) described YOl, 5HCl, 8H,O.

Yttrium, fluoride of, 2YF, H.O. Obtained as a gelatinous pp. by adding HFAq, or solution of

a getatious pp. by-adding HrAq, or solution of an alkali fluoride, to colution of a salt of ytrium (Cleve, Bl. [2] 18, 193). Yttrium, iodide of, (? YI₂). Deliquescent crystals, soluble in alcohol; ootsined by evaporating a solution of yttria in HKAq (Berlin, P.

43, 105; no analyses given).
Yttrium, vxides of. Besides yttria, Y₂O₃, there probably exists another oxide containing

more oxygen.

more exygen.

YTTRIA YO. (Yttrium sesquioxide.) A hydrate, probably Y.O. 6HLO (Topp, l.c.), is, obtained, as a gelatinous pp. closely resembling hydrated alumina, by ppg. the solution of a salt of yttrium by ammonia. The oxide is formed by strongly heating this hydrate; also by decomposing by heat the carbonate, nitrate, or oxafate of yttrium in presence of air. Yttria is described as a heavy, white or almost white or oxaste of yttrium in presence of air. Yttria is described as a heavy, white or almost white powder, S.G. 5-078 (Cleve, &c.); 5-046 (Nilson a. Pettersson, B. 13, 1459). S.H. (0°-100°) 1026 (N. a. P., Le.). By heating amorphous yttria with CaCl, for some hours, and warhing with warm water, Duboin (C. R. 107, 99, 243) obtained highly vertractive crystals of YaO₃, scarcely acted on by acids or by fused Na₂CO₃.
Yttria is a markedly basic oxide; it absorbs CO₂ from the air, and decomposes solutions of ammonium salts, giving off NH_s. Yttria is insoluble in water; it dissolves slowly in cold HClAq, HNO,Aq, or H,SO,Aq, but more rapidly on warning. By heating a mixture of yttria and finely-powdered Mg, in the ratio Y₂O₄:3Mg, Winkler (B. 23, 787) obtained a black powder which slowly gave off H from cold water, rapidly from hot water, and dissolved in dilute HClAq, with violent evolution of H.

YTTRIUM PEROXIDE. By adding H.O.Aq and NH₂Aq to a solution of sulphate or nitrate of yttrium, Cleve (Bl. [2] 43, 53) obtained a white gelatinous pp. to which he gave the composition Y₄O₂; but this formula cannot be regarded as final.

ttrium, salts of. The salts which are formed by replacing the H of acids by yttrium belong to the form Y₂X₂, where X = 2ClO₂, 2NO₂, SO₃, SO₄, CO₃, 4PO₃, &c. Almost all the yttrium salts of oxyncids that have been prepared are normal salts; a basic nitrate, and an acid or no-phosphate and selenate, are known. Many of the relief are stringly by discovery attacks. the salts are obtained by dissolving yttria in acids and evaporating; those salts which are fusionable, or but slightly soluble, in water are formed by ppn. from the nitrate or sulphate. The salts formed by ppn. are the arsentie, borate, carbonate, chromate, iodate and periodate, oxalate, phosphutes, selenite and sulphite; besides these salts, the following salts of oxyacids are known, and are soluble in water: bromate, chlorate and perchlorate, nitrate, selenate, sulphate, thiosulphate and tungstate. A few double salts are known; the principal

A few double salts are known; the principal are $Y_2(CO_3)_xM_2CO_3xH_2$ (Bl. [2] 18, 193, 289; 21, 344; v. also Berlin, P. 43, 105; Högbom, Bl. [2] 42, 2; Popp, A.

131, 179).
Yttrium, sulphide of. No compound of yttrium and sulphur has been isolated with certainty. Addition of (NH₄)₂SAq or NH₄HSAq to a solution of a salt of ttrium ppts. hydrated oxide. By fusing yttria, S, and an alkali carbonate, and washing the fused mass with water, a lowish-green solid is obtained that is insoluble in water, but is partly decomposed thereby to hydrated oxide and H.S; this solid dissolves in acids, giving off H.S. The same solid seems to be obtained by strongly heating yttria in H laden with CS.. No compound of yttrium and S was with CS₂. No compound of yttrium and S was obtained by heating yttria with Na₂S₂. By heating YCl₂ in a stream of H₂S, HCl is given off, and a yellow powder remains, which is decomposed by water, with evolution of much H₂S (v. Popp, A. 131, 179). According to Popp (Lo.), the composition of this substance is Y₂S₂.

By passing dry H.S. over a mixture of YCl, with excess of NaCl, heated to c. 1000° in a boat of gas-carbon, Dufoin (C. R. 107, 99, 243) "obtained a greenish, crystalline solid, which when washed with water left transparent, greenish lamilie of the double compound Y₂S₂.Na₂S. M. M. P. M.

ZANZALOÏN & Aloïn.

ZEOBLY C13HmO. [231°]. Occurs in the ethereal extract from Zeora sordida (Paterno, G. 7, 281, 508). Small pyramids with hexagonal base (from ether-alcohol), v. sl. sol. alcohol and ether, insol. water. Neutral. Not attacked by alkalis or dilute acids.

ZINC. Zn. At w. c. 65.8 (v. infra).
Mol. w. c. 65.8 at c. 1400°; probably the same

Historical.—That copper acquired a reddish solour, and that its properties were modified, by melting with certain ores, was known to the ancients and the alchemists; the ore with which copper was generally melted to form brass was called cadmia fossilis. The fact that a lustrous solid could be obtained by heating cadmia fossilis seems to have been known to the ancient writers on mineralogy. According to Kopp (Geschichte der Chemie, 4, 116), the earliest use of the word sinc is found in a writing of the fifteenth century attributed to Bagil Valentine. Paracelsus, in the sixteenth century, speaks of zinc as a definite metal-like substance, and assigns it to the class of bastard or semi-metals. The name 'zino' was applied during the seventeenth and eighteenth centuries alike to zinc of and of the metal-like substance obtained from these ores. Boyle speaks of zinc, and also uses the word spelter, or splauter, a term of Indian wigin according to Kopp. Tolerably pure zinc seems to have been obtained from zinc ore about 1720, probably by Henckel (v. Percy's Metallurgy, 1850).

probably by Henckel (v. Percy's Metallurgy, 1, 520).

Occurrence. — Zinc is found in small quantities; Becker (J. M. 1857, 698); and Phipon (C. R. 55, 218) noticed the occurrence of native sinc in Victoria. Considerable quantities of compounds of zinc occur in many places; the commonest ores are calamine (carbonate). Silicona calagrine suilicate), blende (fulphic), and red sinc one (oxide); aluminate, arsenate, phosphate, and sulphate of zinc are also found, but in smaller quantities. Small quantities of Od compounds occur in most zinc over. The

ash of a plant that grows on the waste heaps of the zinc works in Rhenish Prussis (Viola calameteria) is said to contain compounds of sinc (Braun; P. 927 175). Zinc compounds have been found in some springs (v. Hillebrand, U. S. Geolog. Survey Bull, No. 113 [1898]). Traces of sinc compounds have been found, according to Lechartier a. Bellamy (C. R. 84, 687), in the human liver, in calves' liver, in beef, hens' eggs, wheat, barfey, maize, beans, and vetches.

Formation.—Line ore, generally carbonate or supplied, is roasted in reverberatory calciners; the roasted ore is mixed with half its weight of powdered chargoal, cokes or anthracite, and heated in crucibles or retorts arranged so that the reduced metal distils from the impurities; the metal is condensed and collected in suitable vessels, and CO passes off. For details and descriptions of the different forms of apparatus v. Dictionary or Applied Chemistry, vol. iii. p. 1042.

p. 1042.

Preparation.—Commercial zinc generally contains from 5 to 3.3 p.c. lead, with c. 2 to 5 p.c. iron and cadmium, and small traces of arsenic.

Pure zinc was prepared by Reynolds a. Ramsay (C. J. 51, 854 [1887]) by dissolving zinc sold as free from common impurities in dilute II,SO,Aq, evaporating, crystallising the sulphate several times, electrolysing a solution of this salt, the metal being deposited on an clectrode of Pt wire, dissolving the metal in dilute HClAq, ppg. ZnO₂H₂ by NH₄Aq, dissolving the pp. in excess of NH₄Aq, and ppg. ZnS by H₂S; the ZnS was dissolved in **HClAq**. and again ppd. from an anynomical solution by H₂S; the pp. was well washed, dissolved in pure dilute H₂SO₄Aq, and the sulphate obtained on crystallisation was re-crystallised several times; an aqueous solution of this sulphate was then electrolysed, using a Pt wire as electrode, and the metal was melted in a tube of hard glass from which the air had been exhausted. By distilling this metal in vacuo in a tube of hard glass, very pure zine was obtained. Pullinger (C. J. 57, 816 [1890]) distilled zine sold as 'chemically pure' in a hard glass tube, bent slightly towards the closed end, placed in a combustion furnace, the open end being con-nected with a good water-pump. By melting By melting the distilled zinc in a tube of hard glass with a small bulb blown on the end, the part of the tube between the bulb and the wider portion containing the zinc being papillary, and the open end being connected with a water-pump, he obtained the zinc insperfectly bright, smooth. lustrous spheres ree from hollows; the pump was stopped while the zinc was molten, and the increased pressure caused the molten metal to increased pressure caused the moiten metal to filter through the capfllery tube into the bulb. For the preparation of pure zind by electrolysis of an ammoniacal solution of the sulphate, v. Myers (C. R. 74, 195).

Stolba (C. C. 1884. 4f9) says that sine can be obtained free from As and nearly free from iron by the combined interaction 3088 and

Slobs (C.C. 1834. 419) says that since an be obtained free from As and nearly free from iron by the combined interaction 358 and water vapour. He mixes burnt gypsum with one-fourth its weight of S powder, moulds the moistened mixture into spheres about 5 cm. diameter, and sinks these to the bottom of a crucible containing molten zinc; vapours of

H,S and S are given off, and the molten metal is thereby briskly agitated. When the reaction is completed, the little balls are taken out, the upper crust is removed, and the operation is

repeated if necessary. Zinc-dust is obtained either in the distil-lation of the metal, or, in not such fine division, by crushing and powdering the metal in an iron mortar at a temperature somewhat below the mp. of zinc. The ZnO₂H₂ always present in specimens of zino-dust may be removed by digesting with NH ClAq and then with NH Aq (, and drying on a porous tile in vacuo (Carnegie, C. J. 53, 471).

Properties.—Zinc is a white metal, with a slight shade of blue; it is very lustrous when polished. Commercial zinc is brittle at the ordinary temperature, but it becomes malleable between 100° and 150°; at 210° it again becomes brittle, and at that temperature it can be finely powdered in a mortac. Pure zinc is said to be malleable at the ordinary temperature. mercial zinc that has been heated to 1008-150° retains its malleability when it cools. Kahlischer (B. 14, 2747) noticed that rolled zinc ceased to give a ringing sound when struck after it was heated to c. 160°-30°, that it could then be bent easily, and that when bent it emitted a sound like the 'cry' of tin; he found that the zinc became crystalline, and the crystalline structure wac more decided the higher the temperature; the S.G. was very slightly increased, and the electrical resistance was reduced by c. 3 p.c. as softer metal than copper; its hardness is in-oreased by rolling. The tensile strength of zinc varies much with the mode of preparation. Zinc crystallises easily, especially when pure; the form is that of hexagonal plates (for references v. supra, beginning of this article). Zinc melts at c. 420° and boils somewhat below 1000° (v. supra). Molten zinc expands somewhat during solidification. The metal can be distilled at a full red heat; the vapour takes fire in the air, and burns with formation of ZnO and the production of a bright white light. Zinc exposed to the ordinary air becomes very gradually covered with a thin film of a basic carbonate which protects the mass of the metal from further corrosion; in pure dry air zinc is unchanged. Zinc dissolves in dilute acids, generally with evolution of H (v. infra, Reactions with sulphuric and nitric acids); it also dissolves in solutions of caustic potash or sods. When impure zinc is amalgamated it results the action of acids. Zinc is not acted on by mineral lubricating oils; some of the commoner animal oils attack it slightly (v. Redwood, C. S. I. 5, 362). Zinc ppts. most of the other metals from their solutions; if a piece of impure zinc is dissolved in an acid, most of the metallic impunities (As. Cd., Cu., Phy. &c.) remain Endissolved as iong as undissolved. most of the metallic impurities (As. Cd. Cu. Ph. co.) remain midissolved as long as undissolved zino is present. Zinc combines directly with O. S. Se, Te, the halogens, and P; it forms alloys with many metals. Pure zinc does not decompose boiling water, but the commercial metal reacts and gives off H. Zinc-dust usually contains some ZnO.H.; it is said also to contain H, produced by the interaction of Zn. 22. 22. 22. produced by the interaction of Zn and ZnO₂H₂ (w. Greville Williams, C. N. 52, 205, 268), Atomic and molecular weights of sone. In 1809 Gay-Lussac (Mem. S. d'A., 2, 174) deter-

mined the weight of ZnO obtained by dissolving a determinate weight of zinc in hitric acid, evaporating to dryness, and strongly heating the residue; Berzelius in 1811 repeated the experiment of Gay-Lussac (G. A. 37, 400; v. also P. 8, 184); and in 1843 Erdmann made similar experiments (v. Berzelius' Lehrbuch, 8, 1219), The values obtained for the at w. of zinc were 0539 (G.-L.), 65-41 (B.), and 64-94 and 64-98 (E.). In 8844-8 aver decomposed ZhC₂O₄ by heating in air, and determined the weights of ZhO and CO₂ produced; the value 65.85 was thus obtained for the at. w. of zinc. In the same year Favre obtained the value 65.78 by dissolving zinc in dilute H₂SO₄Aq, burning the H given off by passing it over hot CuO, and weighing the water than 25.40 and Ch₂S₃ 10 163 In 1884 thus produced (A. Cha[3] 10, 163). In 1884 Marignac determined the Cl and the Zn in ZnCl2-2KCl, and obtained the value 65.18 for the at. w. of zinc (A. Ch. [6] 1, 309; v. also Baubigny, C. R. 97, 908 [1683]). By dissolving zinc in dilute H,SO,Aq and measuring the H given off; van der Plaats concluded that the at. w. of ony van der Plaats concluded that the at. W. of zine is 65-18 (C. R. 100, 52 [1885]). Reynolds a. Ramsay, in 1887, by measuring the H given off by the interaction between very pure zine and H.SO.Aq, obtained the value 65-48 (C. J. 51, 854). By oxidising zine to ZnO, by INO.Aq, in 1888, Morse a. Burton, obtained the value 65-1 (Am. 10, 311). In 1889 Gladstone a. Hibbert (C. J. 55, 443) determined the ratio of gine displayed to gilver deposited by one and the zinc dissolved to silver deposited by one and the same electric current; taking the at. w. of silver as 107.66 (the value adopted in this Distionary) the at. w. of zinc was found to be 65.29.

In 1886 Mensching a. V. Meyer (B. 19, 8295) found the V.D. of zinc at c. 1400° to be 34.3, a number which shows that the gaseous molecule of zine is monatomic. Ramsay, in 1889, determined the lowering of the vapour pressure of Hg produced by dissolving zine therein (C. J. 55, 521); assuming that equal volumes of dilute solutions contain equal numbers of molecules, and that the molecular weight of liquid Hg is 200. Ramsay's results indicate that the molecules of zine in dilute solutions of this metal in clusion that the molecule of zinc in dilute solu-

tions in these metals is monatomic.

Chemical relations of sinc. Zinc is the second odd-series member of Group II. in the periodic classification of the elements. Zinc is periodicensisting and in the elements. Zind if preceded in the odd series of this group by Mg and is followed by Cd, —, and Hg; the members of the even series of Group II. are Be, Ca, Sr, B3, —, —. *Zinc is the second member of settles 5; it is preceded in this series by Cu, and is appropried by Ga, Ga, As, Sa, and Bs. succeeded by Ga, Ge, As, Se, and Br. The general chemical character of zinc is that of a metal; its oxide ZnO is basic, its chloride ZnOl, is volatilisable without decomposition. No acids are known containing zinc, and the molecule of the glament is monatomic. The fact that com-pourits of ZnO and K.O are obtained by dis-solving ZnO.H. in KOHAq and adding alcohol shows that the hydroxide of the metal has feebly marked acidic properties, and the isolaŽÍNO. SEE

tion of a number of oxychlorides and basic carbonates, hitrates, and sulphates illustrates the fact that zinc is less positive than Mg, which is the first member of the zinc family of Group II. For a general account of the properties of the family of which zinc forms a member v. MAGNESIUM GROUP OF ELEMENTS, vol. iii. p. 163. The atom of zinc is divalent in the gaseous

molecules of its compounds.

Reactions and Combinations .- 1. Zine wunchanged in pure dry air; in ordinary air the surface layers are slowly converted into a basic carbonate, which protects the metal beneath. Heated strongly in air or oxygen, zinc burns to ZnO .- 2. Heating zine in bromine, chlorine, or iodine produces ZnBe2, ZnCl2, or ZnI2-3. When zinc is heated in phospherus vapour, phosphete of zinc (q. v., p. 890) is formed.—4. By heating zinc with selenion vapour, a compound of Zn and Se is formed (v. Zinc selenide, p. 890). 5. Zinc combines with tellurium when the elements are heated together (v. ZINC TELLURIDE, p. 891) .- 6. Sulphur and zinc combine when a mixture of these elements is very strongly compressed (Spring, B. 16, 1000).-7. Zinc deconfposes water at a red heat. Commercial samples of zinc decompose water at 100° (L'Hôte, C. R. 101, 1153).—8. ZnSis formed by strongly heating ainc in a stream of hydrogen sulphide; when hydrogen schmide is used the product is ZnSe, and by heating the metal in hydrogen telluride ZnTe is formed (v. Margottet, C. R. 84,1293). --9. Zinc is said to reduce carbon monoxide at a 9. Zinc is said to reduce carroin monorate at a very high temperature.—10. Zinc is superficially oxidised by heating to dull redness in nitric oxide (Sabatier a. Senderens, C. R. 114, 1429). Oxidation in nitrogen dioxide (NO₂) is effected at 300° (S. a. S., C. R. 115, 236).—11. Many metallic oxides are reduced by heating with metatac oxides are reduced by heating with zinc.—12. Zinc reacts with sulphurous acid solution; according to Schweizer (v. C. N. 23, 293), the products are ZnSO₃, along with H₂S₂O₄Aq, H₂S₂O₄Aq, and S.—13. Zinc dissolves in hydrochloric acid, giving off H and forming ZnOl₂. Reynolds a. Ramsay (C. J. 51, 857) say that pure zinc scarcely reacts with boiling hydrochloric acid. For reactions of zinc with sulchloric acid. For reactions of zinc with sat-phuric and nitric acids, v. infra.—14. Zinc dis-solves slowly in hot solutions of caustic soda or potash, giving off H, and forming ZnO.xM.20 (cf. Zing hydroxide, p. 888); the reaction is much hastened by adding iron or Pt along with the zinc .- 15. Many metallic salts in solution are reduced by zinc, with pnn of the metals, e.g. salts of As, Cd, Cu, and Ph.—16. When zincdust is shaken with an aqueous solution of ferric chloride, the whole of the ferric salt is very rapidly reduced to ferrous chloride (for details of the application of this reaction in the estimation of ferric iron, ve Carnegie, C. J. 53, 468 [1888]).—17. According to Siersch (J. 1867. 468 [1888]).—17. According to Siersch (J. 1887. 257), zinc dissolves in sodium chloride schution, forming ZnCl., 2NaClAq, ZnO, and H.—18. Poumarède (J. pr. 73, 496) says that nearly all chlorides and fluorides are reduced by reacting with vapour of zins in an atmosphere of H.—19. By heating to reduces a mixture of zino filings and sodium metaphysphate, Hoslet (A. 100, 99) probably obtained phosphides of sinc (v. Zino Phosphides, p. 890).—20, Zinc reacts with sodium hydrogen sulphite solution,

forming ZnSO, Na.S.O.Aq, and Na.SO.Aq (v. Hrgosulphires, this vol. p. 593).—21. By heating sine with sine sulphide in an exhausted tube, some of the ZnS is carried forward and deposited in the front part of the tube; probably at a high temperature ZnS is decomposed, and there exist only Zn and S, and at a lower temperature these recombine to form ZnS (Morse a. White An. 11, 348). A similar phenomenon is noticed on fleating zine with zine oxide (M. a. W., l.e. p. 258).—22. ZnS is formed by strongly heating zine and mercuric sulphide or zine and potassium polysulphides (vo Zino bulphide,

When slips of zinc-foil are immersed in CuSO₄Aq, a deposit of finely-divided Cu is formed on the sine. This copper-zing couple is an energetic reducing agent; KClO₃Aq is reduced to KClAq, KNO,Aq to KNO,Aq and NH,Aq, K,FeCy,Aq to K,FeCy,Aq, SO,Aq to K, So,Aq to K, FeCy,Aq to K, FeCy,Aq to K, FeCy,Aq to K, FeCy,Aq to C, II, NH, c. (v. Gladstonea. Tribe, C. J. 33, 306).

Reactions of zine with sulphuric and nitrio acids. Commercial zine dissolves easily in

dilute H.SO, Aq, with formation of ZuSO, Aq and evolution of H. In 1830 De la Rive noticed that very little action took place between approximately pure zine and H.SO.Aq; this fact has been confirmed by other experimenters. Reynolds a. Ramsay (C. J. 51, 857 [1887]) found that zine prepared by repeated electrolysis of the sulphate and distillation in vacuo scarcely reacted with H.SO, Aq; L'Hôto (C. R. 101, 1153) also asserted that pure zinc does not react with H.SCAAq. Divers a. Shimidzu (C. J. 47, 598 [1885]) observed very great differences between the rate of action of the same 1.50,Aq on sheets of commercial zine of the same size. Pullinger in 1890 (C. J. 57, 815), and Weeren in 1891 (B. 24, 1785), made somewhat elaborate investigations into the connections between the conditions and the rate of the interaction of zinc and M2SO4Aq.

Pullinger used 'pure' sulphuric acid diluted with three times its weight of water; and zine prepared by distilling that sold as 'chemically pure' in vacuo and casting in balls under pressure to provent the formation of cracks or hollows (v. supra, Preparation of zinc, p. 885). He found that when the surface of the zinc was very smooth this was best accomplished by immersing in aqua regia for 10 or 15 seconds, and washing with water—and the acid was boiled for some hours before the experiment, there was practically no reacting at 20°-25° (spheres of zine weighing c. 2) g. lost from 5 to 6 mgns. in 20 meyers). Pullinger found that the presence of small quantities of H.S. SOg, or H.S. Aq did not affect the weight of zinc dis-solved by the boiled H.S.O. Aq; addition of some H.Q. materially increased the sale of action; and H.S.O. Aq that had been electrelysed before use dissolved from four to zen times more zinc than some of the same acid that had not been than some of the same sold that and not been electrolysed; addition of a few drops of HNO₂Aq considerably increased the action; when a few drops of HIAq were added to the H₂SO₂Aq practically ne action occurred. P. supposed that all the 'pure' acid used by him contained traces of an oxidising substance, probably H₂S₂O₅, and that the solvent action was due to this. P.

866 ZINC.

insists on the important connection between the rate of action and the amoothness or roughness of the surface of the kinc used. But he concludes that 'in all probability gure digite sulphuric acid would, at ordinary temperatures, be entirely, without action upon installic zinc, whether the surface of the latter were rough or smooth.'

Weeren used zinc which he founds to be chemically pure by analysis; he gives no account of his method of preparation nor any details of his analytical results. W. found that the weight of pure zinc dissolved by pure H₂SO₄Aq (1:20) at the ordinary temperature, and under a pressure of 10 mm., was c. ten times greater than the weight dissolved at 760 mm. pressure; but the weights of impure zinc dissolved at the two pressures were almost the solved at the two pressures were almost the same. The pure zinc used by W. dissolved fairly rapidly in beiling H_2SO_4Aq ; in one case when 2·1 mgm. dissolved at 0° after thirty minutes' action, 122 mgm. dissolved in the colling acid. W. found that the solubility of his pure zinc increased very slowly as temperature rose up to within 1° of the b.p. of the acid used, but that when ebullition actually began the solubility of the zinc suddenly increased; the weight of pure sine dissolved by H,SO,Aq at 100° and boiling, was c. sixteen tiffes greater than the weight of the same zinc dissolved by the same acid at 100° but kept from actually boiling by pressure. On the other hand, W. noticed that as much impure zinc dissolved at 100° when the acid was boiling as when it was prevented by pressure from boiling. Addition of oxidisers, CrO, or H₂O₂, enormously increased (c. 300 times) the solubility of pure Are in H₂SO₂Aq at 18°-20°, but only aligntly increased (a. six times) the solubility increased (a. six times) the solubility increased (a. six times) the solution. only slightly increased (c. six times) the solubility of impure zinc. W. supposes that when pufe zinc is immersed in pure H₂SO₄Aq a slight reaction occurs, and that the H produced is attracted to and held firmly on the surface of the zinc, and that the reaction ceases because the surface of the metal is protected by the layer of H. Increase of temperature does not appreciably affect the rate of action, because the layer of H remains fixed to the surface of the zinc, but when the acid boils the H is re-moved and rapid dissolution occurs; any conditions which remove the layer of H increase the solubility of the zinc. W. supposes that the late of dissolution of impure zinc in H2SO, Aq is not much affected by boiling, presence of oxidisers, the zinc, but at the surface of the zinc, but at the surface of the zinc, but at the surface of the more negative impurities. The rapid solution of zinc in HNO Aq is connected, according to W., with the rapid oxidation of the Hproduced at the surface of the zinc, and hence the production of a layer of water on the surface of the metal which destroys the attraction between the zinc and any H that may scape oxidation.

As regards the products of the interaction of sine and sulphuric acid, when the acid is fairly concentrated (o. H.SO., H.O. to c. H.SO.) SO. is given off, and at moderately high temperatures H.S and S are also produced (o. Calvert a. Johnson, C. J. [2] 4, 485 [1867]). A qualitative examination of the products by Pattison Muir a. Adie (C. J. 58, 47 [1898]) showed that ZaSO, is the only salt of sine produced, with any concentration.

tration of acid, and at any temperature up to the b.p. of the acid used; that with approximately pure zinc little or no SO, or H.S is formed unless the temperature be high; and that the purer the zinc the less is the quantity of S produced (cf. Ditte, A. Ok. [6] 19, 68).

of S produced (cf. Ditte, A. Ch. [8] 19, 68).

The products of the interaction of zinc and nitrio soid are Zn(NO₂)Aq, Zn(NO₂)Aq, NH,NO₂Aq and NH,NO₂Aq, and NO, N₂O, and N., Acworth found that when HNO₂Aq reacts with zinc in presence of (NH₂)NO₃ the chief gaseous product is N (along with some N₂O and NO) (C. J. 28, 828 [1875]). Acworth a. Armstrong studied the greation of HNO₂Aq and Zn more fully in 1878 (C. J. 32, 54), and found that more fully in 1878 (C. J. 32, 54), and found that the only gaseous products were N, N₂O, and NO (cf. Deville, C. R. 70, 22, 550 [1870]). According to Divers (C. J. 43, 443 [1883]), a little NH₂OH is formed when bold HNO₂Aq (3 to 4 p.c.) is poured on to granulated zinc and quickly poured off again. Divers a. Shimidzu (C. J. 47, 597 [1885]) found that considerable quantities of NH₂OH are produced by the combined reaction of HNO₂Aq and H₂SO₂Aq, sor HNO₂Aq and HClAq, on sinc (v. Hydroxylamine, Formation, vol. ii. p. 734). Divers (Le.) thought that zinc more fully in 1878 (C. J. 32, 54), and found that vol. ii. p. 734). Divers (l.c.) thought that zinc does not form Zn(NO₂), by a direct reaction with HNO, Aq, but by interacting with some of the Zn(NO₃)₂ formed by the primary action of the metal on the acid. The products of the interaction of zinc and HNO, Aq have been examined recently by Montemartini (G. 22 [1], 277 [1892]), who says that free H is not produced (he also says that no NH₂OH is formed), and that in addition to nitrate and nitrite of zinc and ammonium, hyponitrite is also produced; the gaseous products, according to M., are N.O., NO, NO₂, and N; there is no nitrous acid formed, says M., if the HNO, Aq contains more than 30 p.c. HNO₃, and no NO₂ if less than 30 p.c. HNO₃ is present. M. also gives determinations of the quantities of the various products at different temperatures, and of the rate of reaction with different concentrations of HNO₂Aq (Abstract in C. J. 62, 1279 [1892]).

Zinc, alloys of. Alloys of zinc have been formed with most metals by fusing the constituents togother; the alloys are generally hard, some of them are brittle. With antimony, two crystalline alloys are formed by melting the metals together, in the ratios 3Zn:2Sb and Zn:Sb, and allowing to cool very slowly; Cooke (Ant. S. [2]*e18, 229; 20, 222) formulates these alloys as Zn,2Sb, and Zn,2Sb, respectiyely. These alloys react with water and give off H. Alloys with argenic are formed by heating together Zn, and As, or Zn and As, 03, or by heating Zn in rapour of As and H; by the last method Descamps (C. R. 86, 1022, 1065) obtained crystals agreeing in composition with the formula Zn_As,. Spring (B. 16, 324) formed an alloyby compressing Zn and As, in the ratio 3Zn:2As, at 6,500 atmospheres. Zinc alloys with bismuth when the metals are melted together, but on cooling, two layers are fermed, the upper containing zinc with c. 2 p.c. Bi, and the lower Bi with from 5 to 12 pec. zinc. An alloy of zinc with bismuth and lead (3 pts. Zn, 5 pts. Bi, and 5 pts. Pb) melts at 945°. For descriptions of alloys with calcium v. Caron (C. R. 48, 440 e 50, 547); Wöhles (Z. 138, 253); and Norton a Twiteball

(Am. J. 10, 70). Brass is composed of alloys of sine with copper (v. vol. ii. p. 254; and for details v. Dictionary of Applied Chemistry, wol. tails v. Diotionany of Applied Chemistry, wol.
iii. p. 1052). Alloys of zinc with copper and
mickel form German silver; mast modern,
bromes are alloys of zinc with copper and tin
(v. vol. ii. p. 254; and for details v. Dictionany
of Applied Chemistry, vol. iii. p. 838). Zinc
alloys with tron (for details v. Dictionany of APPLIED CHEMISTRY, vel. iii. p. 1051). For alloys with lead v. vol. iii. p. 125 (also Krant, S. D. I. 5, 537). Alloys with lead and tin are mentioned in vol. iii. p. 126 (v. also Wright a. Thompson, Pr. 48, 25). For alloys with magnetium v. Parkinson (J. pr. 101, 375). Zinc and mercury form a number of amalgams, which are brittle when a little Hg is present and party when much Hg is present (for references v.S.C.L9, 512). For alloys with platinum v. this vol. p. 288. For alloys with silver v. Wright a. Thompson (Pr. 48, 25).

For an account of the formation of zinc

alloys by immersing zinc in various metallic solutions v. Mylius a. Fromm (B. 27, 630

[1894]).

Zinc, amide of, Zn(NH,),. This compound was obtained by Frankland (Pr. 8, 502) by passing dry NH, into an ethercal solution of

passing dry NH, into an ethercal solution of ZnEL, A white, amorphous powder; unchanged at 200°, but decomposed at a red heat to Zn,N,2 (v. Zino nitrains, p. 889) and NH,; reacts with water to form ZnO,H, and NH,. Zino, bromide of, ZnBr,. Formula probably molecular, from analogy of ZnCl,. S.G. 3-643 at 10° (Bödeker). Melts at 394° (Carnelley, C. J. 33, 277). Boils at 695° to 699° (C. a. Williams, C. J. 33, 283); at 650° (Freyer a. V. Meyer, B. 25, 622). H.F. [Zn,Br²] = 75,930 (Th. 3, 275). Preparation.—1. Zino filings are heated to

Preparation .- 1. Zinc filings are heated to dull redness in a stream of Br vapour. - 2. Zinc, or ZnO,H, is dissolved in a slight excess of HBrAq, the solution is evaporated to dryness, and the dry residue is sublimed out of contact with air.

Properties and Reactions.—White needles; y deliquescent. Easily soluble in water, very deliquescent. Easily soluble in water, alcohol, or ether (v. Berthemot, J. Ph. 14, 610). Thomsen gives $[ZnBr^2,Aq] = 15,030 (Th. 3, 275)$. Aqueous solutions of ZnBr, of different concentrations have the following specific gravities according to Kremers (P. 108, 115):—

t 19·5°.	P.c.ZnBr.
	1863
	81.7
•	43.2
	52 ·6
	59.1
	• \$8∙0
	t 19·5°.

**Combinations.—1. With ammonia to form a series of compounds. These compounds were examined by Rammelsberg (P. 55, 240), and, more recently, by André (Bl. [2] 39, 398 [3833]). By dissolving ZnBr, in NH, Aq under different conditions, A. obtained 41 ZnBr, 2NH, H.O. (2) 3ZnBr, 2NH, 2H,O, (3) 3ZnBr, 10NH, H.O., and (4) ZnBr, 5NR, by saturating hot NH, Brisq with 2DO, and obtained 3ZnBr, 5NH, 3D.—2. With casium bromids, to form ZnBr, 3CaBr and ZnBr, 2CaBr (Wells a. Campbell, Zeit. f. pacerg. Chamic. 5, 273).

Zinc, chloride of, ZnCl. Mol. w. c. 136.
Melts at 262° (Braun, P. 154, 190). Boils at
703, 719° (Carnelley a. Williams, C. J. 33, 284);
at 750° (Freyer a. V. Meyer, B. 25, 622). S.G.
2.753 at 132 (Bödeker). V.D. at 890° to 907°
66 (F. a. M. 4.c.). H.F. [Zn,Cl] = 97,210 (Th.
3, 275).

Formation.—1. By fleating zinc filings in Cl.—2. By heating a mixture of 2 pts. HgCl, and 1 pt. zinc filings in a retort.—8. By distilling a mixture of equal pts. ZnSO, and CaOl, or a mixture of 1 pt. ZnO and 2 pts. NH,Cl.—4. By dissolving zinc, or ZnO.H., in HClAq, evaporating to dryness, and heating the residue in a retort.

Preparation. -1. Zinc filings are heated in a small retort in a stream of Cl; the product is distilled.—2. Zine, or ZnO₂H₂, is dissolved in a slight excess of HClAq; the solution is evaporated to dryness, and the residue is distilled from a small retort.

Properties and Reactions .- A white, semitransparent, crystalline, very ca istic solid; very deliquescent. Encily soluble in water, also in alcohol. Thomsen gives [ZnCl²,Aq]=15,680 (Th. 3, 275). Sublimes at a red heat. An aqueous solution is partly decomposed on eva-poration, giving exychlorides (q.v.). Oxychlorides are also formed by heating assolution of ZnCl, in HClAq with ZnO, also with HgO or PhO. Kremers (P. 105, 360) gives the following data:

S.G. ZnCl., Aq	P.c. ZnCl
1.1275	13.8
1.2466	25.8
1.3869	87.5
1.5551	49.2

A conc. solution of ZnCl2 is often used as bath for maintaining fairly high constant temperatures. Dry ZnCl, is used as a caustic; also as a dehydrating agent; a dilute aqueous solu-

as a dehydrating agent; a dilute aqueous solution is employed as an antiseptic.

Combinations.—1. With water. By keeping ZnCLAq containing 70.5 p.c. ZnCl, at 9° for 24 hours, Engel (C. R. 102, 111) obtained large crystals of the tribydrate, ZnCl, 3H,O, melting at 7°. When ZnCl,Aq containing 79.9 p.c. ZnCl, at 0° is kept for a long time it solidifies; on heating to 16° a part melts and a part remains solid; the liquid part is the dihydrate ZnCl, 2H,O, and the solid part is the hydrate ZnCl, 2H,O, and the solid part is the hydrate ZnCl, 2H,O, and the solid part is the hydrate ZnCl, 2H,O, and the solid part is the hydrate ZnCl, 2H,O, and the solid part is the hydrate ZnCl, 2H,O, 3H,O (B, t.c.). By heating a syrupy solution of ZnCl, with a little ECIAq, Schindler (Mag. Pharm. 36, 45) obtained octahedral crys. solution of ZnCl., with a little gloral, Schindler (Mag. Pharm. 36, 45) obtained octahedral crystals of the monohydrate of Dl. H.O. According to Engel (L.C.), the hydrate obtained by S. was 2ZnCl., 3H.O.—2. With hydrogen chloride and water. Engel (M. 5, 432) obtained the compounds 2ZnCl., HCl. 2H.O and ZnCl., HCl. 2H.O by pissing HCl gas into ZnCl., Aq, and adding zine from time 50 times and, when the solution had the S.G. of 2.0, cooling to 6. Warious compounds of Encl., with ammonic have been described; the formula ZnCl., NH., ZnCl., 2NH., 2(ZnCl., 2NH.), H.O. ZnCl., 4NH., H.O. and ZnCl., 5NH., H.O. have been given to compounds obtained by dissolving ZnCl., in NH., All, passing in NH., and evaporating under different conditions (v. Marignac, Ann. M. 5) 12, 1; Divers, O. N. 18, 13; Priwoznik, P. 142, 467; Davis, C. N. 26, 265; André, A. Ch. [6] 3, 84, 98; Thoms, B. 29, 748).—4. Lang (B. 21, 1578) described a compound with pyridine, ZnCl₂.2C,H₃N.—5. ZnCl₂ combines with alkali chlorides. Compounds, ZnCl₂NH₄Cl.xH₂O, ZnCl₂NH₄Cl.xH₂D, and ZnCl₂SNH₄Cl.xH₂D, and ZnCl₂SNH₄Cl.xH₂D, and ZnCl₂SNH₄Cl.xH₂D, and ZnCl₂SNH₄Cl.xH₂D, ZnCl₂SNH₂Cl.xH₂D, ZnCl.XH₂D, ZnCl.X Pharm. 36, 45), Marignac (J. 1887, 217), Ram-melsberg (P. 94, 508), and Hantz (A. 68, 227). A compound ZnCl₂, 2KCz is described by R. (l.c.) A compound ZnCl₂-2KOr is described by R. (l.c.) and M. (l.c.); and a compound ZnCl₂-2NaC' 3H₂O by M. (l.c.). Wells a. Campbell (Zcit. f. anorg. Chemis, 5, 273) describe two compounds with CsCl, to which they give the formulæ ZnCl₂-2CsCl and ZnCl₂-2CsCl. –6. With sinc oxide, v. Oxychlerides, p. 891.

A solution of zinc in conc. ECAq, to which

as much NH,Cl has been added as the weight of zine dissolved, is used for cleaning the surfaces of metals that are to be soldered together; any oxide on the metallic surfaces reacts with the NH₄Cl present to form chloride which dissolves

in the ZnCl₂ solution.

Zinc, cyanide of, and double zinc cyanides; . vol. ii. p. 347. For details regarding the conditions of formation and the properties of zinc-mercuric cyanide, v. Dunstan, C. J. 61, 666 [1892].

Zinc, ferrocyanide of; v. vol. ii. p. 337.

Zinc, fluoride of, ZnF₂. Formula probably molecular, from analogy of ZnCl₂. Formed by heating zinc or ZnO to redness in a stream of dry HF; also by the interaction of fused ZnCl, and dry HF at 800° to 900°; also by heating the hydrated salt to redness in dry HF (Poulenc, C. R. 116, 581 [1893]). The tetrahydrate ZnF2.4H2O is obtained by evaporating a solution of zinc in HFAq, and crystallising. The salt ZnF, crystallises in colourless needles, probably monoclinic. S.G. 4.84 at 15°; the crystals act strongly on polarised light (P., Lc.). Clarke (Am. S. [8] 13, 291) gives S.G. of ZnF, as 4.556 at 17°, and 4.612 at 12°; and the S.G. of ZnF, 4H, O cs 2.567 at 10° and 2.535 at 12°. ZnF, is slightly soluble in cold, more soluble in hot, water; it is insoluble in alcohol at 95°; soluble in boiling HClAq, H2SO4Aq, or HNO3Aq (P., I.c.). Heated in air, or to redness in steam, it is wholly changed to ZnO; fusion with alkali carbonates, produces ZnO and alkali fluorides; heating with H.S forms ZnS, and with IICl forms ZnCl. It is reduced by H at a red heat (P., Lc.). ZuF, forms double salts with Air, and with alkali fluorides. Berzelius (P. 1t 20) described the saits ZnF, 2AlF, and ZnF, 2KF; described the saits ZnF_x.2AlF, and ZnF_x.2KF; and Wagner (B_x 19, 896) the saits ZnF_x.2MH, F. 2aq. ZnT_x.4KF, and ZnF_x.NaF. The compound ZnF_x.ZrF, 6aq = ZnZrF, 6aq is described by Marignac (A. Ch. 13, 60, 257). S.G. 2.255 at 12° (Topsöe, C. C. 4, 76). For ZnF_x.SiF, v. Zinc silicofiluoride, p. 890. Zinc, hydrophosphide cf. ZnPH, A white, righle acid having this composition was abstracted.

friable solid hexing this composition was obtained by Drychsel a. Finkolstein (B. 4, 352) by tained by Drgohsel a. Finkolstein (B. 4, 352) by passing dry PH, into a coole! Ethereal solution of ZnEt. The compound can be kept in a closed, vessel; in air it absorbs moisture and rapidly depomposes, giving off PH.

Zine, nydrosulphide of. According to Thomsen (B. 11, 2044 [1878]), the pp. obtained by mixing NaHSAq and ZaSO, Aq, in equivalent grantities in propagate of size

quantities, is probably a hydrosulphide of zine (no analyses or formula given). Addition of

two equivalents of RaSH in solution to an equivalent of ZnSO, in solution produces no pp., but the solution gives a pp. of ZnS or hydro sulphide on standing, or on addition of scid or solphide on standing, or on addition of scal or code (T., l.v.). According to von Zotta (M. 10, 807 [1890]), the pp. supposed by Thomsen to be zinc hydrosulphide has the composition ZnS₂H₂ZznS. When four equivalents of NaSH are added to one equivalent of ZnSO, both in solution, and the clear solution is boiled, or treated with acid or alkali, a pp. of ZnS.H., 2ZnS is obtained (von Z., l.c). Linder a. Picton (O. J. 61, 130 [1892] obtained evidence in favour of the existence of compounds of Zn, S, and H, probably 7ZnS.H.S and 12ZnS.H.S, by passing H₂S into water at 0° with ZnO₂H, in suspension; they failed to isolate a definite compound with certainty.

Zinc, hydroxide of, ZnO₂H₂. (Zinc hydrate. Hydrated zinc oxide.) Obtained, as a white flocculent pp., by adding to solution of a salt of zinc rather less KOHAq than is sufficient to decompose the whole of the salt, washing thoroughly, and drying at a low temperature. According to Ville (C. R. 101, 375), 2nO₂H, is obtained in crystals by shaking very finely-powdered ZnCO₃, or basic carbonate, with twice as much KOH in 10 p.c. solution as is theoretically required for the decomposition of the carbonate; formation of crystals of ZnO,H, begins at once, and is complete after twenty to thirty minutes. ZnO,H, is said to be obtained in lustrous rhombic prisms by immersing zine in contact with iron or copper on MH₂Aq (Nicklès, A. Ch. [3] 22, 31; Carnu, Bl. 5, 64 [1863]). Bödeker (A. 94. 358) obtained the monohydrated hydroxide ZnO₂H₂H₂O in very fustrous octahedra by keeping a saturated solu-tion of the hydroxide in NaOHAq in a closed vessel for some weeks. S.G. of ZnO2H2 is given vesser for some weeks. S.G. of n_2 Li₂ is given by Nicklès (l.c.) as 2·677, and by Filhol (A. Ch. [5] 21, 415) as 3·053. Thomsen gives $[Zn,0,H^2O] = 82.680$ (Th. 3, 275). ZnO_2H_2 dissolves easily in acids, forming salts ZnX^1 .

ZnO2H2 also dissolves in caustic alkali solutions, and in (NH.).CO,Aq. By adding alcohol to a solution of ZnO,H, in KOHAq, Laux (A. 9, 183) obtained small lustrous crystals (?ZnO,K,); Fremy (C. R. 15, 1106) obtained (?) ZnO2K2.ZnO; Fremy (C. R. 15, 1106) obtained (?) ZnO₂k₂.ZnO₅ by using NaOHAq Como⁵. a. Jackson (B. 21, 1589 [1888]) obtained two compounds derived from ZnO₂H₂ by replacing H by Na. They Chook a solution of ZnO₂H₄, in cono. NaOHAq with alcohol separated the upper (alcoholic) layer 2nd allowed it to crystallise, and treated the lower (watery) layer repeatedly with alcohol until it solidified. The crystals from the lower leaves had the corrections

layer has the composition
Zn₂O₂Na₁H₂.1{E₂O(=Zn₃(OH)₂(ONa),.17H₂O),
agreeing, except in water of crystallisation, with agreeing, except in water of crystanisation, with an ammonium compound described by Malagati (C.R. 62, 413 [1866]); this compound melts at c. 70°, rapidly absorbs CO, from the air, loses $12H_0O$ at 100° , is insol in ether, and is decomposed by water, but not in presence of excess of NaOH, with formation of 2nO and a little ZnO₂H. The crystals from the upper layer had

the composition 2500 NaH.7H.0 = (2Zn(OH)(Oha).7H.0), corresponding with the compound described by Fremy (l.c.); this compound forms white radiating needles, which do not melt at 300°; it

bsorbs COafrom the air more slowly than the ther compound, is decomposed by alcohol or water, and does not lose H.O until heated above 200° (v. Am. 11, 145 [1889]). C. a. J. failed to obtain compounds derived from ZraQH, by replacing H by NH, or Mg. Compounds of ZnO with BaO, CaO, and MgO are described by Bertrand (C. R. 115, 939); these compounds are of the forms 2ZnO.MO.xH₂O.

Zinc, iodide of, Znl. Formula probably molecular, from analogy of ZnCl. Formed by heating together zinc and iodine, and subliming; also by digesting I with water and excess of zinc until the liquid is colourless and evaporating over H₂SO₄ (Rammelsberg, P. 43, 665). Crystallises in white octahedra; •S.G. 4·696 (Bödeker); melts at c. 440° (Carnelley, C. 3. 33, 278); and boils at c. 624° (C. a. Williams, v. Carnelley's Meltingand Boiling-point Tables, 1, 23). H.F. (Zn. I] = 49,230; [Zn, I], 3,0] = 60,510 (Th. 3, 275). Heated in air ZnI, gives off I, and ZnO remains. Kremers (P. 111, 61) gives the following data :-

8.G. ZnI, Aq 1.2340	P.c. ZuI. 23·1	S.G. ZnI,Aq o	P.c. ZnI, 63:5	
1.5121	42.6	2.3976	76.0	
1.7871	56.3			

Hot ZnI Aq is said to dissolve zinc in con-

Hot ZnLAq is said to dissolve zine in contact with the air, and on filtering an oxyio-lide is said to be deposited (Müller, J. pr. 20, 411). ZnI, Aq also dissolves I; Baup (J. Ph. 9, 37 [1823]) says enough I is dissolved to form ZnI, ZnI, combines with NII, By allowing a solution of ZnI, in NII, Aq to evaporate, Rungmelsberg (P. 48, 152) obtained lustrous, founded prisms of ZnI, 4NII, decomposed by water with production of ZnO. Various double companies with ather indides have been described: production of ZhO. Various adults consisted; ZhI_2MI, where, M = NH, K or Na (Rannolsberg, Le.; also P. 43, 665); ZhI_2CsI and ZhI_3CsI (Wells a. Campbell, Zeit. f. anorg. Chemic. 5, 273); ZZhI_BAI, (R., Le.); ZnI2.2BiI3. 12aq (Linau, P. 111, 240).

Zinc, nitride of, Zn₂N₂. Obtained by Frankland (Pr. 8, 502) by heating zinc amide (Zn(NH₂)₂; v. p. 887) to low redness. A grey, pulverulent solid; unchanged by heating to redness out of contact with air; reacts violently with water to give ZnO₂H₂ and NH₃.

Zinc, nitroprusside of, v. vol. ii. p. 341.

Zinc, oxides of. Besides the arornal basic oxide ZnO, there seems to be another higher (? superoxide) of zine.

ZINC ONDE ZnO. Formula not certainly

Occurrence.-With oxides of Mn, and Fe, 3 red sinc ore and franklinite.

Formation.—1. By burning zinc in air or 2. ZnCO, or another salt of zinc with a volatilisable

Preparation.—Pure ZnSO, prepared as described under Zngo, Preparation (p. 883), is disscribed under Zugo, Frequention (p. 883), is dis-solved in water, and the solution is very slowly added to a boiling solution of pure Na₂CO₂ con-taining rather loss Na₂CO₂ than suffices to de-compose all the ZuSO₄. The pp. of basic zing carbonates washed by decantation with boiling water until the washings are free from estbonates

and sulphates; it is then dried, powdered, and heated either in a Hessian crucible, or, better, in a flask of hard glass, until a portion taken from the middle dissolves, when cold, in acid without effervescence. The solid is now finely powdered, sifted through a fine sieve, again heated and then rubbed up with water, and washed and dried ZnO is prepared in crystals by heating ZnCl, to redness in steam crystage by heating ZnOl, to reduces in steam (Daubric, G. R. 39, 153); also by heating the amorphous oxide slowly in a stream of H (Regnault, A. Ch. [2] 62, 350; Devillo, A. Ch. [3] 43, 477); also by heating the amorphous oxide to whiteness in a stream of O. (Sidot, C. R. 69, 202); also by heating Zn(NO₃)₂ to roduces (Brügelmann, W. 4, 283).

(Brugemann, W. 4, 283).

Properties: Asslightly yellow, powdery solid; becomes darker yellow when heated, but recovers its original colour on cooling. S.G. 5-5 to 5-7 (b. Brügelmann, B. 13, 1741; Filbol, A. Ch. [3] 21, 415; Herapath, C. J. 1, 42; Karsten, S. 65, 394). S.Ge crystalline (at 15-) 5-782 (Brügelmann, W. 4, 286). ZhO crystallises in slightly yellow, lustrous, chemimorphous pyramids because the because when the large of the section. longing to the hexagonal system (B., Lc.). Thomsen (Th. 3, 275) gives H.F. [Zn,O] = 85,430. Richards a. Rogers (Am. 15, 567 [1893]) found that ZnO, prepared by heating Zn(NO), gave off some gas when dissolved in dilute acids; the maximum amount of gas from 10 g. ZnO was maximum amount of gas from 10 g. ZnO was 20 c.c.; the gas consisted chiefly of N, with a little O; the higher the temperature to which the Zn(NO₃), had been heated the less was the quantity of gas obtained; but some N always came off, even from ZnO which had been heated to the softening temperature of porcelain. Mota-say (C. R. 115, 1034 [1893]) states that ZnO volatilises readily when heated in an electric furnace, and condenses again in transparent crystals. ZnO is not decomposed at c. 1750° (Read, C. J. 65, 313 [1894]).

Reactions and Combinations .- 1. ZnO is a basis oxide. It interacts with most acids to form salts ZnX(X = 2NO, SO, 3PO, &a) and water .- 2. With fairly cone. caustic soda or potash, salts are formed which are most simply regarded as derived from ZnO2H2 with H replaced by Na or K (v. Zino hydroxidg, p. 888).— 3. ZnO is reduced to Zn, with explosive violence, by heating with magnesium (v. Winkler, B. 28, 123).-4. Morse a. White (Am. 11, 258) heated w mixture of ZnO and zinc in an exhausted tube, and found that a deposit of InO formed in the front part of the tube. They suppose that some of the original ZnO is decomposed by the combined action of heat and zinc, and that zinc and O exist together in the hot part of the tube, but combine in the cooler parts of the tube to form ZnO₈ 5. Oxychlorides, oxybromides, and pro-bably oxylodides of zinc are formed by heating ZnO with inc th'oride, bromide, and iodide re-spectively.—6. ZnO is reduced to zinc by heating with carbon or in cardon monoxide.—7. ZnO does not directly interact with water; ZnO.H. is produced by ppg. a zine salt solution by an as produced by ppg. a zine sait solutiff by an alkali (v. Zino hydroxides of aluminium, chromium, and iron along with B₂O, in a pottery furnace until the B₂O, was voratilised, Ebelmen (A. Ok. [3] 32, 34) obtained the compounds ZnO.Al.O. ZnO.Cr.O., and ZnO.Fe,O.

ZINC PEROXIDE. In 1818 Thénard (A. Ch. [2] 9, 55) obtained what he called 'deutoxide de 3, 00) obtained what he called 'deutoride de zinc' by the action of H₂O₂Aq on gelatificus ZnO₂H₂, and also by adding KOHAq to a solution of ZnO₂H₃ in HClAq to which H₂O₂ had been added. In 1884 Haas (B. 27, 2249) obbeen added. In 1004 Hars (B. 11, 2249) outsined a white, tasteless, neutral, felatinous pp. by adding H₁O₂Aq to softtions of zinc salts and then adding NH₂Aq; after washing and drying at 100°, the solids had approximately the compositions Zn₃O₅ and Zn₃O
5. H. thinks it probable that the substances obtained by him were compounds of ZnO and ZnO₂; the formula 2ZnO.3ZnO₂ agrees well with some of his

analyses.

Zinc, oxybromides of. Oxybromides of zinc are formed by heating solutions of ZnBr, with ZnO, and by partially ppg. ZnBr, Aq by NH, Aq. Several compounds have been described by André (Bl. [2]-89, 398 [1884]):

(1) ZnBr, 4ZnO.xH, O, x = 10, 13, and 19;

(2) ZnBr, 5ZnO.6H, O, (3) ZnBr, 6ZnO.356H, O. Zinc, oxychlorides of. These compounds are formed by adding to ZnCl, Aq a quantity of NH, Aq less than sufficient for complete npn: also by

less than sufficient for complete ppn.; also by boiling ZnCl2Aq with ZnO, or with certain other metallic oxides. Schindler (Mag. Pharm. 36, 45) obtained ZnCl, 3ZnO.4H, O by boiling and the same compound by partially pgg. 2nCl_Aq by NH_Aq. By adding to ZnCl_Aq so much NH_Aq that the pp. which formed at first partly dissolved, and also by treating ZnCl, 4NH, with water, Kane (A. Ch. 72, 296) obtained ZnCl, 6ZnCl.10H, O. André (C. R. 106, 854) obtained 2ZnCl., 3ZnO.11H O by boiling ZnCl., Aq with HgO and letting the solution cool; using Pr) he obtained another own-chloride, probably ZnCl₂.3ZnO, combined with ZnCl₂.PbO.

Zinc, oxyiodides of. According to Müller (J. pr. 26, 441 [1842]), ZnI,Aq dissolves zinc when warmed therewith in the air; on cooling,

an oxyiodide, ZnI, 3ZnO. 2aq, is ppd.

Zice. oxysulphides of. The compound Zine, oxysulphides of. 4ZnS.ZnO occurs native as voltzite, as spherical globules in some specimens of galena. A compound having the same composition was found in a furnace flue at Freiberg by Karsten (S. 57, -186). By heating dry ZnSO, to redness in H, Arrivedson obtained a yellow-coloured oxysulphide ZnS.ZnO (P. 1, 59).

Zinc, perbromoplatinocyanide of, v. vol. ii. p.

Zine, phosphides of. Zinc and P combine when heated together, forming a greyish, lustrous, somewhat malleable compound. By heating finely powdered zino in exapour of P. Schrötter obtained a compound, with S.G. 4.76, having the composition Zn.P. (W. A. B. 1859. 301). Vigier obtained the same compound by 801). Vigier obtained the same compound by heating zinc in F until distribation began, and then passing H laden with vapour of P over the zinc. The same compound was formed by Regnault (A. Ph. [4] 9, 162) by heating to wifiteness a mixture of MgHPO, ZnS and C; along with the Zp. P, were formed crystals of another phosphide, probably ZnP; and by treating Zn.P, with dilute acid, an amorphous, yellow solid remained which detonated when mixed with KClo, and struck and which was perhans with KClO, and struck, and which was pethaps EnP. The compound Zn.P. was obtained by

Housief (d. 100, 99) by strongly heating a mix-ture of ZnO, P.O., and C. By heating a mix-ture of NaPO, and zinc shavings in a retort, H. (l.c.) obtained a yellowish red, loose sublimate which contained Zn and P; and by heating the fused mass in the retort with HClAq, grey fus-trous tablets of ZnP₂, remained, Lüpke (C. O. 1890 [ii.] 642) formed zine phosphide († ZnP₂) by adding amorphous P to molten zinc covered by accurate amorphous r to molten zinc covered rithe(NH_s)₂CO_s; this phosphide was not decomposed by water, but was slowly decomposed by dilute HClAq, giving off PH_s. For the compound ZnPH v. Zinc hydrophosphina 1999

^Сри́пов, р. 888.

Zinc, platinocyanide of, v. vol. ii. p. 344.

Zinc, salts of. Many salts are obtained by replacing the H of acids by zinc. The greater number of the salts of zinc are normal salts; several basic carbonates, nitrates, and sulphates are known. The following are the chief salts of zinc derived from oxyacids:-Argenite and arsenate, borate, bromate, carbonates, chlorate and perchlorate, chromates, iodates, and per-iodates, molybdates, nitrates and nitrites, plosphates and phosphites, selenate and selenite, silicate, sulphates and sulphite, thiosulphate, tungstates, vanadates (v. CARBONATES, NITRATES, SULPHATES, &c.).

Zinc, selenide of, ZnSe. This compound, is formed, in reddish-yellow, regular crystals, S.G. 5.40, by heating zine to redness in a stream of H,Se, and then subliming in a slow stream of

of H (Margottet, C. R. 84, 1293).

Zinc, selenocyande of, v. vol. ii. p. 548.

Zinc, silicofluoride of, ZaSiF₆GH₂O. Obtained in hexagonal plates, easily sol. in water, by evaporating to a small bulk a solution of ZnO in H2SiFAq (Berzelius). S.G. 2.104 (Topsöe, C. C. 4, 76).

Zine, stannifluoride of, ZnSnF.6H2O; v.

this vol., p. 724.

Zinc, sulphocyanide of, v. vol. ii. p. 353.

Zinc, sulphide of, ZnS. This compound is not formed by heating together zinc and S, as the S volatilises before the temperature of combination is reached.

Occurrence. - As zinc blende.

Preparation.—1. By repeatedly subjecting a mixture of zinc and S, in the ratio Zn.S, to a great pressure; the product resembled zine blende (Spring, B. 16, 1,000).—2. By rapidly heating a mixture of zinc filings and cinnabar in a fetort; formation of ZnS occurs with dein a fetcht; Permation of ZnS occurs with detonation; Hg dtatils off.—3. By heating ZnO with S.—4: By heating ZnO, or ZnO,H, in a stream of H₂S; in the case of ZnO₂H, formation of ZnS takes place, very slowly (v. Wagner, D. P. J.e. 197, 334).—5. ZnS is also formed by heating dry ZnSO₄ with S and C.—6. ZnS is obtained by rassing H₂S into e neutral or alkaline soft-tion of a zine salt, or into a solution in a weak acid, such as acetic acid. washing the no. Arriver acid, such as acetic acid, washing the pp., drying that 100°, and heating in a stream of dry H.S. The pp. dried at 100° is said to be 2ZnS.H.O. (Geigor a. Reimann, Mag. Phorm. 31, 178; cf.

Souchay, Fr. 7, 78).

C. Rrogeries and Reactions.—G.G. of ZnS = 8.98 (Kars@n, S. 65, 894); S.G. of Lende = 403 to 4.07 (o. Neumann, P. 28, 1). Thomsen (Th. 8, 276) gives H.F. of ZnS.xH.O as [Z2,S.xH.O] = 41,580. ZnS prepared by ppn_ds a yellowing solid; easily sol. in acid; forming salts of an and giving off H.S. Zino blende is a grey to black crystalline solid; slowly acted on by solids. By repeatedly washing ppd. ZnS, also by passing H_SS into water containing pure ZnO₂H_S in suspendion. Winssinger (Bl. [2] 49, 452 (1888)) obtained colloidal ZnS, sol. in water; the solution could be boiled until all excess of H.S was expelled without ppn. of ZnS. ZnS prepared by adding excess of NH Aq to ZnCl Aq. ppg. all the sinc as ZnS by H_sS, washing and drying the pp., and then heating nearly to whiteness in a Hessian crucible inside a plumbago crucible, is very phosphorescent (v. Henry, C. R. 115, 503).

By heating ZnS with zinc in a vacuous tube,

Morse a. White (Am. 21, 348) found that some of the ZnS was carried forward and deposited on the cooler part of the tube; they supposed that some of the ZnS was decomposed, and that Zn and S existed in the hottest part of the tube and combined in the cooler portions. By heating blende with I and a little water some ZnSO, is formed (Filhol a. Melhies, A. Ch. [4] 22, 58;

Lasaulx, J. 1870.1272).

According to Schiff (A.115, 74), a polysulphide of sinc, probably ZnS, is formed by ppg. a neutral solution of a salt of zine by K,S,Aq, and drying the pp. over H₂SO. Spring (B. 16, 1000) thought that a polysulphide of zing was probably formed by strongly compressing a mixture of zinc with excess of S.

Zinc, telluride of, ZnTe. Obtained, in large Zino, telluride of, Zine. Obtained, in angeruby-red, regular crystals, by strongly heating zine in estream of H.To, and then subliming is a slow current of H (Margottet, C. R. 84, 1293).

Zino, titanifluoride of, ZnTiF₆; v. this vol., p. 742.

M. M. P. M.

ZINC, ORGANIC COMPOUNDS OF.

Zine methyl or Zine methide ZnC,H, i.e. ZnMe, Mol. w. 95. V.D. 3·29 (calc. 3·30). —40°] (Haase, B. 26, 1053). (46°). S.G. 195 ZnMe₂. 1.386.

Formation.—1. By heating methyl iodide with zinc in sealed tubes at 150°. The compound IZnMe is formed as an intermediate product. The reaction takes place more easily when the MeI is mixed with two-thirds of its volume of ether and heated to 100°, but it is then difficult to separate the ether from the ZnMe₂ (Frankland, A. 85, 346; 111, 62; Wanklyn, C. J. 13, 124; Butlerow, A. 144, 2; Ladenburg, A. 173, 147).—2. By heating fine granulated zine with HgMe, in a scaled tube for 24shours, at 120°, and distilling the product (Frankland a. Duppa, C. J. 17, 30).—3. IZnMe is formed in 24 hours if MeI is left in contact with a large amount of copper-zinc couple (Gladstone, C. J. 35, 109).

stone, C. J. 35, 109).

Preparation.—Zinc filings (9 pts.) are heated with reduced copper (1 pt.) till the copper-zinc fluple is produced, and the product treated with MeI (Gladstone, C. J. 35, 569).

Properties.—Colourless mobile liquid, taking:

Properties.—Colourless mobile liquid, taking fire on exposure to air. Decomposed by water into CH4 and Zn(OH). By very careful exidetion it appears to yield Zn(OMe), and crystalline Zn(Me), which is split up by water drifto Zn(OH), methal alcohol, and CH4.

Ractions.—1. Actyl chlorids (1 mol.) forms CH4. COl(@ZnMe).CH4, which is slowly converted, by further streatment with ZnMe, into

CH., CMe(OZnMe). CH. + ClZnMe. crystallising in prisms, and converted by water into tert-build alcohol, CH, zinc chloride, and Zn(OH). The compound OH, COI (OZnMe). OH, yields acctone on addition of water (Butlerow, Z. 1864, 365, 702; Privlow, N. Petersb. Acad. Bull. 22, 497; Bogomeletz, A. 209, 88).—2. Bromotacetyl bromide, followed by water, yields methyl-isopropylecarbinol (Winogradoff, A. 191, 127). 8. In ethereal solution secondary hexyl iodids has In ethercal solution secondary hexyl iodids has no action at 100°; but at 125° the products appear to be CH₁, ethyl iodide, and hexylene (Pufflie, C. J. 39, 464).—4. Chloral followed by water forms CCl₂.CHMe.OH₄ while butyric chloral yields CH₂.Cl₂.CHMe.OH₄ while butyric chloral yields CH₂.Cl₂.CHMe.OH₄ while butyric passed into ZuMe, forms OH₂N₂O₄(ZnMe), which is decomposed by water, yielding crystalline (CH₂N₁O₂).Znaq, from which the Na salt CH₃N₂O₂Na aq of 'di-nitro-methylic' acid may be obtained (Frankland, A. 99, 309).

Zinc ethyl or Zinc ethide ZuEt. Mol. w.

Zinc ethyl or Zinc ethide Zulet. Mol. w. 123. [-28°] (Haase, B. 26, 1053). (118°). S.G. 12 18182. H.F. - 31,800 (Guntz, C. R. 105, 673). V.D. 4.26 (obs. and calc.).

Formation.—1. By heating zinc or zinc.

Formation.—1. By heating zine or zinesedium alloy with EtI or a mixture of EtI and
ether (Frankland, C. J. 2, 297; 3, 44; Tr. 147,
431; 145, 259; A. 95, 28; Wanklyn, C. J. 13,
121; Pebal, A. 118, 22; 101, 105; Rieth a.
Beilstein, A. 123, 245; 126, 248; Chapman,
Laboratory, 1, 195; Alexejeff a. Beilstein, C. R.
63, 171; Rathke, A. 152, 220; Wichellaue, J. 1868, 425).-2. By heating granulated zinc with HgEt, in sealed tubes for 36 hours at 100° (Frankland a. Duppa, C. J. 17, 3).—3. From zine filings and EtBr (Wichelhaus A. 152, 321).

Preparation .- Clean zin filings (180 g.) are mixed-with copper (20 g.) reduced from the oxide at a dull-red heat by coal gas; the mixture is rapidly heated over a very large Bunsen flame, and is well shaken meanwhile. As soon as the filings begin to cake together and the copper is no longer visible, the copper-zine couple has been made. The flask is now connected with an inverted condenser, inclined slightly upwards, and when it is cold ethyl iodide (175 g.) is added. Dry CO₂ is passed through the apparatus, and the flask, heated by a water-bath; in half an hour the Eff ceases to run back from the condenser, for it has been converted into IZnEt. The apparatus is now tilted so that the condenser is inclined downwards, and heated in a bath of paraffin. reaction 2IZnEt = ZnI, + ZnEt, now takes place, and ZnEt, (60 g.) is collected in a receiver kept full of CO₂ (Gladstone a. Tribe, C. J. 26, 445; 35, 569).

35, 569).

Properties.—Colourless, mobile liquid, fuming in the air, and quickly taking fire, burning with a luminous green-sided flame, and giving off clouds of ZnG. Immfediately decomposed by water into Zn(OH), and ethans. In like manner containing a containing containing it attacks ofgenic compounds containing hydroxyl or amidogen, with elimination of ethane. It causes india-rubber to swell remark-

ably. Reactions .- 1. Gradually treated with dry oxygen it appears to produce ZnEt(OEt) and Zn(OEt), successively (Frankland). According to Demuth a. Meyer (B. 28, 394), the passage of oxygen through a solution of ZnEt in ligroin

(7 vols.) yields EtZn.O.O.Et, which is decomposed by heat, sometimes with explosive violence. The compound EtZn.O:OEt sets free I from a solution of KI and yields alcohol when distilled with dilute H.SO. —2. Sulphur forms zine mercaptide Zn(SEt).—Be appears to uct in like manner (Chabrie, Bl. [3] 2, 789).—3. Iodine forms IZnEt and ZnII successively, together with Etl. Bromine acts in like manner. Sinc ethyl takes fire in chlorine. 4. Dry ammonia forms $\text{Zn}(\text{NH}_2)_2$ and ethane (Frankland, Pr.~8, 502).—5. Nitric oxide is absorbed by an ethereal solution of ZnEt2 forming crystalline ZnEt2(NO)2 which melts below 100° and is split up by water into ethane and C.H., N.O., ZnOH. Carbon dioxide passed into an aqueous solution of this salt ppts. passed into an aqueous solution of this sure pres-tine carbonate, while zine "dinitrothylato" (C₂H₃N₂O₂)₂Zn remains in solution (Frankland, Tr. 1857, 59; A. 99, 342; C. J. 37, 570). The salt (C₂H₃N₂O₃)₂Zn aq crystallises in prisms, yields NH₂ and NH₂Et on treatment with sodium-amalgam (Zuckschwerdt, A. 174, "302), and HNO₂ and NH Et on treatment with alcoholic potash (Zorn, B. 15, 1008). The dinitroethylpotesta Zolin, B. 15, 10005. And difficulty attes NaA', BaA'₂, CaA'₂3aq, MgA'₂, CuA'₂3aq, AgA', and Ag₂A'(NO₃) were prepared by Frankland.—6. SO₂ forms zine ethane sulphinate (Hobson, C. J. 10, 455).—7. PCl₂ yields PET, (Hofmann a. Cahor.rs. Tr. 1857, 578).—8. Sicl. gives Fift,—9. Heated with Etl at 170° it forms n-butane and ZnI., Ethano and ethylene are also formed (Brodie, C. J. 3, 405). ZnEt, does not act on amyliodide.—10. Displaces halogens in organic compounds by ethyl.—11. Adds itself to a carbonyl group. Thus with di-chyl-hotone it forms Et₂C(OZnEt).Et, which is converted by water interirethyl carbinol. Di-pmpyl ketone forms, in like manner, ethyl-di-propylcarbinol. Ketones containing the group CO.CH. act differently, forming condensation-products; thus acetone yields mesityl oxide and phorone (A. Saytzeff, J. pr. [2] 31, 319). Zinc ethyl has no action on paraldehyde (Wedensky, J. pr [2] 39, 568). With acetic aldehyde it forms CH,CHEt.OZnEt, which is converted by water into sec-butyl alcohol .- 12. In some cases it can add ZnEt and H to a carbonyl group, C.H. being evolved. Thus ZnEt, converts chloral, dissolved in pure ether, into crystalline CCl2.CH2.OZnEt, which is converted by water into tri-chloro-ethyl alcohol (Delacre, Bt. [2] 48, 784). Further action of zinc ethide on chloral yields (CCl₂.CH₂O)₂Zn, s white powder. In like manner butyric chloral is converted into C₂H₁Cl₂.CH₂.OH.

In this splitting off of an olefine, ZnEt₂ differs from ZnMe, but resembles zinc propyl and zinc isobutyl (Garzarolli, A. 223, 162)—13. Can displace oxygen by two ethyl radicles; thus it converts oxalic ether into CO_Et.CEt_CO_Et (Fank-land a. Duppa, A. 142, 1; Pa 12, 396).—14. Can displace ethoxyl by ethyl. Thus iv converts formic ether into HCEt(OZnEt).OEt and then into HCEt(OZnEt). Et, which in turned by water into di-ethyl-sarbinol (Wagner & Saytzeff," A. 175, 851) .- 15. Candisplace chlorine by hydrogen. Thus with chloro-benzoic acid the first product is probably C.H. (ZnEt). CO.Et., which is converted by water into benzoic ether, C.Y., and ZnO.—16. With benzonicitie at 150°, and subsequent treatment with alcohol, cyaphenene is formed (Frankland a. Evans, C. J. 37, 568). It

polymerises phenyl-actionitrile in the same way, forming cyanbenzine.—17. Cyanbgen forms ZnO, and EtCN (Frankland a. Graham, C. J. 37, 740).—18. Azobenzene is reduced by ZnEt, collowed by water, to aniline (Frankland a. Louis. bollowed by water, to antime (Frankland a. Louis, C. J. 37, 563).—19. Acts on primary and secondary amines, giving off ethane, but has no action on tertiary amines (Frankland, Pr. 8, 502; Gal, J. Ph. [5] 7, 484). ZnEt, has no action on nicotione or quinoline, but forms with many alkaloids containing O compounds from which the alkaloids are regenerated by water.—20. Acetamide gives (AcNH).Zn, while oxamide gives C.O.(NH).Zn.—21. Acts on HgCl, forming ClHgEt and HgEt, (Buckton, A. 109, 218). Cilight and Hgret (buckton, A. 107, 210). Hg_Cl₂ yields HgEt₂, mereury, and ZnCl₂— 22. AgCl forms ZnCl₂ silver, and butane.— 23. CCl₄ forms EtCl, ethylene, and propylene (Rieth a. Beilstein, A. 124, 242).—24. Chloroform yields amylene (R. a. B.), while bromoform gives propylene and EtBr (Alexejeff a. Beilgtein, C. R. 58, 172). CHCl₃I produces ethylene, butane, and hydrogen (Borodine, A. 126, 239).

Zinc bromo-ethide ZnBret.* [62°]. Formed

by the action of the copper-zinc couple on EtBr at 100° (Gladstone a. Tribe, C. J. 27, 410).

Pearly scales, decomposed by heat partly into ZnBr, and ZnEt, and partly into Zn, ZnBr, C, II, and C, H.

Zinc iodo-ethide ZnIEt. Formed in like

manner. Crystalline. Split up by heat into

Zinc propyl ZnPr. (148°) (S.); (146°) (Glastone a. Tribe, B. 6, 1136); (150°) (Pape, B. 14, 1873). Formed by heating propyl lodide with zine and a small quantity of an alloy of zinc and sodium (Stcherbakoff, Bl. [2] 37, 345). Heavy liquid, with disagreeable odour. Reacts with aldehydes, forming propylene and such com-pounds as RCH...OZnPr, which yield secondary alcohols on addition of water.

Zinc isopropyl ZnPr... (136°) with decomposition; (96° at 40 mm.). Got by heating PrI (170 g.) with ether (100 g.), zinc (100 g.), and zinc sodium (3 g.) at 100° (Ragozin, J. R. 24, 549). Fuming liquid. Yields crystalline Zn(OFr),

549). Fuming liquid. Yields crystalline Zn(OFr), on exposure to air. Split up at 132° into Zn and hydrocarbons (Gladstone a, Tribe, C. J. 39, 6).

Zine jsobutyl Zn(C,H₀), (166°) at 734 mm.
(Garzarolli-Thurnlackh a, Popper, A. 223, 167).

Formed from zine and Fr.CH₂I. Got also from Zn and Hg(O,H₀), (Cahours, Bl. [2] 21, 357).

Zine isoamyl Zn(C,H₁), (220°). S.G. 2
1-022. V.D. 6·25 (calc. 6·87). Prepaged by heating zine with Hg(O,H₁), (Ffankland, A. 85, 860; 130. 122b. Liquid, fuming: in the air but not 130, 122). Liquid, fuming in the air but not taking fire. Takes fire in oxygen. When addedo to cooled aldehyde it yields, after addition of ice-cold water, methyl-isoamyl-carbinol, ice-cold water, and chyl and isoamyl alcohols.

Historical:—Klaproth in 1789 (Beiträge, 1,

203, 227) announced the discovery of a new earth, in combination with silica, in the rare mineral sircon. The same earth has been found in a few other rare minerals, such as eudialyte, polymignite, fergusonite, &c. Bright-coloured varieties of zircon are generally called hyacinth, the greyish or brown-kinds are called zirconites and a variety which is nearly colourless is known

as Jargon.

In 1845 Svanberg (A. 56, 223) stated that zirconia was a mixture of at least three oxides, but Berlin (J. pr. 58, 147), Marignac (A. Ch. [3] 60, 257), and Hermann (J. pr. 31, 75; 97, 331) failed to obtain any evidence of the composite character of zirconia. At a later time, Sorby (B. 2, 126, 193 [1869]), and also Forbes (B. 2, 337, 383), thought they had obtained spectroscopic indications of the presence of another earth in zircon; but it was shown that the abnormalities observed were due to traces of compounds of tranium (Sorby, C. N. 21, 73; Knop, A. 159, 44; cf. Hannay, C. J. 26, 703).

Occurrence.—Never uncombined. The principal naturally occurring compound of Zr is zirconite, which is more or less pure ZrSiO. This mineral is found in small quantities in the sand and alluvial deposits of certain rivers in Ceylon, and in the older rocks in many parts of the world; it has been found in the granites of Sweden, Switzerland, Tyrol, and North America (v. J. M. 1877. 97).

Formation.—1. By heating K,ZrF, with K (Berzelius, P. 4, 117 [1825]).—2. By passing vapour of ZrF, over Na in a red-hot tube (Troost, C. R. 61, 109 [1865]).—3. By heating ZrO₂ with Mg (Phipson, J. pr. 96, 353 [1865]).—4. By melting ZrO₂ in a carbon crucible in an electric furnace; or by mixing ZrO, with carbon, melting in an electric furnace, then mixing the Zr parbides thus formed (v. Carbides, p. 894) with excess of ZrO2 and again melting (Moissan,

J. R. 116, 1222 [1893]).

Preparation.—1. Finely powdered zirconite (ZrO, SiO,) is thoroughly mixed with an excess of finely powdered carbon, the mixture is compressed into small cylinders which are placed in a closed carbon crucible and heated in an electric lurnace (with a current of 30 to 35 ampères and 70 volts), while a stream of CO₂ is sent through the crucible; the greater part of the \$10₂ is thus voltilised (Troost, C. R. 116, 1428). The carbides of Zr in the crucible are now mixed with excess of ZrO. and melted in the electric furnace (Moissan, C. R. 116, 1222).—2. Finely powdered and sifted zirconite furnace (Moissan, C. R. 116, 1222).—2. Finely powdered and sifted zirconite furnation with 2 to 3 timesits weight of KHF, the mixture is heated to bight redness for c. 15 mins., and after cooling, it is boiled with water containing a little dilute HFAq; K,SiF, is removed by filtration, the filtrate deposits K,ZrF, on cooling. The K,ZrF, is re-crystallised from water, then dried, mixed with K, and heated in a vessel of glass or iron, the product is washed with water, digested for a long time with cele. HClaq at 40°, then yashed with water containing NH Cl, and finelly with alcohol (Berzenus, Lc.: Trocat, A. 136, 353). This method yields amorphous sirconium. According to Bailey (Pr. 46, 74 [1889]), the only

method that gives nearly pure amorphous Zr is to heat ZrO, with Mg foil (not powder) and treat with HClAq.—3. One part dry K,ZrF, is mixed with 11 pts. Al and the mixture is heated to the melting-point of iron in a crucible made of gas coke; the product is digested with conc. HClAq diluted with twice its volume of water, when the crystalline leatlets of A, that have formed on the surface of the Al, separate from the mass of Al before the latter is wholly dissolved. When the whole of the Al has dissolved an alloy of Zr and Al remains, besides the crystalline leaflets of Zr; if the temperature of reduction is not sufficiently high, the main product is the Zr-Al alloy (Troosa, c., cf. Franz, B. 8, 58). This method yields crystalline zirconium.

Various methods have been used for decomposing zirconic and obtaining compounds of Zr. Franz (B. 3, 58) fuses the powdered mineral with KHSO, treats the fused material with boiling water containing a little H.SO., washes the insoluble 3ZrO.SO. thus formed, and adds it, in small portions at a time, to molten NaOH; he then lixivister with cold water, dissolves the ZrO, that remains in hot conc. H2SO, dilutes, ppts. by NH,Aq, washes, dries, and decomposes the ZrO,xH,O by heat. The method of fusing the Zro...zH. to by heat. The method of reasons with KHF, used by Marignae (r. supra., No. 2) yields pure K.zrF_e very readly; Zr(SO_e), may be obtained by heating the K.zrF_e with cone. H.SO_e (v. Hiortdahl, A. 137, 34; cf. J. pr. 83, 201). For other methods v. Hermann (J. pr. 21). 201). For other methods v. Hermann (J. pr. 97, 330); Scheerer (P. 59, 48); Stromeyer (A. 113, 727); Chancel (J. pr. 74, 471); Berlin (J. pr. 58, 145); Henneberg (J. pr. 88, 508); Bailey (Pr. 46, 74 [1889]).

Properties .- Zirconium las been isolated as black amorphous powder, and also as a greyish

crystalline solid.

Amorphous zirconium (v. Preparation, No. 2) is a black powder, which is extremely porous and resembles powdered charcoal; when pressed with a burnisher it agglomerates to graphite-like lamine. After being heated strongly, and then cooled, in vacuo, it is said to glow and burn when exposed to air. The porous amorphous metal is said not to conduct electricity. Amorphous Zr is stated to be insoluble in ordinary acids, including aqua regia; but, according nary actos, including aquar regits; but, according to Bailey (Pr. 46, 74 [1889]), it dissolves in cold coac. H.SO₄; HFAq dissolves it readily, H being given off. It is oxidised by heating in the air, when it burns to ErO, with a brilliant white light; oxidation is also effected by fusion with caustic or carbonated shales, or with KNO, or KClO,

Crystalline zirtonium (v. Preparation, No. 3) is a very lustrous, greyish, brittle, solid, which resembles Sb in appearance; very hard, easily scratching glass and ruby (Moissan, C. R. 116, 1227/s. Sec. 4.15 (Troos. J. 1865. 183); 4.25 (Moissan, L.c.). S.H. (0° to 1002) 006 (Mixter a. Dana, A. 169., 388 (1873)). Crystalline Zr burns in the Q-H flame; it is not oxidised in Outli bested to whiteness at dissolves slowly O until heated to whiteness it dissolves slowly in hot conc. HClAq, and is very slightly acted on by HNO, Aq or H, SO,, even when warm; cold HFAq dissolves it readily. Molten KClO, or KNO, is said to be without action; molten KOH dissolves the metal as long as any moisture is

present.

According to Troost (J. 1865. 188), Zr melts

According to Troost (J. 1865. 188). Zr melts above the mp. of Si (i.s. above c. 1800°). The emission-spectrum of Zr has been mapped by Thalén; the chief lines are 6127 in the red, and in the blue, 4815, 4771, 4738, 4709, and 4886.

The at w. of Zr was determined, (1) by Berzelius (P. 4, 126; 8, 186 (1825)), by finding the ratio of ZrO, to SO, fit the sulphate; (2) by Hermann (J. pr. 31, 77 (1844)) by analysing ZrOl,: (8) by Marignao (A. Ch. '3) §0, 270 (1860)), by analysing K₂ZrF₂; (4) by Bailey (Pr. 46, 74 [1889]), by decomposing Zr(SO₄), by heat and weighing the ZrO₂ produced; (5) by Mixter and weighing the ZrO, produced; (5) by Maxter a. Dana (A. 169, 388 [1873]), by determining the S.H. of Zr; (6) by Deville a. Shoot (P. 108, 636; 641 [1859]), by determining the V.D. of ZrCl.. The results of Berzelias gave the at w. of Zr as 89.2; those of Hermann, 88.5 to 90.7; those of Marignac, 90.3 to 90.6; and the results obtained by Briley gave 90.4 as the at. w. of the metal.

Zirconium is the fnird member of the evenseries family of Group IV. in the periodic classification of the elements. This group contains the following elements:-

As is to be expected from its position in the classificatory system, Zr is a metal with some non-metallic properties; the oxide ZrO₂ forms corresponding salts, many of which are basic salts; the haloid compounds, ZrX₄, are propably all volatilisable without decomposition (the V.D. of ZrCl, only has been determined), but aqueous of Zru, only has u en determined, our aqueque solutions yield oxyhalides on evaporation; hydrated ZrO, reacts as a weak acid towards strong bases, forming zirconates; salts are known derived from the acid H₂ZrF₆; there is an oxide higher than ZrO₃, probably ZrO₂. For a more detailed comparison of Zr with the other evenseries elements of Group IV. v. TITANIUM GROUP OF ELEMENTS (this vol. p. 749), and cf. Tin GROOP OF ELEMENTS (this vol. p. 735). The atom of Zr is tetravalent in the gaseous mole-

cule ZrCl.

Reactions and Combinations.—1. Heated in Reactions and Combinations.—1. Heated in air, or oxygen, Zr burns to ZrO, giving out dazzlingly white light; amorphous Zr burns easily, orystalline only at a white heat, and then merely superficially.—2. Both amorphous and crystalline Zr dissolve readily in hydrofluoric acid, giving off H and forming ZrF..—3. According to Bailey (Pr. 46, 74), amorpheus Zr dissolves in cold cone. Sulphuric acid. Both forms dissolve in aqua regia.—3. Cone. hydrochloric acid reacts with Zr, when warm, forming ZfCl, solution. Crystalline Zr is said to interact chloric acid reacts with Zr, when warm, forming ZfCl, solution. Crystalline Zr is said to inveract with gaseous hydrogen chloride, &c. dull redness, forming ZrCl, =6: Amorphous Zr is exidised by molten potash or soda, also by molten mitre or potassium chlorate; the crystalline form of Zr is said not to be acted on by molten KNO, or KClO, and by molten caustic alkalis only as long as there are traces of moisture present.—6. Zr combines directly with the halogens, to form ZrX, and probably with sulphur (v. Sulphide, p. 897).

Detection and Estimation.—Addition of hot

edic. K.80.Aq to solutions of salts of Zr pptd. white basic sulphate of Zr, which is insoluble in water and nearly insoluble in much Hölaq. Turmerio paper becomes reddish-brown when immersed is a solution of a salt of Zr in Hölaq. the reaction is completely masked by the presence of boric acid (v. Brush, J. pr. 62, 7).
Bailey (C. J. 49, 481 [1886]) found that addition of H₂O₂Aq to a slightly acid solution containing salts of Zr, along with salts of Fe, Nb, and Ti, ppd. the whole of the Zr as ZrO, (or Zr,O,), but none of the other metals. Troost makes use of the comparatively small volatility of ZrO, at a very high temperature, to separate this oxide from SiO₂ (v. C. R. 116, 1428).

Zr is generally estimated as ZrO₂; salts of volatilisable acids are decomposed by heat; or solutions may be ppd. by NH₂Aq and the pp. washed, dried, and strongly heated.

Zirconium, alloys of. An alloy of Zr with aluminium is obtained in the preparation of Zr by reducing K₂ZrF₄ by Al (v. Preparation of Zirconium, No. 3). Mellis (Z. [2] 6, 296) obtained crystals having the composition ZrAl, (or perhaps Zr,Al,Si) by heating to whiteness a mix-ture of 1 pt. powdered zirconits with 5 pts. cryolite powder, 10 pts. mixed KCl and NaCl, and 1 pt. Al, treating with dilute HClAq, and separating the larger crystals of the alloy from the finer crystals of Si.

Zirconium, bromide of, Zrir. Formula probably molecular, from analogy of ZrCl. Obtained by mixing finely powdered ZrO, eugar charcoal, making into balls with starch paste, drying, and heating to bright redness in a current of dry CO₂ and dry Br (Mellis, Z. [2] 6, 296). ZrBr₄ is a white, microscopically crystalline, hygroscopic powder; it is easily volatilised; heated in H it is not reduced to a lower bromide. Contact with moist air or water paduces the oxybromide ZroBr,; evaporation of an aqueous solution gives the heptahydrate of this compound ZnoBr, TH, O in large needleshaped, transparent crystals (M., l.c.).

Zirconium, carbides of. By heating an in-

timate mixture of ZrO, and C in the electric arc, in an atmosphere of CO, Troost (C. R. 116, 1227 [1893] obtained a very hard, steel grey solid, approximating closely to the composition ZrC, By using less C, other carbides seem to be produced (cf. Moissan, C. R. 116, 1222), but analyses other compounds are not given. ZrC, dissolves easily in dible HFAq, but is not acted on by other toids. Moissan (l.c.) says that carbides of Zs containing more than 5 p.c. O (ZrC₂ contains c. 21 p.c. O) take fire fairly desily when exposed to the air; Troost says that carbides with a small proportion of O are only superficially oxidised by heating to redness, but that these with much Q burn brilliantly at that temperature.

temperature.
Zirgonium, chloride of, ZrCl., Mol. w. c. 2315. V.D. 117 at 440° (Deville a. Troost, P. 108, 636).

P. 105, 550).

Representation.—1. By heating Zr in Cl.—2. By heating an intimate mixture of ZrO, and Cl in Ch.—3.4. By passing vapour of BiOl, over heated ZrO, Troots a. Hattefeuille, C. B. 76, 1819).

Preparation.—A mixture of ZrO, with c. its own weight of lampblack is made into a paste with oil a little balls, c. the size of frazel nuits.

are rormed or ruis, and mese are covered with powdered charcoal, and heated to full redness in a closed ordeible until the oil is completely charred; the pellets are then heated to bright redness in a tube of hard glass, while, a current of dry Cl is passed through the tube, the ZrCl, which terms on the cooler parts of the tube is sublimed, in a stream of dry Cl, into a tube drawn out into bulbs, which are sealed off when

the operation is finished (v. Bailey, Pr. 46, 74).

Properties, Reactions, and Combinations. A white solid; volatilises unchanged at c. 400°. Dissolves in water, with production of heat; the solution on evaporation gives cayechorides (q.v.). Does not interact with sine ethica at 180° (Hinsberg, A. 239, 253). Combines with ammonia to form ZrCl, ANH,; with sodium chloride to form ZrCl, 2NaCl (Paykull, B. 6,

1467).

Zirconium, ferrocyanide of. According to Hornberger (A. 181, 232), the pp. formed by adding K.P.Cy.Aq to a solution of a salt of Zr, when washed and dried, has the composition Zr₃(FeCy₆)₂(?); it is a blue powder with a greenish tinge, insoluble in water, decomposed by acids, giving off HCN.

Zirconium, fluoride of, ZrF, Form bably molecular, from analogy of ZrCl, Formula pro-

Formation.—1. The hydrated compound Erf., 3aq is formed by slowly evaporating a solution of ZrO.H., or ZrF., in HFAq.—2. By heating ZrO. with twice its weight of (NH.)HF. to dull redness, till all the ammonium salt is

volatilised (Marignac, A. Ch. [3] 60, 263). Preparation.—Deville (A. Ch. [3] 49, 84) obtained ZrF, by heating to whiteness a mix, ture of finely powdered sirconite and fluorspare in a stream of HCl (? ZrSiO₄ + 2CaF₂ + 2HCl = ZrF₁ + CaCl₂ + CaSiO₃ + H₂O₃.

Properties and Reactions.—Prepared as de-

scribed, ZrF, is a colourless, transparent, crys. talline (probably hexagonal) solid; volatilisable at white heat; insoluble in water and acids.

ZrF, prepared by heating ZrO₂ with (NH₄)HF'₂
is said to be soluble in water and in dilute HFAq. The crystals of Zrf., 3aq are partially decomposed on drying. Heated to full redness in air, Zrf. gives ZrO. and HF.

Combinations.—1, With water (v. Formation, No. 1) to form Zrf., 3aq. -2. With various me-

tallic fluorides to form compounds of the form ZrF, xMF.yH.O. These salts are often calle zir, xmr.ym... these saits are often called sirono-fluorides, or fluo-sironates; they are better named sirconi-fluorides. The zirconi-fluorides have been examined chiefly by Marignac (4 Ch. [3] 50, 257); they are obtained sibbel by marignacy and solutions of solutions are either by gradual evaporation of solutions con-dining the constituent fluorides or by adding hydroxides or carbonates of the various metals to colutions of ZrF, in HFAq, and evaporating.
Ammonium zircon? fluorides. Tro

(NH.), ZrF., rhombic crystals, isomorphous with K.ZrF.; (2) SNH, F.ZrF., small octahedrs, showing simple retraction (Baker, C. J. 35,

oadmium simoni-fluorides. Two salts seem to exist: (1) 2CdF, ZrF, 6aq, monochinic crystals, isomos hous with the Mn salts? (2) CdF, 2ZrF, 6aq, laminar, fan-shaped groups of crystals.

Manganese sirconi-fluorides.

MnF, ZrF, 5aq; and (2) 2MnF, ZrF, 6aq.
Nickel zirconi-fluorides. (1)

(1) Mif-2rf, 6aq, hexagonal prisms; S.G. 2-227 (Topsös, C. C. 3, 76); and (2) 2Nif-Zrf, 12aq, monoclinic crystals. The first salt forms a double salt with K-Zrf, viz. NiZrf-K-Zrf, 8aq.

Potassium zircomi fluorides. (1) K_ZrF_a; obtained by strongly heating sirconite with two or three times its weight of KHF_a, boiling with very dilute HFAq, filtering from K.SiF, and allowing the filtrate to cool. from K.SiF., and allowing the filtrate to cool. Crystallises in rhombic crystals, terminated by six-sided pyramids; solubility. 78 at 29, 14 at 15°, 2.7 at 193, and 25 at 10°. S.G. 3.582 (Topse, Lc.); (2) KF.ZiF., aq (= KZiF., aq); obtained, in monoclinic crystals, by dissolving the preceding tall in water containing a large excess of ZiF. (3) 3KF.ZiF., [a, KZiF.]; obtained by crystallising K.ZiF., from a solution containing excess of KF; small, brilliant, regular octubedra, with simple refraction (n. Baker, C. J. 35, 762). Soluble in water; the hot come, solution deposits K.ZiF., on cooling. Sodium zirconi-fluorides. The salt 5NaF.2ZiF. is said to be always formed in

5NaF.2ZrF, is said to be always formed in whatever proportion the constituent fluorides

whatever proportion the constituent matrix are mixed. Small, monoclinic crystals; solubility at 18° = 38, and at 100° = 0. 1°6.

Zinc zirconi-fluorides. (1) ZnZrF, 6aq; isomorphous with ZnSiF, 6aq and ZnSnF, 6aq. crystallising in regular hexagonal prisms, easily crystallising in regular hoxagonal prisms, easily soluble in water. S.G. 2.255 (Topsöe, L.c.).
(2) 2ZnF₂ZrF, 12aq; deposited from a solution containing excess of ZnF₂, in monoclinic crystals, somorphous with 2NiF₂ZrF, 12aq. Zirconium, hydride of. By leating ZrO, and Mg powder, in the ratio ZrO₂2Mg, in an atmosphere of H, Winkler (B. 24, 888; of B.

23, 2666) obtained a black powder which burnt 23, 2666) obtained a black powder which obtain in O, and contained c. 73 p.o. H. On treating this with dilute HClAq, Mg and MgO dissolved, H being given off, and a black residue was left which W. regarded as ZrH., Supposing the reduction of the ZrO₂ had proceeded in accordance with the equation ZrO₂ + 2Mg + 2H = 2MgO + 2ZrH₂, the product would have contained 53·44 p.c. ZrH₂, and, therefore, would have given 1·15*p.e. H; as only '73 p.c. H was found, W. concluded that c. ½ of the ZrO₂ had been

reduced. Airconium, hydroxide of, (?) ZrO.H. Addition of NH,Aq to a solution of a salt of Zr produces a white, bulky, gelatinous pp. of ZrO...eH.O. According to Berzelius, the dry pp. has the composition ZrO.H.O. ZrO.H., Hermann (J. pr. 97, 318) gave the formula ZrO.2H.O. ZrO.H. to the pp. driedwisti7.5°; Paykull (B. 12, 1719) to the pp. dried at 17.5°; Paykull (B. 12, 1719) said that after drying in vacua, the composition was \$7.0.3H_0. and after drying at 1009 YZrO_H_0...A detailed examination of the dehydration of the pp. formed by adding NH_Aq to a cold solution of Zr(90), was made by Carnelley a. Walker (U. J. 53, 48, 82 [1888]). The loss of water by the air-dried pp. was fairly regular to c. 90°, when the pp. had approximately the composition ZrO_2H_0; the loss was then less rapid, but very regular, up to c. 385°, whereat the composition was approximately 2ZrO_H_0; the composition was approximately 2ZrO, H.O; somewhere between 385° and 415° there was a sudden increase in the percentage loss of water

for a rise of 10°, this increase being accompanied by a change of colour from grey to pure white; at 415° the composition was approximately 24ZrO₂.H₂O; water was then given off very fegu-larly, until at c. 550° dehydration was completed. C. a. W. conclude that probable to definite hydrate of ZrO, unchanged throughout a fair range of temperature, is formed by heating ZrO.xH2O ppd. from a salt of Zr; theyothink that the change of colour which accompanies the comparatively large percentage loss of water at c. 400° is an accompaniment of a condensation of molecules chiefly of the composition $n(2ZrO_2.H_2O)$ to inclosures chiefly of the composition $n(24ZrO_2.H_2O)$. There's, a distinct resemblance between the phenomena of the de-hydration of ZrO₂xH₂O and those of the dehydration of SiO₂xH₂O, SiO₂xH₂O, and TiO, xH,O.

Hydrated ZrO2 ppd. cold, and washed with cold water, dissolves easily in the ordinary acids, including oxalic acid (Bailey, C. . 49, 481), forming salts ZrX1, and ZrX11, when ppd. hot, or washed with hot water, the pp is only slowly dissolved by the ordinary acids. According to Paykull (B. 12, 1719), moist ZrO...xH.O absorbs produces basic sulphates 3ZrO_x4SO₃. 15aq and 6ZrO_x7SO₃, 19aq \(\frac{P}{L}\), \(\lambda c.\), \(\lambda c.\)
ZIRCONATES. \(\frac{ZrO_x \text{C}_1}{L}\) behaves as a weak

acid towards the stronger bases. A few salts have been prepared which are most simply rogarded as derived from $Zr(OH)_x$ by replacing II by alkali and alkaline earth metals; these y analy a reconstruction of the state of the

= Na₂O.ZrO₂); obtained by heating ZrO₂ with Na₂CO, in the ratio ZrO₂:Na₂CO₃; the crystalline mass thus formed is gradually decomposed by water with separation of amorphous ZrO₂. (2) Na₄ZrO₄ (=2Na₂O.ZrO₂); obtained by heating ZfO₂, with a considerable excess of Na₂CO₃ to whiteness for a considerable time; decomposed by water, with formation of (3) Na2O.8ZrO2. 12aq, which forms hexagonal tablets.

Zirconates of calcium and magnesium were obtained by H (l.c.) by heating to reduess mix-tures of ZrO, with SiO, and CaCl, or MgCl, Ouvrard (C. R. 112, 1444 [1891]) describes lithium zirconate, Li,ZrO, obtained by fusing ZrO, with LiCl, and cooling slowly; when Li,CO, was used, and the fused mass was treated with boiling water containing a little acetic acid, pure

ZrO, remained.
Zirconium, nitride of.. In fusing amorphous
Zr with Al, in a cracked little crucible, Mallet (Am. S. [2] 28, 346 [1858]) obtained a dark-grey, porous solid, which gave yellowish luctrous microscopic cubes wher treatel, with HClAq; the crystals wife unchanged by aqua replace alkali solutions; when fixed with KOH they gave off NH. The yellow crystals were probably a nitride of Zr.

Zirconium, oxides of. Besides zirconia, ZrO., there exists a higher oxide, probably ZrO,; and, possibly, also a lower oxide (?) ZrO.

ZIRCONIUM DIOXIDE ZrC., (Zirconia. Zirconic anhydride.) Mol. w. not known.

Proparation.—There are many methods for

preparing ZrO, from Urgonite. 1. The mineral is fleated to redness and thrown into water, and the least-coloured pieces are finely powdered and levigated; the powder is very strongly heated with four times its weight of Na₂CO₃, in a Pt orucible, and the product is heated with excess of HClAq; the whole is evaporated to dryness; of Hold; the whole is evaporated to dryness; the residue is digested with water, filtered from SiO₂, and ZrO₂xH₂O is ppd. by NH₂Aq. The pp. is washed and dissolved in Hold, and the solution is nearly saturated with Na₂O₂, and boiled with Na₂S₁O₂Aq as long as SO₂ is given off, whereby ZrO₂xH₂O is ppd. (Berzelius, P. 4, 124; 8, 186; Hermann, J. pr. 31, 77; Chancel, A. 108, 237; Stromeyer, A. 113, 127).—2. Very finely powdered sigconite is boiled with conc. High powdered successes is bosted with water and dried; 100 g. of the dried powder are added to 400 g. molten NaOH, with which 20 g. NaF have been mixed, and the whole is heated in a nickel crucible until the action ceases, when the molten mass is pouled on to a sheet of nickel, and, after solidification, is plunged into water; the portion insoluble in water is dissolved in HClAq, the solution is evaporated to dryness, and treatment with HClAq and evaporation to dryness are repeated several times to remove SiO, and HF. The solution in HClAq is then ppd. by NH, Aq; the ZrO, xH,O is thoroughly washed by decantation, dissolved in the smallest possible quantity of cone. HClAq, and the solution is evaporated to fryness: the residue is washed in a funnel with conc. HClAq mixed with 4 pts. of alcohol; the washed solid Inixed with 4 pis. 62 alcohol; the washed solid is then repeatedly orystallised from cond. HClAq. The white, lustrous crystalls of ZrOCl_xxH₂O hus obtained are dissolved in water, and ZrO_xxH₂O is ppd. by NH₂Aq (Venable, C. N. 64, 315 [1891]; cf. Bailey, Pr. 46, 74 [1889]; cf. Preparation of Zirconium, p. 893). By heating ppd. ZrO₂xH₂O to c. 150°, ZrO₂ is obtained tained.

Crystalline zirconia is obtained from the amorphous form (1) by fusing with borax at a very high temperature, and washing with HClAq (Nordenskijold, P. 114, 612; Knop, A. 157, 363); (2) by fusion with microcosmic salt (K., l.c.);
(3) by heating to dull redness in dry HCl at a pressure of three atmospheres (Hautefeuille a. Perrey, C. R. 110, 1038); (4) by melting and volatilising in an electric furnace, using a current 360 ampères and 70 volts (Moissan, C. R. 116, 1232 [4893]); (5) by heating, to dull redness, a salt of Zr with an acid that can be removed by heating, in a current of dry HCl (H. a. P., l.c.).

(H. a. P., l.c.).

Properties.—Amorphous zirconia is a white, tasteless, chodorous powder; S.G. c. 5% insoluble in adds, except in conc. H.SO, (v. Beactions, No. 7) or HFAq. Crystalline zirconia is a transparent, colourless solid; S.G. 5-1 (Moissan, Lc.), 5-42 (Knop, Lc.), 5-7 (Nordenskjold, Lc.). The crystals are desoribed by N. (l.c.) as quadratic prisms, isomorphous with SnO₂ (tinstone) and TiO₂ (rutile). The crystals are extremely hard; they soatton class easily SnO_c (tinstone) and ThO_c (ruttle). The crystals are extremely hard; they so that had see easily (Moissan, Lc.). It is generally said that when ZrO_c is heated to incipient redrises it glows brightly, and becomes denser but the experiments of Carnelley a. Walker (C. J. 58, 82 [1888]) on the action of heat on ZrO_c Eligon

make it probable that the glowing is an accompaniment of the dehydration from approximately 2ZrO₂,H₂O approximately 24ZrO₂H₂O. Zirconia reacts towards acids as a basic oxide, forming salts ZrX^{I} , and ZrX^{II} . (many of which are basic salts); it also decompose alkali care bonates and some other alkali and alkaline earth salts, when fused therewith, forming zirconates mZrO, nM, O (v. Zirconates, p. 896).

Reactions.—1. When ZrO, is heated to a very high temperature it melts, boils, and vola tilises, condensing in crystals; Moissan (C. R. 116, 1222 [1893]) effected the volatilisation in crucible heated in the electric furnace, using a current of 300 ampères and 70 volts.

2. When very strongly heated with excess of carbon, carbides are formed (v. Carbides, p. 894). Heating in a carbon crucible in the electric furnace produces Zr (M., l.c.) 3. Heating with magnesium produces Zr, perhaps also an oxide lower than ZrO₂ (Winkler, B. 23, 2642; 24, 888; Phipson, pr. 96, 353; Bailey, Pr. 46, 74; cf. Zirconium monoxide). When heated with magresium in an almosphere of hydrogen, some ZrH₂ is perhaps produced (v. Zirconium hydride, p. 895).—4. ZrCl₄ is formed by heating ZrOs mixed with carbon in a stream of chlorine; using bromine produces ZrBr, (v. Bromide and tusing oromine produces Zini, by Somme and Chloride, pp. 894). — 5. ZrF, is formed by heating ZrO? to dull redness with excess of ammonium flyoride. — 6. K.ZrF, is formed by ammonum provide.— o. R.267; is formed by slightly heating ZrO₂ with excess of polassium hydrogen fluoride, boiling with very dilute HFAq, and filtering.—7. Zr(SO₂)₂ is obtained by heating ZrO₂ with excess of a mixture of 2 pts. conc. subphuric acid and 1 pt. water.

ZIRCONIUM PEROXIDE. By adding H.O.Aq and NH2Aq to a solution of Zr(SO₁), Cleve (Bl. [2] 43, 53) obtained an oxide containing more Othan ZrO₂; to this oxide he gave the formula ZrO₃. Bailey in 1886 (C. J. 49, 149, 481) czamined the pp. obtained by adding H₂O₂Aq to solution of Zr(SO₄)₂; according to B., the moist pp. has the composition Zr,O,, and this composition is unchanged after keeping (moist) for some months. In Bailey's paper in 1889 (Pr. 46, 74) he gives the composition ZrO, 3H, O to the oxide ppd. by H₂O₂Aq, either from an acid or an alkaline solution of Zr(SO)₁, after drying over P₂O₂; and the composition ZrO, after drying at 100°. The oxide ZrO, 2H₂O was obtained (C. J₄ The oxide ZrO, 2H,O was obtained (C. J. 100°. The oxide ZrO, ZH,O was obtained (C. J. 49, 485) by preparing a solution of Zr(SO), by heating K,ZrF, with H,SO,, and at once adding H,QAq. Zr peroxide is insol. in very dilute (1 p.c.) H,SO, Aq or HC,H,O,Aq (B., Lc.). Bailey (Lc.) employed the pan. of ZrO, zH,O to separate Zr from Fe, Nb, and Ti.

Mg by treatment with dilute HClAq, washed with nnauy with ethergand dried in vacuo. He thus obtained a deep-black powder, which was unacted on by HClAd, HNO, Ara or H, SO, A. even on warming, a: I which burnt to ZrO, when heated in air. W. supposed this black powders to be ZrO. Yor. IV. water containing HCl, then with alcohol, and

Zirconium, oxyacid of. Hydrated airconia, ZrO, xH.O, reacts as a weak soid towards strong bases (v. Zirconates, p. 896).

Eircenium, oxybromide of, ZrOBr_xH_O.

ZrBr, dissolved in water; on evaporation, transparent needle-shaped crystals are formed, to which Mellis (Z. [2] (2.296) gave the composition ZrOBr_7H_O. Bysissolving ZrO_xrH_O in HBrAg and evaporating, Weibull (B. 20, 1394 [1887]) obtained lustrous needles of ZrOBr_8H_O, isomes Block with ZrOCI 8H, COCI. 8H. isomorphous with ZrOCl, 8H O.

Zirconium, oxychlorides of. Zirconium, oxychlofides of. Various oxychlofides have been described. (1) ZrOCl_xxH₄O; prepared by dissolving ZrO_xxH₄O in HClAq and evaporating (10) details as to the best conditions v. Weibull, B. 20, 1394). Hermann (J. pr. 81, 77) gave the formula as ZrOCl₂9H₄O; Mellia (Z. [2] 6, 296) gave 2ZrOCl₂9H₄O; and Weibull (L.c.) ZrOCl₂8H₄O (c. also Paykull, B. 6, 1467; and Bailey, Pr. 46, 74, (2) Zr₂OCl₂; prepared by Troost a. Hautefeuille (C. R. 73, 563) by passing steam and vapour of ZiCl₄ through a red-hot tube. (2, 2Zr₂O₂Cl₂15H₄O; prepared by Ende-Various oxytube. (3) 227.0,Cl.,15H.0; prepared by Endemann (J. pr. [3] 31, 219) by adding ether to a warm alcoholic solution of ZrOCl., xH.0.

Zirconium, expiodides of By adding the calculated weight of Bal, in solution, to Zr(SO;) dissolved in a slight excess of H.SO, Aq, filtering, evaporating over H.SO,, any removing free I from the residue by CS, Hinstory (4. 239, 253 [1887]) obtained a white, amorphous powder, easily soluble in water, giving off I in moist air to which he gave the formula ZrIO, H, xH,O (x probably = 3).

Zirconium, oxysulphide of; v. Zirconium BULPHIDES (infra).

. Zirconium, salts of. The salts formed by the replacement of H of acids by Zr belong to the forms ZrX," and ZrX,; many basic salts are known. The following are the chief salts of are known. Zr derived from oxyacids: Arsenates, borates. carbonates, nitrates, oxalates, phosphates, selen tes, silicates, sulphates, and sulphites.

Zirconium, silicofluoride of, (?)Zršif, probably obtained by Berzelius by evaporating a solution (? of ZrO_xHI_O in H_Sif_sAq) (v. Lehrbuch, 3, 505 [5th ed.]).

Zirconium, sulphides of. According to Berzelius (v. Lehrbuch, 2, 189 [5th ed.]), a compound of Zr and S is formed by heating the clements together in vacuo, or with H. compound, to which no formula is assigned, is compound, to which in lothing is assessed of described by B. as a dark-brown coloured powder; unacted on by H.SO.Aq. ISNO.Aq. or HClAq; slowly attacked by boiling apua regia; dissolved easily by HFAq, giving off H.S.; insol. in KOHAq, and decomposed by usion with KOH to K.S and ZIRCONIUM MONOXIDE (7) Zrd. By heating ZrO. By strongly heating ZrO, in vapour of ZrO, and powdered Mg, in the ratio ZrO. Mg, in CS., Rremy (A. Ch. [3] 38, 326 [1863]) obtained a stream of H, Winkler (B-23, 2668 [1890]) by a graphite-like solid, which was rapidly acted tained a black powder, which he allowed to cool on, by HNO, Aq. with separation of S; Fremy in H, then kept for some time in CO, free from supposed that the substance might be an oxysulphide.

Zirconium, sulphocyanide of a By adding Ba(SCN), to Zr(SO₄)₂ solution, Hornberger (A. 181, 232 [1876]) obtained a solution which, he said, contained Zr(SCN),; this solution quickly

M. M. P. M.

ADDENDA

[DESCRIPTIVE ENORGANIO CHEMISTRY ONLY.]

ALUMINIUM (vol. i. p. 141). Preparation .-By electrolysing a molten mixture of All'₃.KnaF with NaGl (Minet, C. R. 111, 603 [1890]). The best results are obtained by using the salts in the ratio AlF₃.SnaF.6NaCl; details of the quantities are obtained by using the salts. tities to be used, the strength of current, &c., are

Properties.—Minet (C. R. 111, 603 [1890]) gives m.p. of Al as 675°; and S.G. at 820° as 1.76. The S.H. of Al is given by Richards (C. N. 65, 97 [1892]) as 224 at 20°, 232 at 100°, and 2845 at the m.p. = 625°; the S.H. of molten Λl at $650^\circ = 308$, according to Pionthon (C. R. 115, 162 [1892]). The molecule of Al in dilute'soluat 1892 = ove, according to the field [1892]). The molecule of Al in dilute solution in tin is perhaps diatomic (Heycock a. Neville, C. J. 57, 376 [1890]).

Reactions.—Volatilises in electric furnace,

with current of 250 ampères and 70 volts (Moissan, C. 12. 116, 1429 [1893]). Not appreciably acted on by NO₂ at 500° (Sabatier a. Senderens, C. R. 115, 236 [1892]). An amalgam senterens, C. L. 113, 230 [1892]). An amalgam is formed by bringing Al into a solution of a mercuric salt (Klaudy, C. C. 1893 [1] 201; abstract in C. J. 64 [11] 376 [1893]). Heated with NaPO₃ in a current of H, from 28 to 31 p.c. of the P distils over ; P is also obtained by heating Al with any phosphate of Ca or Mg (Rossel a. Frank, B. 27, 52 [1894]). According to Lunge (C. N. 65, 110 [1892]), vessels made of Al may be used for holding articles of food, at least at the ordinary temperature, without danger of the metal being dissolved; this result is confirmed by Balland (C. R. 114, 1536 [1892]).

Aluminium, alloys of (vol. i. p. 143). alloy with gold, Al, Au, v. Heycock a. Neville (C. J.

65, 74 [1894]).

Aluminium, chloride of (vol. i. p. 144). Nilson a. Pettersson (Z. P. C. 4, 206 [1889]) made a number of determinations of the V.D. of "AlCl₃; they find that the compound gradually metal. The reactions of liquid NH₃ with CrC dissociates above its b.p. until c. 800°, when its and FeCl₃ are described by Christensen (Zeit. V.D. becomes constant and corresponds with the anong. Electric, 4, 227; abstract in C. J. (211, 480 (1992)) formula AlCl₂. AlCl₃ may be prepared by heating an alloy of Al and Cu-alcarly to redness in dry an aloy of Al and Ol-learly to redness in dry HCl; AlCl, distils over unmixed with any Cu compound (Mabery, B. 22, 2658 [1889]). Sabatier (Bl. [8] 1, 88 [1889]) says that crystals of the hydrated chloride after being in vacuo fog three months at 20° over H₂SO, have the composition AlCl, 6H,O. AlCl,.6H,O.

AlCl. 6H.O. Aluminity, oxides of (vol. i. p. 146). By heating Al.O. with Mg, in the ratio Al.O. Mg, Winkler (B. 93, 780 [1890]) obtained a brownish-black powder which, he says, contained a considerable quantity of an oxide lower than Al.O., probably AlO. By the incomplete combustion of Al, Pionchon obtained a dark grey powder, said by P. to have the composition Al, 0, = 2Al, 0, Al, 0 (C. R. 117, 328; abstract in C. J. 64 [11] 572 [1893]). By heating amorphous Al, 0, to in-

cipient redness in HCl gas at a pressure of three ethen reduces in He ages as a prosent contact at most, Hautefeuille a Perrey (C. R. 110, 1038 [1890]) obtained crystals of corundum. According to Read (C. J. 65, 313 [1894]), Al₂O₄ is unchanged at c. 1750°.

Aluminium, phosphide of (vol. i. p. 146). A grey crystalline powder, Al, P, was obtained by Rossel a. Frank (B. 27, 52 [1894]) by heating Al in vapour of P, and then heating the product

till P ceased to come off.

AMMONIA (vol. i. p. 196). Formation.— According to Loew (B. 23, 1443 [1890]), traces of Nfl, are formed by shaking Rt black with very dilute NaOHAq in the air. NH, is also formed dilute NaOFAq in the air. NH, is also formed by the combined action of Pt black and dextrose

on KNO₃Aq (L., l.c., p. 675).

Properties.—Ludeking a. Starr (Am. S. [3] 45, 200 [1892]) give S.H. of liquid NH3 as 8857. For measurements of the wave-lengths of the lines in the emission spectrum of NH, v. Mag-Incs in the emission spectrum of Mily v. mag-nanini (Z. P. C. 4, 435 [1889]). Perkin (C. J. 55, 689, 728 [1889]) gives M. M. of NH, in Aqueous and alcoholic solutions; also Mol. R. of various NH, salts in solution. Tables showing the solubility of NH, in alcohol of various conbentrations, at 10°, 20°, and 30°, are given by Delépine (J. Ph. [5] 25, 496; v. abstract in C. J. 62, 1049 [1892]). For the freezing-points of aqueous solutions of NH₃ v. Pickering (C. J. 63, **181** [1893]).

Reactions.—Dry NH, does not combine with dry hydrogen chloride when these gases are mixed (Baker, C. J. 65, 611 [1894]). Nor do dry NH, and dry carbon dioxide combine (Hughes a Soddy, C. N. 69, 138 [1894]). Michel a. Grandmongin (B. 26, 2565 [1893]) say that the products of passing NH, over heated peroxide of Ba, Pb, Mn, or No, are N with a little HNO, and HNO, and oxide or hydroxide of the metal. The reactions of liquid NH₂ with CrCl

anong. Chemie, 4, 227; abstract in C. J. 64 [11] 459 [1893]). AMMONIUM COMPOUNDS (vol. I. p. 200). Ammonium amalgam (50l. i. p. 201). From measurements of the polarisation given by this ubstance in a solution of NH Cl against zino amalgam, and a comparison of these measurements with the polarisations given by metallic analgams, Le Blanc concludes that ammonium amalgam really exists (Z. P. C. 5, 467; abstract in C. J. 58, 1204 [1890]).

Ammonium chloride (vol. i. p. 202). Baker dC. J. 65, 611 [1894]) asserts that the V.D. of the dry salt at 350° is 28.7, corresponding with that sequired by the formula NIECL. B. also says

that no reaction occurs when dry NH Cl and dry CaO are heated together.

ANTIMONY (vol. i. p. 282). Reactions.—
Montenattini (G. 22, 384, 426) finds that no

appreciable quantity of NH, is formed byothe! interaction of Sb and HNO, Aq varying from 2 to 70.3 p.c. HNO₃; NO₂ is practically the only gaseous product of the reaction; when 70 p.c. HNO, Aq is used, the residue probably has the composition (SbO)NO3.

Artimonates (vot. i. p. 285). Several salts have been prepared by double decomposition from the K salt, by Beilstein and O. v. Biase (C. C. 1889, 803; abstract in C. J. 56, 1123). All the compounds are salts of $HSbO_3$; R. a. 1. conclude that the only well-marked antimonates are derived from this acid. Ebel (B. 22, 3011

[1889]) describes several metantimonates.

Antimonites (vol. i. p. 285). For antimonites of K and Na v. Corminba uf (C. R. 115, 1305; abstract in C. J. 61 (11', 171 (1893').

Antimony, bromid of (vol i. p. 286). The b.p. of SbBr, is given as 275° by Freyer a. V. Meyer (Zeit. f. amorg. Chemic, 2, 1 [1892]).

Antimony, trichloride of (vol. i. p. 286).

Boils at 283° (Freyer a. V. Meyer, Lc.).

Antimony, pentachloride of (vol. i. p. 287). The V.D. at 218° and 58 mm, pressure was found to be 1447 (corresponding with the formula SbCl₃) by Auschütz a. Evans (.1, 253, 95 (1890.). Double compounds of SbCl, with 1664 and CsCl are described by Saunders (.1m. 14, 152 [1892]), and by Wheeler (.1m. S. [3] 46, 269 [1893]).

Antimony, fluoride of (vol. i. p. 287). The double compound ShF₃.2AmF is described by H. von Helmholt (Zeit, f. anorg. Chemie, 3, 115 [1893])

Andmony, hydride of (vol. i. p. 288). temperature whereat decomposition of SbH, begins is given by Brunn (B. 22, 3202 [1883]) as c. 150°. For the reactions of SbH, with AgNO Aq v. Vitali (abstract in G. J. 6 111], 206 (1893).

Antimonic exide (vol. i. p. 290). When heat d to dull redness Sb₂O₂ gives off O₂ forming Sb₂O₄, which at c. 1750 is further reduced to Sb.O. (Read, C. J. 65, 313 [1891]).

Antimonious sulphide (vol. i. p. 291). Black Sb.Sa is formed, according to Mitchell (C. N. 67, 291 [1893]), by passing CO, into hoiling water with ordinary Sb.S, in suspension. Picton (C. J. 61, 142 [1892]) obtained a colloidal Sb S_J in very fine suspension in water, by allowing solution of tartar emedic to flow into saturated

H₂SAq. Antimony thio-chlorides and thio-indides of (vol. i. pp. 292-3). Ouvrand (C. J. 116, 1516 (1893) describes SbSCl and Sb₄S Cl., obtained by the action of H.S on SbCl_s; and SbSl formed by heating SbI_s to 150° in dry H₂S, and Sb₂S_sI_s formed by heating Sl₂S_s with I and crystallising from CS.

• ARSENIC (vol. i. p. 301). A full account of the different forms of As obtained, along with As O_B by subliming As in a tube is given by Retgers (Z. P. C. 4, 403; abstract in U. J. 44 [11], 570 [1893]). Petersen gives the following heats of oxidation, and stomic volumes, of the allotropic forms of As (Z. P. C. 8, 601 [1891]):—

At whime •[As²,0`] \$56,830 Grey, rhom hedric Grey-black, amorphous 154,840 Brown, amorphous 163,500 163,500 . 15.99

Arsenic, bromide of (vol. 1, 309). AsBr. combines with NII, to form AsBr., 3NH, (Besson, CoR. 110, 1258 [1890])⊾

Arsenates (vol. i. p. 307). For arsenates of Cd v. A. de Schulten (Bl. [3] 1, 473 [1889]); for arsenates 36 Cu, and of Cu and Na, v. Hirsch (C. C. 1891 [1], 15; abstract in C. J. 60, 6441; many double agreement of K, and of Na, with Cd. Co, Mg. Mn. Ni, and Zn are described by

fevre (C. R. 110, 405 (1890)). For this arsenates of Cn. Hg. Zn; and Zn and

Na, v. Preis (A. 257, 178 (1800)). Arsenites (vol. i. p. 306). For the preparation, by double decomposition from the salt 2KASO As O and proporties, of the arsenites of the following metals v. Reichard (B. 27, 1019 [1894]):—Al, Ba, Cd, Ca, Cr, Co, Cu, Au, Fe, Pb, Mg, Mn, Hg, Ni, Pd, Pt, Ag, Sr, Sn, Ti, U, and Zn (references and criticisms of former investigations are given). Stavenhagen (Zeit. f. angew. Chemie, 1891, 165) obtained the double salt of Kaysenite and sulphate, KASO, 10K SO, by evaporating solutions of the constituents after mixing.

Arsenic acid (vol. i. p. 307). For a detailed account of the reaction of H S with solutions of H.A.O. v. Brauner a. Tomeetchek (C. J. 53, 145. [ISSS].

Arsenious chloride (vol. i. p. 310). According to Besson (C. R. 109, 519 [1880]), AsCl. solidifies at -18°, forming white meedles; at - 30 'AsCl, absorbs much Cl, forming a liquid which does not solidify at 60°, and which with water gives off much Cl and forms As,0,Aq. Besson (C. R. 110, 1258 [1890]) says that the compound formulated by Rose as 2AsCl, 7NH, is really AsCl. 4NH

. Arsenious fluoride (vol. 7, p. 310). Moissan (4. Ch. [6] 19, 280 [1891]) prepared AsF, by heating As₂O₄ with HF; he gives b.p. as 63° at 750 mm., and says that it solidifies to white crystals at -8.5°. Besson (C. R. 110, 1258) [1890]) describes the compound 2AsF₃.5NH₂.

Arsenic, trihydride of (vol. i. p. 310). Brunn (B. 22, 3202 [1889]) finds that the first products of the action of air, or O, on AsH, are solid nAsH and H.O, and the next products are As mast and H.O. AsH, and the next products are As and H.O. AsH, and H.S. do not react in absence of air as the ordinary temperature either as gases or in solution (B., L.c.). AsH, begins to decompose at c. 230° (B., L.c.). For the reacons of AsH, with AgNO,Aqv. Vitali (abstract in C. J. 64 [11] 206 [1893]).

Arsenious iodifie (vol. i. p. 311). (C. R. 110, 1253 [1890]) describes the compounds AsI, 4NH, and AsI, 12NH.

Arsenious sulphide (vol. i. p. 315). Picton (C. J. 61, 140 114 [1892]) obtained an aqueous solution of colloidal As.S., containing also some very finely divided sulphide in suspension, by allowing As.O. eq to flow into saturated H.S.Aq, into which H.S. was columnally bassing, and re-

moving H.S by a stream of H.

Arsenic pentasulphide (sol. i. p. 315) As₂S, is obtained, according to McCay (Am. 12, 547 [1891], by passing H.S for a long time into a het solution of an alkali dihydrogen arsenate,

and then ppg. by a mineral acid.

Armanic, thiochlorides and thio-iodides of (vol. i. p. 316). Olivard (C. R. 116, 1516 [1893f] obtained As,S,Cl, by passing H.S into

AsCl., and washing the pp. with CS. By heating 1 pt. As.S., with 10 pts. AsCl. to 150° he obtained AsSCl. AZO-IMIDE (v. Hudrazoic acid. p. 219. Addenda).

BARIUM (vol. i. p. 440). Richards, in 1893, riade an elaborate experimental revision of the at w. of Ba (P. Am. A. 28, 1; 29, 55). As a mean result of the most trustworthy experi-

ments, R. adopts 137 1 as the at. w. 7 Ba (O=15.96). Limb (C. R. 1'2, 1434 [1891]) failed to obtain any Ba by electrolysing fused

Bacl₂, or Bacl, mixed with NaCl.

Barium, carbide of. By heating a mixing of Ba amalgam and powdered charcoal in H, Maquenne (C. R. 114, 361 [1892]) obtained grey

maquenne (C. R. 114, 301 [1892]) obtained grey BaC₂; decomposed by water, giving BaO₂H.Aq and C₂H₂; v. also Moissan, C. R. 118, 683 (abstract in G. J. 66 [1], 314 [1894]).

Barium, chloride of (vol. i. p. 441). By bringing BaCl₂ into contact with liquid NH₃, and allowing the gas to escape at 0° and 760 mm.

Joannis obtained BaCl₂:8NH₃ (C. R. 112, 337 [1801])

Barium, fluoride of (vol. i. p. 441). BaF, is obtained in microscopic crystals by adding wall, Aq (3.6 p.c.) to beiling KFAq (1 p.c.), boiling, washing, drying, and heating strongly (Moissan, BL. [3]5, 5, 152 [1891]). Poulence (C. R. 116, 987 [1893]) obtained BaF, in well-

formed octahedra by fusing amorphous BaF, with KHF, and KCl. Barium, nitrides of. Maquenne (C. R. 114. 220 [1892]) obtained a mixture, probably containing some Ba,N,, by heating Ba amalgam to reginess in a current of N. Berthelot a. Matignon

(A. Ch. (7) 2, 144 [1834]) say that BaN, is formed

by heating AmN_sAq with BaO₂H_sAq.

Barium monoxide (vol. i. p. 442). BaO is unchanged at c. 1750° (Read, C. J. 65, 313 [1894]); it liquenes at c. 2,000°, but is not decomposed at c. 2,500° (Moissan, C. R. 115, 1034 (1894)).

1034 [1892]).

Baium dioxide (vol. i. p. 443). BaO₂ is decomposed by salts of Al, Cr, Co, Fe, &c.; some " valts -e.g. those of Ca, Li, K, Na-do not react with BaO, (v. Kwasnik, B. 25, 65). For decomposition of BaO, by heat v. Le Chatelier (C. R. 115, 654; dostract in C. J. 64 [11], 71 [1893]).

BERYLLIUM (vol. i. p. 504). Krüss a. Moraht (B. 23, 727 [1890]) obtained hexagonal crystals of Be, mixed with BeO, by heating BeF_2KF to redness with Na., K. a. M. (l.c. p. 2552) obtained the value 9.03 for the at. w. of Be by

converting BeO into BeSG. 4H.O, and this again to BeO. Gibson (C. J. 63, 909 [1893]) describes

to Bec. Groson (C. J. 5., 909 [1993]] describes methods for preparing BeC from herpt.

Beryllium, fluoride of (vol. f. p. 506). Peterser (E. F. C. 5, 203 [1890]) gives the thermal 'ata H. J. [BeO*H*2HFAq] = 19, '83. The delible compound BeF, 'AmF is described by H. von Malwholt (Zeithern C. Chemic 2, 115 (1893)). compound BeF., AmF is described be to volume the limbol (Zeit. J. anorg. Chemie, 3, 115 [1893]).

Beryllium, oxide of (vol. i., p. 506). By dissolving BeO, xaq in KOHAq, Krüss a. Moraht (B. 23, 727 [1890]) chained potassium beryllate BeO, K. [?], mixed with K, CO, as a snow-white, allky solid.

BISMUTH (vol. i. p. 509). The at. w. of Bi was re-determined by Cla.sen in 1890 (B. 23, 928 [1890]), by converting Bi into nitrate and

988 [1890]), by converting Bi into nitrate, and

this into Bi O.; the Mean result was 20030 (O=15-96). Schneider (J. pr. [2] 42, 558; 44, 23 [1891]) criticises Classen's results and maintains that Marignac's value (almost exactly 208) is as trustworthy as that obtained by C. The

molecule of Bi in dilute solution in tin is perhaps diatomic (?) (Heyrock a. Nevill , C. J. 57, 376 [1890]).

Preparation.—Classen (l.c.) says that pure Bi is best prepared by electrolysing a solution of the enetal in HNO, Aq, using a cone of Pt as the negative electrode, then washing with alcohol, and fusing with KCy.

Properties.—Melts at 264°, according to Classen (l.c.): at 269 22°, according to Callendar a. Griffiths (C. N. 63, 1 [1891]). S.G. 9.7474 (C., l.c.; no temperature given'; 9.787 at 0. 9.673 solid at the m.p., 10.004 liquid at the m.p. (Vicentini, Rend. Acad. Lincci, 6 [11], 121, 147 [1891]). For S.G. of liquid Bi from 235° to 280°

v. Cattaneo (Rend. Acad. Lincei, 79 [11], 88 [1892]). For electrical resistance v. E. v. Aubel (C. R. 108, 1102 [1889]). Reactions .- According to Veley (Pr. 48, 458

Reactions.—According to valoy (Pr. 48, 438 [1891]), Bi does not dissolve in 30 p.c. HNO,Aq at 30° if HNO₂ is absent; but Bi dissolves readily in 1 p.c. HNO,Aq.

Bismuth, bromide of (vol. i. p. 511). BiBr. boils at 453° (V. Meyer, A. 264, 122 [1891]). Cavazzi a. Tivoli (G. 21 [11], 306 [1892]) describe a lustrous, black, hygroscopic solid, PBrH(BiBr2)3,

nistrous, black, hygroscopic soind, 1 Brit(BiBr₂), obtained by silowing BiBr, to fall gradually into PH, (abstract in C. J. 62, 279).

Bismuth, chloride of (vol. i. p. 512), Boils at 485°-441° (uncor.) (V. Meyer, I.c.). The only decuble chloride of Bi and K of those hitherto described that exists is BiCl, 2KCl. 2aq, according to Brigham (Am. 14, 164 [1892]). B. has also prepared BiCl₃.KCl. aq. Bismuth, fluoride of (vol. i. p. 512).

Helmholt describes the double flue ride BiF. AmF

(Zeit. f. anorg. Chemic, 3, 115 [1893]).

Bismuth, iodide of (vol. i. p. 513). Astre
(C. R. 110, 525 [1890]) obtained the double iodide 2Bil, KI by keeping I, KCl, Bi, and water in contact for some weeks, and then crystallising from Et acetate. Bismuthous oxide (vol. i. p. 513). Classen (B. 23, 938 [1890]) gives S G. as 9 044. Read (C. J. 65, J13 [1894]) found Bi₂O₂ to be unchanged

at c. 1750°. of Bismuth, oxysulphide of (vol. i. p. 516). By bassing dry H.S into boiling benzene containing Bi₂O₃ ire suspension, P. v. Scherpenberg (C. C. 1889. [11] 643) obtained Bi₂O₃S. Bismuth, selenide of (vol, i. p. 5-6). The double compound Bi,So, K,Se is described by P.

v. S. (l.c.).

Bismuth, sulphide of (vol. i. p. 516). S.,(l.c.) obtained the double compound Bi,S,.K,C by fusing Bi,O, with K polysulphide.

by fusing Bi_oO, with K polysulphide.

BORON (vol. i, p. 524). The at. w. of B has been determined by Abrahall by the analysis of BBr₂ (C. J. 61, 650 [1892]); the value obtained was 10 67 (O = 15/96). Also by Ramsay a. Aston (C. J. 63, 207 [1893]), by funding the perceltiage of water in crystalises borgx, and by distilling fused borax with HClAqa, d.CH., OH and weighing the residual NaCl; the values varied about 11, but showed considerable differences.

901

Rimbach 4B. 26, 164 [193]), by titrating elutions of horax with standard HClAq, using methyl orange as indicator, obtained the salue of 10-91 (0=15-96). The following values for S.H. of amorphous B are given by Moñsan a. Gautigr (Co. R. 116, 924 [1893]): 0° to 100°=3066, 0° to 102°=3407, 0° to 234°=3573. For atomic refraction of B v. Ghira (G. 23 [1], 452; sostract in C. J. 64 [11], 517 (1893)).

Preparation.—According to Moissan (C. R. 114, 319 [1892]), the methods employed of gidentorphous boron yield substances containing from c. 45, to c. 72 p.c. of B. M. (l.c. p. 392) says that nearly pure amorphous B is obtained by heating to reduces a mixture of one pt. powdered Mg with 3 pts. fused B.O., washing with HClAq. KOIT in alcohol, HFAq, and water (the process is tedious, details are given); by fusing this product with 50 pts. B.O., and washing with HClAq &c., a brown powder is obtained containing c. 985 p.c. B, with traces of Mg and small quantities of other impurities.

Properties and Reactions.—The properties of anorphous boron are described by Moissan (C. R. 114, 617 [1892]). Brown powder; S.G. 2-45. Does not fuse in electric are, but volatilises (M., C. R. 117, 423 [1893]); increases in density when heated to c. 1500° in H. Specific electrical resistance = 801 megohms. Burns in air at c. 700°. Combines directly with Br, Cl, (not I), N at c. 12002, Se, S, (not Te); also with Al, Fc, Mg, Pt, and Ag. Reduces many oxyacids and oxides when heated therewith; HClO₃, HIO₃, and H.SO₄ are readily reduced; As,O₄ and AS,O₅, CO, N.O, P.O₅, SiO₂, steam, and SO₄ are also reduced; many metallic oxides are reduced to metals, often with explosive violence; molten KOH gives off H; metallic fluorides are generally decomposed, giving BF₄; many other metallic salts, both in solution and when heated as solids, are adduced by amorphous boron.

Boron, bromide of (vol. i. p. 525). Bly, boils at 90° (Freyer a. V. Meyer, Zeit. f. anorg. Chemie, 2, 1). Ghira (Z. P. C. 12, 768 [1893]) gives S.V. 94'72; and S.G. $\frac{\sigma}{e^2} = 2^{-64985}$. According to Besson (C. R. 112, 1001 [1891]), when a mixture of gascous HI and BBr, is passed through a glass tube at 300°-400° the products are BBr, I. BBr, and BBr, BBr, and BBr, are colourless liquids, distilling at c. 125° and 180°; they are rapidly decomposed by air and light. Tarible (C. R. 116, 1521, [1893]) says that BBr, combines with PBr, and PBr, as for form compounds easily decomposed by water, Cl., or NH, in the cold. Besson (C. R. 114, 542 [1892]) describes BBr, 4NH, obtained by massing dry NH, into BBr, in dry CCl. 50.

Boron, carbide of, B.C. Moissan (C. R. 18, 556 [1894]) says that B and C combines when amorphous B is mixed with c. i its weights.

Boron, carbide of, B.C. Moissan (C. R. 418, 556 [1894]) says that B and C combine when amorphous B is meted with c. i its with of sugar charcoal, and the mixture is heated in the electric furnace for some minutes using a current of 250-300 ampères and 70 volts. After treating the product with HNO,Aq, and then with KClO, and HNO,Aq, the carbide remains as a very hard, lugrous, black, crystalline powder; S. G. 2.512, burns very slowly in O at \$1.0000; sotted on by Gl below 10002 but not by Br, I, S. P. N. on miners acids; feacts with molten KOH. Tr. KNaCO, (abstract in C. J. 66 [11], 279 [1894]).

Boron, chloride of (vol. i. p. 525). BCl, boiling at 17° (Freyer a. V. Meyer, Zeit. f. anorg. Chemie, 2, 1). Ghira (Z. P. C. 12, 768 [1893]) gives S.G. 2° = 1.48386, and S.V. 81.94.

Boron shoride of (vol. i. p. 526). According to Besson (C. R. 110, 80 [1890]), BF, unites with PH, at c. -30° to four 2BF, PH, decomposed by water giving off H and PH.

Ammonium borofluoride is described by Stolbs. (C. Of 1896. [1] 211; abstract in C. J. 58, 560).

Boron, hydride of (vol. i. p. 526). Sabatier, (C. A. 112, 865 [1891]) says that the gas produced by adding HClAq to the brown powder forfied by heating B_iO₁ with Mg is H has a very disagreeable odour, barns with a green flame, gives a brown pp. with AgNO₂Aq, deposits B when passed through a glass tube, at a dull red hoat (H coming off), and is decomposed by electric sparks, giving pure H. The gas contains a little B hydride, according to S. (i.e.); of. Winkler (B. 23, 772 [1899]).

Boron, iedide of (vol. i. p. 527). BI, Prepared by Moissan (C. R. 112, 717 [1891]), (1) by heating I and B to 700°-800°; (2) by heating amorphous B (dried in I at 200°), in a stream of dry HI, in a tube of hard glass until the glass nearly softens; (3) by passing HI and BUL vapours through a porcelain tube heated to redness. The product is dissolved in OS, shaken with Hg, and allowed to crystallisee Colourless erystals, very hygroscopic, rapidly become coloured in light. Melts at 43° and bolls at 210°. Decomposed by water, giving HIAq and H,BO,Aq. (For other reactions v. abstract in C. J. 60, 979 [1891].) For compounds with NH, v. Besson (C. R. 114, 542 [1892]; abstract in C. J. 62, 771).

Boron, oxide of (vol. i. p. 527), B.O., For reduction by Mg powder, giving Mg borde, v. Winkler (B. 23, 772 [1890]). The compound B.O., P.O., (a BPO.) is obtained by evaporating H.BO., Aq mixed with H.PO., heating to redness, and washing with hot water (G. Meyer, Be 22, 2919 [1889]).

Borates (vol. i. p. 529). For some newborates of Li, Rb, and Cs v. Reischle (Zeit. f. anorg. Gleonic, 4, 166 [1893]). For remarks on the classification of alkali and aftaline earth borates v. Le Chatelier (C. R. 113, 1034 [1891]). Eyr a full account of Mn borate, v. Hartley et. 121 [1893]. The compounds GFeO.FeBr. 8B.O. and 6ZnO.ZnBr. 8B.O. are described by Rousseau a. Allaire (C. R. 116, 1445; abstract in C. J. 64 [141, 518 [1893]).

Boron, phosphide of. According to Besson (C. R. 113, 78 [18918), a phosphide of B is obtained by passing PH, into BBr, and heating the product, BBr, PH, to 300°, when it gives HBF and B phosphide. The phosphide is said to be a browspowder; insolubin in water, reacting with boiling cone. alkan solutions to give PH,; gives off B when heated to redness in N (för other reactions v. abstract in C. J. 60, 1418 [1891]).

• Boron, selenide of. (?B₂Se₂). • Obtained, as a yellowish grey powder, decomposed violently by water, giving H₂Se and some Se, by heating B to full redness in a current of H₂Se (Sabatier, C. H. 112, 1000 [1891]).

BORON. 902

Boron, sulphides of (vol. i. p. 531). For heat of formation of B2S, v. Sabatier (C. R. 112, 862; abstract in C. J. 60, 981 [1891]). Moissan (C. R. dostract in C. J. 00, 981 [1891]). Moissan (C. R. 115, 203 [1892]) gives details of various methods of preparing B₂S₃, and describes the reactions of this compound (v. abstract in C. J. 62, 1393 [1892]). According to M. (l.c. p. 271), boron pentassignitude, B₂S₃, is obtained by heating BI, with rather less than only equiv. of S in CS₂ solution at 60° for many hours. M. describes the compound, which was not obtained pure, as

a light white crystalline powder, S.G. 1.85.

BROMHYDRIC ACID (vol. i. p. 532). The
V.D. has been determined by Biltz at -15° and -28° (Z. P. C. 10, 354 [1892]); the results agree with the V.D. fequired by the formula HBr. The M. M.s of HBrAq from 15.47 to 65.59 p.c. HBr have been measured by Perkin

(C. J. 55, 706 [1889]).

Preparation .- 1. By the interaction of P. Br. and H.O, v. Fileti a. Crosa (G. 21, 64 [1891]; and 11.0, 7. 1664 a. 1053 (b. 21, 64 [137]),
 def. Gassman, abstract in C. J. 64 [11], 453 [1893]).
 By passing H.S into Br covered with water (Recoura, C. R. 110, 784 [1890]).
 By adding H.SO.Aq S.G. 141 to KBr (Feit a. Kubierschky, J. Ph. [5] 24, 159; abstract in C. J. 60, 1320 [1891]; v. also Addyman, C. J. 61, 97 [1892]; of. Léger, abstract in C. J. 64 [11], 114 [1893]).

Hydrates.—Pickgring (P. M. [5] 36, 11 [1894]) has isolated HB: 3H₂O and HBr.4H₂O; the former melting at -48° and the latter at -55.8°.

Reactions.—For the decomposition of HBrAq by H₂SO₂Aq of different concentrations v. Addyman (C. J. 61, 98 [1892]).

BROMINE (vol. i. p. 534). Mol. w. in solu-mion in water or acetic acid = 159.5 (Br.) (Paterno a. Nasini, B. 21, 215, [1888]). The V.D.s of Br from 15° to 280°, and at pressures from 15 to 760 mm., have been determined by Perman (Pr. 48, 45 [1891]); no indications of dissociation were obtained. For measurements of the absorption of light by Br v. Camichel (C. R. 117, 807; abstract in C. J. 64 [11], 561 [1893]).

Srocates (vol. i. p. 538). Lithium bromate LiBrO,; prepared by the interaction of Ea(BrO₃)₂Aq and Li₂SO₁Aq (Potilitzin, J. R. 22, 392; abstract in C. J. 62, 1275 [1892]). Potassium bromate KBrO₃. The decomposi-tion of this salt by heat has been studied by Cook (C. J. 65, 802 [1894]); decrepitation occurs ar c. 180°, with evolution of Br; the salt fusos at a higher temperature, and O is evolved, without any Br, until KBr remains; no oxy- compounds are formed.

Strontium bromati begins to decompose at c. Strottle orbital change is to SrBr. and O, but SrO is also formed (Potilitzin, J. R. 22, 454; ubstract, with summary of quantitative results, in O. J. 34 [11], 11 [1893]).

Leter inations of the at. w. have been made by Partridge (Am. S. [3] 40, 377 [1891]), and by Morse a. Jones (Am. 14, 261 [1892]). P. converted CdC₂O₂ into CdO by heating in H₂S, and CdC₂O₄ into CdS by heating in H₂S. M. a. J. converted Cd into Cd(NO₃), and this into CdO by heating. The results all lie about 112 (v. abstract in C. J. 60, 399; cf. Clarke, ibid. 390 [1891], and 62, 1397 [1892]). Lorimer a. Smith

(Zeit. f. anorg. Chemie 1, 364 [1892]) obtained values varying from 112 182 to 111 908 (O = 16). The molecule of Cd in dilute solution in tin may be diatomic (v. Heycock a. Neville, C. J. 57, 376 [1890]). Cd mets at 320 68°, according to Collendar a Griffiths (determined by Pt thermometer, C: N. 63, 1 [1891]). For the line spectrum of Cd v. Ames (P. M. [5] 30, 33 [1890]). According to Williams (Ame 14, 273, 1892), Cd wintelling in beautiful and the spectrum of Cd v. Ames (P. M. [5] 30, 33 [1890]). crystallises in hexagonal and polyhedral forms; arial catio a:c=1:1.6554. Cd is superficially oxidised at a dull-red heat by nitric oxide (Sabatier a. Senderens, C.R. 114, 1429 [1892]). Montemartini (G. 22 [1] 250; v. ubstract in C. J. 62, 1278 [1892]) has analysed the gases produced by the interaction of Cd and nitric acid; with excess of HNO, Aq (27.5 p.c.) at 80, N, NO, N2O and NH3 are produced.

Cadmium, alloys of (vol. i. p. 655). For an alloy with gold, C&Au, v. Heycock a. Neville (C. J. 61, 914 [1892]; cf. ibid. 65, 65 [1894]). For alloys with copper, gold, and silver, pre-pared by immersing Cd in solutions of salts of the other metals, v. Mylius a. Fromm (B. 27,

630 [1894]).

Gadmium, bromide of (vol. i. p. 655). the double compounds $CdBr_xxCsBr$, x = 1, 2, and3, v. Wells a. Walden (Zeit. f. anorg. Chemie, 5,

266 [1893]).

Cadmium, chloride of (vol. i.p. 655), Wasnik (Ar. Ph. 229, 569; abstrach in C. 3. 62, 566 [1892]) describes CdCl., 2NH, and CdCl., NH, For the double compounds CdCl, CsCl and CdCl₂·2CsCl, v. Wells a. Walden (lc.). Double compounds with HCl; NII,Cl, LiCl, and KCl, of the form CdCl. MCl. raq, are described by Classevant (A. Ch. [6] 30, 5; v. abstract in C. J. 66 [11], 18 [1894]).

Cadmium, fluoride of (vol. i. p. 655). CdF. is obtained by (1) the interaction of HF and Cd at a red heat; (2) the interaction of HF and fused CdCl, or CdO at a red heat; it is a colourless, transparent solid; S.G. 6.64; somewhat soluble water, insoluble alcohol of 95° (Poulenc, C. R. 116, 581 [1893]).

Cadmium, iodide of (vol. i. p. 656). For the double compounds CdL_xCsI, when x = 1, 2, and 3, v. Wells a. Walden (i.c.).

Cadmium, oxides of (vol. i. p. 656). CdO is unchanged at c. 1750° (Read, C. J. 65, 313 [1894]).

According to Kouriloff (J. R. 22, 171; Distract in C. J. 62, 1278 [1892]), the compound CdO, CdO, H, is obtained by heating CdO, H, with H.O.Aq. Morse a. Jones (Am. 12, 488: abstract in C.: J. 58, 1376 [1890]) obtained small orystals, which they say were cadmous oxide Cd.O. by gently hearing CdOH; the hydroxide war obtained by hearing CdCl. CdBr, or CdL. with excess of Cd, to the melting-point, in N, or coo, and treating with water, when Colling CdBt, or CdI, dissolved, a little CdO, H, separated, and CdOH remained as a white amorphous powder.

Cadmium, salts of (vol. i. p. 656). For the electrical conductivities of very clittle solutions of CdBr., CdCl., CdI., K,CdI., Cd(NO.), and CdSO. Wershoven (Z. P. C. 5, 481. [1890]). Cadmium, sulphide of (vol. i. \), 657). Two forms (and perhaps more) of CdS seem to exist,

one lemon yellow and the other red; they differ

CARBON. 903

low is said to change to the red by friction (v. Buehner, Chem. Zeit. 11, 1087, 1107; 15, 778; von Klobukoff, J. pr. [2] 39, 412; abstracts in C. J. 54, 224 [1888]; 56, 946 [4889]; 62, 778 [1892]). A solution of colloidal CdS was obtained by Prost (C. C. 1888, 32; abstract in tanicary Frost (Co. C. 1886, 52; abstrace in J. 54, 653 [1888]) by completely ppg, an ammoniacal solution of CdSO, by H.S. washing well, suspending the pp. in water and passing in H.S. A solution with 4 grms. CdS part little remained clear for many days; one with 11 grms. coagulated in 24 hours.

CÆSIUM (vol. i. p. 657). According to Beketoff (v. abstract in C. J. 62, 274 [1892]), Cs is obtained by heating CsOH with c. 1 its weight

Casium, haloid compounds of (vol. i. p. 658). A series of compounds of the form CsX_3 , where $X_3 = Br_3$, I_3 , or Br and I, Cl, Br and I, &c., is described by Wells a. Penfield (Am. S. [3] 43, 17; abstract in C. J. 62, 773 [1892]). Double compounds of Cs haloids with haloid compounds of Cd, Cu, Mg, Hg, Pb, and Zn are described by Wells (and others) (Am. S. [3] 41, 221; Zeit. f. anorg. Chemic, 3, 195; 5, 266, 273, 300, 304, 306; abstracts in C. J. 64 [11], 67, 322 [1893]; 66 [11], 45, 47 [1894]).

Cosing, hydroxide of (vol. i. p. 658).

S.G. 6 4-0178; [CsOII,A4] = 15,876; [CsOIIAq,HCiAq] = 13,790 (Beketoff, C. C. 1891.

[11] 451).

Cæsium, oxide of (vol. i. p. 658). According to Beketoff (J. R. 25, 433, abstract in C. J. 66 [11], 234 [1894]). Cs.O reacts with slightly moist H to give Cs and CsOH.

CALCIUM (vol. i. p. 663). The molecule in dilute solution in tin may be diatomic (v. Heycock a. Neville, C. J. 57, 376 [1890].

Calcium, carbide of. By heating 120 g. CaCO.

with 70 g. sugar charcoal in the electric furnace with a current of 350 ampères and 70 volts, Moissan (C. R. 118, 501 [1894]) obtained lustrous, yellow crystals of CaC,; S.G. 2.22 at 187; insoluble in most solvents; reacts with Cl, Br, and I at 250°-350°; burnt to CaCO, by O at a red heat; interacts violently with water giving off pure acetylene, and with steam giving CaCO, C, H, and C₂H₂ (destruct in C. J. 66 [1], 313 [1852]).

Calcium, oxide of (vol. is p. 666). CaO is unchanged at c. 1750° (Read, &. J. 65, 312 [1894]). According to Veley (C. J. 65, 821 [1893]); 66, 1 [1894]), dry CaO does not appreciably combine with dry CO, SO, or Clabelow 300°. Baker (C. J. 65, 611 [1894]) says that dry **S00°. Baker (C. J. 65, 611 [100*]) 60, nor with dry SO,, nor with dry NH,Cl. Moissan (C. R. 115, 1031 [1892]) obtained electric furnace.

Calcium, oxychloride of (vol. i. p. 666). Prepared by boiling CaO with conc. CaCl. Act; crystallises in thin, lustrous needles; decomposed by water, alcohol, &c.; dissolves in glycerin. Composition is probably 3CaO.CaCl., 15aq (Zahorsky, Zeit. f. 1002. Chemie, 3, 34 [1893]).

**Calcium, oxylodide of. By heating out with Cal. Act in a feeled tube at 150° for 6 shours, Tassilly (Bl. [3] 9, 629 [1893]) obtained needles of Cal., \$2aO.16aq. pared by boiling CaO with conc. CaCl2Aa; crys-

CARBON (vd. i. p. 684).
Diamond. Moissan (C. R. 116, 218; 118, 320; abstracts in C. J. 64 [11], 275; 66 [11], 189, [1893] and 1894)) obtained grey-black carbonato. by dissolving U in iron, heating to 2000; 3000; and rapidly cooling the exterior by water or by plunging into a bath of melted lead; the fiquid integer expands as it cools and produces a very high pressure. Diamond blackens, swells, and changes to graphite in the electric furnace (M., C. R. 117, 423 [1893]). For various reactions of diamond, v. Moissan (C. R. 116, 460; abstract in C. J. 64 [11], 319 [1893]).

Graphite. For accounts of graphites prepared in different ways, the compositions of the graphitic oxides obtained, and the H.F.s of these oxides, v. Berthelot a. Petit (C. R. 110, 101, 106; abstract in C. J. 83, 448 [1890]). For the action of cone. HNC on various graphites, v. Luzi (B. 24, 4085; 26, 1412 [1892 and 1893]).

Amorphous carbon. Mixter (Am. S. [3] 45, 363; abstract in C. J. 64 [11], 571 [1893]) doscribes the interactions of charcoal and N. S. O. and the halogens. According to Ernst (J. pr. [2148, 31; antend tin C. J. 64 [11], 461 [1893]). the composition of the products of combustion of coke (CO and CO,) depends almost wholly on the temperature; the maximum formation 36 CO₂ is at c. 700°, at 1,000° CO is the only product.

Allotropy of carbon. The following heats of combustion, and atomic volumes, are given by Petersen (Z. P. C. 8, 601 [1891]):

Amorphous . 96,530 to 96,980 6.7 to 8 Graphite . . . 93,360 5.R Diamond . . . 93,240 to 94,550 8.4

For the reactions of various forms of C with and H₂SO₄ v. Wiesner (M. 13, 871; abstract in C. J. 62, 1273 [1892]); and with HNO₂ and KClO₃ v. Schutzenberger (C. R. 111, 774; abstract in C. J. 60, 265 [1891]).

Carbon, tetrabromide of (vol. i. p. 688). Collie (C. J. 65, 262 [1891]) finds that very many compounds of carbon give CBr, when heated with NaOHAq and Br.

Carbon, bromochorides of (vol. i. p. 688). The three compounds CBrCl, CBr,Cl, and CBrCl, are formed by heating CHCl, and Br to 225° in a sealed tube (Besson, C. R. 114, 222

[8892].)
Carbon, tetrafluoride of, CF., Mol. w. 88-87. V.D. 44.6. Prepared by the direct union of O (purified lampblack) and F at the ordinary temperature; by the reaction of F with CCl, slightly heated, or with CHCl, at 100°, or with CH (Moissan C. Re 110, 296, 951; abstracts in C. J. 58, 557, 944 [1890]); also by heating Age with CCl, to 220° in a scaled tube (Chabrid, C. R. 110, 279 [1890]). M. recommends to pass vapum of CCl, over AgE 1195°-200°, to let the vapours pass through a serpentine tube kept at -23°, and to collect the gas over Hg; the gas is kept inacontact with fragments of caoutchouc (to remove CCl,), then shaken with absolute alcohol, in which it dissolves, and then V.D. 44 6. Prepared by the direct union of C solute alcohol, in which it dissolves, and then expelled by heat, collected and shaken with H₂SO_p (to remove alcohol vapour); metal vessels must be used. CF, is a colourless gas, liquefying at - \$5° and 760 mm. pressure, or at 20° under

washing the crystals with NaHSO:Aq, drying, and slowly subliming in vacio. CI, reacts

with Cl to form CCl, and chlorides of I; reduced to CHI, by H at 140° (for other reactions v.

Carbon monoxide (vol. i. p. 689). For some experiments on the sparking of CO, with the formation of brown solids, v. Berthelot (C. R. 110, 609) and Schutzenberger (C. R. 110, 500; abstracts in C. J. 58, 691 [1890]). Winkler (B. 24, 878 [1891]) finds that CO is reduced to C, at a full red heat, by Mg; carbides of Mg are probably formed (cf. W. B. 23, 2612 [1890]).

bably formed (cf. W., B. 23, 2642 [1890]).

Carbon dioxide (vol. i. p. 691). For S.H. of

CO. v. Kurnakoff (f. r. 22, 493; abstract in

C. J. 64 [11], 5 [1893]). CO., is reduced by
heating to redness with Mg, amorphous C, and
some CO being formed (Winkler, B. 23, 2642;
24, 873 [1890-91]). Dry CO. is said not to combine with dry NH, (Hughes a. Soddy, C. N. 69,

W. Carbon awahleride of (vol. i. z. 600). CCC.

Carbon, oxychloride of (vol. i. p. 692). COCl. becomes viscid, by tremains clear, at -75° (Haase, B. 26, 1052 [1893]).

Carbon disulphide (vol. i. p. 693). tractions observed when mixtures of CS, and air are exploded show that the reaction is more complicated than is shown by the equation CS₂+8O₃-CO₂+2SO₂; the volume of CO₂ cornd is, practically, in accordance with the equation, but the volume of SO₂ is smaller; some of the N of the air is oxidised (v. Podler, C. J. 57, 625 [1890]). By heating CS₂ with excess of aqua regia, Schlagdenhauffen a. Bloch (J. Ph. [5] 28, 241 [1893]) obtained SO(OCCl₃)Cl. Decomposition of CS₂ heated in dry N, begins at 216°, and explosion with O at a higher traperature (Baker, C. J. 65, 611 [1894]).

Tricarbon disulphide C.S. B. von Lengyel
[33. 26, 2860 [1893]] obtained this compound by

keeping the vapours of CS, in an electric arc between C poles for some hours, filtering off the black substance formed, allowing the red filtrate to stand over Cu for 6 to 8 days, and evaporating in a current of dry air. C,S, is a deep-y#1 liquid, S,G. 1:27399; the vapour, even in minute quantities, causes violent catarrh; can. be distilled, with partial change to a black solid, at 60°-70° and reduced pressure; insqluble water, but dissolved by EtOH, Et.O. CS., CHCl., or C.H. A cono. solution in CS. deposits a black solid; the same solid is formed by gently heating the liquid, if heating to 100°-120° is rapid the change is explosive. The black solid is probably, polymeride. A so-tion of O.S., in CS, reacts with Br to form C.S.Br., (For other reactions, v. abstract in O. J. C6 [11], 91

[1894].
Carbon, thiobromide of, C.S.Br., ; formed by
the action of Br on a solution of C.S. in CS. (v.

Carbon, thiochloride of (vol. i. p. 695). The polymeride of thio-carbonyl chloride has the molecular formula (CSCl₂), according to the

-a pressure of 4 atmos. Other fidorides seem to be formed along with CF₄; Chabrie (l.c.) says that AgF and C₂Cl₄ yield C₂F₄.

Carbon, tetra-iodide of (vol. i. p. 689). Moistan (C. R. 113, 19; abstract in C. J. 60, 1420 in compounds of Di and La, v. Schottländer (B. [1891]) prepares Cl₄ by heating CCl₄e(free from CHCl₄) with excess of Bl₄ to 90° in a scaled tube, with the excess of Bl₄ to 90° in a scaled tube, are the compounds of Cl₄ and La, v. Schottländer (B. [1894]).

Carlon Hard Carlon (C. R. 113, 145 (1894)).

Cerium, hydride of. According to Winkler (B. 24, 873 [1891]), a compound of Ce and H. p. obably CeH., is formed by reducing CeO. by Mg in Cresence of H.

Cerium dioxide (vol. i. p. 725). CeO, is unchanged at c. 1750° (Read, C. J. 65, 813

CHLORHYDRIC acid (vol. ii. p. 5). Biltz (Z. P. C. 10, 354 [1892]) finds that the V.D. at -77° agrees with the formula HCl. Perkin (C. J. 55, 703, 705 [1889] has determined M. M. of HClAq and HCl in iso amyl oxide; the values obtained for HCl in Eq are c. double those for HCl in iso-amyl oxide. For measurements of the E.C. of HCl in different solvents, A Kablukoff (Z. P. C. 4, 429 [1889]). For revised tables giving S.G. of HClAq, v. Lunge a. Marchlewski (Zeit. f. anorg. Chemie, 1891. 133).

For the relations between the number of molecules of HCl required to ppt, one mok of different chlorides, and the reduction of the freezing-points of solutions of the chlorides and of HCl, v. Engel (C. R. 117, 845; abstract in

of HCl, v. Engel (C. 48. 111, 820; accessed in C. J. 65, 40 [1894]).

Bailey a. Fowler (C. J. 53, 755 [1888]) find that when HCl stands over P₂O₂ the gas is absorbed, with production of POCl₂ and HPO₃; and that when HCl and O stand over Hg an oxychloride, probably Hg₂OCl₂H₂O₂, is formed.

Direct (C. J. 65, 611 [1891]) states that dry HCl deem not combine with dry NH, when the gases does not combine with dry NH, when the gases

CHLORINE (vol. ii. p. 10). For the S.G. of liquid chlorine from -80° to 77°, and the vapour pressures from -88° to 146°, v. Knietsch (A. 259, 100 [1890]). For the preparation of Cl (C. J. 61, 445 [1892]) finds that Cl obtained by heating PtCl, always contains some HCl and O, with water, and perhaps a trace of N. Clexpands when brought into sunlight. Richardson (P. M [5] 32, 277 [1891]) has constructed an instrument wherein the expansion is used to measure the intensity of light. Baker (C. J. 65, 611 [1894]) found that no explosion occurred when a mixture of equal vols. of dry Cl and dry H was exposed to bright sunlight; and that after exposure to bright sunshine for two days, and to diffused light for two days, more than a

quarter of the mixture remained unchanged.

Pedler (C. J. 57, 613 [1890]) has examined the interaction of Cl and water in tropical sun highit; he finds that there is very little action, unless there is an extremely large excess of water. on With very much water and little Ci, exposed to the full light of the sun in the hot season in India, the main reaction is 2H, O * 2Cl., + Aq = 4HC; Aq + O, ; † with diffused suplight HClAq and HClOAq art formed at first, and fightly "HClAq, HClO, Aq, and O. Harker (E. P. O. 9, 673 [1892]), from an extended investigatien of the explosion of mixtures of Cl. H, and O, concluded that when there is insufficient H to

domoine with an the Orang an the O, a division of the H between the Cl and O occurs; and that the product of the numbers of molecules of Hol and 0, divided by the product of the numbers of molecules of H₂O and O₁ is a constant, on in other words, that the law of Guldberg a. Waago holds good. According to Gautier a. Charpy (C. R. 113, 597 [1891]), there is no reaction between Mg or Zn and liquid Cl at the ordinary temperature, very little reaction with Fe or Ag, and rather more with Cu. **Chlorates (vol. i., p. 18). Spring a. Prost (Bl. [8] 1, 340 [1893]) have determined the quantities of Cl obtained by decomposing by heat chlorates of Al, Ba, Cu, Ph. Hg, K, Ag, Na, and Zn; the amount of Cl varied from 20 p.c. from MClO₂ to 14.45 p.c. from Zn(ClO₃). Calcium chlorate. Dry Ca(ClO₃). melts between 300°-350°, having previously given off

from 3 to 5 p.c. of its weight of O; the rate of evolution of O increases, at 330°, until c. 60 p.c. of the total O is given off, after which the rate decreases. For the quantities of O evolved, of Ca(ClO₃)₂ decomposed, and of CaCl. and Ca(ClO₄)₂ formed, v. abstract in C. J. 62, 1275 [1892].

*Potassium chlorate. McLeod (C. J. 55, 184)

*Recognition of the appearments that

when KClO, is heated with MnO, some KMnO,
is formed and again decomposed (c. Manganser Peroxide, vol. iii, p. 183), and that Cl is always given off in this reaction. In 1893 (B. 26, 1790) Brunck stated that Cl is not given off when KClo, and MnO, are heated together, but that ozone is produced. McLeod (C. J. 65, 202 1894)) has proved that Cl is produced in the reaction. Fowler a. Grant (C. J. 57, 272 [1896]) have studied the influence of various oxides on the decomposition of KClO, (references are given to older memoirs); they support McLcod's tiew of the reaction with MnO₂, and think that the exides of Fe, Co, Cu, and Ni react similarly to MnO₂; acidic exides, such as V₂O₃, U₃O₃, and WO3 cause evolution of O accompanied by much Cl, a vanadate, uranate, or tungstate being also formed; powdered glass or san l'also assists the reaction, but only when very finely divided (v. summary of conclusions, C. J. 57, 281-2). According to Thome a. Perry (C. J. 61, 925 [1892]), the main reaction which occurs when 1802), the main reaction which occurs when an intimate mixture of KClO, and iodine is heated is 2KClO, + 1.= 2KlO, + Cl., and some of the Cl reacts with unchanged I to form ICl and ICl. Basset (C. J. 71, 760a [1890]) examined the reactions between KClO, water, and iodine; he concluded that the main reaction, at 80°, in the presence of a very small quantity of HNO, M. Is as shown by the equation 612 + 10KClO, + 6H,O + Aq - KKH,O, Aq + 4KClAq + 6HClAq; in evaporating the solution to dryness. Cl was given off, and the results of several experiments led to the representation of the chance produced We vano-

the results of several experiments lead to the vaporesentation of the change produced by evaporation to dryness as 12KHLO, +8KOI+12HCI-11KHLO, +9KCI+6H-O, + ICI+ICI-HCI+4CI, For determinations of the quantities of oxidising gases (Cl and oxides of Cl) removed by apassing air through PCIO-Aq mixed with HCkAq, v. Pendlebury a. McKilloy (P. S. Proc. 1893-4. [No. 189 211]. Strontium chlorate. For experiments on the decomposition of this salt by heat, giving SrCl Sr(ClO4), and O, v. Potilitzin (J. R. 21, 451; ab-

by Rawson in 1889 (C.-J. 55, 213) by strongly heating (NH.) Cr.O., measuring the N given off, and weighing the Cr.O., that remained; also by reducing (NII.), Cr.O.Aq to CrCl.Aq by HClAq and Ricohol, ppg. by NH.Aq, and weighing Cr.O. produced; the mean value thus obtained was 5226, or 51.98 reduced to 0° and a vacuum

52200, or 51:38 reduced to 0° and a vacuum (O = 16:96). Menicke in 1851 (A. 261, 39); abstract in C. J. 60, 882 [1891]) re-determined the at. w. of Cf by estimating (1) Ag and Cr, and also O, in Ag,CrO, and in Ag,CrO,NH, (2) O in K,Cr,O,; (3) wand Cr in (NH,),Cr,O; the extremo values, from Chirty-six experiments, were 52:12 and 51.83; twenty-eight of the experiments gave values between 51 9 and 52. According to Prinz (C. R. 115, 392 [1893]), or crystallises in minute cubes with pyramidal faces. For the absorption spectra of salts of Cr, v. Lapraik (J. pr. [2] 47, 305 [1893]). Prenaration .- Glat 2el (B. 23, 3127 [1890])

says that almost perfectly pure Cr can be have tained by reducing CrCl, KCl by Mg powder (for details v. abstract in C. J. 60, 152 [1891]). Placet (C. R. 115, 945 [1892]) prepares Cr by electrolysing a solution of Cr alum, containing an alkali sulphate and H.SO. Moissan (C. R. 116, 349 (1893)) says that Cr can be obtained by reducing a mixture of Cr.O, and C in the electric furnace, using a current of 50 volts and 100 ampers, and then breaking up the product, which contains from 8.6 to 12.9 p.e. C, and heating it, furnace in a carbon crucible.

Chromic acid (vol. ii. p. 154). Miss. Field (C. J. 61, 405 [1892]) has found that only CrO. is obtained by working according to Moissan's directions for preparing H.CrO.. Determinations of the increase in the b.p. of water caused by solution of CrO_3 led to the conclusion that an aqueous solution of CrO, contains some H,CrO and probably also H2Cr2O7.

Chromic bromide CrBr, (vol. ii. p. 161). Recoura (C. R. 110, 1029, 1193) obtained green CrBr, 6H,O by boiling saturated CrO,Aq with a large excess of HBrAq and concentrating; deliof escent crystals, soluble alcohol, insoluble ether. Unchanged when kept solid but solution soon becomes blue and then violet, with rise of temperature. By boiling a green solution, then saturating with HBr while cold, filtering, and saturating with HBr while cold, filtering, and drying the pp. thus, formed on porous plates, crystals of the blac variety, CrBr, 6H,O, were obtained; very soluble water, insol. arcohol. Heat of splution of blue crystals = 28,700; and of green = 1,860. The blue solid a changed to the green at 100°. (For more decade v. abstract in C. J. 58, 1063-(1890)).

"Chromic chloride CrCl, (vol. ii. p. 161). Max chetti (G. 22° [11], 375 [1892]) finds that the molecular lowering of the freezing-point of water than that caused by the green form.

Chromic fluoride CrF, (vol. ii. p. 162) Tabris (G. 20, 582 [1890]) obtained CrF, 9H, Casa green crystalline pp., by adding excess c

as a green crystalline pp., by adding excess o

"NH FAq gradually to a cold solution of violet Cr2(SO4)3. Slightly sol. water; insoluble NH, FAq or alcohol; heating in air leaves Cr. Q., Poulenc (C. R. 116, 253 [1893]) obtained Cr.F. in green crystals by heating CfCl₃, Cr₂O₃, or CrF₃, xH₂O in HF.

Chromous fluoride. According to Poulenc (L.c.), CrF₂ is formed by kenting Cr to redness in HF, or by the interaction of CrCl₂ and HF at the ordinary temperature. CrF₂, after fusion, is described as a transparent, green, crystalline mass; S.G. 411; slightly sol. water, insol. alcohol. Heated in air it gives Cr.O₃. (For thore details v. abstract in C. J. 64 [11], 281 [1893].)

Chromic oxide Cr.Q. (vol. ii. p. 664). Moissan (C. R. 115, 1034 [1892]) found that Cr.Q. melted to a black mass, dotted with black crystals, in an electric furnace, using a current of 55 volts and

30 ampères.

Chromium trioxide CrO, (vol. ii. p. 164). For action of water v. Chromic acid, p. 905. Re-For action of water v. CHROMIC ACID, p. 905. Reduced to Cr₂O₃ by NO & the ordinary temperature (Senderons a. Sabatier, C. In 114, 1476 [1892]). For the reaction of Cr₀Aq with Q and BaO₄H₂Aq—said to give a pp. approximately BaCrO₃—v. Péchard, C. R. 113, 39 (abstract in G. J. 60, 1431 [1891]).

Chromium salts (vol. ii. p. 167). According to Recours (C. R. 112, 1439; abstract in C. J. (20, 1430 [1801]).

60, 1430, [1301]), the green solutions obtained by heating solutions of the normal violet chromic salts contain free acid and a soluble basic salt; in the case of the sulphate this soluble basic salt is said to be 2Cr2O, 5SO,. For preparation of green soluble normal sulphates v. Recoura, C. R. 115, 857 (abstract in C. J. 62, 411 [1882]).

**CHROM.AMMONIUM COMPOUNDS (vol. ii. p. 158). Petersen (P. P. C. 10, 580 [1892]) finds. by cryoscopic determinations, that the formulæ usually assigned to the chief salts of this class are probably molecular. For a discussion of the [2] 42, 206; 45, 274).

CHROMATES; and derivatives (vol. iit p.

Ammonium chromates. According to Jäger s. Krüss (B. 22, 2028 [1889]), normal ammonium chromate has not hitherto been obtained pure; they prepare the pure salt by adding excess of NH,Aq S.G. 9 to Cro,Aq free from H.So,Aq, warming until the solid that separates dissolves, and placing in a freezing mixture. (NH₁)_cCeO₄ crystallists in long, monosymmetric, golden needles, a:b:c=1.9603:1:2.4452; S.G. 1.886 at

Ammonium trichromate (NH₁)₂Cr₃O₁₀ is prepared by J. a. K. (l.c.) by dissolving (NH₄)₂Cr₂O₇ in hot conc. CrO, Aq, concentrating, and drying at 100° the fed crystals that separate on cooling; S.G. 2:342 at 18°; explodes at 190°, giving off NO₂, and leaving Cr₂O₂.

Ammonium Letrachromate (RH₂) r₁O₁, is

Ammonium iterrachromate (NH₄)²Ur₄O₁₃ is formed by discolving the trichromate in warm HNO₂Aq S.G. 1.09, at detting cool slowly; S.G. 2.343 at 10°; 'melts at 170°, and suddenly decomposes at 175°, giving off NO and leaving Or₄O₂. J. c.k' K. (l.c.) failed to obtain heatschromate; they say that no nitro-chromates are obtained by treating ammonium characters. obtained by treating ammonium chromates with HNO.Aq. (For more details v. abstract in C. J. H.O (C. J. 41, 113), and also compounds of Or.O., 56, 1117 [1889].) Various double compounds of SO,, K.O and H.O. Recoura (C. R. 114, 477

(NII), Cr.O, with HgC are described by J. a. K.

Ceric dichromate CeO, 2CrO, 2H, O. pared by passing a current of 2.5 to 3 volts through a slightly acid solution formed by dis-solving Ce₂(CO₂), in CrO₂Aq; insoluble water; boiling water forms yellow Ce(CrO₂), and then CeO..xH.O (Bricout, C. R. 118, 145 [1894]). Lead chromates. For double compounds of

Bachard a. Lepierre, C. R. 110, 1035 (abstract in C. J. 58, 1065 [1890]).

Mercury chromates. For basic mercuric.

chromates and a double compound of HgCro, with NH HgCl v. Jüger a. Krüss, B. 22, 2028

(abstract in C. J. 56, 1120 [1889]).

Potassium chromates. Jägen a. Krüss (l.c.) prepare potassium trichromate K2Cr3O10 by treating K,Cr,O, with HNO,Aq S.G. 1.19, pouring off from KNO, that separates, and crystallising; S.G. 2648 at 11°. K.Cr.O., is quickly decomposed by water to Cro, Aq and K.Cr.O., Aq; melts at 250°. Potassium tetrachromate K.Cr.O., is prepared by J. a. K. (*l.c.*) by dissolving K.Cr.o, in hot cone. HNO, Aq S.G. 1:41; s.G. 2:649 at 11°; not deliquescent; decomposed by water; crystallises unchanged from HNO, Aq S.G. 1º41. Schmidt (B. 25, 2917 [1893]) says that no nitro-chromate is obtained by the action of HNO Aq on K.Cr.O.; the substances obtained by Darm. städter (v. vol. ii. p. 158) were mixtures of KNO, and K₂Cr₃O₁₃.
Silver chromates.

Pure silver chromate Ag₂CrO₁ is prepared by J. a. K. (l.c.) by repeatedly boiling Ag₂Cr₂O₇ with water as long as anything dissolves; it is a neep-green solid,

incol. water.

Sodium perchromate. Häussermann (J. pr. [2] 48,70; abstract in C. J. 64 [11], 471) describes a salt Na₆Cr₂O₁₅. 2Saq, prepared by adding Na₈O₂ to a thin paste of CrO₃H₃ and water, kept at 10^{2}

Thallium chromates. For preparation of Tl. CrO, and the double compound Tl. CrO, K. CrO, v. Lachaud a. Lepierre, Bl. [3] 6, 232 (abstract in C. J. 62, 567 [1892]).

For double uranul Uranium chromates. chromates, v. Formanek, A. 257, 102 (abstract in

C. J. 58, 852 [1890]

1010/PHROMATES (rol. ii. p. 157). A series of salts of the forms, IO_O.CrO_COM' and (IB_O.CrO_CO), Mu has been obtained by Berg C. R. 101, '1514 [1887]; 111, 42 [1890]); Mi -NH, Li, & Ag, and Na; Mi'=Co, Cu, Mg, and Ni. Most of the alkali salts were formed by dissolving the alkali iodate in excess of CrO_AQ and crystallising; the other salts were usually retrieved by disselving the discovered or corphometer. prepared by disselving the oxide or carbonate of the metal in excess of CrO₃Aq and adding H[O₂Aq. (For details v. abstracts in C. J. 59, 770 [1887]; 58, 1378 [4890].)

PHOSPHOCHROMATES. By adding conc. H, PO, A4 + CrQ, Aq to K, CO, Aq, Blondel (C. R. 118, 194; abstract in C. J. 66 [11], 193 [1894])

obtained compounds of the form mK_0.P_20,nCrO, raq, m being 0 and 3, n 4 and 8, and x being 0 or 1.

SECTHOCHEOMATES. In 1885 Cross a. Higgirf described a compound of or 0, SO, and

[1892]; 116, 1367; 117, 37, 101 [1893]) has explodes (S. a. ..., cl. [3], w, one (1993]). Monte-made a more complete examination of these and martini (G. 22 [1], 250) finds that the gases proallied compounds. By evaporating, at 100°, solutions containing violet Cr₂(SO₄), and H.SO₄, and H.SO₄ in the molecular ratio 1:1, 1:2, and 1:3, 1, obtained chromosulphuric acid H_cCr_c(SO_c), chromodisulphuric acid H_cCr_c(SO_c), and chromodisulphuric acid H_cCr_c(SO_c), and chromodisulphuric acid H_cCr_c(SO_c), and 1:30 chromodisulphuric acid H_cCr_c(SO_c). chrometisulphuric acid H_cCr_z(SO_z)_z, and chromo-trisulphuric acid H_cCr_z(SO_z)_z; by using various sulphates in place of H_cSO_z he obtained chromo-sulphates, chromodisulphates, and chromotr-sulphates. The acids are green powders casil sol, water; they gradually decompose in solu-tion; dilute BaCl_zAq ppts. Ba chromosulphates, but cone RaCl_zAq ppts. Ba Chromosulphates, but cone. BaCl,Aq gives BaSO. R. obtained chromopyrosulphurio acid Cr. (OH. (S.O.H.), by evaporating a solution of Cr (SO₄)3 and H₂SO₄, in the molecular ratio 1:5, at 100°, and heating the dark-green syrupy liquid so obtained to 140'-115° for some days. The acid forms brittle, transparent, pale-green lambur. Salts of the form Cr2(S2O,)2(OM), are obtained by adding alkalis to the acid in solution; these salts B. calls pyrosulphochromites. By adding cone. Calls pyrosuppocuromites. By adding cone. HCIAq or H.SO, to a solution of chromoprosupportion abid, R. obtained a compound Cr₂(OH)₂(S₂O₂)₂, pyrosulphochromic hydroride, isomeric with chromosulphuric acid Cr₂SO₂(H₂). (For more details v. abstracts in C. J. 62, 783

[1892]; 64 [11], 470,528 [1893])

COBALTA (vol. ii. p. 217). Winkler has redetermined at w. of Co, (1) by dissolving electrolytically deposited Co in RCLA, evaporating to dryness, and determining Cl in the CoCl, obtained (Zcit. f. anorg. Chemie, 4, 10 [1893]);
(2) by finding the quantity of Ag deposited from solution of Ag₂SO₁ by electrolytically deposited Co (*l.c.* p. 462). The values obtained were all about 59.6 (Ag = 107.66).

Alleged decomposition of cobalt. Krüss a. Schmidt (B. 22, 11, 2026 [1889]) supposed they had separated Ni into two constituent, (r. vol. iii, p. 500); and they thought that Co also was probably not a homogeneous substance. Reminler, in 1893, obtained a number of specimens of • Co₂O₃, by ppg. CoCl.Aq Ly KOHAq and Br water, treating the pp. with NH Aq, which gradually dissolves it, decanting off the agmoniacal solutions of the agmoniacal solutions. tion at intervals during 9 months, evaporating each and heating i. CO₂; the different specimens of Co₂O₃ were heated in II, and the quantity of Co obtained in each case was determined. The values thus obtained for the at. u of Go varied from 59:53 to 58:3. R. concluded that Co purified by the ordinary methods is not a flouro-geneous substance. Winkler's determinations of the at. w. (v. supra), however, gave very constant values.

Reactions.—Heated in 20 to 150°, CoO is formed (Sabaticr a. Senderens, C. R. 114, 1429 formed (Sabatier a. Senderens, U. R. 114, 142) [1892]); finely divided Co burns in No, at the grdinary temperature, giwing Co.O.; but if the NO, is largely diluted with N, a black compound is formed, Co.NO, called by S. a. S. (Co.R. 115, 236 [1892]) nitro-cobalt. This compound reacts rapidly with H,O, giving off NO, and forming a solution contairing Co(NO), with a very little Co(NO), Co rem lining insoluble, and sometimes also a basis nigrite; when heated is No great solution covers and then sand decompassition. duced by the interaction of Co and excess of HNO, Ao (27.5 p.c.) are NH, N,O, and N (excession C. J. 62, 1278 [1892]).

AND AGE (212 D.c.) are KIII, M.O., and A washer act in C. J. 62, 1278 [1892]).

Cobalt chloride of (vol. ii. p. 219). For the solubility of CoCl, in water, and the changes of colour produced by disting the solution, with a discussion of the hydrations and dehydrations that accompany these changes, v. Etard, C. R. 113, C. G. (costract in C. J. 62, 278 [1892]);

Engel, Bl. [3] & 239 (abstract in C. J. 62, 569 [1892]); and Polilitzin, Bl. [3] 6, 264 (abstract in C. J. Le. p. 571). The double compounds CoCl., HCl. 3aq. CoCl., LiCl. Saq. and CoCl., NH, Cl. 66aq are described by Chassevant (A. Ch. [6] 30, 5 [1893]).

Cobalt, flugrice of (vol. ii. p. 220). Poulenc (C. R. 114, 1426; v. abstract in C. J. 62, 1159 [1892) prepares CoF, by heating CoCl, with excess of NH, F for 15 minutes, and repeatedly washing the double thouside CoF, 2NH, F thus

washing the double fluctide CoF, 2NH, F thus obtained with boiling alcohol. By heating CoF, to 1200 1300 in IIF, the salt is obtained in singl, rose red prisms; S.G. 4.13. The double compound CoF_2KF is 5 med by heating CoCl, with KHF₂ (P., Le. p. 74); abstract, Le. p. 781). Cobalt, iodide of (vol. ii. p. 220). For some bility in water of CoI, and the formation of various hydrates attending polution, v. Etard, C. R. 113, 699 (abstract in C. J. 62, 278 [1892]).

Cobaltous oxide CoO (vol. ii. p. 220). oxide melts in the electric furnace, and forms rose-coloured crystals (Moissan, C. R. 115, 1034

[1892]).

Cobaltous hydroxide CoO.H. (vol. ii., p. 220).

A. de Schulten (C. R. 109, 266 [1889]) obtained as this compound in microstopic, brownish-red, four-stiled prisms, S.G. 3-597 at 15°, by heating 10 g. CoCl, 6aq in 60 c.c. water with 250 g. KOH, in a flask filled with coal-gas, letting stand for 24 hours, and washing away the lighter amorphous products of the reaction.

ous products of the reaction. • Cobalto-cobaltic oxides (vol. ii. p. 221). Regarding Co,O, and oxides intermediate between this and Co2O2, v. Schröder, C. C. 1890. [1] 931 (abstract in C. J. 58, 1213 [1890]). Co.O. heatel to c. 1750° loses all its O, and leaves Co (Read,

C. J. 65, \$13 [1891]).
Cobalt, dioxide of. By the reaction of IAq and NaOHAq on CoSO, Aq, filtering, and acidifying with acetic acid, Vortmann (B. 24, 2744) abstract in C. J. 60, 1429 [1891]) obtained a greenish-black pp. nearly agreeing with the formula CoO... For compounds of CoO, with Bab v. Rousseau, C. R. 10t, 61 (abstract in C. J. 56, 1115 [1889]).

1115 [1889]).

Cobalt, salss of (vol. ii. p. 221). Marshall
(C. J. 59, 760 [1891]) has prepared the salts
Co.(20], 18aq and Co.(Co), 3(NH₁), Co, 6aq
by electrolysimps solution of CoSO, in H.SO, Aq,
and of CoSO, (a) containing (NH₂), 20, 4.

COBALTAMMINES (vol. ii. p. 222). By
cryoscopic determinations, Petersen (Z. P. C.
10, 580 [1892]) concludes that the formula generally given to the chief cobaltarumines are mole-

rally given to the chief cobartammines are molesolution containing $Co(NO_2)_p$ with a very new countries of the constitution of $Co(NO_2)_p$. Co remaining insoluble, and sometimes also a basis mitrite; when heated in Ni estimates of N are given off and then aspid decomposition of N are given off and then aspid decomposition occurs with formation of 60 and oxides of Coq shen mixed with combustible substance Co_2NO_2 berg (B. 22, 2649), and V. a. Magdeburg (B. 22, 2649), and V. a. Magdeburg (B. 22, 2649), and V. a. 2680; absträcts in C. J. 58, 14 [1890]). V. a. Morgulis (B. 22, 2644; abstract in C. J. 58, 13 [1890]), describe several mercuricobaltammines. Anumber of croceo-, luteo-, and xantho- salts and salts, are described by Jörgensen in Zeit. f. anorg, Ghemie, 5, 147 (abstract in C. J. 65 [11], 50 [1894]). also several flavo- salts isomeric with the croceo-

COPPER (vol. ii. p. 251). An elaborate investigation of the at. w. of Cu has been made by Richards, P. Am. A. 26, 240 [1891] (v. C. N. by McMarkey, $A.M. A. 20, 240 [1631] (8.00.14), 65, 236, &c.; abstract in G. J. 64 [11], 12 [1893]). CuSO, <math>5H_2O$ was analysed and synthesised, and CuO was analysed; the final value obtained by B. is 63.604 (Q=15.96). The molecule of Cu i. dilute solu-(U = 10 '90). The inolectic of the fitted solution in tin is probably monatomic (Heycock a. Neville, C. J. 57, 376 [1890]). For the absorption spectra of solutions of OuCl₂, CuSO, and Cu(NO₁), v. Evan, P. M. [5] 33, 317 (abstract in C* J. 64 [11], 149 [1893]).

Preparation. - For the preparation by electrolysis of pure copper v. Richards (P. Am. A. 25,

199, 206 [1890]).

Reactions .- Heated in the electric furnace, using a current of 70 velts and 350 ampères, Cu rapidly volatilises, and the vapour forms CuO in the air (Moissan, C. R. 116, 1429 [1833]). According to Neumann (M. 13, 40 [1893]), the H occluded in Cu, prepared by reducing CuO by . H, cannot be wholly expelled by heating in a stream of CO,; some of the CO, is also absorbed by the Cu. N. also says that Cu reduced by vapour of MeOH or EtOH, or by coal gas, retains very small traces of C and II after being heated to 220°. Montemartini (G. 22, 484, heated to 220%. Montemartin (c. 22, 2004, 2007, with a little N₂O₂, and with 70 p.c. acid only NO₃ is given' off; no appreciable quantity of NH₃ is produced with acid from 3 to 27.5° p.c. HNO₃. According to Freer a. Higley (Am. 15, 71 [1893]), the only gaseous products of the reaction of Cu with excess of HNO₄Aq S.C. 1.4 (c. 65 p.c. HNO₃) are NO₂ and N₂O₃, c. 90 p.c. NO₃ and 19 p.c. N₂O₄. Cu is superficially oxidised in NO at a dull red heat (Sabatier a. Senderens, C. R. 114, 1429 [1892]). Reduced Cu absorbs NO, at the ordinary temperature, forming a brownish powder Cu, NO, (S. a. S., C. R. 115, 236 [1892]). For the reactions of this nitrocopper v. S. a. S., C. R. 116, 756 (abstract in C. J. 64 [11], 874 [1893]).

Copper, alloys of (vol. i. p. 253). For a description of alloys of Cu with Oc, Sn, and Zn, prepared by immersing plates of Cd, Sn, or Zp, in solutions of salts of Cu, v. Mylips a. Fromm, B. 27, 630 (abstract in O J. 66 [11], 235 18941). li a

Cupric browlde (vol. ii. p. 254). According to Sabatier (C. R. 118, 980 [1894]), the green erystals that separate from CuBrAq are CuBr, 4sq. A solution of CuBr, in conc. HBrAq hee an intense purple colour which becomes less marked on dilution, but even with ·0015 mgm. Cu in solution the colour can be detected (S., l.c.) The double salts CuBr. CsBr and CuBr. 2CsBr are described by Wells a. Walden

(Zgit. f. anorg. Chem**p**, 5, 304; abstract in U. J. 66 [11], 47 [1894]).

Qupric chloride (vol. ii. p. 255). Tzuchanoff (J. R. 25, 151; abstract in C. J. 66 [11], 47 [1894]) ands that the E.O. of dilute blue-coloured CuOl, and increases with increase of concentration to a maximum, after which if decreases while the colour changes to yellowish-brown. For heats of polution and dilution of CuCl., 2aq, v. Reicher ..

Jointon and dilution of Cubl., 2aq, v. Reicher Leventer (Z. P. C. 5, 559 [1890]).

**Diable salts.—CuCl., HCl. 3aq,
CuCl., LiCl. 2aq, CuCl., HCl. 2aq, CuCl., ECl, and CuCl., 2Cl. 2aq, (Chassevant, 4. Ch. [6] 30, 5 [1893]); CuCl., CsCl,
CuCl., ECl. 2aq (x = 0 and 2), and 2CuCl., 3CsCl
CuCl., 2CsCl (xaq (x = 0 and 2), and 2CuCl., 3CsCl
CuCl., 2CsCl (xaq (x = 0 and 2), and 2CuCl., 3CsCl
CuCl., 2CsCl (xaq (x = 0 and 2), and 2CuCl., 3CsCl (Wells a. Dupree, Zeit. f. anorg. Chemie, 5, 300

(18931). Cuprous chloride (vol. ii. p. 255).

(L.c., p. 306) describes the double saits
2CuCl.CsCl, 2CuCl.3CsCl, and CuCl.3CsCl. aq.
Cupric fluoride (vol. ii. p. 256). Poulenc
(C. R. 116, 1446; abstract in C. 7. 64 [11],
525 [1893]) prepares CuF₂, as a white amorphous
powder, by heating NH₄F with CuF₂. 2aq; by
heating in HF at 500° (not above) the CuF₂ becomes exvisalling. Cyptalling CuF₃ is also ob. comes crystalline. Crystalline CuF, is also obtained by heating CuO, or CuF₂. 2aq, in "HF at 400° (P., l.c.). Heated to 300° in air CuO is formed; heating in steam gives CuO and HF; H₂S forms CuS and HF; HCl forms CuCl₂. CuF₂. absorbs water from the air, and becomes blue. H. von Helmholt (Zeit. f. anorg. Chemie, 3, 115 [1892]) describes the double salts CuF. KF,

CuF, RbF, CuF, AmF. x: aq, and CuF, 2AmF. 2aq.
Cuprous fluoride (vol. ii. p. 256). According to Mauro (Real. Acad. Lincei, 1892 [1], 194; asstract in C. J. 64 [11], 124 [1893]), Cu,F, does not exist, and the substance obtained by Berzelius was almost certainly merely impure copper. Poulenc, however (C. R. 116, 1446; abstract, in C, J. 64 [11], 525 [1893]), says that Cu_xF₂ is formed by heating Cu_xCl_x to dull reduces in HF (the action is not complete until 1100°-1200°); also by heating CuF₂ in HF at c. 600°, raising the temperature to 1100°-1200° towards the end of the reaction. P. describes Cu.F. that has been fused as a ruby-red, transparent solid, with a crystavline fracture; exposed to moist air it changes to CuF₂. xaq; it is easily reduced by H at a red heat.

Cuprous iodide (vol ii. p. 256). Brun

Cuprous iodide (vol. ii. p. 256). Brun (A. R. 114, 667; abstract in C. J. 62, 1157 (1893)) describes double compounds with (NH,)520, and NH,I, and also with (NH,)820, and Cu,820; Cuprous exide (vol. ii. p. 258). Russell (C. N. 68; 308 (1893)) prepares Cu,0 by completely reducing Ch2O,Aq mixed with excess of NaCl by SO, heating till excess of SO, is removed, and then ppg. by Na,CO, added solid 42 file (not solution. With HFAq, CuFA4 and Cu are formed (Poulenc, C. R. 116, 1446 (1893)). Cuproc. exide (vol. ii. p. 258). Moissan (C. R. 115, 1034 [1892]) says that CuO is entirely decomposed in the electric furnace at c. 2500°, yielding Cu and a cryst/lline compound of CuO and CaO (the reaction was effected in a block of CaO). By heating CuO to whiteness, in a 14etcher injector-furnace, iff an oxidising amosphere, Bailey & Hopkins (C. J. 57, 269) almosphere, Bailey at Hopkins (C. J_v.57, 269 [1890]) obtained a very hard, yellowish-red

GOLD. 000

solid agreeing with the formula Cu.O. Richards (P. Am. A. 26, 281 [1891]) found that CuO decludes gas, chiefly N ; when prepared by heating Cu(NO_s), the oxide retained c. 08 p.c. of its weight of N, which could not be removed by heating. For experiments on the deliveration of

heating For experiments on the defidration of CuO.xin 0 v. Spring a. Lucion (Zeit. f. amorg. Chemic. 2, 195; abstract in C. J. 64 [11], 210 [193]). For colloidal, jelly-like CuO.xH 0 v. J. van Bemmelen (Zeit. f. amorg. Chemia, 5, 466; abstract in C. J. 66 [11], 191 [1894]). Copper, oxybromides of (vol. ii. p. 260). Dupont a. Jansen (Bl. [3] 9, 193; abstract in C. J. 64 [11], 463 [1893]) obtained the salt 3CuO.CuBr. 3aq by heating Cu.Br. As with CuO in a sealed tube at 200°, or, better, by heating neutral dilute Cu.Br. Aq at 225°; the compound crystallised in green rhembohodral plates, S.G. crystallised in green rhembohedral plates, S.G. 4.39.

Copper, oxychlorides of (vol. ii. p. 260), v. Rousseau, C. R. 110, 1261 (abstract in C. J. 58, 1058 [1896]).

Copper, exysulphides of (vol. ii. p. 260), v. Cliche, Ar. Ph. 228, 374 (abstract in C. J. 58, 1211 [1890]).

Copper, phosphides of (vol. ii. p. 260). For descriptions of Cu₂P₂ and Cu₂P, prepared by heating Cu in vapour of P, v. Granger, C. R. 113, 1401; and for Cu₂P₂, prepared by heating red P with excess of Cu-phosphite and water, v. G., C. R. 117, 292 (abstracts in C. J. 62, 410 [1892]; and 64 [11], 526 [1893]).

Cupric sulphide. From experiments on the

interaction of H₂S and CuSO₄Aq, and CuSO₄Aq in presence of acetic acid, Linder a. Pictod (C. J. 61, 120 [1892]) conclude that a compound TOUS.II.S is formed, and that then such configurates as 9CUS.H.S and 22CUS.H.S are produced, and finally (CUS), is formed.

COPPER.AMMONIUM COMPOUNDS (vol. ii. p. 262). Several derivatives of curriammonium

bromide are described by Richards a. Shaw (P. Am. A. 28, 247 [1893]).

FERRICYANIDES. Barium ferricyanide (vol. ii. p. 337); v. Ranmelsberg, J. pr. [2] 39, 455 [abstract in C. J. 56, 950 [1889]).

Lead ferricyanide (vol. ii. p. 339); v. Ram-

melsberg (l.c.).

Potassium ferridyanide (vol. ii. p. 339); v. Kassner, Chem. Zeit. 13, 1701 (abstract in C. J. 58, 352 [1890]).

DIDYMIUA (vol. ii. p. 382). For an investigation into the separation of Di and Er. v. Krüss, A. 265, 1 (abstract in C. J. 68, 1424 [1891]). For the emission spectra of oxides of neodymium and praseodyn up, v, Haitinger, M. 12, 362 (abstract in C. J. 62, 2 [1892]). Read (C. J. 65, 313 [1894]) says that Di.O. is unchanged at c. 1750°.

ERBIUM (vol. ii. p. 456). For the separation of compounds of Er and Di. v. Krüss, A. 2657 I (abstract in C. J. 60, 1424 [1891]).

FERRITES ool, ii. p. 547). J. van Bernmelen a. Hobb's (J. pr. [2] 46, 497 (18.78) say that Fe₂O₂K₂C and Fe₂O₂No₂O are obtained, in crystals by continued heating Fe.O. with conc. KOHAq and NaOHAq respectively; these ferrites are decomposed by sater, giving Fe,O,H,O.

FLAME (vol. ii. p. 549). Reference should

be made to Smithells a. Ingle on 'The Structure and Chemistry of Flames' in C. J. 61, 204

and Chemistry of Flames in C. J. 61, 204 [1892], and to Lewes on 'The Luminosity of Coal-gas Flames' in ibid, p. 322. FLUORHYDRIC AUD (vol. ii. p. 558). Berthelot a Moissan (C. R. 109, 209 [1889]) give the thermal data [H.F] = 37,600; [H.F.Aq] = 49,400. For the description of an apparatus for purifying HFAq. v. Hemilton (C. N. 60, 252 [1889]).

FLUORINE (vol. ii. p. 560). Moissan (C. R. 111, 770 [1890]) determined the at. w. (L) by converting Na₂CQ, into NaU, and shis into NaSO. verting Na₂Ck, into Nat', and shis into Na₂Ck, (2) by converting CaF, into CaSO, and (3) by converting Bak, into BaSO,; the mean of the results regarded by M. as the most trustworthy was 19.05. V.D. at the ordinary temperature, 18.3 (Moissan, C. R. 109, 861; v. abstract in C. J. 58, 208 [1890]). A column of F one metre long shows no definite absorption bands (M. Lc. 19. 937) • for the emission spectrum v. M. (i.e., abstract in C. J. 58, 329 [1890]). F does not liquely at -95° at the ordinary pressure (M. A. Ch. [6] 25, 125 [1893]). Gladstone (P. M. [5] 31, 1 [1891]) has determined the atomic 1870 fraction of F in C.H.F to be as follows for the different lines of the solar sportrum, at 22.8°;—
A C D A A H
at refraction 63 63 53 48 44 35

The values are much smaller than those for Cl, Br, or I, which are 10.0, 15.23, and 25.2 for the line A.

Kormation. - According to Brauner. (C. J. 65, 393 [1894]), F is given off when 3KF.PbF., HF ... LEAD TETRAFLUORIDE, p. (45) is heated to dull redness.

Reactions.—F combines with the more porous forms of carbon at the ordinary temperature, with incandescence, forming CF4; the denser forms of C combine with incandescence at from 50° to 100° (Moissan, C. R. 110, 276; abstract in C. J. 58, 557 [1890]). For a discussion of the chemical relations of F, v. Moissan, Bl. [3] 5, 880 [1891].

GALLJUM (vol. ii. p. 597). Lecoon de Boisbaudran (C. R. 114, 815; abstract in C. J. 62, 930 [1892]) gives measurements of the chief links in the spark emission spectrum of Ga; the spectrum varies much according to the condi-

GERMANIUM (vol. ii. p. 610). A new mineral from Bolivia, antipolate, Ag. GeS., identical in composition with argyrodite from Freiberg, but crystallying in isometric forms (the form of argyrodic is monoclinic), is described by Kenfield in Am. S. [3] 46, 107 (abstract in C. J. 66 [11], 12 [1894]).

9. GOLL (vol. i. 9. 647). Majlet (Pr. 46, 71; abstract in C. J. 68, 708 [1890]), has re-deter-

mined the al. w. of gold by various methods; the mean value obtained is 1969, but the value 196.88 M. thinks is more trustworthy. The molecule of gold in dilute solution in tinis probably monatomic (Heycock a. Neville, C. J. 57, 878. [1890]). Gold volatilises considerably in the electric furnace with a current of 70 volts and 360 ampères (Moissan, C. R. 116, 1429 [1893]).

910 GOLD.

Concerning the volatilisation of gold v. Rose (C. J. 63, 714 [1893]). Neumann (M. 18, 40 [1892]) says that gold absorbs from 33 to 46.5 [1892] says that gold absorbs from 35 to 350 whene its volume of O at c. 450°. According to Petersen (Z. P. C. 8, 601 [1892]), the heats of formation of Au.O., 3H, O from gold A(1) reduced from AuGl., (2) from AuBlr., and (3) from AuBr, differ very markely. From the results AuBr, differ very markelly. From the results of many experiments on the reaction between gold and KCNAq, Maclaurin (6. J. 63, 721 [1893]) concludes that O must be present to accomplish solution, and that the equation $4Au + 8KONAq + O_q + 2HLO = 4(AuCN.KCN)Aq + 4KOHAq (Elsner, J. pr. 37, 323 [1846]) expresses the proponion between K and Au in the solution$ and Au in the solution.

Gold, alloys of (vol. ii. p. 648). For an alloy with Cd, AuCd, v. Heycock a. Neville (G. J. 61, 914 [1892]). For alloys with Cd and Sn, v. H. a. N. (G. J. 59, 936 [1891]). For alloys with Al and Sn, Cd and Bi, Cd and Pb, and Cd and Tl, v. H. a. N. (C. J. 65, 65 [1894]). For alloys with Cd and with Zn, prepared by immersing plates of Cd and Zn in solution of a salt of geld, v. Mylius a. Fromm (B. 27, 630; abstract in G. J.

66 [11], 235 [1894]).

66 [11], 256 [1894]).

Gold, bromides of (vol. ii. p. 648). Petersen

(J. pr. [2] 46, 328) upholds the existence of

Au, Br, against the statements of Krüss a.

Schmidt (B. 20, 2041); in a later paper (J. pr. [2] 47, 301) K. a. S. still maintain that AuBr, is the ultimate product of the reaction of Br with gold (v. abstracts in C. J. 64 [11], 126, 284). For the double salts AuBr. CsBr and AuBr. RbBr. v. Wells a. Wheeler (Am. S. [3] 44, 157 [1892]).

Wells a. Wheeler (Am. S. [3] 44, 187 [1832]).

Gold, ohlorides of (vol. ii. p. 649). Petersen

(T. pr. [2] 46, 328; 48, 88) maintains that

Au.Gl, is a definite compound; Krüss a. Schmilt.

G. pr. [2] 47, 301; Zeit. f. anorg. Chemic, 3

421) say this substance is a mixture (v. abstracts in C. J. 64 [11], 126, 284, 474 [1893]).

Double sails of AnCl, with CsCl and RbCl are described by Wells a. Wheeler (L.c.); for a double sail AnCl, AgCl, v. Hermann (B: 27, 596; bbstract in C. J. 66 [11], 234 [1894]).

Gold, sulphides of (vol. ii. p. 651). Concerning the conditions of formation of Au.S., v. Antony a. Lucchesi (G. 19, 545; abstract in C. J. 58, 1216 [1890]).

58, 1216 [1890]).

Auric sulphide Au₂S₂. This compound is formed, according to A. a. L. (G. 20, 601; 21 [11], 209; abstracts in C. J. 60, 526; 62, 480 [1892]), by passing H.S into a solution of AuCl₂-LiCl kept at -10°, extracting LiCl by absolute alcohol, and drying in N at 70°. Au₂S₂ is a brack, anorphous solid; decomposed by heat at 200°-205° to Au and S (for other reactions abstracts, Lc.).

v. abstracts, i.e.).
Schneider (U. S. Geol. Survey Bull. No. 90, 56 [1892]) obtained aqueous solutions of collisidal Au S and Au S

HYDRAZOIC ACID (v. p. 919, Addenda).
HYDROGEN (volvii, p. 719). The ratio between the densities of H'and O is 1.15-882; the weight in grams of 1 litre of H is '08991 (Rayleigh, Pr. 45, 134 (1893)). For solubinary in water, and in alcohol, v. Timotéeff (Z. P. C. 6, 141); Winkler (B. 24, 89). Henrich (Z. P. C. 9, 435); (abstracts in C. J. 60, 15, 384 [1891]. For the line spectrum of H, v. 82, 1043 [1892]). For the line spectrum of H, v.

Ames (P. M. [5] 80, 48 [1890]); and cf. Grun wald (M. 13, 111; abstract in C. J. 62, 1381

[1892]). Wilm (B. 25, 217; abstract in C. J. 62, 568 [1892]) describes a lecture experiment to show the occlusion of H by Pd. Regarding the occlusion of H by other metals v. Streintz (M. 12, 642; abstract in C. J. 62, 567 [1892]).

Baker (C. J. 65, 611 (1894)) found that a linkupe of equal volumes of dry H and dry Cl tid not explode in bright sunlight, and that more than a quarter of the mixed gases re-

more than a quarter of the mixed gases remained uncombined after exposure for two days se diffused light and two days to bright sun-

Reactions.—Neumann (Z. P. C. 14, 193 [1894]) has examined the reducing action of H occouded by Pt on solutions of salts of Al, Sb, As, Bi, Cd, Cu, Co, Au, Fe, Pb, Mg, Mn, Hg, Ni, Pd, Ag, Sn, Tl, and Zn. Regarding the rate of combination of H and O, v. Water (p. 860). Regarding the explosion of mixtures of H with

O and Cl, v. Chlorine (Addenda, pp. 904, 905).

'Hydrogen dioxide (vol. ii.,p. 722). Schöne (B 26, 3011; 27, 1233 [1893-4]) affirms the occurrence of H.O. in the atmosphere against the

contention of Ilosva (B. 27, 920).

Formation .- Regarding the formation from ether v. Dunstan a. Dymond (C. J. 57, 574, 988 [1890]). H.O.Aq is formed by the action of light on II.C.O.Aq, excess of O being present (Richardson, C. J. 65, 450 [1894]). Richardson (C. J. 63, 1110 [1893]) has examined the formation of

11.0, in urine exposed to sunlight.

Preparation.—By making commercial 3 p.c.
17.0 Aq distinctly alkaline by Na₂CO₃, filtering, seaking with 10-12 vols. of ether, separating the ethereal solution, evaporating this to 01-0025 of its original volume on a water-bath, and removing the rest of the ether by standing in a bell-jar over solid paraffin, Shiloff (J. R. 25, 293; abstrect in C. J. 66 [11], 186 [1894]) obtained a thick, transparent, slightly acid liquid, S.G. 1-2475, containing 79.6 g. H.O. in 100 c.c. For preparation of conc. H.O.Aq v. Talbot a. Moody

(abstract in C. J. 64 [11], 369 [1893]).

Molecular & eight. Tanmann in 1889 Molecular steight. Tammann in 1889 (Z. P. C. 4, 411) by cryoscopic measurements determined mol. formula to be H₂O₄; but T.'s results stere called in question by Carrest in 2000 (Z. 0.5) who found red w 29.00 1893 (G. 22 [1], 341), who found mol. w. 33-92 (A.O.) com cryoscopic measurements, and this resulf was confirmed by Orndorff a. White (Am. 15, 347-[1893]), and also by Tammann himself (Z. P. C. 12, 431 [1893]).

Reactions.—Regarding the reaction between H₂O₂Aq and KMnO₄Aq, v. Engel (Bf. [3] 6, 17; c. asstract in C. N (2), 277 [1892]).

Hydrogen sulphide (vol. ii. p. 725). Henrich (Z. P. C. 9, 435 [1892]) gives the absorption coefficient of H.S. by water as 4 4015-089117. says that ILS dried by CaCl. and P.O. does not readen dry litnus paper, and does not read with redden dry lithnus paper, and dees net react with BaO, or Fe.O., nor with salts of Sb, As, Bi, C3, Co, Cu, Pb, Hg, Ag, or Sk. According to Peller (*C. J. 57, 625 [1090]), the equation 2H.St. 30, 22SO, 22H.O correctly represents the explosion of H.S and air or O.

HYDROXYLAMINE (vol. ii. p. 734), c.NH.OH has been isolated, as a solid by Lobert 1.

(R. T. C. D. 100; 11, 184 aostracis in C. J. 62, | Hertz (Z. P. C. 1, 358 [1890]) found the value 402, 1891 [1892]). NHOH.HCl dissolved in 254 for the mol. w. of iodine.

MeOH is treated with CH,ONa solution, and most According to Meineke (Chem. Zeitung, 10, of the MeOH is distilled off at 100 mm. pressure; the residue is distilled in small portions at 40 mm, pressure (for details v. C. J., L.c.). For the preparation from 2NHOH.ZnCl, v. Crismer, Bl. [3] 6, 793 (abstract in C. J. 62, 771 [1812]). For details of suitable apparatus for the fractionation of NHOH. of NH₂OH in vacuo, v. Brühl (B. 26, 2508 [1893]) cf. L. de B., B. 27, 907, and reply by Be bid 67. L. de B., B. 27, 907; and reply by 18, 50d 1847 [1894]. For thermal data of NH.OH. v. Berthelot a. André (C. R. 110, 830; abstract in C. J. 58, 934 [1890]). Hydroxylamine is a whito inodorous solid, melting at 8, 33°, and remaining superfused at 0°; boils at 58° under 22 mm. pressure; decomposes at 90°–100°, and detonates at a higher temperature. S.G. 1:35; S.G. when liquid, I:23. A drop heated in a test tube explodes very violently (v. Brühl, L.c.). B., L.c., discusses the molecular refraction of NH₂OH. NH₂OH is fairly sable up to 15°, then gradual decomposition occurs, giving NH₂, IRVO, and H.N.O., which react with unchanged NH.OH producing 20 and N M. de B. B. 27, 967s abstract in f. J. 66 (11), 278 (1891). For a full acount of the reactions of NILOH v. Lobry de Fruyn (L., ; abstract in C. J. 62, 1391 [1892]). IH,OHLICI in water and NaNO,Aq react to orm Na,NO,Aq (v. Tamatar, J. R. 25, 312; bstract if C. F. 66 [11], 136 [1894]; cf. Visilicenus, B. 26, 771; abstract in C. J. 64, 18, 1892. Earther continued to the control of the control 18 1892). For the reactions of 2NH OH H SO vith NaOHAq v. Kolotoff (J. R. 25, 295; abtract in C. J. 66 [11], 187 [1894]). For combounds of NH₂OH with metallic salts, v. Crismer Bl. [3] 8, 114); Goldschmidt a. Syngros (Z. Q. . anorg. Chemie, 5, 129); and Feldt (B. 27, 401) (abstracts in C. J. 58, 558 [1890]; 66 [11], 45, 187 (1894)). Kolotoff discusses the constitution of NH.OH in J. R. 23, 3 (abstract in C. J. 64 [11], 114 [1893]). Kjellin (B. 26, 2377) describes NHEt.OH and NHMe.OH (abstract in C. J. 66 [11], 9 [1894]).

INDIUM (vol. iii. p. 1). The molecule of indium in dilute solution in tin is perhaps diatomic (v. Heycock a. Neville, C. J. 57, 376 [1890]). Linder a. Picton (C. J. 61, 131 [1892]) [1890]]. Linder a Picton (C. J. 61, 131 [1892]) failed to isolate indiam lydrosulphides but they think that it is formed by passing ILS into water with In.O., xH.O in suspension; the continued passage of ILS produces, In.S., Read (C. J. 65, 3130 [1894]) found that indiam sequi-octide, In.O., is unchanged at continue sequi-octide, In.O., is unchanged at continue to the Mol. R. of, HIAq strong 20.77 to 67392 p.c., v. Perkin (C. J. 55, 708 [1889]), y For a research on the dissociation of III, v. Indienstein (Z. P. C. 3, 56 [1894]), photon 20.77 to 3.61 [1894], pho

on the dissociation of HI, v. Bodenstein (Z. P.C.).
13, 56 [1894]; abstracts in C. J. 64 [11], 369;
56 [14], 12 [1893-4]). Micking (B. 26, 2007) has isolated three hydrates of HI: HI.2H.O., melting at o. -43°; HI.3H.O., melting at q. -48°; and HI.4H.O., melting at c. -30°.5°.

10DINE (vol. iii. p. 14). The mol. w. of iodine dissolved in Et. or CS, was found by Beckmann (Z. J. C. 5, 76 (1890)) to be 274, from determinations of the boiling-points; tackeresults were coffrmed by Sakurai (C. J. 21, 997, 1892)). By determining the lowesing of the [1892]). By determining the lowering of the t.p. of naphthalene by solution therein of I,

According to Meineke (Chem. Zeitung, 10, 1213, 1230), very pure I is prepared by covering ordinary. I with a solution of CaCl., S.G. 1.85, ordinary. I wind a solution of Chicle. S.G. 1-20, mixed with a little cone. KIAq and a few drops of HClAq, heating until the I fuses, letting cool, washing the I, drying and subliming K twice, the first time with addition of a little BaO.

1-3r the reactions of I with KClO₂, and with

KClO and water, v. Potassium chiorate (Ad-

denda, p. 905).

Iedine monochloride (vol. iii, p. 17). therfinal data bearing on the two forms of ICl, v. Sortenbekey (Z. P. C. 10, 483; abstract in C. J. 62, 1987 [1892]). Tannar (J. R. 25, 97; abstract in C. J. 64 [11], 514) gives details of the

methods for preparing the two forms of ICl.

Iods'es (vol. iii. p. 21). For iodates of casium and rubidium, v. Wheeler, Am. S. [3] 44, 123 (abstract in C. J. 64 [11], 68 [1894]). Pure potassium iodate is prepared, according to Gröger (Zeit. angew, Chemic, 1894, 13), by heating to 100 for 20-30 minutes 20 g. KI in as little water as possible mixed with 40 g. pure KMnO. in 1,000 c.c. water, reducing excess of KMnO, by cautious addition of alcohol, filtering, adding acetic acid till acid, evaporating to c. 50 cm. washing the crystals of KIO, with cone alcohol, and drying. By heating KIO, till it fuses, O and some I are given off, and KI finally remains: no other oxy- compounds are formed (Cook, C. J. 65, 802 [1894]).

oo, 802 (1894)).
IRIDIUM (vol. iii. p. 46). From analyses of the salts ICl₂3KCl. aq and ICl₂3NH Cl. aq, Joly deduced the value 192-75 for the at. w. of Ir (C. B. 110, 1131 [1890]). According to Prinz (C. R 116, 392 (1893)), ir crystaleses in regular octa-hedra and in forms derived therefrom. Mylius a. Foerster (B. 25, 665 [1892]) stated that Ir is slightly volatilised when heated in a current o CO and Cl to c. 238'; Antony, however (G. 25 [11], 547 [1893]), asserts that no trace of an volutile compound of Ir is formed under thes conditions.

Irid-ammonium salts (vol. iii. p.47). Palmae (B. 22, 15; 23, 3810 [1889-90]) describes a nurber of irido-ammonium compounds. He call then irrido-amminium compounds. He call them irridium pentammine satis, and formulate them as Ir(NI₁)₂X₁; compounds are describe where X₁ · Cl₂, GlBr₂, ClL₂, ClSO₃, Cl(NO₂), Cl(NO₂), ClC₂O₅, ClPtO₄; also where X₄ · B; BrSO₄, and Br(NO₂)₂. One-third of the Cl is the salt when X₂ · Cl, is not removed by the action of cold II.SO₄O₄ or cold AgNO₄O₄; the rection of cold II.SO₄O₄ or cold AgNO₄O₄; the rections of the salts are similar to those of the purpureo-cohaltanumines (v. vol. ii. p. 227) (abstracts in C. J. 56, 352 [1889]; 60, 402 [1891] In B. 21, 2090 (b. abstract in C. J. 60, 11 [1861]) P. describes compounds analogous with the reso₂cobasic salts Co₂(NH₂)₁₀(H₂O₂)₂N₁, xfq; at the I. Walts are almost coldurless, P. thinks the prefix rosco- is unsuitable, he calls them irridium artuopen ammines and formulates them as Ir(NH₂)₂(H₂O)X₁, Salts are described in which X₁=Br₁, Cl₁, and (NO₂)₂. The chlorids In(NP₂)₂(H₂O)Z₁; is formed by boding, for five boufs, S. g. Ir(NH₂)₂(I₂), with 1½ times the calculated weight of KOH in 50 c.c. water, filtering, partially freezing the filtrate, adding 30 c.c. tuming HClAq, washing the pp. thus formed them ir diumpentammine salts, and formulate faming HClAq, washing the pp. thus formed

with 22 p.c. cold HClAq and then with alcohol. dissolving in water, and again ppg. by conc. HCIAq (for details v. abstract in O. J. 60, 1166

Iridium tribromide (vol. iii., p. 48). · Compounds of this bromide with PBr, age described by Goisenheimer (C. R. 111, 40; abstract in C. J. St., 1383 [1890]). By heating IrO...xH.O with IrBr, and PBr, red heedles of IrBr, 3PBr, and PBr, the street in the property of the street in the stre are formed; by heating this with PBr, plack crystals of IrBr, 2PBr, are producedo

Iridium tetrabromide (vol. ifi. p. 48). Geisenheimer (l.c.) describes the compound IrBr, 2PCl,

obtained by heating IrBr₃.3PBr₃ with PCl₃.

Iridium trichloride (vol. iii₁₁ p. 48). The fohowing compounds with PCl₃ are described by Geisenheimer (C. R. 110, 1004; abstract in C. J. 58, 1068 [1890]). IrCl₂,32Cl₃; IrCl₂,2PCl₃; IrCl₂,PCl₃,2PCl₃; IrCl₂,PCl₃,2PCl₃; IrCl₃,PCl₃,2PCl₃, Yarious compounds of IrCl₃ with H₃PO₃ and H₂PO₄. and salts of these, are also described. (C. R. 110, 1336; abstract in C. J. 58, 1069 [1890]) also describes the complex compounds 2IrP_Cl₁.5AsCl₂ and IrCl₂.2PCl₂.2AsCl₃. For the salts IrCl₂.3KCl. aq and IrCl₃.32mCl. aq, v. Joly (C. R. 110, 1131; abs/ract in C. J. 58, 1067 [1890]). For a description of IrCl, 37, iCl. xaq, v. Listony (G. 23 [1], 190; abstract in C. J. 64 [11], 880 [1893]). According to A. (G. 23 [1], 184; abstract in, C. J. 64,[11], 379 [1890]), the passage of H2S hrough a 2 p.c. solution of IrCl, 3KCl produces pps. which are mixtures of Ir₂S₂ and IrS₂.

Iridium dioxide (vol. iii. p. 50). For methods

of preparing IrO, v. Geisenheimer (C. R. 110, 855; abstract in C. J. 58, 948 [1890]).

• Iridium disulphide (vol. iii. p. 50). IrS₂ is obtained by passing FLS over IrCl₃3LiCl at 42, 170 [1890]. to 7°, washing with absolute alcohol, and drying at 90° to 100° in a current of CO. (Antony, G. 23 [1], 190; abstract in C. J. 64 [11], 380 [1893]).

IRON (vol. iii. p. 51). Lockyer (Pr. 54, 359 [1893]) gives the emission spectrum obtained by using vary fine electrolytically deposited iron as

using wiry fine electrolytically deposited iron as the poles of an electric lamp.

Properties and Reactions.—Iron volatilises in the electric furnace, using a current of 850 ampères and 50 volts (Moissan, C. R. 116, 1429 [1892]). Iron is superficially oxidised by heating to dull redness in NO (Sabatier a. Senderons, C. R., 114, 1429 [1892]); heated in NO tea 850° reduced iron is oxidized with fix. NO, to c. 850°, reduced iron is oxidised with in-NO₂ to 0. 550°, reduced from is exidated with incondescerice to Fe₀O₂ (S. a. S., C. R. 115, 236 [1992]; cf. abstract in C. J. 66 [11], 95 [1894]). Montemartini (G. 22₁[1]₆:7.50) says that NH₃, N₂O, and N are formed by the solution of iron in excess of 27:5 p.c. HNO₃ q (for, quantities, v. abstract in G. J. 62, 1278 [18.32]). For quantities of the district of the district of the conduction tities of iron dissolved by HNO, Aq of different concentrations, v. Gautier a. (Parpy (C' R. 112, 1451; abstract in C. J. 60, 126 ft 91]).

Passivity of iron. Concerning the passivities of steel and wppught iron to HNO, Aq. v. Andrews (Pr. 48, 146, 40, 41), abstraction

Tron, by acchloride of. The comegund

Iron, by acchloride of. The compound Febril, was obtained by Lenormand (J. R. 116, 820; abstract in C. J. 64 [11], 371 by heating FeCl, with excess oi. Br in a sealed tube at c. 100°. The compound is opaque in thin

sections, and green by reflected light; very de-liquescent; crystallists probably in hexagonal plateg; easily sol. alcohol and ether, CS., &c., can be sublimed by heating in a tube containing a little Br.

Iron catelide. Arnold a. Read (C. J. C.5, 788 [1894]) confirm the existence of Fe₂C in steel (v. Abel, Proc. Inst. Mechan. Engineers, 1885, CO; also Müller, Stahl und Eisen, No. S); ... a. R. say that two forms of Fe₂C are found ih stee

Iron carbonyls. In 1891 Mond a. Quinote (C. J. 59, 604) obtained a compound of Fe with CQ; further investigation of the reaction by Mond a. Lenger (C. J. 59; 1090 [1891]) led to the isolation of two compounds.

Ferropentacarbonyl F. (CQ). 195.55. V.D. at $142^{\circ} = 93.2$, S.G. $\frac{16^{\circ}}{100} = 1.4664$: distils completely, without decomposition, at 102.8° under 749 mm. pressure; solidifies at -21°.

Preparation.—FeC.O., ppd. by adding a slight excess of K.C.O.Aq to hot FeSO.Aq, is well washed, and dried at 120°, it is then heated in a slow stream of H, temperature being raired until the substance in the tube is black, and then kept constant until gas ceases to come off, when the current of H is stopped; the product is allowed to cool in H, placel in water without coming into the air and treated with successive quantities of boiling water until sulphate is removed; it is then quickly dried on plates of gypsum, placed in the combustion tube, heated to c. 300° in H till quite ky, and allowed to cool in H. The tube is then con ngeted with a gas-holder containing CO, and the II is completely displaced by CO; one end of the tube is then sealed, and the open end is kept in connection with the supply of CO. After 24 hours the tube is heated to c. 120°, while a slow current of CO is passed through it, and the issuing gases are passed through a tube kept at -20°. When iron carbonyl ceases to come over, the tube is let cool, and is then again put in connection with the CO supply. These processes are repeated many times; the daily yield of the carbonyl is not more than c. 1 g. from 100 g.

Properties.—A pale yellow, somewhat viscous liquid; unchanged in the dark, but in-sunlight gipts solid Fe₁(CO), (v. in/ra); slowly decomposed on exposure to air, giving chiefly Fe₂O₂±H₂O; ann letely decomposed at 180° to Fe and CO; soluble in EtOH, Et₂O, Ch., mineral tile, &c. (For S.G., V.D., &c., v. supra.) Fe(CO), in not acted on by dilute H₂SO₂A₂, HClA₂ or HNO Aget the ordinary to respect to the contraction. HClAq, or HNO, aq at the ordinary temperature; bu is rapidly decomposed—to Fe(NO,),Aq, FeCl,Aq, or FeBr,Aq -by conc. HNO,Aq, ClAq, ar ZrAq.

Eiferroheptacarbonyl Fe (CO), Obtained by expang Fe (CO), in a sealed tube to sunlight for some hours, collecting the solid that forms, washing with ether, and drying over H.SO, for a short time. Yellow, listrous finkes; gradually decomposed by exposure to air turning brown.
Not of 5d on by H,SO,Aq or HC! Aq at the
ordinar, temperature; decomposed by HNO,Aq,
Of or Br.

Iron carbonyls seem to be present in water-

also semetimes in compressed coal-gas a. Ferrous chloride (vol. iii. p. 53). Chasse-ant (A. Ch. [6] 30, 5 [1898]) describes the leuble solds FeCl, 2AmCl, FeCl, LiCl, 3aq, and toe a. Scudder, C. J. Proc. 1891. No. 10 FeCl. 2KCl.

Ferril chloride (vol. iii. p. 54). By determining the vise of b.p. of alcohol and ether when FeCl. is dissolved in these solvents, Müller (C. R. 118, 644; abstract in C. J. 66 [11], 282 [1894]) finds that the molecular formula of the chloride in these solutions is FeCl, FeCl,Aq reacts with many metallic sulphides, when heated therewith in scaled tubes; FeCl.Aq. S. and a chloride of the metal & the sulphide are and a chloride of the increase of the sampling generally formed (Cammerer, C. C. 1891 [11]. 370; abstract in C. J. 62, 18 [1892]). Seehert a. Dorrer (Zeit. f. along Chemic, 5, 339, 411; v. abstracts in C. J. 66 [11], 140, 190 [1891]) have made a full investigation of the interaction of FeCl, Aq and KIAq; their results are in keeping with the hypothesis that the direct reaction $FeCl_{q}Aq + KIAq = FeCl_{q}Aq + KClAq + IAq$ is counterbalanced by the reverse reaction Fecl.Aq + KeAq + IAq = FeCl.Aq + KIAq. S. a. D. think that the first stage of the resaction is to produce an iodochloride; thus $FeCl_{2}Aq + KIAq = FeICl_{2}Aq + KClAq$; that this then decomposes, more or less completely then decomposes, more or less compared, according to conditions of concentration, time, temperature, and mass), into FeCl, Aq and IAq; and that FeICl, Aq, and probably FeCl, Aq, are re-formed until equilibrium is established. S. a. D. do not agree with the explanation of the mechanism of the reaction given by Carnegie (v. vol. iii. p. 55). Roozeboom (Z. P. C. 10, 477 [1892]) Has investigated the conditions of equilibrium in aqueous solution of the hydrates of FeCl.; he has isolated hydrates 2FcCl.xH₂O where x = 4, 5, 7, and 12. (For details, v. abstract in C. J. 64 [11], 119 [1893]). For a study of the interaction of FeCl.₃Aq and archivestic Lawring C. P. 112 [14]. oxalic acid, v. Lemoine, C. R. 116, 981 (abstract in C. J. 64 [11], 405 [1893]). A compound of of Cl, with nitroxyl chloride, FeCl, NOCl, was obtained by Sudborough (C. J. 59, 660 [1891]), by immersing iron in liquid NOCl, and letting the liquid stand over HSO,; the compound forms small golden-brown, deliquescent crystals

torms small golden-brown, deliquescenterystals (cf. vol. iii. p. 56; Combinations, No. 7).

Forsus fluoride (vol. iii. p. 56). FeF₂ was obtained by Poulenc (C. R. 115, 941; abstract in C. J. 64 [11], 122 [1893]) by passing alr-free HF over red-hot, from or dry FeCl₃; small, white, rhombic prisms; S.G. 4-09; decentioned by beauting with HSO. No CO. steam air, HCl. heating with H2SO4, Na2CO4, steam, air, HCl,

or H.

Ferric findride (vol. iii. p. 56). Poulche (l.c.)
obtained FeF, in small, very refractive, greenisty
crystals, S.G. 3-87, by passing HF over red-hot
ifon, FeO, FeF, xaq, or FeCl, ; also by dropping
FeF, xaq into fused AmCl and heating in a curcrystal or input green. FeF does not five at or H. rent of an inert gas. FeF, does not fuse at 1000°; but is decomposed by heating in ar, also, by fusion with Na CO₂, by heating in Ax, also by fusion with Na CO₂, by heating in steam, or with HCl or H. O₂. According to Speraksky (J. R. 24, 294; Abstract in C. J. 64 [11], 314 [1 33], FeF₂Adjshows a very small plectical conductivity; there is, therefore, no appreciable all strolyte dissociation; as the solution scarcely in the strong of some suggest R. Amplides. effects any inversion of cane sugar, S. concludes | l.c. p. 524).

that there is practically no hydrolytic dissocia-tion. Cryoscopic determinations showed that the molecules in a dilute aqueous solution are chiefly FeF, but indicated the existence of Fe,F.

chiefly FeF, but indicated the existence of FeF, in more gene solutions.

Iron, nitrides of (vol. iii. p. 59). Fewler (C. N. 68, 15 [1893]) obtained Fe,N by heating reduced iron in a rapid stream of NH,., (For details v. abstract.in C. J. 66 [11], 50 [1894]).

Fewic oxide (vol. iii. p. 61; also p. 57 for hydrate.). Atc. 1750° Fe,O. is completely changed to Fe,O. (Read, C. J. 65, 313 [1894]); in the electric furnace Fe,O. is formed, partly metted and partly crystallised (Moissan, C. R. 115, 1034 [1892]). According to J. van Bemmelou a. Klobbio (J. pr. 22 46, 497 (1893)), crystallised Fe,O. [140 is okained by treating with water the Fe O. H.O is obtained by treating with water the hexagonal crystals of Fe O. Na O formed by heating Food, for some time with cone. NAOHAq; the crystalline Fe,O, HO is not hygroscopic; H₂O is given off below 100°.

Iron, oxychlorides of (vol. iii. p. 62). Rousseau (C. R. 110, 4032; 113, 643; 116, 392; abstracts in C. J. 58, 1083 [1890]; 62, 119 [1892]; 64 [11] 280 [1893]) describes compounds xFeCl_xyFe₂O_y some crystalline and some amorphous, formed by heating FeCl, Aq at different temperatures, and also by the interaction of FeCl, and steam.

LANTHANUM (vol. iii. p. 116). Bettendorff (4, 256, 159 [1890]) obtained the value d38-28 for the at. w.; and Brauner (B. 24, 1328 [1891]) the value 138-21 (O = 16).

Winkler (B. 24, 873 [1891]) obtained results, by heating La O, with Mg in H, which pointed to the existence of a hydride of La (cf. Brauner,

LEAD (vol. iii. p. 122). The molecule in diffice solution in tin is probably monatomic (Heycock a. Neville, C. J. 57, 376 [1890]). The m.p. of lead was found by Griffiths a. Calendar using a Pt thermometer) to be 327-69° (C. N. 63, 1 [1891]). Lohmann (Z. K. 17, 274 [1890]) says that lead separated electrolytically, by a weak current, crystallises in leadets that are probably monosymmetric, but that the crystals are regular octahedra when separated by a strong current. Veley (S. C. I. 10, 206; summary of conclusions in C. J. 62, 410 [1892]) has examined the interaction of lead and nitric acid: an acid of intermediate concentration acts most rapidly; when HNO, is present the action in-preates. Montemartini (d. 22, 384, 397, 426 [1892]) found that a little NH₂ was preduced, esfecially with dilute IINO,Aq. Lead rapidly oxidises to PbO when heated in NO; oxidation occurs at c. 200° in NO₂, with for nation of a basic nitrate (Sabatier a Senderens, C. R. 114, 1429 – 115, 236 (1892). Lead rapidly

[11], 324 [1893]); and for K,Pb,Br, 4aq and K,Pb, (BYI), 4aq, v. Wolls, i.e. p. 190 (abstract,

8 N

Lead, chlorides of (vol. iii. p. 125). The statement, on p. 125 (vol. iii.), that only one chloride has been isolated is no longer true;

chloride has been isolated is no longer wue; PbCl, was prepared by Friedrich in 1893.

Lead tetrachloride (vol. iii. p. 126). PbCl, has been obtained by Friedrich (B. 26, 1484; abstract in C. J. 64 (11], 415 [1803]; cf. M. 14, 505; abstract in C. J. 66 [11], 16 [1804]), by passing cl into HCl. Andontaining PbCl, in suspension, adding NH,Cl to the solution thus obtained, separating and drying the compound PbCl, 2NH Cl thus formed, adding it to conc. cooled H.S. allowing the oily drops that formed to collect at the bottom of the vessel, and shaking these drops repeatedly (and duickly) with conc. H.SO. PbCl, is a transparent, yellow, very refractive liquid, furning in moist air with formation of PbCl2 and Cl; it is unchanged in contact with cold conc. H.SD, but when heated with the acid it decomposes explosively to PbCl, and Cl; when heated with conc. H.SO, in a ourrent of Cl, some PiCl, passes over, but at c. 105° explosion occurs. PbCl, has S.G. 3·18 at 0°; at c. -15° it solidifies to a yellowish, crystatic. talline mass. A hydrate is formed with a little water; but addition of mend water produces HClAq and PbO. By adding PbCl, to a little cooled cone. HClAq, a crystalline compound, probably PbCl .2HCl, is formed.

Several double salts of PbCl, with alkali chlorides haven been isolated. Classen a. Zahorski, (Zeit. f. anorg. Chemie, 4, 100) give the formula 2PbCl, 5AmCl to the salt formed by the formula 2PbCl_{*},5AmCl to the salt formed by digosting PbCl₂ with liquid Cl and furning HClAq, and adding AmCl; but Friedrich (l.c.) says the compound is PbCl_{*},2NH_{*},Cl. For compounds PbCl_{*},2MCl, when M=NH_{*}, Cs, K, and NBb, v. Wells (Am. S. [3] 46, 180; abstract in C. J. 64 [11], 523 [1893]); C. a. Z. (l.c.) describe compounds of PbCl_{*} with the hydrochlorides of compounds of the compound of the hydrochlorides of compounds of the compound of the hydrochlorides of compounds of the compound of the hydrochlorides of compound of the hydrochlorides of compound of the hydrochlorides of the hydrochlorides of compound of the hydrochlorides of compound of the hydrochlorides of the hydrochlo pyridine and quinoline (abstract in C. J. 64 [11],

461 [1893]).

Lead dichloride (vol. iii, p. 125). Several double convounds with alkali chlorides are described by Randall (Am. 15, 494 [1893]) Wells L. Johnston (Am. S. [3] 46, 25 [1893]); and Wells

L. J. Ahnston (Am. S. [3] 46, 25 [1893]); and Wells (I.c. p. 34). The compounds are of the forms, PbOl, 2MCl., PbOl, 3MCl. raq, and 2PbCl_MCl (v. abstracts in C. J. 64 [11], 523, 524 [1893]).

Lead, fluorides of (vol. iii, p. 127). Brauner (C. J. 65, 393 [1894]) has prepared the compound PbF, 3KF.HF in various ways; the simplest process being to dissolve Pb(C, H, O.), (R. Brackley b. 124, 24), (and p. first) in various ways. (v. RED OXIDE OF LEAD, Addenda, infra) in conc. HFAq and adl KF. By acting on this salt with cone. H₂SO₄-B. obtained evidence of the formation of lead setre, Loride, PbF₄, but he did

formation of lead *etr. f. toride, PbF., but he did not succeed in isolating the con sound.

Lead, iodide of (vo. iii. p. 127). Several double compounds of PbL, with alkali ibdides have been isolated by Well-, W. a. Johnstyn, and Herty (v. References under Lea. Browner, p. 91.5). For the compound PbL, 2MgL, 16a0, b. Otto a. Drowes (Ar. 'Fin. 229, 179; abstract in C. J. 64 [11], 984 [1893]).

Lead iodobromidee and ir-dochlorides (vol. iii. p. 128). Miss. Field (C. J. 63, 540, 11803).

iii. p. 128). Miss Field (C. J. 63, 540 [1893]) has dev. ibed the compounds 2Pf 7r. FbI., 2PbCl., PbI., and 5PbCl., PbI.

[1894]). The hydrage 2PbO.H.O (v.l. iii, p. 12: is obtained in large crystals by allowing a solution of PbO in KOHAq to cool in the air; CO is absorbed, and the hydrate is deposited in colourless, tetragonal crystals, a:b:c = 1: 82

Cloudekings Am. 13, 120 [1891]).

Red exide of lead (vol. iii. p. 180). Hutchin son a. Pollard (C. J. 65, 1136 [1893]) have son a with glacial acetic acid, and have isolated lead tetractate. acid, and have isolated lead tetrachtate. Pb(C;H,O,), melting at c. 175°, and decomposing a little above that temperature.

posing a little above that temperature.

Note.—The formula PbO(OC₂H₂O)₃ said to be assigned by Jacquelain to the salt obtained by him (vol. iii. p.,130, cbl. 2, line 28 from top; and p. 1,21, col. 2, line 24 from bottom) should have been given as PbO₂(C, H₂O₃), old notation.

Plumbates (vol. iii. p., 132). Kassner (Ar. Th. [3] 28, 109; abstact in C. J. 58, 561 [1890])

describes plumbates of Ba, Ca, and Sr. Regarding the dissociation of Ca plumbate, v. Le Chatelier (C. R. 117, 109; abstract in C. J. 64 [11], 524 [1893])

Lead oxylodides (vol. iii. p. 132). Gröger (M. 13, 510; abstract in G. J. 62, 1892) describes

the compound PbO.PbI... iii. p. 132). The salt Pb(O.H.O.), (v. supra, Red oxide of lead) belongs to the type PbX', to which form PbOl.

also belongs.

Lead, sulphide of (vol. iii. p. 18'i). According to Hannay (C. J. Proc., Noz. 139 and 141 [1894]), when air is passed into molten PbS, one half of the lead remains as lead, and one half is volatilised, and deposited as PbS; H. accounts for this change by supposing the reastion to be 2PbS + O₂ = Pb + PbS.SO₂, the volatile PbS.SO₂ being decomposed in the colder part of the apparatus to PbS and SO.

Lead sulphobromide and sulphochloride (vol. iii. p. 133). Parmentier (C. R. 114, 298; abstract in C. J. 62, 685 [1872]) obtained the compounds PbS.PbBr, and PbS.PbCl, by dissolving the halides in their acids and shaking the liquids while H2S was passed over the sur-

faces of the solutions.

LITH UM (vol. iii. p. 147). Guntz (C. R. 117, 732 [1893]) recommends to use a mixture of equal weights of LiCl and KCl, for the electrolytic preparation of the metal; the mixture melts t 450° and the m. decreases as electrolysis proceeds. (For ditails as to size of elec-"woden streagth of current, &c., v. abstract in C. J. 66 [11], 91 [1894].) Holt a. Sims, C. J. 65, 445 [1894], find that traces of a peroxide are formed, along with Li,O, by burning Li in O. Lithium, amide of LiNH₂. Formed by

gently yeating clean Li in a stream of NH, until violent action ceases, and then heating to c. 400° until the reaction is finished. A white, crystalline, transparent solid; melts between 5,00° and 400°; lecomposes in cold water slowly, is 30° and 400°; tecomposes in cold water slowly, giving LioHAq and NH; decomposed by heating it, air, but without taking fire (Titherley, U. J. 55; 504 [1894]; g. v. for further reactions). Lithium, bromide of (vol. 40ii. p. 150). The hydrates LiBr. xaq, where x 11 and 2, are described by Bogorodsky (J. R. 25, 3.3 [1895]).

Lithium, chlowide of (vol. 41i. p. 150). For LiC. aq and LiCl. 25q v. Bogorodsky (L.). For the dayle company LiCl MCl. area, where

Lead protoxide (vol. iii. p. 128). PbO is, LiC. aq and LiCl. 22q v. Bogorodsky (Lc. unchanged at c. 1750° (Read, C. J. 65, 818) the double compounds LiCl.MCl. 22q,

The Car Fe, Mh, or Nias: Chasecvant (C. R. 115, 640; 115, 118; abstracts in C. J. 62, 118, 1177 [1993]).

Lithium, Sucride of (vol. iii. p. 150). Poulenc (B. [3] 11, 15 (1994)) obtained LiF in regular of tabedra by Reating the amorphana fluoride with KHF, and KCl, and washing with water; al. soft water, insol. 95 p.o. alcohol; melts at c. 1000° in H, and partially volatilises at 1100°—12476°. 12/00

Lithium, hydroxide of (vol. iii. p. 150) For the freezing-points of adveous solutions of LiOH v. Pickering (C. J. 63, 899 [1893]).

Lithium, nitride of. Ouvrard (C. R. 114, 120 [1692]) obtained a black solid, probably Li, N. by heating commercial Li to dull redness in N.

Lithium, oxides of (vol. iii. p. 151). Almost the only product of heating Li in O is Li₂O; only traces of a peroxide are formed (Holtes. Sims, C. J. 65, 448 [1894]).

WAGNESIUM (vol. iii. p. 157). Burton a. Vorce (Am. 12, 219 [1890]) obtained the value 24.22 (O = 15.96) for at. w., by converting pure Mg into Mg(NO₃), and this to MgO. The molecule of Mg in fillute solution in tin is probably monatomic (Heycock a. Neville, C. J. 57, 376 [1896]). Mg crystallises in holohedral hexagonal ferms, a:c=1:1:6202, isomorphous with Zn and Be (B a. V., l.c.).

According to Montemarini (G. 22, 381, 397,

426 [1892]), a considerable quantity of H is given off when Mg interacts with HNO, Aq (c. 13 p.c.); the quantity of NH, formed increases with conthe quantity of MI, formed increases with concentration of the acid up to 40 p.c. HNO,, after which it decreases. Mg burns in NO at a dull red heat (Sabarter a. Senderens, C. B. 115, 236 [1892]). Giorgis (G. 21, 510 [1891]) sayse that Mg dissolves in water saturated with CO₂: that H is given off, and crystals of MgCO3. 3aq are deposited. For the interactions of Mg and chlorides v. Sewert a. Schmidt (A. 267, 218; abstract in C. J. 62, 776 [1892]). Winkler has made an extended examination of the interactions of Mg and oxides (B. 23, 44, 120, 772, 2642; 24, 873, 1966; abstracts in C. J. 58, 331,

2022; 24, 617, 1900; 60, 801, 155 [4891]).

Magnesium, bromide of (vol. iii. p. 159).

Beketoff (v. abstract in C. J. 62, 762 [1992])
gives H.F. [Mg.Br²] = 121,700. The double sail
2Mg2. PbBr., 16aq is described by Ottoa. Drewes
(Ar. Ph. 229, 585; abstract in C. J. 62, 566

[1892]).

Magnesium, chloride of (vol. iii. p. 159). Skinner (C. J. 61, 341 [1892]) gives the beiling-points of solutions of MgCl, in water and alco-

bol, from c. 4.5 to c. 14.5 p.c. MgCl.,

Magnesium, ioditie of (vol. iii. p. 161).

Beketoff (l.c.) gives H.F. [Mg, I^{*}] = 94,800.

Magnesium, nitride of (vol. iii. p. 161). For

description of an experiment to demonstrate the formation of Mg.N. v. Mero (II 24, 8,940; assarat in C. J. 62, 409 [1892]). **

Regnessium, oxide of (vol. iii. p. 161). MgQ is unchanged at c. 1750° (Read, U. J. 65, 315

Is unchanged at c. 1750° (Read, U. J. 65, 313° action of MnU., xaq'and II,O.4q. Heated in the [1894]); heated in the electric furnace, it needs clearly formation of the electric furnace, in the el

ing very strengty, retained c. 10 times its volume of gas, chichy O and N.

Magnesium, silicides of (vol. iii. p. 162).

Regarding the formation of compounds by heat-

regarding the formation of compounds by heating together Mg and Si, v. Winkler (B. 23, 2642a abstract in G. Je-68, 1878 [1890]).

MANGATESE (vol. iii. p. 177). Moissane (C. R. 116, 549 [1893]) tained Mn containing to 5 p.o. G. by fusing MnO with charcoal (keeping MnO in excess) by means of a current of 60 volts and 800 ampères. Prelinger (M. 14, 353; abstract in C. J. 66 (111, 40 [1894]) pre-353; abstract in C. J. 66 [11], 49 [1894]) propared pure Mn by heating Mn amalgam (formed by electrolysing MnCl. Au using a cathode of

Hg) in pure H.

Mn is described by P (l.c.) as a grey porous metal; unchanged in dry air; reacts slowly with cold, rapidly with warm, water; dissolves in NH, Clar giving off NH, and H; S.C. 7-4212 referred to water at 4°. Moissan (C. R. 116, 1429 [1893]) found that Mn volatilises readily in the electric furnace, using a current of 80 volta and 380 ampères. Montenarthi (O. 22, 384, 397, 426 [1892]) says that the gaseous products of the interaction of Mn and 1800, Aq are H, NH, N, and N.26. Finely divided Mn roacts with CO at c. 400°, producing MnO and C (Guntz, C.R. 114, 115 [1892.).

Manganese, alloys of. The presence of & 5 p.c. Mn in iron or steel scarcely affects the properties, except by slightly increasing the tenacity and malleability; a very hard tool-steel is formed with c. 1½ p.c. Mn. Alloys with iron containing from 7 to 30 p.c. Mn are extremely

hard and tough.

Manganese, amalgams of (vol. iii. p. 179).
Prelinger (M. 14, 353; abstract in C. J. 36 [11],
49 [1894]) prepared Mn.Hg, by passing a curvet from a kathode of Hg through saturated MnCl.Aq to an anode of C, or Pt-Ir, in a porous vessel, washing in running water, squeezing out excess of Hg, and drying in H over CaCl. By heating gently in a stream of pure, dry H, pure Mn was obtained.

Menganous chloride (vol. iii. p. 179). Chasse vant (A. Ch. [6] 30, 5 [1893]) describes several vani (A. Ch. [6] 30, 5 [1835]) userines several double salts of MnCl.; viz. MnCl.,2AmCl. 2aq, MnCl.,2AmCl. aq, and MnCl.,LiCl. 3aq. For the double salts M.KCl. 2aq, M.CsCl. 2aq; M.2xCl. 2aq; X = NH., Cs., Rb; 2M.MgCl., 12aq (M = MnCl.), v. Saunders (Am. 14, 127; abstract in C. J. 62, 780 [1892]).

Manganic chlorides (vol. iii. pa 180). Regarding the composition of the chlorida in the solution obtained by dissolving MnO, in HClAq. v. Vernon (P. M. [5] 31, 469), and Pickering (P. Mo [5] 33, 284) (astracts in G. J. 62, 19,

687 [1892]).

Manganese peroxide (vol. iii. p. 183). Regarding the compositions of the hydrated oxides, garding the compositions of the nythest approximately MnO.3. and, prepared by different methods, at Googen (Bl. [8] 4, 16 [1891]). G. (C. R. 120, 867; whatfact in U. J. 58, 946 [1890]) gives some details regarding the interaction of MnO. xac and I.O.44. Heated in the additional content of the content of t cleater of annoy sag and reposed. Heated in the cleater furnace, MnO, melts gives off O, and leaves MnO (Moissan, C. R. 115, 1034 [1892]). Mn,O, what to be formed by heating MnO, to c. 400° in NO (Sabatire a. Senderens, C. R. 114; 1476 [1891]). Molocal (C. T. Se. and Cleater). Permanganates (vol. iii. p. 186). Regarding the interaction of permanganates with H₂O₂Aq, Regarding v. Gorgeu (C. R. 110, 958; abstract in C. J. 58, 1062 [1390]). Klobb (Bis [3] 3, 508; abstract in C. J. 58, 947 [1890]) describes compounds of NH, with permanganates of Cd, Cu, Ni, and Zn.

Barium permanganate BaMn.O. (the formula is wrongly printed BaMnO, in vol. iii. p. 186). For the preparation of this salt from KMnO, Aq and Ba(NO₃), Aq v. Muthmann (B. 26, 1016, abstract in 7. J. 62 [11], 324 [1893].

Calcium permanganate. The formula given on p. 186 of vol. iii. is wrong; it should be

CaMn₂O₈.5H₂O.

Polassium permanganate (vol. iii. p. 186). Tivoli (G. 19, 630 [1890]) gives the following as the reactions that occur when pure AsII, is passed into dilute KMnO,Aq.: (1) 2KMnO,Aq.+AsH₁ = K,HAsO,Aq.+Mn₂O₂+ H₂O₃ (2) 2KMnO,Aq.+AsH₂= K₃HAsO₂Aq.+2MnO₂ th.D. Silver permanganate (wi. iii. p. 187).

stiver permanganate (vs. 111. p. 487).

AgMnO, decomposes plowly at the ordinary temperature, rapidly at 100°, and very rapidly at 125° (Gorgeu, U. R. 114, 912; abstract in C. J. 62, 942 [1892]).

Margenous su'phide (vol. iii. p. 188). The pp. produced by adding (NH₄)HSAq to an ammoniacal solution of a Mn salt, after washing in an atmosphere of H.S and drying in CO. at 70°, is MuS; S.G. 17° = 3.55. By heating to 300°-320°, or by leaving in contact with (NII,)HSAq for some days, the reddish MnS becomes green wit out changing its composition; the green form of MnS is crystallific, S.G. 170 = 3.63 (Antony a. Donnini, G. 23 [1], 560 [1892]).

MASRIUM. In 1892 (C. J. 61, 491) Richmond a. Husseinoff obtained indications of the existe ce of an element before unknown in specimens of Egyptian fibrous alums. The suprosed new element gave reactions indicating analogies with Be, Ca, and Zn; the results obtained by decomposing the oxalate by heat led to the at. w. of c. 228. The authors suggested the name masrium, from the Arabic name for Zgypt.

MERCURAMMONIUM COMPOUNDS (vol.

iii. p. 206).

Mercuro-ammonium salts NH_{1-x}Hg_xX (vol. iii. p. 207). Barfoedis cealclusion that these supiii. p. 207). Barfoed's ocalclusion that the sapposed compounds are really mixtypes of mercuricompounds and Hg is sonfirmed by Pesci (G. 21 [11], *69 [1891]). The product of the interaction of HgCl and NH, Aq. described as dimercuro-ammonium chlorider NH, Hg., *l. invol. iii. (p. 208), leaves metallic Hg when treated with ammoniacal (NH,), *SO, Aq. according to P. When the reaction of HgCl with NH, Aq. proceeds out of the light, P. says that the change is 2Hg, Cl., *4NH, Aq. (NHg,), *W,NH, Cl. *2NH, ClAq + 2Hg. S villarly the reaction of NH₂Aq with Hg₂SO, produces a double compound of dimercuro-ammonium sulphate ((NHg₂)₂SO₄, (NK₁)₂SO₅) and Hg; and

(NHg,)NO, NH, NO, and Hg are formed, according to P., when HgNO, Aq is treated with NH, Aq. Mercuri-ammonium salts NH, Hg. X. Regarding the conditions of formation of compounds

of mercuri-ammonium obloride MH-Hg.Cl (vol. Ri. p. 208) with HgCl and NH₄(Hg₂O)Cl c. Balestra (J. 21 [11], 294; abstract in G. J. 62, 276 [1892]).

Dimercuri-ammonium salts NHg.X (vol. iii. 2.209). Pesci (G. 20, 485 [1890]) has examined the onditions of formation of various salts of this class, especially the nitrate NHg, NO, and compounds of this with NH, NO,. The sulphate (NHg.), SO, 2aq was formed by saturating conc. RH,Aq with HgSO,, allowing the solution to evaporate in an atmosphere of NH, over CaO,

and collecting the first orop of crystals; various compounds of (NHg₂)₂SO₂JAith (NH₃)₂SO₄ are also described (v. abstrart in C. J. 60, 208 [1891]).

MERCURY (vol. iii, p. 212). Heycock a. Neville's results (J. J. 57, 376 [1890]) show that some condensation from monatomic molecules perhaps occurs in dilute solutions of Hg in tin. For corrected tables of the vapour pressures of Hg for each 10° from 180° to 480°, and each 1° from 830° to 860°, v. Young &C. J. 59, 629 [1691]).

Jäger (W. 48, 209 [1893]) recommends to prepare pure Hg by converting Hg that has been distilled in vacuo into IIgNO, and electrolysing a solution of the salt, using Pt as isachode and distilled IIg as anode. Shenstone (F. J. 61, 452 [1892]) noticed that IIg adheres to glass when brought into contact with Cl, Br, or I. Montemartini (G. 22, 384, 397, 426 [1891]) finds that the amount of NO produced by the interaction of Hg and HNO, Aq decreases as concentration of the acid increases; that NO2 is produced with acid more cone. than 27.5 p.c. HNO3, HgNO3 is formed with 25 p.c. acid, but Hg(NOs)2 with 50 to 70 p.c. acid; no NII, is formed with 27 and 50 p.c. acid.

Marcurio bromide (vol. iii. p. 215). HgBr, boils at 325°, according to Freyer a. V. Meyer (Zeit. f. anorg. Chemic, 2, 1 [1892]).

Mercurous obloride (vol. iii. p. 215). Harris

a. V. Mey'r have re-determined the V.D. of calomel at 4489 and 518°; the value obtained was 117.5. M. a. M. obtained considerable quantities of Hg and HgCl, by allowing the vapours obtained by heating calomel to c. 465° to diffuse along a glass tube; also by ceating chome at 420° for half an hour in a distillation flask at 33 mm. pressure. By heating calomel to \$40,22002, and bringing a piece of KQH, which had been heated to c. 250%, into the vapou, they noticed that the surface of the KOH at once became cover d with yellow HgO; they also found that a piece of gold leaf held or a moment in the vapour was amalgamated (if kept for some time in the hot vapour the yellow Colour was restored. H. a. M. think their re-sults leave no doubt that the vapour obtained by heating calomel is Hg + HgCl₃, and that the molecular formula of calomel is Hg.Cl₃.

The reaction of Hg₂Cl₂ with NH₄Aq gives (NHg₂)Cl.NH₄Cl and Hg, according to Pesci (v. 1977. MERCURO-AMONIUM SALTS).

Therefrie chloride (vol. iii. p. 217). HgCl, boile at 307° (Freyer a. V. Meyer, Zeit. f. anorg. Themie, 2, 1 [1892]). The white Substance

progress by one reaction of HgCl.Aq with a bilver photographic intege, or with pulverulent Ag, is HhAgCl., according to Jones (S. C. S. 12, 985; abstract in C. J. 66 [11], 188 [1894]).

Marcuffe organide; for an account of the conditions of formation and properties of the clouble merculy-sine cyanide, v. Dunstan (C. J. 63, 668 [1892]).

**double mercury-sine cyanide, v. Dunstan (C. V. 61, 666 [1892]).

**Miceury, haloide compounds of (vol. iii. p. 219). Wells 44m. S. [3] 44, 221; abstract in C. J. 64 [11], 68 [1893]) describes a number of double compounds of mercury and session halides; the compounds belong to the fores (1) Ca.HgX., (2) Ca.HgX., (3) Ca.Hg.I., (4) Ca.HgX., (5) Ca.Hg.X., (6) Ca.Hg.X., (7) Ca.Hg.X., (8) Ca.Hg.X., (9) Ca.Hg.X., (1) Ca.Hg.X., (2) Ca.Hg.X., (3) Ca.Hg.X., (4) Ca.Hg.X., (5) Ca.Hg.X., (6) Ca.Hg.X., (7) Ca.Hg.X., (8) Ca.Hg.X., (8) Ca.Hg.X., (8) Ca.Hg.X., (9) Ca.Hg.X., (9) Ca.Hg.X., (1) Ca.Hg.X., (1) Ca.Hg.X., (2) Ca.Hg.X., (3) Ca.Hg.X., (4) Ca.Hg.X., (5) Ca.Hg.X., (6) Ca.Hg.X., (7) Ca.Hg.X., (8) Ca.Hg.X., (8) Ca.Hg.X., (8) Ca.Hg.X., (9) Ca.Hg.X., (1) Ca.Hg.X., (1) Ca.Hg.X., (1) Ca.Hg.X., (2) Ca.Hg.X., (3) Ca.Hg.X., (4) Ca.Hg.X., (5) Ca.Hg.X., (6) Ca.Hg.X., (6) Ca.Hg.X., (7) Ca.Hg.X., (8) Ca.Hg.X., (9) Ca.Hg.X., (1) Ca.Hg.X., (2) Ca.Hg.X., (3) Ca.Hg.X., (4) Ca.Hg.X., (5) Ca.Hg.X., (6) Ca.Hg.X., (6) Ca.Hg.X., (8) Ca.Hg. ferent halogens.

Mercury hydrosulphide; for experimental attempts to prepare a definite compound, v. Linder a. Picton (C. J. 51, 123 [1892]).

Mercury phosphide (vol. iii. p. 223). By heating Hg and PI, in a scaled tube for many

hours at 275°-300°, and removing HgI, by treatment with KIAq, Granger (C. R. 115, 229 [1892]) obtained Hg.P. in lustrous, metal-like, hexagonal crystals, appearing red by trans-mitted light; and giving a brown powder. The compound gives Hg and P when heated; heated in air it burns; detonates when mixed with KClO, and struck; burns in Cl; dissolved by aqua regia.

Mercutous sulphide (vol. iii. p. 224). Antony a. Sestini G. 24 [1], 193 [1894]) obtained a black powder by passing dry H.S., diluted with CO, over dry Hg,Cl₂ or Hg(C,H₂O₂), kept at -10°; when freshly prepared the black powder was scarcely changed in dry IsCl at -18°, but at a somewhat higher temperature (below 0°) Hg,Cl₂ was quickly formed. The substance dissolved in cold K,SAq or Na,SAq, but when temperature rose above 0° the solution became turbid and ppd. Hg. A. a. S. think their results show that Hg,S exists at low temperatures (abstract in C. J. 66 [11], 318 [1894]). in C. J. 66 [11], 318 [1894]).

Mercury sulphochloride (vol. iii. p. 225).

in C. J. 66 [11], 318 [1894]).

Mercury sulphochloride (vol. iii. p. 225).

The compound 2HgS.HgCl, is formed, according to Colson (C. R. 115, 657 [1892]), by passing H.S into a solution of HgCl, in dry benzone.

MOLYBDENUM (vol. iii. h. 421). Smith a. Maas (A. C. J. 15, 897 [1894]) obtained the nean value 95*85 (O = 15*96) hr the at. w. of Mo. by heating Ng.MgO, in a surrest of dry HCr and weighing the NaCl that remained (MoO, 2Hcl and H.O were formed, and semocal). Smith a. Oberholtzer (Zeit. f. anorg. Chemie, 63 [1893]) say that a mixture of MoOC', and Mo(CO)@, is formed by heating Mo to 150°—200° in CoCl.; and that Mo.S.Cl., is yu.duced by heating Mo to endness in S.Cl., Mo is said to ppt. Ag from AgNO,Aq, Av from AuCl,Aq, HgCl and then Hg from HgCl,Aq, and Cu farm solutions of its salts (Smith, Zeit. f. anorg. Chemie, 1, 860 [1891]). Montemartini (G. 22, 284, 897, 426 [1891]). Montemartini (G. 22, 284, 897, 426 [1891]) finds that no NH, is formed in the interaction of Mo and HNO,Aq with from 3 to 70 pc. HNO; the most vigorous action occurs with acid c. 50 p.c., but the whole of the metal is not wideed of MoO, a nitrate being probably formed; the gaseous products are MO and NO, the quantity of NO decreasing as the concentration of the soid increases.

Molystenum, carbides et. By heating a mixture if MoD, and charcoal in the electric furnace, doisean (C. R. 116, 1225 [1898]) obtained a very hard carbide, containing from 977 to 979 p.c. C; S.G. 86.

Molybdenum sesquioxide (vol. iii. p. 431). Heating Mo.O. in NO produces MoO. (Sabatier a. Senderans, C. R. 114, 1429 [1892]). Molybdenum trioxide (vol. iii. p. 432). MoO. partially volatilises, and is partially reduced to one of the blue oxides, at c. 1750° (Read, C. J. 65, 818 [1894]). According to Smith a. Oberholtzer (Zmit. f. anorg. Chemie, 4, 236 [1898]), the products of heeling MoO, in HBr are (1) MoO, 3HBr, and (2) Mo,O,Br.; when HI is blue oxide Mo₂O₃: raq is formed; HF at 300°-400° forms Mo₂O₃: R₄(v. abstract in C. J. 64 [11], 471 [1893]). Cammerer (Chem. Zeit. 15, 957; abstract in: C. V. 62, 944 [1892]). says that 2MOO, H.O. H.O. is formed by boiling MoO, with H2OzAq.

Molybdenum, oxybromides of (vol. iii. p. 438). Smith a. Oberholtzer Weit. f. anorg. Chemie, 4, 236 [1892]) describe Mo.O.Br.; square plates, color of KMnO. Formed, along with McO.3HBr, by heating MoO. in HBr.

Molybdenum, oxyclfforides of (vol. iii. p. 438) For the products of the interaction of MoO.C., and NH., v. Smith a. Lehner (Zcit. f. anorg. Chemic, 4, 374; abstract in C. J. 64 [11], 529 [1893]).

Molybdenum, oxyeganide of. By dissolving MoO₂ in KCyAq, and adding a strong-acid, Pechard (C. ll. 118, 804 [1894]) obtained MoO₂Cy₂. Easily decomposed by contact with MoO₂Cy₂. acids; double compounds with KCy and AgCy are also described.

Molybdenum, oxyfluorides of (vol. iii. p. 483) for Mo,O,F, a white, crystalline, deliquescent solid, obtained by heating MoO, in HF at 300°-400°, v. Smith a. Oberholtzer (l.c.).

Molybdenum, thiochloride of. For Mo.S.Cl.,

v. S. a. O. (l.c. 5, 63).
Molybdates, and derivatives thereof (vol. ili. p. 123). For compounds of molybdates of MI, and K with SO₂ and SeO₂, v. Péchard (C. R. 116, 1441; 117, 104; abstracts in C. J. 64 [1] 530 [1893]).

Permolybilates. By the reaction of H₁O₂Aq with K₂Mo₂O₁₀Aq, Péchard (C. R. 112, 720; abstract in C. J. 60, 988 [1891]) obtained potential permolybilate K₂Mo₂O₃, 4qq; the correspondent of the correspondent sponding NH, salt was also formed.

sponding NH, salt was also tormed.

Arseno-molybelates (vol. iii. p. 425). For salts of this class, v. Frighteim (Zeit. f. anony. Chemie, 2, 314; 6, 11, 27; abstracts in C. J. 64 [11], 283, 66 [11], 238 [1893-4]).

Iodonoifibelates. A great many salts of the form aMoO, yI, Q. 2MO are described by Blomstrah (Zeit. f. anory. Chemie, 1, 10; abstract in C. J. 64 [13], 122 [1893.]).

Phosphomolybelates (vol. iiis p. 426). Friedheim (Zeit. f. anory. Chemie, 3, 275; 6, 11, 27; abstracts in C. J. 64 (11], 472 9 66 [11], 288 [1893.4]) describes several salts of this class.

Fluomolybelates (vol. iii. p. 425), v. Piccini (Real Acad. Lincei, 7 [1], 267; abstract in C. J. 62, 44 [1892]), and Mauro (l.c., 1692 [1], 194; abstract in C. J. 64 [11], 124 [1893]).

MICKEL (vol. iii. p. 498). The at. w. has been re-determined (1) by Schützerloerger, by reducing oxides of Ni in H (C. R. 114, 1149 [1892]); (2) by Winkler, by estimating Cl in NiCl, prepared from electrolytically deposited Ni. (Lett. f. anorg. Chemie, 4., 10 [1893]). Schützenberger's values varied from 58-52 to Nick. (Wildland men value from 58-52 to 19.8: Winkler's mean value from the gravimetric determinations was 58.903, and from the volumetric determinations 58.910 (Cl = 35.37, Ag = 107.66). Kriiss a. Schmidt (Zeit. f. aporg. Chemie, 2, 235 [1892]) insist that the substance called nickel is not an element, but Winkler (l.c.) controverts this sty tement (v. abstracts in C. J. 64 [11], 212, 469 [1893]). The molecule of Ni in dilute solution in tinis probably monatemic (Heycock a. Neville, C. J. 57, 376 [1890]). Scautzenberger (Cc R. 113, 177 [1891]) says that a volatile compound is formed by passing dry HCl over finely divided Ni heated to dull redness. Montemartini (G. 22 [1], 250; ab Aract in C. J. 62, 1278 [1892]) gives the quantities of NH_s, N_sO, N, and HNO₂ (no NO) produced by the reaction of excess of HNO₃Aq (27.5 p.c.) with Ni. Heated to 200° in NO, the oxule NiO is NI. Heated to 200° in NO, the oxide NIO is formed without any Ni₂O₃ (Sabatier & Sandarens, C. R. 114, 1429 [1892]). Be epassing NO₃, diluted with N, over reduced Ni, nitro-nicket (? Ni₂NO₂) is obtained; it resembles nitro-cobalt

(gr.w., p. 908) (S. a. S., Bl. [3] 9, 669 [1893]).

Nickel carbonyl Ni(CO), (Nickel carbonoxide, vol. iii. p. 501.3 Mol. w. was confirmed by Mond a. Nasıni (Z. P. C. 8, 150 [1891]), by finding the depression of the freezing-point of benzene. S.G. 1.35613 at 0°, 1.27132 at 36° (water at 4° = 1); S.G. at b.p. = 1.25406; molecular volume = 186.04; critical temp. = 151°. For some reactions v. Berthelot (C. R. 112, 1343; abstract

in C. J. 60, 1427 [1890]).

Nickel, chloride of (vol. iii. p. 501). volatile substance, decomposed by heating, is said to be formed by passing dry HCl over dry NiCl, at dull redness (Schützenberger, C. R. 118, 177; v. abstract in C. J. 60, 1429 [1890]). Chassevant (A. Oh. [6] 30, 5 [1893]) describes the double compounds NiCl, AmCl. 6aq and

NiCl, L'Cl. 3aq.

Nickel, fluoride of (vol. iii. p. 502). Poulenc 'Q. R. 114, 1426 [1892]) obtained amorphous NiF, by heating NiCl, with excess of NH,F, and washing away NH,Cl with boiling alcohol; by heating in HF to 1200°-1300°, the amorphous MIF, became crystalline, forming green crisms, S.G. 4'63, not acted on by warm INO₂A₁, HOlAq, or H.SO.Aq. Heated in air, NiF, gives NiO; heated with S it gives NiS; and with H iPis reduced to Ni (for other reactions, v. abstract in C. J. 62, 1159 [1890]. The double salt NiF, KF is formed by heating NiCl. with KHF, and washing away KCl by water (F., C. R. 114, 746 [1892])

Nickal monoxide (vol. iii.). 502). NiO malts and forms green crystals in the dectric furnace (Moissan, C. R. 115, 1034 [1892]). NiO occludes small quantities of N and O (Richards a. Rogers, P. Am. 4, 28 200 [1992]).

P. Am. A. 28, 200 [1893]).
Nickel sesquioxide (vol. iii. p. 502). Ni.O. fuses, gives up all its O, and leaves Ni at c. 1750 (Read, O. 1.55, 313 [1894]).

Nickel peroxide (vol. iii. p. 503). Campbell

3. Trowbridge (J. Anal. and App. Chem. 7. 301;

abbtract in C. J. 86 [11], 288 [1894]) conclude that an oxide with more O than M.O. can be obtained by ppg. NiSC, Aq by Ma, CO, Aq in presence of Br at different temperatures.

Mickel monosulphide (vol. iii. p. 508). Regarding the oxidation of this galt in air, to NiSO, 6NiO, 40., v. P. de Clermont (C. R. 117; 229; abstract in C. J. 64 [11], 528 [1894]).

NYOBIUM (vol. iii. p. 505). Nb O, sise not changed at c. 1750° (Reads C. J. 55, 313 [1894]). Piccini (Zeit. f. anorg. Chemie, 2, 21 [1894])
las Prepared potassium fluoxyperniobate

bO.F. 2KF. aq.

NITRAMIDE NG₂(NH₂). Thiele a. Lachman B. 27, 1909 [1894]) obtained this compound by throwing NO₂.NK.CO₂K (potassium nitro-car-bamate) into a mixture of ice and excess of II.SO., exfracting with ether, and evaporating in a stream of air. Crystall #8s in clear prisms, which melt at 72° with decomposition; decomposed instantly to N.O and H.O by alkalis, alkali carbonates, borax, or Na acctate.

NITRATES (vol. iii. p. 509). Rodsseau a. Tite (C. R. 1!5, 174 [1892]) find that many basic nitrates are completely decomposed by heating with water at 150°-200°. Regarding Regarding negaring with water at 100-200. Regarding the formation of basic nitrates of Cd, Ca, Ni, and Zn, v. R. a. T. (C. R. 114, 1184); Riban (C. R. 114, 1357); and Werner (C. R. 115, 169); (abstracts in C. J. 62, 1156, 1157, 1276 [1892]).

NITRIC ACID [vol. iii. p. 517]. Pagazding

NITRIC ACID (vol. iii. p. 517). Regarding the colours produced by diluting ced fuming HNO₂Aq v. Marchlewski (B. 24, 3271 [1891]). For revised tables showing the composition of HNO, Aq of different concentrations v. Lunge a. Rey (S. C. I. 1891. 543). Regarding the magretic rotations of HNOsAq v. Perkin (S. J. 63, 57 [1893]). Hall (Am. 13, 554) has examined the rate of production of H and O, and the effect on the concentration of the acid, by the slow and steady electrolysis of HNO₃Aq (abstract in C. J. 62, 680 [1892]). The interactions of HNO, Aq with many metals have Joen examined by Montemartini (G. 22 [1], 250, 277, 384, 397, 426 [1891]; abstracts in C. J. 62, 1278, 1402 [1892]), Veley (S. C. I. 10, 206; and elsewhere), and

Veley (S. C. I. 10, 206; and elsewhere), and others; the results are noted under various metals. Pickering (C. J. 63, 436 (1893)) has isolated the hydrates HNO, H,O and HNO, 3H₂O; the fraczing points of HNO, eq. from 1-82 to 86:19 p.c. HNO, are given by P.

NITHOGEN (vol. iii. p. 556). S.G. of N. Lark = 1) = 97209; 1 litre weighs 1-25749 g. ξ_1 Ray-light, P. ξ_2 3, 434 (1893)). μ_D = 1-2053 at = 190° (liquid N. containing 5 p.c. O) (Liveing a. Dewar, P. M. [5] 36, 929 (1893)). Absorption coefficient in alcohol, w Henrich (Z. P. C. 9, 435 (1892)). Diffusion in water, v. Dunc. n. a. Hoppe-Seyler (Zeit. physiol. Chemia, 17, 147 (1893)). Preparations of pure nitrogen. Threlfall

Preparations of pure nitrogen. Threlfall (5: M. [5] 35, 1 [1893]) gives minute directions for preparing pure N by passing air and NH, www. hot Cu, and absorbing traces of 9 by CrCLAq; exact directions for preparing the CrCl.Aq are given, and the paper contains numerous details regarding the purifications of the

reagents used in the process. Supposed allotropic form of Atrogen. Threlfall (i.c.) has repeated experiments on sparking extre. sly ours N (u vol. iii. p. 557); no condensat on occurred down to -10° and c. 8 mm. pressure, but when Hg is present a compound of N and H is formed (probably Hg,N, v. vol. iii. p. 221). Regarding the fixation of nitrogen growing plants, H Beyerinck, also Sohloesing a. Laurent (abstracts in C. J. 62, 1019, 1021

Nitrogen, hydrides of (volt dii. p. 559).

Hydragoic acid N.H. For new methods of preparing N.H v. Curtius. (B. 24, 334; 26, 1263; abstracts in C. 7. 62, Fi.2; 64 (11], 463 (1892-3)).

Wislicenus (B. 25, 2084 [1892]) has obtained N.H by the interaction of N.H, and N.O.F. From § 5. to § 8. Na is heated in a stream of N.H, until all is converted into Kanh.; a current of Nr. N. of them presed over the Nanh.; at 150. dry N₂O is then passed over the NaNH₂, at 1502–250° as long as NH₃ is given off (2NaNH₂ + N₂O = NaN₃ + NaOH + NH₃). By dissolving the product in water, filtering, decomposing by dilute H₂SO₂Aq, and distring, N₂HAq is obtained.

The following salts are described by Curtius

(B. 24, 3341; abstract in C. J. 62, 112 [1892]): (NH₄)N₃ Pb(N₃)_v, HgN₃, NaN₃.

Nitrogen, iodides of (vol. iii. p. 560). Di-iodamine, NHI, is the product of adding excess of NH₂Aq to a conc. solution of I in conc. KIAq; by suspending NHI₂ in water, and adding an ammoniatal solution of AgNO₂ or Ag₂O₃ a black compound NAgI₂ is obtained which explodes when dry (Szuhay, B. 26, 1933; abstract in C. J. 64 [11], 568 [1893]; cf. Selivanoff, B.

in C. J. 64 [11], 568 [1893]; cf. Selivanoff, B. 27, 1012; obstract in C. J. 66 [11], 312 [1894]).

Nitrout oxide (vol. fit. p. 561]. Ramsay a. Shields (C. L. 63, 833 [1893]) give the m.p. of N₂O as -102·3°, and the b.p. as -80·8°. Villard (C. R. 118, 1096 [1894]) gives the following data for the S.G. of liquid N₂O: 9105 at 6°, 885 at 5°, 856 at 10°, 804 at 17·5°, 720 at 26·5°, 640 at 32°, 605 at 34·9°, 721 at 36·3°. Liveing a. Deway (P. M. (5) 34, 205 [1892.) give Liveing a. Dewar (P. M. [5] 34, 205 [1892]) give

$$\frac{\mu_0 - 1}{d} = 2634$$
, and $\frac{\mu^2 - 1}{(\mu^2 + 2)d} = 163$ at -90° .

Smith (S. C. I. 11, 867; 12, 10 [1893]) says that a regular stream of N₂O is obtained by heating to 240°-250° a mixture of 1 pt. dry NaNO, with c. 13 pt. dry (NH.),SO. By passing N₂O, mixed with a little H, over Pd black, the H is entirely converted to H,O, with formedion of N (Montemartini, Real. Agad. Lincoi, 7 111, 219 [1892]).

Nitric oxide (vol. iii. p. 562) Very pure NO obtained, according to Emily (V. 13, 73 (1897), by the interaction of copper and a mixture of H.SO, and HNO, Aq. Emich (i.e., p. 78) finds that NO is completely decomposed to and O by passing over netsoof Pt 8: Pel wire Rept ver? hot by an electric courent. Emich (L.c. p. 86) says that NO and O unite after being dried by long contact with P.O.; but Baker (C. J. 65, 611 [1894]) finds that dry NO and dry O do not combine at the ordinary temperature. Segarding the reactions between NO and metals and metallic oxides, v. Sabatier a. Sendering (C. R. 114, 1429; 1476; abstracts in C. J. 62, 1151, 1271 [1892]; results are noted under the different metals and oxides in Addenda).

Nitrogen rioxide (vol. iii. p. 565). For the reactions of N), with various metals and oxides v. S. s. C. (30.R. 115, 286; abstract in CaJ. 62, 1890 [1892]; results are noted unlar the different motals and oxides in Addended. different metals and oxides in Addenda).

Nitrogen tetroxide (vol. Mi. p. 565). For preparation of N.O., v. Cundall (C. J. 59, 1076... [1891]). U. (l.c.) has measured the dissociation of liquid N.O. in CHCl, up to c. 25°; Ostwald (C. J. 61, 242 [1893]) shows that the dissociation follows with the dissociation of the control of the

(C. J. 61, 242 [1892]) snows that the dissociation follows van't Hoff's law for dilute solutions. Mitrau, and (vol. iii. p. 567). Regarding the formation of HNO, in solution in HNO, p. Veley (Pr 52, 27; abstract in C. J. 04 [11], 413 [1893]). [1893]).

Hyponitron acid (vol. iii. p. 568). Tanata, (J. R. 25, 342; abstract in C. J. 66 [11], 186 [1894] propared Ag, N, O, by adding CaO to fairly conc. KNO, Aq is the latic CaO: KNO, then an equivalent of solid NH₂OH.HCl, heating to 50°, letting stand for a few days at the ordinary temperature, diltering, acidifying with acetic acid, ppg. by AgNO₂Aq, dissolving Ag₂N₂O₂ in HNO Aq (which leaves AgCl), and ppg. again by

OSMIUM '(vol. iii. p. 641). Os fuses readily in the electric are in a carbon capsule; when fused it has a constalline fracture, and

(John a Vezes, C. R. 116, 577 [1893]).

Osmic action (vol. iii. p. 646). Moraht a.

Wischin (Zeit, f. anory Chemic, 3, 163; abstract
in C. J. 64 [11], 880 [1893]) say that the black powder obtained by the interaction of acider and K₂OsO₂Aq (vol. iii. p. 645), when dried over P₂O₃ in vacuo till inceases to lose weight, is osmic acid H₂OsO₃. M. a. W. describe the is osmic acid H₂OsO₁. M. a. W. describe the compound as a sooty black powder, smelling of OsO, in moist air, but unchanged under water containing alcohol. By passing H2S over Os O.S. H.O is formed. Heated with conc. HClAq for many hours with a little alcoholy and evaporated, Os C. 7. was obtained; an alcoholy is gethern of this authorises. alcolodic solution of this substance with KClAq gave K, OsCl, and the filtrate yielded OsCl, 3aq: the substance Os,Cl, is therefore supposed by M. a. W. to be a mixture of OsCl, and OsCl. By heating H, OsO, with HIAq, violet black crystals, probably OsI, were obtained. No action occurs when Os is heated with I, or with Br.

Potassium osmiamate (vol. iii. p. 645). (C. R. 112, 1442 [1891]) prepares this salt dissolving 100 pts. OsO, in a solution of 100 pts. KOH in 50 pts. H₂O, keeping the solution at c. 40°, and adding 40 c.c. NH₂R₂; after a time the brown liquid becomes colourless, and time the brown liquid becomes colourless, and yellow crystalline pp. is formed. J. gives the formula KNOsO₃ to this salt. Heated in vacuo it is rapidly decomposed above 200°, and at 440° almost all the N is given off, the salt products being K₂Co₂, OsO₂, and KOsO₃ (v. abstract in C. J. 60, 1433 [1891]).

OXIDES (vol. iii. p. 658). Regarding the connections between the stability of oxides when heated and the periodic classification of the

connections between the stability of oxides when hested and the periodic classification of the eliments, v. Bailey (C. J. 65, 106, 321 [1894]).

OX TOEN 4701, iii. p. 703). Atomic weight of oxygen (vol. iii. p. 705). Distinar a. Henderson (C. N. 37, 127, 138, 151, 164; abstract in C. J. 64 [11], 410 [1893]), from careful determinations made by passing H over hot DuO, and religing the water and Cu prodlead, adopt the value 15-87 for the at. w. of O. By measurement of the combining volumes of O and H. combined the combined the combined that the combined the combined the combined that the combined the combined that the combined the combined that of the combining volumes of O and H. combi

ning the results with Rayleigh's determination of the S.G. of O. Scott (T. F34, 548 [1898]) got the value 15·862. The following values summarise the most recent determinations (v. D.c., H., L.c.), Cooke a. Richards, 15·868; Noyes, 15·885; Rayleigh (Pr. 45, 425 [1890]), 15·89; Keiser, 15·949; Ledue (C. R. 146, 1948 [1893]), 15·88; D. a. H., 15·87; Scott, 15·862, The value adopted in this Dictionary, 15·96, is almost certainly too high; the Lican of the values obtained by C. a. R., N., R., D. a. H., and S., is 15·875.

The ratio of the combining volumes of O and H was determined by Scott (l.E.) to be 2 00245:1 (v. Water, this vol. p. 861). S.G. of O referred to H = 15 882 (Rayleigh, Pr. 50, 448 [18/2]). For an examination of the whole of the spectrum of O, v. Eisig (W. 51, 747: abstract in C. J. 66 [11], 265 [1894]). Liveing a. Dewar (P. M. [5]

84, 205 [1892]) determined $\frac{\mu_0-1}{d}$ to be 1389, and $\frac{\mu^2-1}{(\mu^2+2)d}$ to be 1265, at -182° (cf. Olszewski a.

Witkowski; abstract in C. J. 64 [11], 853 [1893]). For diffusion of O in water, a Duncan a. Hoppe Seyler (Zeit. physiola Chemie, 17, 147 (1892]).

Regarding the division of O between H and Or when mixtures of these gases are exploded, v. Harker (Z. P. C. 9, 673 [1892]). Dry O does not combine with dr. NO at the ordinary temporature (Baker, C. J. 65, 611 [1894]); nor with dry K or Na, even when these metals are distilled

ir the gas (Holt a. Sims, C. J. 65, 440 [1894]).

OZONE (vol. iii. p. 788). Regarding the conditions of exemination of exygen, v. Shenstone a. Pries. (C. J. 63, 938 [1893]). Baker (C. J. 65, 611 [1894]) confirms the observation of Shenstone a. Cundall (C. J. 81, 610 [1887]) that day O is ozonised as rapidly as moderately diy O.

PALLADIUM (vol. iii. p. 792). The at. w. of Pd has been re-determined (1) by Bailey a. Lamb Pd has been re-determined (1) by Bailey a. Lamb (C. J. 61, 746;1892), by analyses of Pd(NH,Cl); (2) by Keller a. Smith (Am. 14, 423 (1892)), by,ppg. Pd elettrolytically from a solution of Pd(NH,Cl); in NH,Aq; (3) by Joly a. Leidić (C. R. 116, 146, 14893)), by electrolysing K,PdCl, in HOlAq; (4) by Keiser a. Breed (Am. 16, 20 (1894)), by determining the ratio of Pd to Cl in Pd(NH,Cl). B. a. L. obtained the value 105 459; K. a. S. the value 106 35; J. a. L. the value #95 665; and K. a. B. the value 106 37. and K. a. By the value $106^{\circ}27$ (Cl = $35^{\circ}27$; Ag = $107^{\circ}66$; N = $14^{\circ}01$; O = $15^{\circ}96$). The molecule of Pd in dil te solution in tin is probably monatomic (Heycock a. Neville, C. J. 57, 376 [1890]). Regarding he preparation of pur Pd, v. the memoirs referred to supra. Pd absorbs O at 450°, forming Pd.O (Neumann, M. 18, 40 [1892]), but when Pd sponge f: heated in city O till the weight is constant Pd.O is formed (Wilm, B. 25, 220 [1892]). Heated to 20° in NO. Pd. sponge that has been saturated with H becomes incandescent and the NO is completely changed to H₂O and NH₂, but oridation of the Pd does not occur (Sabatier a. Jenderens (C. R. 114, 1429 [1892]), Regarding palladium sulphides, v. Petrenks Aritschenko (Zeit. f. anorg. O'emte, 4, 247; abstract in C. J. 64 [11], 475 [1898]). Phosphopalladous compounds, PdCl.POl. and

Pddi, P(OH),, are described by Fink (C. H. 139, 170; abstract in C. J. 69, 1985 [1992]. Verse (C. R. 115, 111) describes polyseium palladosochiorcuitrite K.Pd(NO₂), Cl. (abstract in C. J. 39, 1804 (1994).

PHOSPHATES (vol. iv. p. 106). Rossel a. Frank (B. 27, 52) say that P is obtained by heating NgPO₂₅ or any phosphate of Ca or Mg, with Al in a current of H.

Al in a current of H.

Dipotassium-hydrogen orthophosphate (vol. 1. p. 111). According to Standenmaier (Zeit?f. anorg. Chemie, 5, 883 [A898]), K.Hl'O, cannot be isolated. S. (f.c.) describes acid safts, K.H.(PQ.), aq, K.H.(PQ.), 2aq, and K.H.(PQ.), Thorium orthophosphates (vol. iv. p. 112). Velok (Zeit. f. anorg. Chemie, 6, 101 [1894]) obtained Th(HPQ.), aq by adding dilute H.PO.Aq to ThCl.Ad.

to ThCl,Aq. Sodium pyrophosphate (.St. sv. p. 114). For a study of the reaction of HClAq with Na,P.O, v. Watson (S. C. I. 11, 224; abstract in C. J. 64

Watson (S. C. I. 11, 222; austrace in C. 11], 272 [1893]).

ORTHOPHOSPHORIC ACID (vol. 67, p. 125).

According to Watson (C. N. 68, 199 [1893]), H,PO, is changed completely to H,P,O, at 255°–260°, and HPO, begins to form at 290°–300°.

PHOSPHORUS (vol. iv. p. 120°). Regarding the complete state of continuous phoses.

the action of light and heat on ordinary phosphorus, v. Retgers (Z. P. C. 5, 211; abstract in

C. J. 66 [11], [1894]).

Phosphorus hydride (vol. iv. p. 136). PII, and O react at a low pressure to form H₁PO. (2PH₂+3O₂=2H₂PO₃); when the gases are allowed to diffuse with one another at less than 50 mm. pressure, the reaction is PH₃+O₂=H₂+HPO₂; slow oxidation at greater pressures proceeds approximately according to the equation $4PH_1 + 5O_2 = 2HPO_2 + 2M_3PO_2 + 2H_{2e}$ (H. J. van de Stadt, Z. P. C. 12, 322 [1893]). According to van de S., explosion occurs at a certain low pressure, and this pressure depends much on the amount of moisture present, the moisture preventing and retarding the explosion. Rovij preventing and retarding the explosion. Rövij (Z. P.-C. 12, 155 [1893]) has examined the rate of decomposition of PH₂ by heat. For the reaction of PH₃ with AgNO₂Aq v. Vitali (abstract in C. J. 64 [11], 206 [1893]). Phosphoric opide (vol. iv. p. 141). For de tails regarding the preparation of pure P₂O₃, and for methods of detecting traces of P in P₂O₃, v. Threlfall (P. J. 65] 35, 14 (1893)). Phosphorus suboxide (vol. iv. p. 189). Phosphorus suboxide (vol. iv. p. 189). Rival (B. 27, 1257 [1894]) thinks that P₄O is formed by the retardition of P₂O₃ and NH...

(B. 27, 1257 (1894)) thinks that P.O is formed by the interaction of P.O. and NH..

Phosphorus, sulphides of (vol. iv. p. 145). Helfi (Z. F. Q. 12, 809 [1893]) confirms the statemant that there are no definite compound P.S and P.S.; by heating together red P and S, he obtained P.S., P.S., P.S., and P.S.,

Phosphorus sulphicodide of. Ouvrard (C. R. 145, 1801; abstract in C. J. 64 [11], 164 [1893]) obtained P.S. by seventy are a solution of the there.

1202; also by evaporating a solution of the three elements in the proper proportion in CS, and heating the residue to 120° in an inert gas; also by dissolving I as a solution of P,S, in CS. The giving P.O., SO, and P; at c. 300° in prouvit

leparates into I and P.S.; decomposed by hot water, and explasively by fuming HNO.

Potassium hypophosphates (vol. iv. p. 153).
Bansa (Zeit. f. anorg. Chemic, 6, 128 [1894]) lescribes many double salts of K.H.P.O. with MH.P.O. where M = Cd. Co. Cu.Mn. Ni, or Zh.; ilso double salts MK.P.O., where M = Co or Ni. The double salts K.Na.P.O. 2aq is also described abstract in C. J. 66 [11], 279 [1894]).

Thallium hypophosphates. Joly (C. R. 118, 549 [1894]) obtained the normal sults Ti.P.O., and the acid salt Ti.H.P.O. (abstract in C. J. 56 [11], 282 [1894]).

PLATINATES (vol. iv. p. 281).

Sodium thioptatinates. Schneider has obtained the salts Na.PtS. and Na.S.PtS.2PtS. [J. pr. [2] 48, 411 [1894]).

Platino-oxalias (vol. iv. p. 285). Regarding

Platino-oxalines (vol. iv. p. 285). Regarding the constitutional fermulae of the K salts, v. Werner (Zeit. f. anorg. Chemie, 3, 267), and Söderbaum (ibid. 6, 45 [1894]).

PLATINUM-AMMONIUM COMPOUNDS (vol. iv. p. 292). Petersen (Z. P. C. 10, 580 [1892]) finds, from cryoscopic determinations, that most of the formulæ generally used for these compounds are molecular. For a discussion of the constitutions of several classes of these compounds, and for measurements of the electrical conductivities of aqueous solutions of some of them, v. Werner a. Miolati (Z. P. C. 12, 35

POTASSIUM (vol. iv. p. 297). Holt a. Sims (C. J. 65, 452 [1894]) found that K became soft at 54.5°, and remained soft to 60.5°, whereat it became brittle; complete melting occurred at 62.5 H. a. S. say that dry K may be distilled in dry Q without the formation of any compound of the two elements. They found the products of the oxidation of K to be K₂O₂, K₂O₃, and finally K.O₄ (v. Oxides, infra). Mixtures of KNO₂ and KNO, were formed by oxidising Kin NO and in the red oxides of N.

Potassium amide (vol. iv. p. 299). Titherley (C. J. 65, 504 [1894]) says that KNH, is white and wax-like, melting at 270°-272°. It may be distilled without change in H at 400°-500°. T. says that KNH, is not decomposed by heat-It says that KNH₂ is not excomposed by heating at c. 400° in a sliver boat; if a glass vessel is used, NH₂ is given off with some N and H, and K silicate is formed; a mall amount of tecomposition occurre in a silver boat at c. 500°, and at a full red beat the amide distils with

and at a full red heat the amide distils with partial splitting up into its elements. For other reactions of KNH,, v. T. (Lc.).

Potassammonium (vol. iv. p. 299). Joannis (C. R. NS, 713 [1894]) finds that there is no reaction between N and N.H.K., he says that N.O. produces KeH., NH,, KCH, and N. For the action of O. v. J. (C. R. 116, 1870; abstract in C. J. 64 [11], 462 [1893]).

Potassium bromide (vol. iv. p. 299). The nelling-point is given as 315° by V. Meyers. Riddle (B. 26, 2443 [1893]).

Potassium chloride (vol. iv. p. 300). Melts at 766°, according to M. a. R. L.C.).

Potassium hydroxide (vol. iv. p. 802). Melts at 1045° (M. a. R., Lc.).

Potassium chloride (vol. iv. p. 303). Melts at 128° (M. a. R., Lc.): Regarding the interaction of KlAq and FeCl. Aq. v. Ferrance ognorus, iddlenda, p. 913.

Iddenda, p. 913.

Potagium tri-fodide (vol. iv. p. 804).
'Jakovkin (Z. P. C. 13, 539 [1894]) has made an examination of the dissociation of KI, in aqueous solution to KI, and IAq (abstract in C. I. 66 [11] 271 [1898])

C. J. 66 (11), 271 [1891]).

Polassium nitride (vol. iv. p. 304). The experiments of Titherley (C. J. 65, 512 [1894]) show that K,N does not exist.

Potassium oxide (vol. iv. p. 304). Holt.a. Sims (C. J. 66, 432 [1894]) failed to obtain the monocide K.O by any of the methods said to give this compound, but they say that when K.O. is kept at a redehent & loses O and gives a substance the composition of which approaches that of K.O. By heating K in a fairly dry mixture of oracle. By heating K in a fairly ary mixture of O and N, oxidation proceeded until K,O, was formed (dry O is without action on K); when kept in water-vapour K,O, gave off O, and formed K,O,; and by heating K in N,O, H. a. S. obtained K,O, which on exposure to air became K O. K,O.

RUBIDIUM.

Rubidium haloid compounds (vol. 1v. p. 418). Wheeler (Am. S. [3] 46, 88 [1893]) has prepared wheeler [Am. S. [3] 46, 88 [1893]) has prepared double company of the forms 3RbX.AsX, and RbX.As.Q₄; and (l.c. n. 269) various compounds of RbX with SbX_v. For physical properties of various salts of Rb, v. Erdmann, Ar. Ph. 232, 8 (abstract in C. J. 66 [11], 351 [1894]).

SELENATES (vol. iv. p\$436). Basic salts of Co and Cu are described by Bogdan (Bl. [8] 9, 584; abstract in C. J. 66 [11], 16 [1894]); the compositions given are 4CoO.3SeO, aq ad 3CuO.2SeO, 4aq.

SILICON CHLORIDES (vol. iv. p, 458). In B. 27, 1943 [1894] Gattermann a. Weinlig detail the best conditions for peoparing SiCl, SiHCl, and Si₂Cl_a, from crude & obtained by the interaction of SiO_2 and Mg powder (v. vol. iv. p. 455). Si_2Cl_a melts at -1° ; with NH_2Aq it gives off **H** and forms SiO_2xH_2O (O. a. W., l.c.).

Silicon octochloride Si Cl. Mol. w. 366.9. Vab. 187.7. Obtained by G. a. W. (l.c.) by fractionating crude Si chlorides; boils from 210° to 215° ; does not solidify at -12° .

SILVER (vol. iv. p. 464). The molecules Ag in dilute solution in tin is probably monatomic (Heycock a Neville, O. J. 57, 376 [1890]). According to Lüdtke (W. 50, 678; abstract in C. J. 36 [11], 92 [1894]), thin deposits of Ag on the control of the control glass, mica, &c., are allotropic forms of the metal. Regarding alloys of Ag with cadmium, v. Heycock a. Neville (C. & 65, 65 [1894]); s. also Mylius a. Fromm (B. 27, 630 [1894]).

Silver chloride (volv iv. r. 468). By the action of EgCl.Aq on pulverulent silver, Jones.

action of TgCl.Aq on pulverulent silver, Jones. (S. C. J. 12, 983; dbstract in C. J. 66 [11], 188 [1904]) obtained the compound AgrigCl₂.

SODIUM (vol. iv. p. 473). The molecule of sodium in fillute solution in the probably monatomic Haycock a. Newille, C. J. 57, 376 [1890]). Holt a. Sims (C. J. 65, 440 [1894]) found that dry sodium may be distilled unchanged in dry 0; modium y 0 the products a limited volume of N.O forms Na,O; heating in N.O or the red exides of N. produces a mixture. NO or the red oxides of N produces a mixture of NaNO, and NaNO, (H. a. S., I.o.).

ledium amide (vol. 1v. p. 475). Eitherley (C. J. 65, 504 [1894]) describes Natvil, as a white, transparent solid, with a crystalline struce white, transparent solid, with a crystalline struce ture; softens at 149°, and is completely melted at 255° to a colourless liquid. NaNH, is obtained in transparent, crystalline speeder by heating Ra in NH, at 8. 400°, allowing the product to sublime through a narrow tabe, and again subliming by warning gently. NaNH, decomposes at a red heat into Ra, N, and H. It does not give NaN, as generally stated (T., l.c.): no decomposition occurs at 300°, 400°.

Le.); no decomposition occurs at 300-400°.

Sodium bromide (vol. v. p. 476). Panfil in (J. R. 25, 272 [1893]) obtained NaBr. 5aq by exposing cone. NaBrAq out of doors in winter in Russia; desomposed at -25° to the dihydrate

Sodium iodide (vol. iv. p. 481). NaJ. 5aq separates from a solution of 100 g. Par ni. 50 c.c. water at -14°; at -10° it gives NaI. 2aq and water (P., l.c.).

Sodium nitride (vol. j., p. 482). NaN, is not formed by the interaction of Na or Na,O and NH,, or Na and N, according to Titherley (C. J. 25, 507; of. Sodium amide, supre-k

**S5,507; of. Sodium amide, suprek Sodium monoxide (vol iv. p. 482). Na₂O is formed by heating Na in a limited volume of O at the temperature below 180°; also by heating Na in a limited volume of N₂O at 180°-200° (Holt a. Sirsa₂C₁J. 65, 42 [1894]). Heated in excess of 0, the peroxide Na₂O₂ is formed. H. a. S. say Na₂O is greyish wlide. NH₃ reacts with gens. Theated Na₂O to form NaNH₂ and H₂O fittherley, O. J. 65, 510).

not combine with 0 when heated therein (H. s., s., s., B. Begarding the interestion of Ne. C. and an alcoholic solution of H.C., o. Take (B. 27, 916 [1894]). For reactions of Ne. C. Poleck, B. 27, 2051 (abstract in C. J. 66 [11], 116). 816)

STRONTIUM. For Strontium carbide, . v Moissan, C. R. 118, 683 (abstract in C. J. 66 [1].

Moissan, C. R. 118, 000 (abstract in C. 5, 00 [1]; 818 [1894]).

SULFAATES (vol. iz. pt 567).

Ohromium sulphates (vol. iv. p. 570). Double salts of Cr. (SO₁), and (NH.) SO₂, are described by Klobb (Bl. [3] 9, 663; abstract in C. J. 66 [11]; 95 [1894]).

Vanadium sulphates (v. this vol. pp. 847,

848, 850)

OXY-IMIDO SULPHONATES (vol. iv. p. 602). Divers a. Haga have published a lengthy com-

munication on these salts in C. J. 65, 523 [1894]. SULPHUR (vol. v. p. 606). For measurements of the viscosity of molten S at different temperatures, v. Brunhes a. Dussy, C. R. 118, 1045 (abstract in C. J. 66 [11], 343 [1894]).

THALLIUM (vol. iv. p. 674). The molecule of Tr in dilute solution in tin is probably monatomic (Heycock a. Neville, C. J. 57, 379 [1890]).

Thallium tri-iodide TII,. Wells a, Penfield (Zeit. f. anorg. Chemie, 6, 312; abstract in C. J. 66 [11], 318 [1894]) obtained this compound, in rhombic crystals, a:b:c=6828:::1217, by digesting TII and I with alcohol and evaporating over H2SO4.
